I can from experience bear testimony to the advantages to be derived by the renewal of Vine borders if they are properly and efficiently drained, but what constitutes efficient drainage in one case may not be so in another, although a somewhat similar one. I venture to state that if Vines were planted in good ordinary garden soil, under similar conditions to hardy fruit trees growing outside, that they would produce more satisfactory results than they do when the roots are confined to what is often comparable to a huge tank from which the air is partially excluded, causing the soil to become sour and inert.

It is an acknowledged fact that soil is improved by exposure to the atmosphere. We dig or trench our land in winter and cast it up roughly in order to expose as large a surface as possible to the pulverising influence of the atmosphere, which not only improves it in texture, but also renders soluble some of the valuable plant food that it contains. I do not suggest that Vine borders should be treated in this manner, but consider it would be beneficial to leave them exposed to the atmosphere.

There appears to be a wide-spread belief that the roots of Vines are very susceptible of injury by frost, hence the prevailing custom of covering outside borders with a heavy coating of decaying vegetable matter, which is injurious rather than beneficial. When the roots of Vines are established in well-made borders the soil with which they are covered will afford all the protection that is requisite. Cases could be cited in which Vines have been improved by increasing the supply of water to the roots, but still more could be quoted where they have been practically ruined by an excess of it.

Instances are frequently occurring in which, when there is a change of gardeners, the Vines fail to succeed during the first year or two under the new management. This may not be from any lack of knowledge of the requirements of Vines generally, but simply from failing to comprehend the conditions under which those taken charge of are growing and treating them accordingly. For example, a border composed of sandy soil and a large proportion of porous material would require more water than one with a heavier soil, which is more retentive of moisture, especially if the former were raised above the level of the surrounding land.

Judicious watering has a great deal to do with the health and growth of the Vine. When the wood is approaching maturity the supply may with advantage be diminished, but care must be exercisd never to allow the soil to become too dry, as in many instances the Vines suffer from an inadequate supply of water, injudiciously withheld for the purpose of hastening the maturation of the wood. It is most injurious to allow the soil to become quite dry, as such treatment causes the destruction of the fibrous roots, the consequences being ill-health and shanking.—W. Neild

PLANTING APPLES — LATE VARIETIES WANTED.

There can be no doubt that during the last ten years enormous numbers of fruit trees have been planted in the United Kingdom. On looking at the agricultural returns I find that the acreage under small fruit culture has been more than doubled during that period. There is, however, plenty of room for a still further extension in the matter of planting, for we have to provide for the wants of a rapidly increasing population, as well as to largely diminish the enormous quantities of fruit sent to us from other lands. We have also to take into consideration the number of old orchards still in existence, which will soon have to be destroyed because their owners will find that the worthless fruit they produce will not pay for growing now that many young orchards are coming into bearing, and proving what fine samples can be grown in this country when intelligent culture is pursued.

Fortunately, such fine fruit-growing counties as Kent, Herefordshire, and Worcestershire, have long been alive to the importance of fruit-growing, and began to plant in earnest a few years ago; but there are many counties in the Midlands which have not followed their example. In many parts of Warwickshire, situated away from the manufacturing centres, both soil and climate are favourable for fruit-growing. This can easily be seen by noting the fine crops produced in private gardens where good varieties have been planted and well cared for. This ought to urge farmers and landowners to take up the matter, seeing that the county is within easy reach of so many great manufacturing towns. I have met with a few good orchards in the county; none of them were, however, large, and in the majority of instances the trees are far from young. In December last I assisted in awarding the prizes in the fruit and vegetable classes at the Birmingham Agricultural Show. The grand Potatoes staged showed what the British farmer could do in that direction, but when we came to the two or three classes provided for fruit the state of affairs was not very satisfactory. In the larger class for a collection of Apples only one exhibit was staged; this, fortunately, being in every way a good one, showed conclusively that the little interest taken by farmers in fruit culture cannot be excused on the score of their having either an unsuitable climate or soil.

It is to be hoped, therefore, that fruit culture, as an adjunct to farming, will in the near future be taken up with as much spirit in the Midlands as it has already been in the Southern counties. The time for planting is now upon us, and, fortunately, an ample stock of fine trees can be obtained at home without having to draw—as in so many other instances—upon the ever-ready foreign supply.

When the planting of fruit trees is contemplated on either a large or small scale, Apples should, I think, come in for a large share of consideration. For, whether we look in the markets or in the fruit rooms of private gardens, we usually find the supply of good Apples is not too plentiful during March and April. Early and midseason Apples have been largely planted in many districts, but the late ones

have to a great extent been neglected. The planting of such fine late varieties as Yorkshire Greening, Lane's Prince Albert, Bramley's Seedling, and Dumelow's Seedling is therefore most desirable, and it is to be hoped that during the present season they and other good late sorts will have a larger share of attention than heretofore.

The selection of suitable varieties for different kinds of soil is one that is now receiving much attention, and intending planters will do well to make inquiries as to what varieties thrive in the soil of their district. In the light and rather poor soil found in many parts of Warwickshire Wyken Pippin, Hanwell Souring, Sturmer Pippin, Bramley's Seedling, Hoary Morning, and Bismarck may be taken as types which succeed admirably. With good deep culture and proper attention to feeding at the right time, almost any of the hardier varieties will succeed fairly well.

When preparing the soil for the formation of fruit plantations it ought, if possible, to be trenched to a depth of 2 feet; but if that expense cannot be incurred, holes 2 feet in depth and 4 feet in width should be prepared, and the soil at the bottom of the hole broken up as well. This amount of space will give the trees a good start, and if after three or four years the soil is broken up to the same depth as the station, a few feet beyond it, the first cost of tree planting will be lessened, and room for an extended root run provided at a capital time. Of course this refers to instances where small fruits are not planted as an under-crop. When this is done, the trenching of the whole ground is an absolute necessity if the best results are expected.

In dealing with heavy land, unless it is on a slope, draining must, of course, have attention; without it much splendid land is quite useless for fruit culture, which when well drained could be made to produce good trees and fruit of the finest quality. I should, however, never care to plant fruit trees in a heavy soil without first trenching and incorporating with it as much gritty matter as procurable—road scrapings, burnt refuse, coal ashes, and lime, or old mortar rubbish, all answer the purpose well. Prepared stations seem to form so many drains into which the water runs and stands for a long time. If such land were cultivated deeply for a few years, and employed for growing vegetables, it would, without doubt, be rendered more suitable for fruit culture.

Apple trees grown in the bush form are becoming more popular than ever, and when we consider their many advantages, it is somewhat surprising that tall standards should still be so largely planted in any position except on grass, where, of course, that form of tree may be termed a necessity. Bushes planted 12 feet apart, with small fruits grown between till the permanent trees require the whole space, is a method of arrangement I would follow in preference to all others. Having settled on the site of an orchard, prepared the ground, and marked out the stations with a stake, the digging of the holes must be attended to; but it is often good policy to defer this till a few weeks after the ground has been trenched, to allow the soil to settle. Then, when it is in good working order, the planting can be performed expeditiously.

After the thorough preparation previously spoken of, the soil need not be taken out to a great depth, but the holes should be wide enough to allow every root to be spread out at full length after the points have been cut with a sharp knife. In free working soil the roots near the stem should be slightly above the ground line, and be covered with 3 inches of soil, after working it well in between the fibrous roots, the whole being pressed moderately firm. When finished, there will be a slight mound, which will, in a few months, sink to the ground line.

On the other hand, when planting in heavy soil, many noted fruit growers plant almost on the surface, and heap the soil around the roots into the form of a mound from 9 to 12 inches in height. The soil about the roots is thus kept free from stagnant moisture, and the warmth of spring induces early and vigorous root action. This planting upon the surface and forming mounds around the roots is an excellent practice when well carried out, but it does not succeed if the mounds have only a small diameter, or are made with a very sharp slope, because the soil becomes extremely hard and dry during the summer, and in hot seasons prevents the trees from making much progress for a year or two after planting. We want to avoid going to extremes in either direction. Deep planting is the worst of all practices, but that is no reason why we should rush to the other extreme and plant on high narrow mounds, which become cold in winter and baked through in summer. Even in heavy land a slight rise of the soil above the ground line will insure freedom from stagnant moisture. If, therefore, we so arrange matters as to have the top of the mound about 9 inches above the ground level, give the mound a diameter of 4 or 5 feet, and carry it with a gentle slope from its apex to the ground line, we accomplish the object we have in view, without being led into other evils worse than those we are trying to avoid.

The importance of early planting is such that it cannot be too strongly urged upon the consideration of intending planters. While the land is still warm root wounds heal quickly, a callus is formed, and in some instances rootlets begin to grow at once; in other words, the underground branches are brought into a state of activity far in advance of those above ground. They take up and store food, ready for the time when the buds burst into leafy growth. Contrast this state of affairs with what happens when planting is deferred till late in the spring, when the buds are swelling. As soon as top growth begins the stored up sap is quickly used up, and until fresh rootlets are formed in fair quantities the growth is held in check if not entirely suspended. It is simply a case of starving in a land of plenty, for there is food in abundance in the soil, but the trees do not get it because of the absence of the "connecting link," active rootlets. Trees that are checked in growth in the way described are retarded almost a year in their progress. I like to defer the pruning of newly planted trees until the spring, just as the terminal buds are beginning to swell, as this practice seems to stimulate early sap circulation.

In a country like our own, where the population increases at the rate of nearly 3,000,000 in ten years, it is a fallacy to think the land will ever be less valuable than it is now. Every inch of fairly good agricultural land will pay for cultivating well, until we are able to supply—to a far greater extent than we do at present—the vegetable products required in this sea-girt isle.—H. D.

ROYAL HORTICULTURAL SOCIETY.

DRILL HALL.—OCTOBER 26TH.

THE meeting of the Committees of the Royal Horticultural Society at the Drill Hall on Tuesday was made the occasion of one of the most handsome displays of flowers that has been seen of late. Not only were exhibitors numerous, but visitors flocked in, so that despite the dull weather, the day was a doubly successful one. Each section was strongly represented. In the afternoon the Victoria Medals of Honour were presented to the recipients. Of this function a report will be found below.

FRUIT COMMITTEE.—Present: P. Crowley, Esq. (in the chair); with Messrs. T. Francis Rivers, George Bunyard, J. Cheal, William Crump, A. H. Pearson, A. F. Barron, W. Empson, Alex. Dean, James Veitch, W. Farr, W. Balderson, F. Q. Lane, James Smith, J. Willard, R. Fife, G. Wythes.

Messrs. J. Carter & Co., High Holborn, sent a collection of fresh clean Beets and a few Carrots. Several varieties were represented in good form. A magnificent collection of vegetables came from Messrs. H. Cannell & Sons, Swanley. Onions were grand, as were Carrots, Cabbages, Leeks, and Potatoes. Messrs. J. Laing & Sons, Forest Hill, sent ninety-two dishes of Apples and Pears. The fruits were clean and well coloured. Amongst Apples the most prominent were Lord Derby, Lane's Prince Albert, Stirling Castle, Hollandbury, Peasgood's Nonesuch, Emperor Alexander, Beauty of Kent, Gloria Mundi, and Sandringham. The best Pears were Beurré Clairgeau, Doyenné du Comice, Beurré Diel, Charles Ernest, and Glou Morçeau.

The Apples staged by Messrs. J. Cheal & Sons, Crawley, were conspicuous for their high colour and evenness. The Apples comprised Cox's Pomona, Mère de Ménage, The Queen, Peasgood's Nonesuch, Cellini, Bramley's Seedling, Bismarck, Warner's King, Jubilee, Annie Elizabeth, Stirling Castle, Atalanta, and Hawthornden. Some beautiful Pears also came from the same source. Messrs. Dobbie & Co., Rothesay, sent Parsley Dobbie's Selected, with Parsnips and Turnips.

Mr. W. Taylor, gardener to C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, sent a handsome exhibit of Grapes, most of which were good in colour and finish, as well as in berry and bunch. The varieties comprised Foster's Seedling, Mrs. Pince, Gros Guillaume, Gros Colman, Muscat of Alexandria, Trebbiano, Lady Downe's, Alnwick Seedling, Black Hamburgh, and Alicante.

CLASSES FOR FLAVOUR.—Mr. C. Herrin received the first prize for Apples with Cox's Orange Pippin, and was followed by Mr. G. Woodward with American Mother. Col. Brymer was first for Pears with Doyenné du Comice, and Mr. G. Woodward second with Emile d'Heyst.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair); with Messrs. Owen Thomas, John Laing, Chas. T. Druery, H. B. May, R. B. Lowe, E. Molyneux, George Glenny, Geo. Engleheart, James Hudson, J. Fraser, J. D. Pawle, Charles Jeffries, Herbert Cutbush, James Walker, Charles E. Pearson, Chas. E. Shea, George Gordon, Charles Blick, Harry Turner, George Paul, J. T. Bennett-Poë, H. Selfe Leonard, Geo. Nicholson, and D. B. Crane.

Mr. G. Wythes, gardener to Earl Percy, Syon House, Brentford, contributed handsomely towards the magnificent display of Chrysanthemums in the Hall. His blooms were not arranged on boards, but on long stems above a groundwork of Fern. The best varieties were—Charles Davis, Edwin Molyneux, Amos Perry, Mons. Chenon de Leché, Lago Maggiore, and Miss Elsie Teichman, with several incurved. Mr. W. J. Godfrey, Exmouth, arranged a splendid collection of Chrysanthemums, comprising all the standard as well as several newer varieties. The colours were clean and the blooms very fresh. Amongst the most noticeable were Simplicity, Antoinette, Mons. Delamotte, Lady Byron, Lady Ridgway, Mrs. G. W. Palmer, Geo. Gower, Topaze Orientale, Edith Tabor, King of the Yellows, Ella Curtis, Ma Perfection, and J. E. Lager.

A group of Chrysanthemums, margined with Carnations and Ferns, was staged by Mr. T. S. Ware, Hale Farm Nurseries, Tottenham. The plants were not carrying large flowers, but were clean and healthy.

Messrs. J. Veitch & Sons, Limited, Chelsea, sent an imposing group of Chrysanthemums. The healthy plants were splendidly flowered, the blooms being of good size and massiveness without being coarse. Such varieties as Mons. Chenon de Leché, Wm. Fyfe, W. Seward, Mrs. G. W. Palmer, Phœbus, Louise, Eva Prass, and Mutual Friend were conspicuous. Mr. W. Wells' exhibit of cut Chrysanthemums and plants was very fine. Grand flowers of Australie, Phœbus, Edith Tabor, Mrs. J. Lewis, Antoinette, Madame Desblanc, Thomas Wilkins, Surprise, G. J. Warren, Queen of the Earlies, and Madame Gustave Henry were seen.

Chrysanthemum blooms from Messrs. H. Cannell & Sons, Swanley, made a capital display. There were good examples of Iserette, Lady Byron, M. Massange de Louvrex, Madame G. Brunt, Dorothy Seward, Mrs. Hugh Gardener, Lady Ridgway, Australie, N.C.S. Jubilee, Madame G. Henry, Chas. Davis, Lady Hanham, Robert Powell, and Madame Bergier. Besides the large flowered varieties, the same firm sent singles in fine form. Messrs. W. Cutbush & Son, Highgate, arranged a miscellaneous group in which Chrysanthemums, Carnations, Palms, and Ferns were well utilised. Messrs. J. R. Pearson & Sons, Chilwell, exhibited three superb blooms of Chrysanthemum Mrs. G. W. Palmer.

Messrs. J. Laing & Son, Forest Hill, exhibited a collection of well grown foliage and flowering plants. Crotons were beautifully coloured, as were Dracænas. Besides these there were Begonias, Ericas, Bertolonias, Ferns, Palms, and Chrysanthemums. Mr. W. Fyfe, gardener to Lord Wantage, V.C., Lockinge Park, Wantage, sent flowers of Sunflower Beauty of Lockinge. Mr. H. B. May, Edmonton, sent finely grown plants of Begonia Gloire de Lorraine, interspersed with Ferns. H. J. Elwes, Esq., Colesbourne, Glos., staged a collection of seedling Nerines, amongst which were several charming varieties. Messrs. J. Veitch & Sons contributed hybrid Rhododendrons as well as plants of Begonia Gloire de Lorraine and Richardia Pentlandi.

Messrs. W. Paul & Son, Waltham Cross, sent a really beautiful collection of Roses cut from plants in the open ground. Many varieties were represented in excellent form.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair); with Messrs. H. Ballantine, W. H. White, Fred. J. Thorne, T. W. Bond, W. H. Young, E. Ashworth, H. J. Chapman, Henry Williams, James Douglas, S. Courtauld, D. B. Crawshay, H. M. Pollett, and A. H. Smee.

Messrs. J. Veitch & Sons, Limited, Chelsea, sent a magnificent display of Orchids. Not only was there quantity, but also quality. There were Cattleyas, Cypripediums, Oncidiums, and Dendrobiums, all finely represented. Messrs. H. Low & Co., Upper Clapton, sent some handsome examples of Vanda cœrulea, with a few other Orchids. Messrs. F. Sander & Co., St. Albans, sent Orchids conspicuous for their quality. Cattleyas were the main feature, but Cypripediums and others were also included. Thos. Statter, Esq., Stand Hall, sent the original Cattleya Hardyana, which was carrying three flowers.

A small group of Lælia præstans was staged by Messrs. W. L. Lewis and Co., Southgate, while Mr. W. J. Empson, gardener to Mrs. Wingfield, Ampthill, exhibited miscellaneous Orchids. There were finely grown and healthy plants of Cattleya labiata in variety, with Oncidiums and Cypripediums. Fred Hardy, Esq., Ashton-on-Mersey, sent some superb Cattleya aurea. Mr. G. Cragg, gardener to P. Walker, Esq., Winchmore Hill, sent Cattleyas and Odontoglossums in choice variety. Mr. H. J. Chapman, gardener to R. I. Measures, Esq., Camberwell, was splendidly represented by some excellently cultivated Orchids in considerable variety.

CERTIFICATES AND AWARDS OF MERIT.

Cattleya Melpomene (J. Veitch & Sons).—Soft rose is the colour of this hybrid. The fimbriated lip is very pale blush. The parents were C. Mendeli and C. Forbesi (award of merit).

Cattleya Olivia (J. Veitch & Sons).—A lovely hybrid resulting from a cross between C. intermedia and C. Trianæ. The colour of the sepals and petals is delicate blush, the outer portion of the lip being rose and the inner part cream (award of merit).

Cattleya Hardyana magnifica (J. Hardy).—One of the best Hardyanas that have been seen of late at the Drill Hall. In colour and size it is a marked advance on the type (award of merit).

Cattleya Bowringiana (R. Pallant).—A grand form of this comparatively well known Orchid (award of merit).

Chrysanthemum Simplicity (W. J. Godfrey).—A Japanese with drooping florets. The colour is pure white (award of merit).

Chrysanthemum Lady Ridgway (W. J. Godfrey).—An incurved Japanese of good build. The colour on the inner side is brick red, and the outside much paler (award of merit).

Chrysanthemum Modesto (W. J. Godfrey).—This handsome yellow is now well known (award of merit).

Chrysanthemum Madame Phillip Rivoire (W. J. Godfrey).—A handsome white, after the form of Souvenir de Petite Amie, but superior (award of merit).

Chrysanthemum Sunstone (W. J. Godfrey).—A Japanese. The colour is soft yellow and the shape good (award of merit).

Chrysanthemum Ella Curtis (W. J. Godfrey).—A superb yellow. The florets are of immense width and substance (award of merit).

Chrysanthemum Robert Powell (H. Cannell & Sons).—An incurved Japanese. The inner portion of the floret is light brownish red, and the reverse amber (award of merit).

Chrysanthemum Lady Hanham (H. Cannell & Sons).—A grand sport from Viviand Morel; the colour is soft rose (award of merit).

Chrysanthemum N.C.S. Jubilee (H. Cannell & Sons).—A charming incurved Japanese; the colour is silvery rose (award of merit).

Cypripedium Haynaldo Chamberlainianum (H. Holbrook).—A charming hybrid. The pouch is claret, the dorsal sepal white at the margins and green within, with chocolate spots. The petals are narrow, wavy, and green in colour, profusely marked with brown (award of merit).

Gesneria amabilis (P. Blair).—A handsome plant. The cream coloured flowers are very profusely borne (award of merit).

Grape Marchioness of Downshire (T. Bradshaw).—Said to be a cross between white Gros Colman and Muscat of Alexandria. The flavour is rather poor, but if, as is said, it hangs well when ripe, it should be useful (award of merit).

Lælia præstans albens (F. Hardy).—A very chaste form. Save for a patch of purplish maroon on each side lobe the colour is pure white (award of merit).

Lælia purpurata Mrs. R. I. Measures (H. J. Chapman).—A distinct and handsome form. The petals are delicately tinted with pink and white; the sepals are deep purplish rose, as is the lip (award of merit).

Lælia pumila magnificum (W. L. Lewis & Co.).—A superbly coloured form of the type (award of merit).

Melon Excelsior (G. Wythes).—A red deep fleshed Melon of handsome appearance. It is of medium size. The flavour is very good, especially for the time of year (award of merit).

Maranta Burkei (J. Veitch and Sons).—A graceful Fern. The leaves are much divided (first-class certificate).

Nerine Lady Bromley (H. J. Elwes).—The colours of this form a very peculiar combination. The outer portion of the segments is bright rose, and the central portion purple (award of merit).

Nerine Lady Ffolkes (H. J. Elwes).—Delicate salmon rose is the colour of this variety (award of merit).

Nerine Lady Lawrence (H. J. Elwes).—The colour of this is bright brick red (award of merit).

Nerine Countess of Bathurst (H. J. Elwes).—This variety is white, with bright rose in the centre of each segment (award of merit).

Nerine Lady Llewellyn (H. J. Elwes).—A deep crimson form of much beauty (award of merit).

Nerine Lady Mary Shelley (H. J. Elwes).—A good form. The colour is pale flesh pink hue (award of merit).

Nerine Lady Dorrington (H. J. Elwes). One of the best. The flower is bold, and the delicate rose colour effective. Down the centre of each segment is a bright rose line (award of merit).

Odontoglossum Sunlight (R. B. White). A lovely crispum. The brown spots make a very chaste flower (award of merit).

Turnip, Golden Ball (Dobbie & Co.).—A splendid yellow variety. The shape is perfect (award of merit).

Turnip, Model (Dobbie & Co.).—This is well known as a fine variety of the old Snowball (award of merit).

THE VICTORIA MEDALS OF HONOUR.

THE Victoria Medals of Honour, granted by the Council of the Royal Horticultural Society in celebration of her Majesty's Jubilee, were publicly distributed at the Drill Hall, Westminster, on Tuesday afternoon. Previous to the distribution the President (Sir Trevor Lawrence, Bart.) and the Council entertained the recipients of the honour, as well as a number of officers and friends of the Society, at luncheon at the Hotel Windsor, Victoria Street, S.W.

The loyal toast having been duly honoured, the PRESIDENT said: The Council found, early in this year, that there was a strong desire to do something on behalf of the Royal Horticultural Society to celebrate the sixty years of her Majesty's reign. Her Majesty has for many years been patroness of the Society, and many members of the Royal Family are Fellows of the Society; and as you all recollect, the Prince Consort was, for some years, President of the Society. Well, I think, if you will remember, gentlemen, that the Society was established in the very early years of this century; that it has, during a large part of a hundred years, presided over, and in a great measure directed, the gardening interests of this country, I think that, the Queen being patroness of our organisation, it was only becoming that the Society should do something to celebrate the very remarkable occasion of her Majesty's reign. (Applause.) If I were to enter into the question of the advances that have been made in horticulture, in the cultivation of fruit, and in the other branches of gardening during the reign, I should take up far too much of your time, and, in addition to that, these subjects have already been dealt with by persons far better able to deal with them than I can. Therefore I say that they must be blind indeed who do not see the enormous strides gardening has made in this country during the last sixty years; and not only is that so, but I venture to think that the strides that have been made illustrate the fact that horticultural gardening is by no means one of the pleasures of the rich alone. I remember perfectly well when I had the honour of representing a part of London, rather a poor part—Battersea, Wandsworth, and that neighbourhood—being very much struck with the care and trouble the people took with their window gardens and plants, and I venture to think that as great interest is taken in the humble gardening of the poorer people as in the gardens, the extensive gardens of wealthy people; in fact, it may be that a greater interest is taken. (Hear, hear.) Now perhaps it will be an exaggeration to say that gardening is the mother of the virtues; but at the same time I do think that one may say with perfect truth that there are very few pursuits and occupations which have so much good in them with as little admixture of evil. (Applause.) Well, gentlemen, when the question came as to what we were to do to celebrate her Majesty's Jubilee, I need scarcely say that the fertile brain of our Secretary had a suggestion to make. (Applause.) I do not mean to say that his brain was the only one which was fertile, far from it, but the fertility of his brain produced a more sturdy plant

than the fertility of the brains of others, and I think I may truly say that it was due to an inspiration of the Secretary that we took into consideration the proposal of establishing a Victoria Medal of Horticulture. Well, when that, and kindred projects were looked at all round, it became perfectly clear that our Secretary's suggestion was by far the best that came before us, and I was instructed to ask her Majesty's gracious permission to establish this medal. I daresay, gentlemen, you are aware that her Majesty scrupulously abstains at any time from taking any prominent share in any method of celebrating her Jubilee, but she graciously intimated to us her assent to our proposal, and expressed the opinion that there could be no possible objection to it. That being so, we decided to adopt the proposal which originated with our Secretary, and established the Victoria medal. Well, lady and gentlemen, I am very glad that we did. We have only two lady members. I wish that they were both present. (Applause.) I feel a sort of embarrassment in saying lady and gentlemen. One is so accustomed to say ladies and gentlemen that when you deal with the more commanding sex in the singular it becomes, to a certain extent, embarrassing. But, the medal being instituted to celebrate the Jubilee of her Gracious Majesty, nothing could be more becoming than that we should have some members of her sex as medallists. I do not think anything could show more conclusively that we did wisely in adopting the proposal that emanated from our Secretary than the gathering I see around me, where the relative departments of scientific and practical horticulture, including of course botany, are represented by many men of the greatest possible eminence, gathered round this table. I venture on behalf of the Society to thank them most heartily for their presence to-day. When the question arose as to who should be the recipients of these medals we thought that every department connected with the art and science of gardening should be represented. It may occur to some here present that there are names absent which they would like to see present. There may be perfectly good reasons why they are not there. In the first place, it would not have been at all becoming that the Council who had the selection should distribute medals among its own members. That was perfectly obvious. Then there are other reasons, lesser reasons, private reasons why various gentlemen who were invited to become recipients of the medal thought it their duty, however little might be their desire to forfeit it, to decline. That explains the absence of certain names. The present position is this. We have the honour of having among our medallists eight botanists. I take them first, as science, beyond all things, is the moving power of the world at the present time. Among these, and at the head of them, we have the distinguished botanist who sits on my right, Sir Joseph Hooker - (applause)—who, I venture to say, during his long life has done more valuable work for the advancement of botany than any one man has ever done. Then we have among collectors and hybridists six members. We have among the gardening profession and trade fourteen nurserymen and men engaged in business. We have two members who represent the market aspect of gardening; twenty-seven medallists who represent gardeners—fifteen amateurs and twelve gardeners by profession. Some people may very justly think the proportion ought to have been reversed. We have one landscape gardener and two members of the horticultural Press. I can assure you, gentlemen, that the greatest possible trouble was taken to award the medals to those who seemed most to deserve them in every department. I daresay we have made mistakes; that there are names omitted who ought to be included. Possibly there are names included that ought to have been omitted; but at the same time, it is through no lack of care. We did our very utmost, and we had the advantage of the advice of very competent advisers. We did our utmost to secure a thoroughly representative list of those connected with the art and science of gardening. There is only one other remark I wish to make—and it is due to her Gracious Majesty to say so—the Queen has no responsibility whatever, except to have been sufficiently gracious to have given her consent to the institution of this medal. It would be manifestly extremely distasteful to her Majesty if the medal were used under any circumstances for the purpose of advertising. (Hear, hear.) I am extremely grateful to the lady, and to the gentlemen here present for their being so kind as to be here to-day. It has been a very great pleasure to us to meet them, and if any little trouble has been taken in the matter we are fully requited for it by their presence here to-day. With this toast of the health of the Victoria medallists I beg to couple the names of Sir Joseph Hooker and of my friend Dean Hole, of Mr. Sherwood for the trade representatives, and Mr. Hudson for the gardeners. There is another observation which I desire to make in conclusion - namely, that the medal itself is the work of a lady, who I think has carried out a very graceful conception in a most satisfactory way. It is exceedingly difficult to put within the limits of a very small medal, as the Victorian medal is, any conception at all, and I think that when you see the medal you will agree with me that the lady—Miss Margaret Giles – who carried out the work has done it admirably.

The toast was warmly received, and Sir JOSEPH HOOKER thanked the Council on behalf of the recipients for the honour conferred upon them. There were some present whose claims to honour for services rendered in the cause of horticulture were greater than his own. (No! no!) There were those present who represented three generations of horticulture, men who had introduced more new plants than even Kew Gardens had done, and the fruits of whose labours were to be found in every garden all over the globe, from the garden of the prince to that of the peasant. He proudly accepted the position they had given him on account of his connection with the Royal Gardens of Kew. The objects of Kew were many and varied, and especially were they for the study of botany and economy. Those there were engaged in the production of new and rare plants—their classification, identification, description, and illustration; and what was more important than that, the propagation of useful and economic plants all over the world, for the welfare and benefit of mankind. But what would be the use of all that without practical horticulture? The gardens of Kew without horticulture would be a barren wilderness. Where would theoretical botany be without horticulture? Ask Darwin. Vegetable physiology would be a barren branch without it. Botany and practical horticulture must go hand in hand, and so long as they did both would prosper. He desired to tender, on behalf of his co-recipients, his scientific friends, and himself his warmest thanks for the honour conferred on him, and to express their deep sense of her Majesty's goodness in giving her name to the medal.

Dean HOLE also responded, and said he should always regard that day as one of the brightest of a long and happy life, so long that he thought he might claim the title coveted at Cambridge next to that of Senior Wrangler, and call himself senior medallist. If there were such a thing as righteous pride, and if it were even justifiable to put a little side on—(laughter) - he thought they gardeners had the right to adopt it that day. However, it was not pride which was uppermost in their thoughts, but a very humble thankfulness that they themselves had

FIG. 63.—THE VICTORIA MEDAL OF HONOUR.

not only been permitted to appreciate the purest of human pleasures, but that they had been allowed to communicate to others the methods and fruits of their success. The Society, with the aid of its unwearying Secretary, had done excellent work for a long time to promote the science of horticulture, and he believed that the institution of the Victoria Medal of Honour would prove to be a great encouragement and an important help in quickening the ambition and developing the qualities of those men who should excel hereafter in botanical science and in horticultural skill.

Mr. SHERWOOD thanked the President and Council on behalf of the members of the commercial and seed trade for their recognition of services rendered during the past sixty years. He had heard many express the opinion that the members of the Council of the Society ought to receive some recognition. He could only hope that some such recognition would take place. (Applause.)

Mr JAMES HUDSON returned thanks on behalf of gardeners generally, and congratulated the Society that they steered clear of the controversies which troubled so many other professions. He desired to cordially congratulate the President on the honour he had received from the Queen during the last few days – (applause) - for no one was more deserving.

Baron SCHRÖDER gave "The health of the President and Council of the Society." As an old retired member of the Council he had had a great deal of experience in the troubles and anxieties connected with the office of President of their great Society, therefore he felt that all honour was due to those gentlemen who had brought the Society to its present splendid position. When he was called to the Council they were located at South Kensington, where they had a large and lofty conservatory but a wretched Council chamber. At that time the Council was much divided. Some gentlemen were for continuing in the old room and seeing the Society gradually die, but others and at the head of them was Sir Trevor Lawrence – (applause) - were determined to face the position, and to believe that they were doing right in breaking with the old traditions. That was a grave step. They had many consultations altogether. They had no money and few friends, while the Society was going from bad to worse. However, they had a President who helped them, but while they were considering the advisability of leaving South Kensington they were turned out. (Laughter.) That was the darkest hour of their Society, but under their President's wise and careful management the Society had gradually prospered, and was now in a position such as was held by no other Society in the world. It was thought, he said, that they should have their own home – (applause)—but he was afraid that was past. It would have been a splendid speculation to have gone where he wanted them to go. He was sure that all agreed with him that their splendid Society should have its own home, as those in America and on the Continent had. Under the guidance of their good President, who had stuck to the old ship like a brave pilot, they would find a way to get such a home. The President had had wonderful tact in getting a good Secretary. (Applause.) It was the best day's work he ever did for the Society when he obtained the services of the Rev. William Wilks.

The toast having been responded to, the PRESIDENT thanked Baron Schröder for his kindly references, and said that it was largely owing to the Baron's hearty support that they were able to carry out the change of policy to which he had referred. It was the duty of a horticultural society to stick to horticulture, and from the moment their Council took up the position of devoting itself entirely to promoting the interests of horticulture, it had not looked back. They entertained strong feelings of gratitude to the amateur gardeners and professional

gardeners of the country for the great support they had given, and which was so well exemplified in the show at the Drill Hall. It was a beautiful and characteristic illustration. He desired to endorse what had been said with regard to the Secretary, who had done his work admirably, and at one period, notwithstanding very serious physical obstacles. He desired to quote the following passage from an article in the Journal :—"The Royal Horticultural Society has spent during the ninety-two years of its existence not less than £400,000. That it has made mistakes and wasted money its best friends will not deny, but it may confidently be asserted that it has done and is doing good work such as no other society could do—good work of great value to the community. The productions of the Society and the lessons it has taught have embellished the land and smiled on the visitor from every park and garden in the kingdom." So long as the Society stuck to that work it would have the very hearty and cordial support of the horticulturists of the kingdom. (Applause.)

The gathering then adjourned to the Drill Hall, where the President distributed the medals.

SEASONABLE HINTS ON FLORISTS' FLOWERS.

ALTHOUGH the seasons come round in their unvarying course, it does not follow that in our changeable climate the conditions are quite the same year after year, hence the directions for one season are not suitable for others. In 1896 we had during September and October a great quantity of very heavy rain, while in the present year October has hitherto been, and promises to continue, a very fine month, and to the florist above all others these conditions make a good deal of difference in his operations, for his being such very highly bred flowers they are more susceptible to the influence of cold and damp than the species from which they originated. It is the same way in the animal kingdom; the beautiful and highly bred Channel Islands cattle have a delicacy of constitution from which the more common kinds are free, and require, consequently, greater attention and care ; so that the florist must be prepared to find that he cannot grow his plants in any rough and ready way, but that they require the close attention which only he who loves them will give them. Take for example

AURICULAS.

I sometimes hear people say, "Oh, the Auricula ; yes, I have grown that for many years, and it is quite hardy ;" but when one comes to inquire it is found that the Auriculas to which the speaker alludes are either alpines or border varieties, and not the highly bred edged varieties which are the delight of the true Auricula lover. Woe be to the grower that tempts to cultivate these as if they could hold their own against the uncertainties of our winter months. The past season has been on the whole a good one for them. I have already given my estimate of the spring exhibitions. The flowers were late, and, consequently, the northern growers were not in the running, and so we had no new varieties about which to write. Everyone who grows the plant knows how difficult it is to obtain a good variety. It is not so with other flowers. Every season brings forth dozens of new Roses, while with regard to other flowers, such as the Gladiolus, Pelargoniums, Chrysanthemums, and others, we have to look through our lists and see what we have to get rid of; but in the Auricula we still cherish the old established favourites of thirty or forty years ago, and very few are the additions made to our lists.

I am afraid that the beautiful autumn weather we are having will stimulate them to throw up autumn blooms. Where this is the case they should be pinched off. The plants ought now to be in their winter quarters. I believe a pit to be the best place for them, for they are much more accessible, and there is no necessity, as when they are in frames, of lifting up the lights to look at them. All decaying foliage ought to be removed, and should there be an appearance of green fly it will be desirable to give them a slight smoking before shutting them up. Water should be given very sparingly for two reasons : the plants ought not to be stimulated, and watering may engender damp; and we must bear in mind that, however fine the weather may be now, we must be prepared for a spell of cold more or less severe, and so have mats or other material ready to cover them with when it comes.

CARNATIONS AND PICOTEES.

No two seasons can be more diverse as far as these flowers are concerned than 1896 and 1897. In the former even so experienced a cultivator as Mr. Turner of Slough had to complain of the difficulty of getting layers to root, while this year they have everywhere rooted most readily. The taste for what are called border Carnations seems to be on the increase. No doubt they are most effective in the open ground, and the improvement that has taken place in them is very marked; still it would be a sore thing for the beautiful flakes and bizarres and the delicately marked Picotees to be neglected.

The question of wintering these is a matter of some importance. There are those who advocate planting them in the autumn and left unprotected during the winter. This seems to me a risky proceeding. It may sometimes answer, but I have known even the old Clove to be killed by frost, and I therefore always recommend that they should be potted and kept in cold frames during the winter. If kept tolerably dry and given plenty of air I do not think that there is any fear of their contracting that fatal fungoid disease called spot, and then by the time they are ready to be planted out the pots will be full of roots. It is best to pot them singly, as the roots become less disturbed when they have to be placed in the beds. Now is the best time to obtain new varieties ; they are to be had from all nurserymen who cater for the florist, and lovers of the beautiful will not fail to include in their orders some of the fine yellow varieties raised by Mr. Douglas and others.

I can remember the time when three or four only of these were to be had, and they were difficult to keep. They were flowers, however, which were more in accord with the exacting demands of the florist than any of those of recent years. The same remark with regard to green fly applies to these, and frames or pits containing them should be fumigated. Old and experienced growers know this well, and take no little pains to remedy this evil, but novices are inclined to think a few green fly will do no harm ; this is, however, a mistake, and no pains ought to be grudged to get rid of the varmint.

GLADIOLUS.

It will now be time for the lifting and storing of these bulbs. For those who grow a named collection it is a troublesome process. Dry weather ought to be chosen for doing it, so that a large quantity of earth may not cling to the roots. It has been by some supposed that the varieties degenerate. This is not the case. The individual corm may do so, and after three or four seasons may not be worth much ; but they nearly all produce a quantity of spawn, and this, when taken care of, will be found to produce as good flowers as ever.

This was exemplified by the fine collection shown by Mr. Burrill at the Drill Hall in September, when a grand spike of Orphée, a variety which came out about thirty or forty years ago, was exhibited with fourteen splendid blooms. and therefore anyone who wishes to continue their stock or increase it had better take care of all the spawn, rubbing it carefully off the corms and putting it by carefully in paper bags until the spring. But what a long time, it may be said, we shall have to wait for flowers. Not so. The same authority informed me that many of the beautiful spikes shown by him were produced from corms not larger than a Cob nut, and this in their second year.

Care should be taken when the bulbs are taken up that they should be placed in a dry cool situation, where they will be free from frost, and where they can be looked at from time to time. This should be a favourable season for harvesting them, being so bright and dry. As usual, several new varieties have been exhibited, amongst them some of Child's American varieties, of which one has not formed a very favourable opinion. Several of the Lemoinei section have been exhibited in good form ; these may be left in the ground, and with slight protection of coal ashes or cocoa-nut fibre refuse, may pass through the winter unharmed.

PANSIES.

The past has been a more favourable season for them in the South of England, as they like both coolness and moisture, and for this reason they do so much better in the North of England and in Scotland than with us. The Fancy varieties are those most in favour ; their size and varied colouring give them a great advantage over what are called the Show varieties. In truth, if one wants to see these or the Violas, called by some by the absurd name of Tufted Pansies, they must go to Scotland. And these again are, at any rate with us, plants that cannot very well be left in beds during the winter ; they should now be placed in pots singly, if possible, and then in the spring they may be transferred into the pots in which they may flower.

PINKS.

An attempt is made to revive an interest in these in and about the metropolis, but I think it is doomed to failure. The fact is that there is so little variety amongst them that they will not suit the taste of the present day. Those, however, who grow them will now see to their being planted in beds. They will succeed in any good garden soil, and when planted should be firmly pressed in ; they may be planted about a foot apart. It is long, however, since I have seen in any amateur's garden a bed of these sweet and prettily marked flowers.

ROSES.

There will be several things to engage the attention of Rose growers at the present moment. He will look through his beds to see if there are any weak or sickly plants to cast out ; he will also see what varieties he may wish to discard and what new ones to add. There need be no hurry, however, in filling up the beds or in making new ones. The mild open weather of this autumn has kept the plants, especially the Teas, in full growth, and even in my small garden I can cut handfuls of these refined and beautiful flowers every day. If anyone is ignorant of the proper way of planting let them procure the little tractate issued by the National Rose Society, where they will find every detail carefully marked out for them.

There is evidently a tendency towards the growth of what are called garden Roses, and many perhaps will wish to add to their collections, but they must be careful to remember that many of them are summer-blooming Roses, In fact, for a continuance of blooming, there is no class so dependable as the Tea-scented Roses, although they lack the brilliancy which characterises some of the Hybrid Perpetuals, nor is their perfume comparable to that emitted by the darker coloured varieties of the Hybrid Perpetual class.—D., *Deal.*

A FINE EUCHARIS BLOOM.—I am sending you a scape of Eucharis amazonica, the second flower of which consists of a double row of segments, ten in all. I should like to know if similar instances occur. The bulbs were all repotted last spring.—GEO. WEEKES. [We have had similar examples sent to us from time to time. The bloom is very symmetrical, of great substance, and 4½ inches in diameter. There were nine blooms and buds on the scape, representing excellent cultivation.]

SILICO-FLUORIDES IN HORTICULTURE.

I HAVE no wish to discuss the opinions expressed by your correspondent in this matter, but perhaps you will allow me to hint that one grain of practical experience is usually equivalent to several tons of *à priori* argument. The use of silico-fluorides as germicides is at present unknown; the sooner it becomes well known the better, in my humble opinion, for horticulture and agriculture, and I shall be happy to assist in making it known. Soap must not be used with the silico-fluoride of ammonium. The silico-fluoride of ammonium does not roll up into globules even on freshly opened, glassy looking leaves. It is acid to litmus; but the saturated aqueous solution does not attack the leaves of plants. It is proper to use a very much weaker solution than that.—W. MILLS.

[By all means let the product be tried. Mr. Abbey appears to have tried it already, and his statement of its beading off a mealy phylloxera is embodied in a reply to a correspondent.]

DEATH OF MR. EDMUND J. BAILLIE, F.L.S.

ALL those of our readers who enjoyed the acquaintance of this gentleman, or came into contact with him at public meetings, will deeply lament his death, which occurred at his residence, Woodbine, Chester, on the 18th inst., at the early age of forty-six years. The deceased leaves a widow and ten children to mourn his loss. We learn from the "Cheshire Observer" that Mr. Baillie was educated at Tarvin, and on leaving school he spent a few years on his father s farm. Rather more than thirty years ago he entered the firm of Messrs. F. & A. Dickson & Sons, seed merchants and nurserymen, Eastgate Street, Chester. and his business career was most successful. He commenced as a junior in the correspondence department, the charge of the department eventually falling to his care and supervision. He was next appointed cashier and confidential adviser of the firm, and afterwards became a partner, and subsequently managing partner of the business. When the two firms of Dicksons were amalgamated, Mr. Baillie became deputy chairman and a managing director of Dicksons Limited. Since the death of Mr. Alfred Dickson he had been more intimately connected with the extensive nursery department.

By Mr Baillie's death Chester is much the poorer. His wide attainments, many-sidedness, and wonderful grasp of everything he took in hand, made him a man of whom any community might well be proud. A distinguished botanist, he was a Fellow of the Linnæan Society. For his services to the cause of natural science he was awarded the Kingsley Memorial medal. He was one of the prime movers in the formation of the Chester Paxton Society, and, a true lover of art, he practically initiated the Chester Guild of Arts and Crafts. Mr. Baillie was ever striving to popularise art. A Fellow of the Royal Horticultural Society, deceased on several occasions lectured before this body while articles on fruit culture frequently appeared from his prolific pen in various publications. He held strong views on the value of fruit as a food. As is well known, Mr. Baillie was an enthusiastic vegetarian, being one of the vice-presidents of the Vegetarian Society. He took an active part in the Vegetarian Conference in Chester two years ago, and it is a melancholy coincidence that the Society celebrated its Jubilee in Manchester on the very day of his death. What makes the circumstance infinitely sadder is that an interesting paper by Mr. Baillie himself was read at this gathering.

Mr. Baillie has on many occasions adorned the columns of the *Journal of Horticulture*, and especially a few years ago over the signature of "John Edmunds." A giant in stature, our friend was gentle as a child, and we join our Cheshire contemporary in its concluding paragraph —"Universally admired and respected, if ever anyone deserved the epitaph 'He had no enemies,' it is the late Mr. E. J. Baillie."

FRUITING YOUNG VINES.

CULTIVATING Vines from eyes and fruiting them their entire length the following year is, I think, a little out of the beaten track, especially with Vines that are to remain permanently. In January last year (1896) I inserted eyes of Black Hamburgh in thumb pots containing loam and a little sand, merely covering the eyes. When they had made about 5 inches of growth, and the roots were commencing to run round the pots and coil up a little, the Vines were shifted into 6-inch pots. They progressed favourably and were ready to plant in the border about the end of May.

Previous to that I prepared the border, drained it thoroughly, and had room for about 26 inches of good turfy loam. That, along with some wood ashes, lime rubbish, and a little crushed bones, made a suitable compost for the young Vines. As the border was made up I had two men at work with rammers beating down the turf as firmly as they possibly could. When all was finished I gave the border a good watering as the loam was rather dry.

The Vines were planted a few days afterwards, and grew rapidly, reaching the top of the 10 feet trellis by the end of July. The top was pinched off each Vine, and the laterals after they made three leaves were pinched also. About the first week in November the wood was as brown as a nut.

All the winter pruning that was required consisted in cutting back the laterals to the main rods. This year the Vines were allowed to start almost of their own accord. They broke very strongly, showing two and three bunches on each lateral. Their vigour induced me to leave twelve bunches on five of the rods, and fourteen bunches on two others. The Grapes finished well, the average weight per bunch being 2 lbs. The heavy crop seemed to have no bad effect on the Vines, as the wood is ripening well this autumn, and I am looking forward to similar results next year.—WM. K. PETTIGREW, *Hewell Grange Gardens, Worcestershire.*

[A very good beginning, and Mr. Pettigrew will oblige by reporting progress another year.]

THE YOUNG GARDENERS' DOMAIN.

THE MEANS AND MODES OF PROPAGATING PLANTS.

(*Continued from page* 226.)

HITHERTO we have been dealing with the means of propagation that Nature affords, but there are others in which Nature requires the aid of Art. One of these modes is propagation by layers, which consists in arresting the downward current or deposition of formative matter, which collects and forms a callus, from which roots issue. In this operation an upward slit is made half across a joint, and the part so cut is fixed in favourable soil, with the results above stated. This process is adopted with Pinks, Carnations, Roses, and many other plants. It is, however, an important operation, and should be neatly executed.

Choosing the suitable branch of a Carnation, for instance, remove all leaves below the joint selected. With a sharp knife make an incision in the under part of the branch a quarter of an inch below a joint, passing the blade upwards through the joint in a slanting direction to a quarter of an inch above, terminating as nearly as possible in the centre of the stem. The tip of the tongue thus made is cut off with a clean sharp knife, and the layer pegged down an inch deep in fine soil. In the case of Carnations the plant is in a fit state for the operation as soon as the flowering season is over. No stem which has already produced flowers should be employed for the purpose.

In the case of Roses and other shrubby plants, all that is required is to run the knife through a joint sufficiently to make an opening near it, and affix it with a peg 3 inches below the surface of the soil, leaving that part above the soil as erect as possible. When roots are produced freely the layer may be separated from the parent and planted out.

From the middle of July to the middle of August is a good time for layering Ivy, Jasmine, the Wistaria, and many other plants of the same kind. Ivy will take root readily if merely pegged down; but it will root more quickly if a notch or slit be made at the joint and buried under the surface of the soil. Jasmine should be cut partly through a joint when laid down for propagation. The wound intercepts the flow of the sap backwards to the root, and the accumulation forms a callus from which roots issue.

Propagation by means of slips or cuttings is applied to almost every description of plant, but especially to those which refuse to ripen their seed with us, or which are many years in attaining maturity, as in the case of ordinary fruit trees. To be successful in the operation the cuttings should be made just at the point where the wood of last year's growth terminates and that of the current year begins. It should be removed with a clean, sharp, sloping cut just below a bud. Different kinds of cuttings require different management, and no hard and fast rule can be laid down for all.

Silver sand is the best medium in which to root small cuttings. A light, free soil, through which the air can pass freely, yet moisture being also present, is essential to the well-being of all cuttings. That aëration is necessary is proved by the fact that cuttings root freely in cocoa-nut fibre refuse, a material which is extremely pervious to air, and retains moisture for a considerable period. Powdered charcoal also forms a good medium.—C. W. M.

FIGS UNDER GLASS.

(*Continued from page* 395.)

WHEN the fruits are about the size of shelled Walnuts they may be observed to stand still for about a fortnight; this is when the tiny seeds are forming, corresponding with the stoning period of Peaches. On no account maintain high temperatures just then, or the fruits may drop instead of swelling. Other causes of this misfortune are immature wood and cold draughts in early spring. As soon, however, as the fruits are seen to be on the move again everything should be done to encourage the fruits to swell. The temperature may be raised 5°, the syringe used thoroughly and dexterously twice daily, especially on the under sides of the leaves, and the roots supplied with liquid manure and a light mulch. At closing time damp the floors with liquid manure to give off ammonia to strengthen the leaves and to improve the trees generally. Admit air with discretion, leaving a chink open all night to allow the ammonia to pass off before morning, or a scorch may result.

When the fruits commence ripening less water will be required at the roots, and liquid manure should be withheld altogether. Syringing must be discontinued, also the afternoon and late dampings. Much more air will be required to improve the flavour of the fruit, while a very gentle heat in the pipes will dispel damp. During the fruiting season when an opportunity presents itself the ripe fruit should be gathered closely, and the trees given a good syringing with clean rain water on a bright morning to keep red spider in check, which is sure to make its appearance to a more or less degree.

All growths for next year's fruiting should be laid in full length; others may be stopped at about the sixth leaf, and these will produce the second crop of fruit, which will mature in about two months.

When Figs are gathered they should be handled by the footstalk whenever this is practicable, as being very soft they are easily disfigured and made unfit for table or exhibition. For packing Figs we find nothing better than the leaves of the Runner Bean, their own leaves being rough are quite unsuitable for it.

The standard variety grown in England is Brown Turkey, being a sure cropper; fruits of medium size and very luscious. A good large variety is Negro Largo. As its name implies, it is nearly black, of handsome appearance, but inferior in flavour to Brown Turkey. For outdoor culture Brunswiek is an exeellent variety, eoming into use in September. —YOUNGSTER.

FRUIT FORCING.

Vines.—*Earliest Vines in Pots.*—Many lovers of Grapes do not appreciate the thick-skinned varieties, and desire thin-skinned Grapes at all times. In that case it is better to take the early supply from Vines in pots than to start the permanently planted Vines at a very early period. Vines in pots produce fruit little inferior to that borne by others planted out, and often superior to that produced by those having the roots in inside borders, and always better than when the borders are wholly outside. Suecess in early forcing is more certain where there is convenience for affording bottom heat, the canes being sufficiently strong, thoroughly ripened, and duly rested. The materials for affording bottom heat, such as tree leaves and stable litter, should be in course of preparation. The heat to begin with must not exceed 65° about the pots, augmenting it by bringing up the fermenting materials to the level of the pots by degrees, so as to raise the temperature to 70° to 75° when the Vines are in leaf. We advise the pots to be stood on pillars of loose bricks. Let the Vines be suspended over the fermenting materials in an horizontal position to induce the buds to break evenly. Sprinkle the canes three times a day, and damp every part of the house at the same time in bright weather. In order to induce regularity of starting a somewhat higher temperature is necessary at this period than later in the season, 50° to 55° at night, and 60° to 65° by day is not too high to begin with. The Vines to have fruit ripe in April must be started early in November.

Early Forced Planted-out Vines.—Those for affording fruit at the end of April or early in May should be set to work about the middle of November, not later. Thoroughly moisten, but not saturate to soddenness, the inside border at a temperature of 90°, and in the ease of weakly Vines supply liquid manure. This enriches the soil, even conducing to a good break by the imperceptible ferment taking place in the soil and by increasing the supply of food. If the border or floor of the house is covered with leaves and litter in a state of fermentation, occasionally turning the material and adding fresh, the moisture and warmth, also the ammonia-eharged atmosphere, are very beneficial to the Vines, and make a considerable differenee in the fuel used. The outside border must have a covering of leaves, with some litter or fern sloping from the house outwards, and thus throw off some rain as well as exclude frost. No roots can work in frozen soil. Fermenting material is not indispensable for placing on outside borders, but the warmth is a great aid in keeping the roots active and near the surface. Outside borders, however, are great mistakes for Vines that are forced early year after year.

Vines for Starting in December.—Prepare the Vines and house for active service at the time named, which is the latest to have Muscats ripe early in June and the early varieties in May. Prune the Vines directly the leaves have fallen, as it contributes to early and complete rest. In pruning two buds are mostly sufficient to leave for affording compact bunches of Grapes. Longer pruning may be practised when the Vines are wanted to give fewer and larger bunches, for it does not answer to allow as many large bunches on a Vine as of medium sized. Large bunches are, as a rule, loose, irregular in size of berry, and do not finish satisfactorily. Medium sized bunehes are more regular in form and size of berry and finish well. If the eyes at the base of the shoots are not plump three eyes may be left, but this requires frequent renewal of the spurs. The Vines should be stripped of loose bark, in fact all that can be removed without stripping them to the live bark, and be washed with a tepid softsoap solution, 2 ozs. softsoap to a gallon of water. That is all that is necessary where the Vines are free from insects, and where there has not been mealy bug, scale, red spider or thrips, but for these use a solution of caustic soda and commereial potash (pearlash), 2 ozs. each to 1½ gallon of hot water, applying with a brush at a temperature of 130° to 140°. It kills both hibernating pests and eggs.

If troubled with fungous pests in previous season use a solution of sulphate of iron 1 lb. to 1 gallon of water, applying cold with a brush; but do not use both, the latter sufficing for both fungi and insects. The woodwork must be thoroughly cleansed, if necessary painted, and the walls limewashed, adding a handful of flowers of sulphur to each pailful of limewash. Remove the surface soil down to the roots, and supply fresh lumpy loam with a 9-inch potful of bonemeal. Though a somewhat dry condition of the roots is desirable, the border must not be allowed to become parched and cracked, affording water if necessary, but not saturating the soil to the extent of making it sodden. Keep the house cool, admitting air freely except when frost prevails. If the house is occupied with plants employ fire heat only to exclude frost.

Vines Ripening the Wood.—Vines not yet ripe in the wood, the foliage being quite green and the wood not brown, should have the laterals closely pinched, bringing them down by degrees to the principal buds, which will have a tendency to promote rest by admitting more light and restricting the root action, especially if air is admitted freely at night, the house being kept rather warm, but not elose, by day, as that would have a tendency to induce growth. When growth in the laterals has been checked the shoots may be shortened to a few leaves above the pruning buds. This will assist the basal buds to plump and the wood to ripen, a genial warmth being kept in the pipes and air freely admitted.

Houses of Ripe Grapes.—A temperature of about 50° artificially is most suitable, Muscat of Alexandria being the better if 5° more, losing no opportunity of giving air when the days are fine, turning on the heat in the morning so as to cause a genial warmth in the pipes, and so expel damp, turning off the heat at midday, or soon after, so as to allow the pipes to cool, and the temperature at night not to be kept above 50°, even for Muscats, and 5° less for other varieties, or even less on cold nights; but a slight warmth in the pipes will prevent the deposition of moisture on the berries and prevent "spot," inasmuch as the moisture is condensed on the glass instead of the Grapes. A low night temperature causes the moisture present in the air to be rapidly condensed on the Grapes in the early part of a fine day, when the heat is not turned on early and air admitted, the sun heating the atmosphere much quicker than the Grapes. This must not be overlooked, and during the prevalenee of dull weather it will be necessary to keep a gentle warmth in the pipes, the ventilators elosed; yet there will be a circulation of air, causing the moisture to settle on the glass, thereby preserving the Grapes from damp. Excess of dryness or of heat will, however, cause the Grapes to shrivel; hence the question is air—the prevention of moisture settling on the berries.

Pines.—Only sufficient heat need be employed to sustain the plants in health and maintain the progress made. They should be placed as near the glass as possible. This will enable them to make the most of every ray of light and sunshine whenever it prevails. Though the plants may not perceptibly grow they store essential matter in spells of bright weather, and become stouter where due attention is given in keeping the glass clean, and admitting air whenever favourable conditions arise. The sturdy plant throws up a well-formed fruit in due season, but the drawn weakly plant, though apparently larger in leaf, furnishes a much smaller fruit on a lanky stem at an uncertain and irregular time. Therefore to give plants the benefit of clean glass and proximity to it without touching is to grow with a view to fruit, and to keep them at a considerable distance from the glass and crowded or beneath glass more or less opaque through dirt, with a concomitant moister atmosphere, is to produce foliage instead of fruit.

Fermenting Beds.—The materials subside considerably through decomposition, and fresh made up beds settle rapidly unless well trodden down. In either case prompt attention should be given to raising the plants so that they have full benefit of the light, and in so doing take care not to chill or allow them to become overheated at the roots. New beds should be made where necessary. The best plan is to remove all the plants to a structure with the suitable temperature, clear out the old fermenting material, supply fresh, and not return the plants until the beds are in a proper condition. To take plants out of a warm house and then in a cold place chills them, and returning to warm beds from cooler quarters acts in the opposite direction, sometimes causing them to "bolt"—that is, throw up fruit prematurely. Oak, Beech, and Spanish Chestnut leaves are much the best, as they are more durable than others, and the heat is consequently milder and lasts longer. Tan is the most serviceable where it can be easily procured, and about half the quantity suffices, but leaves in many cases may be secured for nothing beyond the labour.

THE FLOWER GARDEN.

Tuberous Begonias.—These plants are in most places left in the beds and borders till frosts cut down the tops. It is a great mistake to wholly clear the tubers of soil. Enough to fairly hide them should be left on each, this keeping some of the fleshy roots alive, a stronger and sure growth of shoots resulting next spring accordingly. Expose the Begonias as much as possible to all the sunshine and air going; stages and dry beds in borders in freely ventilated vineries being good places for them till the tops are sufficiently dried and decayed to admit of their being cleanly separated from the tubers. Pack them closely together in shallow boxes. If the tubers have been cleared of earth these should be surrounded by some fresh fine dry soil, but those not so cleared need none of the latter. Tuberous Begonias keep admirably in a dry, warm cellar, and failing this convenience store them in a shed or cool room, taking care to provide a sufficiently heavy covering of mats to exclude frosts. The tubers are far from being hardy, and on the other hand a very warm, dry position may cause their loss by dry rot. Those in pots may be turned out, partly cleared of soil, and wintered as advised in the case of those dug from the beds; or they may be stored on their sides under a staging in greenhouse where moisture does not reach them. Late-raised plants left thickly in pans or boxes should be kept cool and dry, and the tops when decayed be cleared off them; but the tiny tubers should remain where they are till next spring. They can be grown into strong plants before bedding-out time comes round again.

Dahlias.—These should now be cut down, leaving 9 inches length of stem, the labels being securely attached to this. The tubers should be lightly cleared of soil and laid on their sides in a covered shed for a few

days for any moisture there may be to drain out of the stems. Pack the tubers closely together, distributing fine soil among them, where they will be safe from frost. Under a greenhouse stage is not the proper place, the moisture constantly falling about them either rotting or causing the tubers to start prematurely into growth. Moderately warm sheds and outhouses best suit them, a cool dry cellar being a still better storing place.

Other Flower Roots.—Many of the Gladioli, notably the commoner G. brenchleyensis, are fairly hardy, and frequently winter well in the open ground, while the G. Colvillei should certainly not be disturbed. The rest ought not to be lifted before the tops have lost their greenness, and after these have been shortened and the corms thoroughly harvested store them in boxes of sand, where frost cannot reach them. The cormlets often found clustering round the old ones should be taken care of, as these would develop into flowering stuff in the course of one or two seasons. Store them in sand. The tuberous-rooted Salvia patens should be treated similarly to Dahlias

Fuchsias.—These are rightly fast becoming popular in the flower garden, as they relieve the stiffness of ordinary bedding plants. This season they have grown rather more strongly than usual, and many of the plants were flowering very freely when the frosts intervened. Where they were kept in pots and plunged deeply there need not be much difficulty in keeping a portion or all of the stock through the winter. All that is necessary is to keep them in a cool dry house, and to gradually withhold water so as to keep the wood plump. Any lifted and potted will require to be more carefully dried off. Numbers of Fuchsias are annually lost owing to being badly injured by frosts before being housed. While resting unheated sheds and outhouses are too cold for them, but they keep well in vineries and fairly well on their sides under greenhouse stages, only just enough water being given to keep the wood plump. Standard Fuchsias are very effective, and can either be grown from quite young plants or obtained by trimming off the lower branches of some of the roughest of the pyramids in the spring.

THE KITCHEN GARDEN.

Asparagus.—At this time of year the Asparagus beds usually present an untidy appearance, but not till the tops are brown ought they to be cut down. In this condition they are no longer of any service to the roots and crowns, and may be removed 4 inches or so above the soil, taken away and burnt. If any seeds are wanted hang up selected growths covered with berries in a cool dry shed till next spring, when the seed can be easily cleaned. The surface of the beds and alleys should be cleared of weeds and left in a neat condition. The old plan of raking or forking off the surface soil nearly or quite down to the roots, returning it to the top of a liberal dressing of "fat" manure, answers well where the soil is of a free working, somewhat hungry, nature, but there should be no shaving off the sides of the beds and robbing the alleys of soil for covering the manure, as this has a destructive effect upon the roots of the outer rows of Asparagus. When the soil to a considerable depth happens to be of a clayey, retentive nature, this is already unfavourable to the growth of Asparagus, and to heavily dress it with manure aggravates the evil. Severe frost is less injurious to Asparagus than a cold saturated rooting medium in which the roots sometimes perish wholesale. There ought, then, to be no top-dressing the beds if the soil is naturally heavy and cold. Clean them and defer manuring till next spring.

Brussels Sprouts.—Where abundance of rain fell in August last, Brussels Sprouts are excessively strong, those disposed somewhat thickly literally smothering each other. Most of the lower leaves are fast turning yellow, a strong smell denoting early decay. All in this condition ought to be removed to a heap where they can be converted into good manure, but do not heedlessly strip off any that are fresh and green. They may be the means of saving the stems from being injured by frost. Nor ought the tops to be cut, as these protect and foster the growth of late supplies of sprouts.

Broccoli and Cauliflower.—A good supply of early Broccoli and late Cauliflowers is always appreciated in November and December. No reliance can be placed upon unprotected plants, as they will not stand nearly so much frost as will late Broccoli. Those nearly fit for use should be covered with leaves taken from old stumps already cut over, and have their own leaves further tied together over the hearts, in which condition they will keep white, clean, and sound. A portion of those with hearts about the size of cricket balls must also be protected, while the rest, together with all not so far advanced, may well be lifted and stored where they can be protected from severe frost. For convenience of moving and replanting, snap off quite the oldest lower leaves, and save a little soil about the roots. Deep rough frames, brick pits, and pits in empty vineries, are good positions for storing. Bed the plants in rather closely, firmly surrounding the roots with rich moist soil. Covering them with poor dry soil would be quite a mistake. Better wholly cover with manure than that, because unless the plants have something to root strongly into, the hearts they produce are small and poor in quality. Keep the roots well supplied with moisture, and protect the plants from frost. Fully developed Broccoli and Cauliflower will keep some time embedded in moist soil in sheds. Remove all decaying leaves.

Parsley.—Extra strong early raised plants are frequently the first to suffer injury from frost, the later sowings possessing more vitality. None can wholly be depended upon, and unless the precaution of storing Parsley under glass is taken a serious gap in the supply may be the consequence. Whether a few or many plants are stored should depend upon the nature of the demand for Parsley. Three or four lights in a brick pit filled with plants are none too much in some gardens; in others two or three large, moderately deep boxes would hold enough. The plan of closely filling 12-inch pots with plants is also a good one, as they are not much in the way, and can be readily shifted about. Strong plants are the best for storing, and these ought to be lifted carefully, so as not to break their Carrot-like root. Trim off the outer already discoloured leaves, and sink the roots to their full depth in rich, loamy soil, arranging the plants thickly. They may be arranged in pits, frames, vineries, Peach houses, or greenhouses, genial warmth acting beneficially after the new year has commenced.

Storing Roots.—Parsnips, Salsafy, Scorzonera, and Jerusalem Artichokes keep best in the ground where grown, but when severe frost may reasonably be anticipated some of each should be lifted and stored in sand or fine soil, where they can be got at when the ground is too hard frozen for digging. Heavily mulching some of the rows or breadths with strawy litter would answer the same purpose, as it must be a very severe frost that will make the ground hard under 1 foot depth of litter. Late-sown Carrots should also be left where they are, as the roots keep sweeter and more tender in the ground and continue growing whenever the weather is mild. The main crop of Carrots ought now to be taken up and stored. Beet keeps well in clamps, covering with straw and soil. Turnips fit for storing are somewhat scarce this season, and most dependance will have to be placed upon late breadths. Where plentiful a portion of the crop may be stored similarly to Potatoes. Chicory roots are hardy, but if a portion of the crop is lifted and stored similarly to Carrots they will be ready for introducing into a Mushroom house or other warm dark place at intervals of a week or rather more.

Rhubarb for Forcing.—Not till frost has reached the roots, or an enforced rest has been otherwise brought about, does Rhubarb force readily. The plan of lifting the clumps and leaving them exposed to all weathers for about three weeks prior to introducing them into heat answers well. They start into growth stronger and more quickly for this check.

THE BEE-KEEPER.

Lecturers on Bee-keeping.

A correspondent says, "the old brimstone system still prevails in spite of lectures on bees and technical education." But are not lecturers often to blame for this state of things? I am induced to ask this question from what has come under my own observation. Not many weeks ago I attended a lecture on bee-keeping in a country district, which was given in the hope of stirring up a greater interest in bee-keeping in that part of the country, which had fallen off very much of late years.

The lecturer doubtless understood the management of bees, but failed to explain some of the simple rules necessary to make bee-keeping a success. He said, "In driving bees, it was only necessary to place three stocks of driven bees together. The bees would kill off all the queens but one." No explanation was given of the advantage of having a young queen which should have been selected from the old stock that had swarmed, or from a cast or second swarm, and the queens from all first swarms killed off by the operator. The bee-keeper may then have confidentially looked forward to another year without the risk of his bees being headed by an old worn-out queen, which would probably be the case if his instructions were carried out.

In illustrating the management of bees in straw skeps, no mention was made or instructions given how to obtain sections when placed on supers on the top of the skep; some of the best sections in colour, weight, and finish were obtained from a flat-topped skep. In speaking of the profit to be derived from bee-keeping, honey was debited at a shilling a pound, and "as the bees would consume 20 lbs. of honey to make 1 lb. of wax, it was a decided advantage to purchase comb foundation at 2s. 6d. per lb." It is certainly a great assistance to the bees to provide them with foundation, but I think 10 lbs. of honey is as much as the bees will consume to make 1 lbs. of wax in comb building; a shilling per pound for honey is altogether a fancy price where one has it in bulk to dispose of.

Disappointments in Bee-keeping.

It is discouraging to bee-keepers, after hearing a glowing account of the profits to be derived from this source, to find on making a practical test they have much to learn, if the advice is followed as given by the lecturer from which the above notes were taken. In the first place the whole success of a colony of bees depends on the queen being hardy and prolific. If the queen is old she will probably die just at the time she is most needed, and if the bees are all kept in straw skeps it is just as easy to have all the colonies headed by young queens, as it would be if they were in the moveable frame hive, and it is also practical to obtain a surplus from them by storing in supers as stated above, instead of depending on the honey stored in the brood combs.

Again, as to the price of honey. If sold in the trade to sell again a lower figure is obtained than would be expected from the consumer,

but showing the fancy prices that are sometimes obtained I may mention the fact that during the past season a dealer sold over 800 lbs. of honey in sections at 1s. 9d. per lb., the bee-keeper obtaining 9s. per dozen for the sections which were glazed. This is an exceptional case, and such prices can only be obtained in districts much visited by tourists. It, however, shows the prices that may sometimes be procured by shrewd men of business, but is no criterion to the general value of honey in the country.

To avoid disappointments in the management of bees and in selling honey, it is advisable in the former instance to commence with only a few stocks, which may be increased as experience is gained, and in the latter case to always supply a good sample of honey; if inferior feed it back to the bees. By this means a good reputation will be gained, and although prices may be low, if the right advice is obtained bee-keeping will be a success, although the seasons may not be all good for honey production.

Flowers for Bees.

The autumn frosts have not come as early as usual, and at the present time the garden is still gay with flowers; but as a sharp frost may come at any time, it is advisable to make preparations for planting the spring flowers that are suitable for the bees either for pollen or honey production. Some of these are among the most beautiful of the hardy flowers grown in our gardens. Wallflowers, which are favourites with the majority of people on account of their showy appearance whilst in bloom, and also for their perfume, should be planted in quantity, as during the time they are in bloom they are much visited by the bees, being good pollen-producing plants. Honey is also obtained from this source, but only in sufficient quantity for the bees' daily requirements.

Arabis alpina blooms freely in early spring, and is much frequented by the bees. It may be planted in any open position, forming an edging to the beds. It looks best planted in masses, and as a rockwork plant it is unsurpassed. Limnanthes Douglasi is a perfect bee flower, and is usually called the "Bee Plant," owing to the bees being so fond of it whilst in bloom. It is a dwarf plant, only growing a few inches in height, and makes a good edging plant for borders. It does not bloom until April, when flowers are becoming somewhat plentiful. The bees, though, will work on this in preference to any other.

Mead.

A correspondent desires particulars for making mead. The best that has come under my notice was made from a recipe given by the Rev. G. W. Bancks, Dartford. Mr. Bancks having devoted much attention to this subject for the benefit of bee-keepers at large, I can confidently recommend his recipe to the favourable notice of readers. It is now published in pamphlet form, which may be obtained from the above address.—An English Bee-keeper.

TO CORRESPONDENTS

All correspondence relating to editorial matters should, until further notice, be directed to "The Editor," **8, Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Autumn Tints in Winter (*J. B.*).—A lady from London informs you that she "has frequently seen in the month of January, in London houses, branches of our native deciduous trees with leaves attached and the autumn tints on them, placed in large vases." You ask if these are artificial, or if there is some way of preserving the leaves? A number of these decorations are artificial, though we have heard that others are not, but that the process of preservation is a trade secret. The case is stated on the possibility of some of our readers being able to give information on the subject.

Bones for Vine Border (*Bryn*).—We presume the bones are mostly free from fatty matter and flesh, being such as generally collected by rag and bone gatherers, in which case they answer well—at least, we found similar do so, they being smashed in our case with a heavy hammer on an old anvil, and cost not more than half the price you name, including bones and smashing by hand. They answered even better than crushed, but they were old and dry. It is the fatty matter that makes bones injurious to Vines, as this dissolves very slowly, and proves deleterious by the acid reaction. If clean, use them; if greasy and fleshy, either boil them to remove this, or reject them.

Mina lobata (*L. F. F.*).—This plant was originally introduced from Mexico in 1841, but it either died out or for a long period was so exceedingly scarce as to be practically unknown to the majority of cultivators. A few years since, however, it was re-introduced, and has since become generally grown. It is a half-hardy annual plant, and therefore dies on the approach of frost. Propagation is effected by sowing seeds in February or March, placing them in a pot or pan filled with light sandy soil, and put in a warm greenhouse, stove, or frame on a hothed. When the young seedlings are about 3 inches high transfer them singly to small pots and grow in an ordinary greenhouse until the first week in June, when plant them out against a south wall as you did last spring.

Fruit Trees for Cool House (*W. H.*).—Two good early Peaches for back wall:—Alexander (to come in about three weeks before Hale's Early, which you have) and Dymond (to follow Hale's Early). Two good late Peaches (in addition to Royal George and Barrington) for back wall:—Bellegarde and Sea Eagle. Six late Peaches for growing in pots:—Belle Bauce, Gladstone, Desse Tardive, Late Admirable, Lady Palmerston, and Golden Eagle. Three late Nectarines for growing in pots:—Dryden, Pine Apple, and Victoria. Six dessert Pears for growing in pots:—Souvenir du Congrès, Beurré Superfin, Louise Bonne of Jersey, Doyenné du Comice, Glou Morçean, Josephine de Malines, or, if you want a larger, Marie Benoist. Six dessert Apples for growing in pots:—Red Astrachan, Washington, American Mother, Cox's Orange Pippin, Melon Apple, and Northern Spy.

Cyclamen Infested at the Roots by Grubs (*W. C.*).—The grubs are the larvæ of the grooved or black Vine weevil, Otiorhynchus sulcatus. The grubs are very tenacious of life, and do not die for some considerable time after solutions of nitrate of soda and kainit have acted upon them, nor, indeed, by any substance at a safe strength to use for the plants. We do not know of any preventive other than catching the beetles and sterilising the soil before use by treating it with boiling water. This answers well enough if the parent has already deposited eggs, but sometimes they are not laid until after repotting, and, being commonly at the base of the corms, the eggs may be there even at the time of repotting, as the old soil is not wholly removed in most cases. The use of freshly ground hellebore powder, 1 oz. to a gallon of hot water, applied at a temperature of 130° to 135°, has given good results, and mustard dross in the same proportion has also proved satisfactory as far as regards the destruction of the pests, but a too free use of the dross injures the plants. Eucharis mite killer acts very decisively on the pests, and does not injure the corms or roots, only follow the instructions carefully.

Diseased Double White Primulas (*Double Primula*).—The plant was badly attacked by the brown spot fungus (Ovularia interstitialis, syn. Peronospora interstitialis). The leaves attacked turn yellow and then brown, eventually decaying. In your plant the parasite had spread down the stem and literally eaten the hearts out of the plants. The stem below ground was perfectly sound, showing the nature of the disease to be from above downwards. We can advise nothing but cutting the parts away, burning these, also any plants not having sound centres. Then dust the parts remaining with anti-blight or fostite, and the disease may not spread: it certainly would not have got so far if this had been used instead of flowers of sulphur. The plants have been kept too close and too moist. They needed more air, or at least a drier atmosphere and close proximity to the glass, with a genial warmth—conditions under which the fungus can make but little progress.

Phylloxera on Vines (*Pat*).—The roots you have sent have been carefully examined by Mr. Abbey, and though no phylloxera could be found there was plenty of evidence of the attacks of the enemy. Mr. Abbey states that the phylloxera found in the excrescence on the rod exactly coincided with the figure shown in Mr. Barron's "Vines and Vine Culture," page 106, at *e*, when magnified 15 diameters, but the caudal appendages were much larger and the whole body covered entirely by a white meal, the colour beneath brown or dull orange. It was a very active creature, moving about rapidly when disturbed, and always coming to rest in the depths of the excrescences on a soft part. The meal covering has an important influence in the matter of substances intended for the destruction of the pest, as for instance, a drop of the new silico-fluoride of ammonia solution was thrown off promptly, and the insect not a particle the worse. It was much the same with aniline, soluble phenyle, nicotine, and formalin, but a drop of spidicide broke up the meal and the insect at once. Methylated spirit acts similarly on this pest and mealy bug. The border needs to be cleared out and the Vines, too, and these burnt, or the scourge may spread. Proceed with the same thoroughness that Mr. M. Dunn of Dalkeith did when he was gardener at Powerscourt, near Dublin. See "Vines and Vine Culture," page 110. It can be obtained from the publisher, 171, Fleet Street, by post, for 5s. 3d.

EDITORIAL NOTICE.—It is particularly desired that all communications, parcels, catalogues, and newspapers intended for the Editor, be sent direct to 8, Rose Hill Road, Wandsworth, S.W.

Large Dessert Apples (*W. T.*).—For the purpose of guiding judges and exhibitors at the shows of the Royal Horticultural Society, lists of dessert and cooking Apples are published in the schedule of the show that was recently held at the Crystal Palace. This is an excellent plan, as all doubts as to the inclusion or otherwise of certain varieties in the respective classes are removed. The varieties, Peasgood's Nonesuch, Cox's Pomona, and Lady Henniker are in the R.H.S. cooking list; but this list is only binding when it is clearly stated in the schedules of local shows that such is to be the case, and then the R.H.S. plan should be adopted of printing the names of the 150 varieties in the same schedules, otherwise the varieties mentioned are quite eligible for dessert classes. We should not think of disqualifying them at any show where the schedule did not specifically exclude them. It would be unjust to many exhibitors to do so who staged in the honest belief that they were within the terms of the schedule, and relied on the "Fruit Manual," the "Fruit Grower's Guide," or the catalogues of leading fruit nurserymen as to the eligibility of these and other varieties in either class. At the same time, it must not be supposed that judges would give greater weight to large and attractive fruits of fair eating quality than to good specimens of the smaller admittedly dessert varieties. We should not do so, but we should estimate the former more highly than some of the miserable speckled "woody" samples of real so-called dessert Apples that find their way on exhibition tables. One of the worst Apples for eating, if not for cooking also, is Baumann's Winter Reinette, now placed in the dessert list at the R.H.S. shows. You had better stage in accordance with the custom of your district, and remember that as a rule the "decision of the judges is final."

Names of Fruits.—*Notice.*—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*J. B.*).—If the tree is an upright grower the variety is Gloria Mundi, if of spreading habit Warner's King. The first-named often keeps till Christmas. (*W. W.*).—1, Lewis's Incomparable; 2, Beauty of Hants; 3, Cellini; 4, Warner's King; 5, Winter Pearmain: 6, probably a highly coloured fruit of Dumelow's Seedling. (*Gardener*).—1, Beauty of Stoke; 2, unknown, probably a local seedling; 3, crushed beyond the possibility of identification; 4, Beurré Clairgeau. (*A. D. & Sons*).—Doyenné Boussoch. (*J. Burch*). 1G, London Pippin; 3G, Yorkshire Greening. (*J. J. D.*).—1, Durondeau; 2, Comte de Lamy; 3, Gloucestershire Costard; 4, Old Hawthornden; 5, not recognisable, quite mealy; 6, an abnormal specimen; if the tree is an upright grower the variety is Gloria Mundi, if of spreading habit Warner's King. (*W. S.*).—Marie Louise.

Names of Plants.—We only undertake to name *species* of plants, not varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*Junior*).—1, Clematis flammula; 2, Ophiopogon jaburon variegatum. (*G. M. C.*).—1, Sedum azoidenm varicgatum; 2, Polypodium aureum; 3, dead. (*O. B.*).—Chrysanthemums are obviously florists' flowers, which can only be named by comparison. If the varieties were purchased the vendor, if the grower of a large collection, will be able to supply the names. (*G. G.*).—No. 5, a form of Cattleya Bowringiana: the remainder are varieties of C. labiata. (*A. Z.*).—1 and 4, forms of Pteris serrulata cristata; 2, P. cristata albo-lineata; 3, too withered for identification.

ACCIDENTAL POISONING, AND OTHERWISE.

Why should the last clause remain in the title? Surely premeditated poisoning is only to be heard of among hardened criminals; but, alas! such is by no means the case. Possibly many cases will occur to our readers, and if, happily, they are ignorant of such cases, so much the better for them. On a stock farm losses of all kinds are continually occurring, and even with the greatest care such losses can often not be prevented. Perhaps it is almost a wonder more accidents do not occur, such as broken or dislocated bones; but these are not frequent.

There are diseases also incidental to the seasons; diseases produced by an over-abundant supply of sappy food, as also by an under supply. This latter cause does not necessitate instant death, it only makes a debilitated body ready to receive any poison germs, and to nourish them hospitably. There are the diseases, too, confined to breeding animals, and these often amount almost to an epidemic.

For all these losses a farmer is, in a measure, prepared—that is, he expects a certain percentage per annum, and although he may not like it, still bears these losses with a certain equanimity born of expectation. But every now and again we hear of other and heavy losses that fall like a bolt from the blue, their very unexpectedness making them most alarming. There is one form of poisoning far too common in this country, and the cause is, to a certain extent, under our own control. We mean the poisoning by Yew.

This has always been a favourite shrub; it lends itself well to decorative purposes; it makes the most excellent of hedges, and it is found far and wide all over the kingdom. Planted and cultivated in the churchyards by the first Edward, it produced those wonderful bows which made the English archer the terror of all nations. Nothing and no one could withstand the deadly shaft from that bow of Yew when the string was drawn by an English bowman.

Beautiful as this evergreen is, and useful as it was, it still should be confined to very limited areas. There has been at one time an impression abroad that only in a withered state it was poisonous. We are perfectly sure of many deaths that have arisen after the eating of withered hedge-trimmings and remains of Christmas decorations, and we know of other cases where the result has been fatal after eating from the living tree; and then again have we seen bits of a Yew hedge nipped off by passing animals, which certainly has not killed nor apparently injured them. Mr. Harold Leeney has an exeellent article on this subject in a recent number of the "Agricultural Gazette." Having lately lost a valuable Hackney from this cause he speaks feelingly. He says that if all cases of Yew poisoning could be published no one would dare to have a tree on the premises.

The worst of this poison is that an animal is dead before there is any idea that anything whatever is wrong. Then the rest of the stock in the same field are more carefully observed, and probably some will be found unable to walk straight, and apparently suffering from narcotic irritant poisoning. Paralysis of the hind quarters, closely followed by death, are the next steps.

Mr. Leeney goes on to say that there is no direct chemical antidote which will neutralise the poison, so all we can do is to resort to such physiological antidotes as are best calculated to counteract the symptoms produced. He suggests a large dose of linseed oil, which possibly expels the offending matter before it can do much harm. Then the narcotic symptoms must be dealt with. The heart must be roused to action, either by a dose of sal volatile, sulphuric ether, or nitrous ether; these are the best stimulants, but failing these (and the case admits of no delay) brandy or whisky may be given. Even though the case be severe, and the patient apparently *in extremis*, the dose must not be too large, or there is a danger that the remedy may act in an opposite direction to that desired —namely, becomes a sedative. The animal heat should be kept up by clothing and rubbing, especially of the legs.

It is most desirable, if evergreens be grown about a farm, that all the cuttings be most carefully burned. This also applies to withered Christmas decorations, which are often treated in a most careless fashion.

Laburnum seeds, too, are a great source of danger, and the removal of a quantity of rubbish together with fallen seeds into the foldyard once taught us a very practical lesson as to their disastrous effect on pigs.

We suppose we need hardly mention the desirability of carefully destroying any Wheat that has been "dressed" for sowing that may by chance be left over.

There is another form of animal poisoning that happily is of rarer occurrence than formerly. We allude to deleterious matter in cakes. This, of course, is the fault of the manufacturer, who is either in too great haste to be rich, or who is wilfully ignorant of the impurity of his mixture. That cake is not always what it should be we may gather from reading the reports of analysts; but a good deal has been done to remove the absolutely poisonous ingredient. Dirt kills so slowly, and it is only few firms that guarantee 95 per cent. pure linseed.

A new, or comparatively new, cake is that made from Cotton seeds. These seeds are encased in much soft tissue, the raw cotton of commerce, and which if unremoved before the seed is crushed is most pernicious in its action, clogging up the stomach and alimentary canal.

A grave form of poisoning still remains for notice—a form which is found to be very widespread. This may come under the head of "otherwise," for it should never exist. That it does exist is through the gross ignorance of those who have to do with valuable horses—we mean not only pedigree ones, but the teams of the farmer. It is not only the farm servants who are to blame, as we often find the older men quite ready to aid and abet. That a great many fearful drugs are used every year by horsemen is absolutely certain, and it is a constantly occurring piece of news in local papers of so-and-so losing valuable horses from the effects of deadly poison, given them secretly by their attendants.

No amount of watchfulness on the part of the owner seems able to prevent acts of this sort, and even when detected it is a difficult matter to punish the offender. The horse or horses are dead, and the farmer hesitates before going to the expense of a trial, where, possibly through some little technicality, he loses his case, or at the best finds the magistrate is able to inflict only a very inadequate punishment. The punishment should be severe enough to deter future offenders.

WORK ON THE HOME FARM.

With so much to do in a short time we should never advocate the ploughing of fallows until other autumn work is completed; it is often done in October, and we have done it ourselves, but it is work just as well left until nearer Christmas. For one thing, where land has been worked and a crop of twitch got off, there are always a few small bits left on the surface; if ploughed in early these bits generally retain life enough to make their way to light and air, but if we delay ploughing until later, and in the meantime take advantage of every dry windy day (and we have had several lately) to give the land a good harrowing, the early winter frosts will add the finishing touch to the withering particles, and if well turned down to the bottom of an 8-inch (depth) furrow, little will survive to commence new growth in spring. The use of the chilled plough makes the ploughing a simple matter, for one plough with three horses will plough 1½ acre per day easily, even in the short days of winter.

The fine warm weather is very favourable for the Potato harvest. Since our last notes buyers have been on the alert, and prices are decidedly higher; in fact there is quite a little boom. This is not very surprising, for we believe this year's crop to be the smallest on record.

We have been taking up Bruce, a very small crop, not one-half being fit for sale as ware. To-day we begin with the "Up-to-Date," and it is quite refreshing to see such a fine turn-out, large in size and splendid in quality. We weighed one straight well-grown tuber and found it 30 ozs. This is, in our opinion, the finest variety of late Potato in existence.

We have tried the digger, but find it bruises many of these large Potatoes, so we have reverted to the plough. We find stack sheets very useful to put over the pies before earthing up, and have had two long ones 12 yards each by 4 wide made expressly for the purpose. They not only protect from frost, but keep the straw dry until soiled up.

OUR LETTER BOX.

Feather-eating Fowls (*W. S.*).—Your letter shall have attention. In the meantime give them plenty of green food, such as cabbage or anything of that kind to occupy their attention.

Webbs' Barley Competition.—The valuable prizes for Barley offered by Messrs. Webb & Sons, of Wordsley, brought a keen competition, and the Judge, Mr. T. Phipps, of the firm of Messrs. Pickering, Phipps and Sons, Limited, of Northampton, was occupied a considerable time in making his awards, which were as follows:—Class 1, champion prize, open to the United Kingdom, £25, Mr. W. Nisbett, Stratford St. Andrews, Saxmundham, Suffolk; Class 2, open to Salop, Stafford, Hereford, Worcester, and Warwick; first prize, £15, Mr. E. Bomford, Spring Hill, Fladbury; second prize, £10, Mr. W. Chick, Sutton Maddock, Shifnal; third prize, £5, Mr. G. Corbishley, Bricklehampton Court, Pershore. The conditions of competition stipulated that the Barley should be one of Webbs' varieties, and grown with Webbs' special Barley manure. The high quality of the samples exhibited testified to the value of both seed and manure.

REMARKS.

17th.—Bright sun till 2 p.m.; fair after.
18th.—Sunny morning; cloudy afternoon; rain at night.
19th.—Dull, damp, and rainy till 9 a.m.; faint sun till 1 p.m., followed by high fog; bright sun from 3 p.m.
2 th. Fog early, bright sun from 9 a.m.
21st.—Fog till 9 a.m.; bright sun from 9.30 a.m. to sunset; fine night.
22nd.—Fair, but sunless till 3 p.m., then bright for half an hour.
23rd.—Overcast morning; sunny afternoon; fine night.

A lovely autumn week, with rain on only one day. Temperature about 5° above the average.—G. J. SYMONS.

Journal of Horticulture.

THURSDAY, NOVEMBER 4, 1897.

HARDY AUTUMN FLOWERS.

WE view with dread the prospect which appears before us. We feel that all too soon shall the garden's pleasures vanish before the frost, and leave us forlorn and longing for the coming round of spring. Frost and snow and wintry rain shall steal our treasures away.

"First drops the bloom, then darkens the green leaf;
Everything in life is brief
Save autumn's deepening gloom and winter's changeless grief."

Fewer are the flowers even now, and before long their ranks will be sadly thinned. Frost we have had, sufficiently severe to injure the leaves of the Dahlias, Tropæolums, and plants of similar tenderness, but not enough to deprive us of all their blooms, or to mar the hardier flowers. This year it has not come, as it often does, with little warning, sweeping down upon us from the bitter North with furious biting breath, and shrivelling before our eyes the leaves and flowers. It stole upon us gently, as if unwilling to harm our flowers, and gave place to drenching rain, far from pleasant to see or feel.

Thus, though the leaves fall faster every day and hedges grow thin and leaves are lit up by autumn's fiery tint, we have many bright flowers in our garden yet. Sunflowers have almost gone, or look unhappy now that their deity has lost his power. The Water Lilies in the pool have their buds arrested; never will these flowers charm us this year again. Their leaves begin to decay, and soon shall mingle with the waters on which they float, to make again fresh sustenance for flowers and leaves. There are tokens of decay all around, yet even without the beauty yielded by many of the dying leaves the time has its chaste pleasures for us still.

There are Heleniums and Michaelmas Daisies in plenty, and here and there, as we look along the rock garden or the border, we see some bright patch of colouring lighting it up. The choice of flowers is limited now, and we cannot but think those left are doubly dear. They are the last of our friends for the year, unless it may be some of the rarer Snowdrops and Croci, which seem to laugh at winter's effort to bid them halt. The frost has left its mark upon the Eccremocarpus scaber, which

has for so long veiled with beauty the trellis on the outhouse gable. There are flowers on it yet, and these mingle with the curious seed vessels, some rough and green, others brown, and open to unlade their hosts of seeds. Some Gladioli there are in the middle of October, and with Colchicums and Crocuses these keep up the succession of bulbous plants.

Not many of the Meadow Saffrons are left now, and the best of these are the double forms. The ivory white blooms of Colchicum autumnale album fl.-pl. are nearly over, and are tinged with the pale shade of pink with which they are suffused as they begin to fade; but three other double varieties of the same species are attractive, and increase more rapidly than the white variety. Very pretty are C. a. roseum plenum and C. a. striatum plenum. The former is of a soft rosy purple, and the latter almost the same, but with broadish white stripes down the segments. These double forms are later than the single, and although liable to fall to the ground more readily, are more lasting in their beauty. Another exceedingly pretty Meadow Saffron is C. Parkinsoni or Chionense. If C. Sibthorpi is the largest of the chequered varieties, and the most beautiful, C. Parkinsoni has its beauties as well. It has sharp, pointed segments, and the chequering very marked; so much so, indeed, as almost to be formal in its character. Its great defect is its erratic ways as regards time of blooming. It seldom blooms with the others, but makes an effort to flower with the Snowdrops with but poor success, the blooms being comparatively poor and colourless. This season it was unusually obliging, and favoured me with some flowers in the end of September. These were in perfect character, and made one more willing than before to put up with, and almost overlook, past disappointments.

Very delightful now are the Michaelmas Daisies. They have been later than usual this year, and it is unusual for us to have the favourite A. novi belgii lævigatus at its best in the middle of October. The old name of longifolius formosus dies hard, and this pretty little Aster is more frequently found with this name attached than with that adopted by the Aster Committee. Very soon we shall be so overwhelmed with seedling Starworts of great beauty that the need of names will be less than before, and we may have to content ourselves by selecting from those we see in flower. A nice bunch of charming flowers from Mr. Wolley-Dod is before me as I write. They are exceedingly beautiful in their varied shades from white to purple and blue, and comprise some varieties of the highest worth. It may, after saying the foregoing, seem almost contradictory to speak of a named variety, but as things are one cannot very well dispense with doing so.

The one now chosen is Aster Coombe-Fishacre, not a particularly pleasing name, but appropriate as indicating that it originated in the garden of Mr. T. Archer-Hind, a well-known lover of flowers. The flowers are not very large, and are, perhaps, a little stiff-looking in themselves. The colour is what is called, with the latitude allowable in colour nomenclature, "flesh," and is, if not highly effective, very pleasing. The height of the plant is about 3 feet, or a little more with us in the North. The habit of Aster Coombe-Fishacre is one of its strong points. It is very graceful and of really elegant habit, and covers itself profusely with flowers. It had just begun to flower in the beginning of October in a partially shaded place, and gives promise of flowering for a very long time.

Another good Starwort, of an entirely different character, is A. puniceus pulcherrimus, which is, perhaps, rather tall in growth for some, being about 5 feet high in ordinary soil. It has very pretty blush-white flowers of large size. These have the florets prettily incurved. As a garden plant, its appearance is enhanced by the contrast of the deep crimson stems with the colour of the flowers.

There are also some exquisitely coloured varieties of the novi-belgii class. Among these may be named Ella, soft mauve; Janus and John Wood, white; Nancy, pale blue; and Daphne, deep blue. The number of beautiful Starworts is, however, almost inexhaustible and certain to increase from the ease with which they are raised from seed. Raising seedlings takes a large space unless a number of odd corners are at hand, and by far the larger number are so like existing sorts as not to be worth naming. It is safe to say, however, that our gardens can be still further enriched in this way, and we may hope to see these hardy and beautiful flowers do more than in the past to give the autumn garden additional attractions for the admirers of flowers. A touch of frost even seems to brighten some of the Michaelmas Daisies. Few flowers are improved by such unkindly treatment, and we prize them all the more when they are left to us when others of our favourites have succumbed to the power of advancing winter.—S. Arnott.

ESTIMATES OF GARDENING.

The comparatively young will never think exactly the same as the relatively old, and it is no doubt well that this should be so. There is a disposition on the part of those who have worked long and well to think there are no times like the old times. They reflect with pleasure on the triumphs of the past, and not without good reason. Had they not ripe Grapes in March with flue-heated houses, the result of often giving all-night attendance to the fires? Did they not also cut Cucumbers in the same month, and ripe Melons in May, without any fire heat at all, but from frames solely heated by fermenting materials? And did they not with admirable devotion, consummate judgment, and unwearied attention, not for one year, and then starting again with young stock (as with Chrysanthemums, so splendidly produced now), but for a dozen years and more, succeed in building up those magnificent hardwooded specimen plants, then so prized, but now almost gone, and some of which might have been ruined by one mistake in watering?

The veterans are entitled to dwell on those achievements with pride, indeed it is creditable to them to do so. Moreover, they find pleasure, not unmixed with regret, in pointing to periods in the distant past when they believe that national enthusiasm in horticulture in its broadest aspect was greater than it is now, and the achievements of the skilful workers in it were not less worthy of their kind than those in a different way are worthy at the present time.

Then no amount of argument can make the old masters feel that wall trees as a whole did not reflect evidence of greater care and skill in the olden time than those, as a rule, display now; nor can they be convinced that the supply of fruit grown for home use was not, so far as varieties and means permitted, quite as good as is the case in these modern days; indeed they do not hesitate to aver that the Grapes and Peaches at the famous Chiswick shows of the long ago were better than those at the Crystal Palace in the beginning of last month.

It may be that these veterans were too generous in their estimates, formed at a time when they were young, and with minds more impressionable than now; and if that is so, is there not the same possibility of the not yet old and ardent workers of to-day being similarly impressed with the products of the times which they worthily aid in producing?

It seems natural for the young to be sanguine, and the middle-aged to be satisfied that nothing better has been done in the past in gardening than is achieved now. This ought certainly to be the case, and it doubtless is in some things, but not in all. The requirements of the present differ from those of the past, and a comparison cannot be drawn between the efficiency of gardeners as a body in, say, the forties and the nineties. There were splendid men in the old days as there have been down to the present time, and if we were to say there are more thoroughly competent gardeners now than could be found in the "forties" that would be no particular compliment to the craft. There ought to be more, because of the increase of population, of wealth, and the increased appreciation of the products of the garden.

While it may be said, with regret, that many fine old gardens have fallen from their high estate, infinitely more of varied extent and character have come into existence, with the result that the industry of horticulture in the aggregate is greater than it has ever been before. This means that the number of gardeners is greater than at any time anterior to the present generation—or men employed as such. Of thorough gardeners there is no lack—men of high character, bright intelligence, and conspicuous competency. In the whole wide world the superiors of, if equals to, the best British gardeners cannot be found. But what of the fringe? Is this not of necessity, under the circumstances, also greater than at any time in the whole long history of gardening?

The next thing to recognise is the existence of something that is not infrequently overlooked in estimating the real merits of both past and

present-day gardening—namely, the law of averages. Much, in the ordinary course of present-day procedure, is heard of what is famous, as in descriptions of, and well-merited work in, specially noteworthy gardens; also, in the registering of names of prizewinners at many shows. This is what is justly due; but, after all, it only represents one side of the subject. And again, what of the fringe?

For arriving at a true estimate of the actual state of gardening or anything else, the other side—the weak side—must not be ignored. It simply cannot be, if the actual state of the whole is to be determined. Without any suggestion from us, it seems that this is exactly what has occurred to one of our correspondents, who has exceptional means for observing the best and the worst conducted gardens in the kingdom. He appears to have been taking note of all kinds and endeavouring to strike an average. With what accuracy or otherwise we do not know. He may have over-estimated the badness of the bad, and under-estimated the goodness of the good; but whether this has been so or not, the average was bound to be very much lower than if the very best work only were appraised and the worst forgotten. What wonder, then, that really able men, whose work is a credit to them, should enter protests against the conclusions of this self-appointed scrutineer?

Two things are certain. This daring "Traveller" not only knows what is good when he sees it, but sees more gardens in a week than few gardeners see in a month, or many in a year. It is no novelty to him to see his name in print. He has had enough of that in his time to satisfy even a vain man, though we do not place him in that category. Some years ago one of the gardens from which he retired with as much credit as a man could wish, had prominence in this and other gardening papers, and the produce from it won the highest honours at the leading shows. It is due to him to acknowledge this without endorsing all, if anything, that he has said.

He has possibly to some extent attained his object—namely, of awaking the lethargic from their slumbers, and stimulating the laggards to greater endeavour. His letters were inserted because, despite of many men who have in one way or another come to be called gardeners, and whose ignorance is so great that in their estimation they have nothing to learn by reading or attending meetings for instruction, we believed that the position of British gardening at the present time could be well defended, and we have not been disappointed.

Let the veterans rest and be thankful in the pleasant memories of the past; their successors maintain the best standard of the present, and probitioners strive assiduously and perseveringly to excel both, and healthy growth (not decay) will be insured in gardening.

FRUIT AND TABLE DECORATIONS.

"S. B. O." (page 402) is evidently a cautious, if not a sceptical man, for he wants to know if there is any mistake about my former statement that "the young men used to turn out *en masse* to prune and nail wall trees." Certainly not; and although it may surprise him, I will add that is one of the best ways, if not *the* best way, to manufacture good tree trainers and fruit growers. If several young men are set to do work of that description together, under the watchful eye of the chief or foreman, a laudable spirit of emulation will cause each to try and do the work better than the others. A little competition of that kind gives great impetus to workers in every walk in life. Of course the youngsters do not begin at the top, any more than they do when pursuing other branches of gardening. The practice was for the foreman to go in front and prune, the younger ones following to remove old shreds and nails, while the journeymen arranged and nailed in the main branches. After a time the promising youngsters were allowed to nail in some of the small shoots between the main branches, and if they did not do them satisfactorily at the first attempt, why they simply had to loose them and "try again." Those with a little "true grit" in them soon learned to accomplish the work creditably, and were then rewarded by being allowed to nail in a small tree from start to finish. I know of many men holding good positions who look back with lively satisfaction upon their early attempts at tree training, and regret that they are not able to follow the same system now in the gardens they preside over; still they do not despair, but plod quietly on, knowing well that it is necessary for them to change their methods even as the times are changing. They see also a new light, which comes to them in the shape of bountiful crops, even though the tree branches are somewhat crooked.

In paragraphs 1, 2, and 3 on the page cited there is little that I do not agree with, in fact I have conveyed the same ideas in other words on many occasions to readers of the *Journal of Horticulture*. "We have a fair share of decorative work," writes "S. B. O." Very well, then consider yourself fortunate, and by all means try and keep your decorations down to that point as long as you can. If you get beyond it your present impressions will perhaps vanish like the "myths" of old. Floral decorations are of course not the cause of all the bad examples of fruit culture that we see, but I am quite sure of this, that in many places with the best of energy, ingenuity, and management, fruit trees do not get the attention they would if the decorative work were proportionate to the resources of the establishment. I know of a gardener who for weeks together keeps 300 flower glasses continually filled, some of them being trumpets 5 or 6 feet in height. He has also from twelve to fifteen large Palms, 6 and 9 feet in height, continually in the mansion, and about the same number of stands, baskets (3 feet in diameter), and groups of flowering and foliaged plants to be kept constantly in good condition. Then the dinner tables have to be smartly done. This occupies two men—sometimes three—and a boy three or four hours daily when large parties take place, and that is pretty often. This is the style of decoration that must inevitably lead to deterioration in some departments of gardening, unless the staff is largely increased.

It is a pity there are not more employers like the one "S. B. O." has the honour to serve, for it is far more satisfactory to gardeners to have their fruit placed upon the dinner table. Perhaps the fine display made by the dessert tables at such shows as Shrewsbury (which I examined closely) will in time influence the prevailing fashion—though I am not very sanguine on that point, as the "highest circles" do not take their fashions from horticultural shows. I thought it was generally known that the acknowledged leaders of fashion in what is called "society" form themselves into a series of rings known as the "highest circles," and the fruit, as well as everybody else connected with their "smart parties," must be of the very best. Mediocre samples will not satisfy them even for handing round, and the finest examples of cultural skill will not secure a place on the dinner table except on some comparatively unimportant occasion. There is, however, a good deal to be advanced in favour of the present state of affairs (though, perhaps, not from a gardener's point of view), as it marks another stage of refinement. There can be no doubt that, from an artistic point of view, a dinner table can be made more effective when the dishes of fruit are kept off, and nothing but flowers and foliage employed for embellishment. The whole can then be made light and graceful, like a scene from fairyland.—H. D.

HARMFUL AND HARMLESS GARDEN MOTHS.—10.

Before introducing the Hybernias to the reader's notice, a group of moths well known in our gardens, also in shrubberies and woods, I must refer to a species that might have been associated with the Currant moth of last article. This is the V moth, or Halia wavaria, so named because one of the four conspicuous dark spots upon the grey upper wings has a resemblance to that letter. It has the peculiarity that the margins of the wings have rows of black lines; from the middle of each is a tiny brush of white fringe. We find the caterpillar feeding upon Gooseberry and Red Currant, about an inch long when adult. The ground colour varies much, but the body is always studded with black warts, and has a yellow line along each side. Feeding in August or September, they are seldom numerous enough to do the bushes harm. By shaking, these are easily dislodged; they double themselves up as they drop, remaining a long while in that folded position. Nearly related to this moth is the pretty brown silverline (Panagra petraria) which flies in June, the general colour of which harmonises with the Ferns amongst which it is usually noticed. The caterpillars occur upon the common Brake Fern or kindred species, slender-bodied loopers, of a dull green tint, marked with numerous dark lines running from head to tail.

The Hyberniæ, or winter moths, present a natural and very interesting group. Most of them come under the observation of the gardener in one or other of their stages. We call them by that name, as they appear at a time when few moths are abroad; but several species emerge before the end of autumn, or in the early spring, not during mid-winter. One of the remarkable circumstances in their history is that the females have merely the rudiments of wings, or they are entirely wingless. The reason of this peculiarity is not far to seek. Coming forth at a season when the weather, if not cold, is likely to be wet and stormy, wings to the female moth, which lives the longer, would be a source of peril. Without them, she can traverse easily the stems and branches, and deposit eggs for the continuance of the species. Possibly, too, the absence of wings renders these females less likely to be seized by birds. The male moths, whose life is but brief, have wings of the usual proportions for their size; their flight, however, is not rapid.

First, I mention the mottled umber (H. defulvaria) as about the largest of our winter moths, one putting in an early appearance, since it emerges during October, or at the beginning of November. Its older English name was the Lime looper, on account of the caterpillar often infesting that tree, and the Latin refers to its ravenous propensities, the food being very varied; Hawthorn and Hazel are favourites. On

the Continent it is complained of as an Apple foe, and, with us, several fruit trees are occasionally visited. The Rev. J. G. Wood remarks that a journey of a few inches is fatiguing to the female. I doubt if that is so, since the caterpillars frequently drop in a spring gale from the higher branches. Certainly, it is possible they may travel upwards while young. Even rudimentary wings are wanting in this female moth, but her dark brown body is marked with black dots, and she deposits nearly 200 eggs. This caterpillar has been said to be handsome; the head is brown, and the upper surface of the body divided by a black stripe from the yellow beneath; there are also dots of grey and white, the legs being pale green.

In walking through a copse, or perhaps an orchard, on a May day we may see hundreds, even thousands, of these caterpillars dangling by their silken threads. Newman seems to have thought they do this sometimes as a recreative performance, but a strong wind brings them to the earth, from which, after a pause, they return to the branches, gathering as they go their threads into loops for future use. The Germans strike the trees with long poles in the spring to bring them down, and endeavour to stop the ascent of the moths by placing a wooden sheath smeared with tar round the trunks or stems, on the plan followed for the destruction of the female winter moths (Cheimatobia). It may be well to note here that none of the caterpillars of this group descend far into the earth to undergo the chrysalis change; frequently they lie upon the surface, protected only by a slight web; in any case they are covered with but a thin layer. No doubt some are eaten by birds, and some that do not emerge till the new year perish through the rains of autumn and winter. They do not appear to be much reduced in numbers by the agency of parasitic ichneumon flies.

On a January day it may surprise a gardener to see a moth, the dull colour of which harmonises with the season, flying briskly along, or having a rest on a fence. Rightly is the Hybernia rupicapraria named the early moth, for the cold of the first month of the year affects it not. Its pale under wings, however, contrast with the dark brown of the upper pair. The female has very short wings, useless for flying, but exhibiting a bar across the centre. Sloe, Plum, and Whitethorn chiefly furnish food to the caterpillar, which hatches early in April, and is full grown in about six weeks. It sits upon the twigs in a looped position when not eating, and is velvety, of various shades of green, but always displays white marks on the body, arranged in lines. A harmless species of early habit is the dotted border (H. marginaria); it flies generally in February, conspicuous by its marginal spots. The female has larger wings than the rest of the groups, yet of no service for flight, nor probably any help in walking. During the summer the brown caterpillars feed on Oak, Birch, or Hornbeam; occasionally they appear in large colonies amongst the woods, but about gardens we seldom see more than a few specimens.

Cheery is the English name of Hybernia leucophearia. It is called the spring usher, and comes forth as a moth regardless of the rough winds of February or March. It is of very variable colour; some are dark brown with a white bar, and others pale, having wavy lines across the wings. The females have not even the rudiments of them. The caterpillars are also of divers colours, and feed upon many trees and shrubs. When they first emerge in May they spin a few leaves together for their protection from birds, then scatter about, being adult in June, so that they pass a good while in the chrysalis state, generally on the surface of the earth. In and near gardens occurs the March moth (Anisopteryx æscularia), a smaller species of the family. The green and white caterpillar eats the leaves of Chestnut, Lime, Elm, and Whitethorn.

Of all the species the most mischievous and abundant is the winter moth, too well known to every gardener and fruit grower. It is unnecessary that I should enter upon its history now, since its economy has been fully described in the pages of this Journal, and I shall simply mention a few facts concerning it. One of these is the importance of keeping an outlook for it in October and November, when measures should be taken to prevent, if possible, the females from ascending to deposit eggs; but it must be remembered that the period of emergence may extend over several weeks after the first moths have been seen. Also, there is proof that some years a portion of the brood does not come out till after Christmas; hence Newman advises us to examine the twigs with a lantern early in the year, lest there should be females busy after dusk, and he suggests that pruning should be deferred as late as possible, so that some eggs of the moth may be possibly removed in the operation. Hardly sufficient attention has been paid to measures tending to destroy both sexes in the chrysalis state or at emergence by application of gas lime and other substances of a caustic nature to the soil around trees or shrubs. Since writing the above I have discovered that Girard, a French entomologist, noticed years ago that females of several species of Hybernia occurred on the lamps of the Bois de Boulogne, and he wondered however they got there. This does rather look as if the winged males conveyed their wingless partners to localities they would scarcely reach by crawling.—ENTOMOLOGIST.

ONCIDIUM CRISPUM.

THIS useful and free-flowering old species has always been a popular plant, and when it is well grown it is one of the most showy Orchids now in flower. Its habit is distinctive of the section to which it belongs, a section comprising such beautiful representatives as O. Marshallianum, O. Forbesi, O. curtum, and O. Gardneri. As far as the roots are concerned these may be treated somewhat similarly, but the temperature and other slight details are rather different, as will be noted in due course. None of them likes much compost about the roots, and for this reason they are not usually so satisfactory in wide and deep pots as they are in shallow wood baskets or on rafts.

The latter are, perhaps, the most suitable receptacles of all for O. crispum, and in order to prevent any possibility of rocking about, the plants must be very firmly wired on with about an inch of peat fibre and sphagnum moss underneath the rhizome. If baskets or pots are used, these should be nearly filled with drainage, the upper inch or so, for medium-sized plants, being ample room for compost. With the peat and moss allow a plentiful supply of roughly broken crocks and charcoal, this serving to aërate the compost thoroughly, a condition of things absolutely essential to the well-being of the roots of epiphytal Orchids.

Where roots are plentiful it is easy enough to fix the plants in position by firmly bedding the compost around them, but if roots are absent it is more trouble. In this case use smaller receptacles and very little peat in the compost, placing a few thin strips of cork over the rhizome, and wiring the plants down to the rods of the basket. Trim off the ragged ends of moss or peat when finished, as if these are left loose it becomes difficult to see for certain whether the plants are dry or not. These Orchids are rather sensitive to root disturbance, consequently the plants must not be re-basketed oftener than is absolutely necessary.

Should the roots be much entwined about the rods of the basket it will usually be necessary to cut this to pieces before the plant can be removed. A fine-toothed saw may be run through the corners, and the wires drawn out, the small pieces of wood with roots attached may then be introduced into the new basket. But until the plant grows out of these, or they decay, it will usually be more satisfactory to remove a little of the surface material, and replace it with clean fresh compost. A frequent mistake made by beginners in this operation is removing crocks and charcoal with the old material, and placing back only peat and moss. This gradually thickens the compost, and makes it close and inert, so that the roots cannot enter it, the result being soon apparent in the diminished health of the plant.

With regard to temperature and position, a place near the roof glass in the Cattleya house does admirably. The atmosphere must be kept moist, and no more shading allowed than is really necessary to prevent scalding the foliage. While growing freely the roots must be well moistened, and never, in fact, allowed to be dry for any length of time; but after the flowers are past and root action ceases, or practically so, they must be kept very much drier. The atmospheric moisture, of course, has to a certain extent to depend upon what plants are grown with them in the same house. I am of opinion that during the winter many of these South American plants are kept too moist. The growths are finished and there is little demand for moisture, and to supply it is, to say the least, unnecessary.

The beautiful O. Forbesi and its varieties are among the finest Orchids in existence, but unfortunately they are difficult to keep in health many years in succession. I had an idea some years ago that a rather severe drying was good for them, and I kept some very fine specimens—of which the owner was very proud—in health by this means for several years. But this, too, proved ineffective, and by degrees these plants went back, the growths getting weaker every year until they ceased to be of any practical value.

O. Marshallianum does with less heat than those I have grouped with it; in fact, it is a cool house plant pure and simple. It should not be so closely or heavily shaded as some of the Odontoglossums, but otherwise they get along together very well. Plenty of moisture should be allowed all the year round. O. curtum is another very useful and ornamental kind, the large spikes of showy blossoms produced lasting well, and having a very fine appearance meanwhile. It may be treated precisely as noted above for O. crispum, while the treatment for O. Gardneri is also similar. The latter likes rather less heat and a very moist atmosphere while growing. Taken as a whole, the crispum set, as it is called, is well worthy of the best care of orchidists, and will be grown long after some of the present-day botanical curiosities are forgotten.—H. R. R.

A VISIT TO SAWBRIDGEWORTH.

A DENSE fog hung over London on a recent day, when the writer set out to make his first visit to Messrs. T. Rivers & Son's nurseries at Sawbridgeworth, and it was not until Harlow was well nigh reached that the sun shone through the mist. As the journey had never been made before, and the reputation of the firm was well known, the pleasure of the visit was accentuated. What with the fog and special trains for some races the time occupied in travelling afforded ample time for meditation and speculation upon what would be seen when the destination was eventually reached. The picture presented by the grand fruit trees in pots staged by the firm at the Crystal Palace Show was recalled, as were the dishes of handsome Apples and Pears, with the splendid Grapes seen on the same occasion. "Will anything like those be seen?" was the mental question, and the day provided the answer of, "Yes, and something more."

The firm is of wide reputation for its fruit trees, and of these it is justly proud, but its genealogical tree is certainly worthy of a brief paragraph. It was from Mr. T. Francis Rivers, the present talented head of the firm, and of whom we give a portrait, reproduced from a photograph by Mr. A. Maxwell, Bishop Stortford, that the following particulars were gleaned. It appears that the family has been established there for nearly two centuries, though Mr. Rivers did not state decidedly that fruit trees were then grown for sale. The house of 1720 was moated and armed for the exclusion of unwelcome visitors, but in 1897 the characteristic principally apparent is the hearty British welcome that is afforded. It is probable that the times were more troublous in the days of the first of the Georges than under the beneficent régime of Queen Victoria. The moat even no longer remains, having been filled in two generations ago because, in the words of our guide, "it was a nuisance."

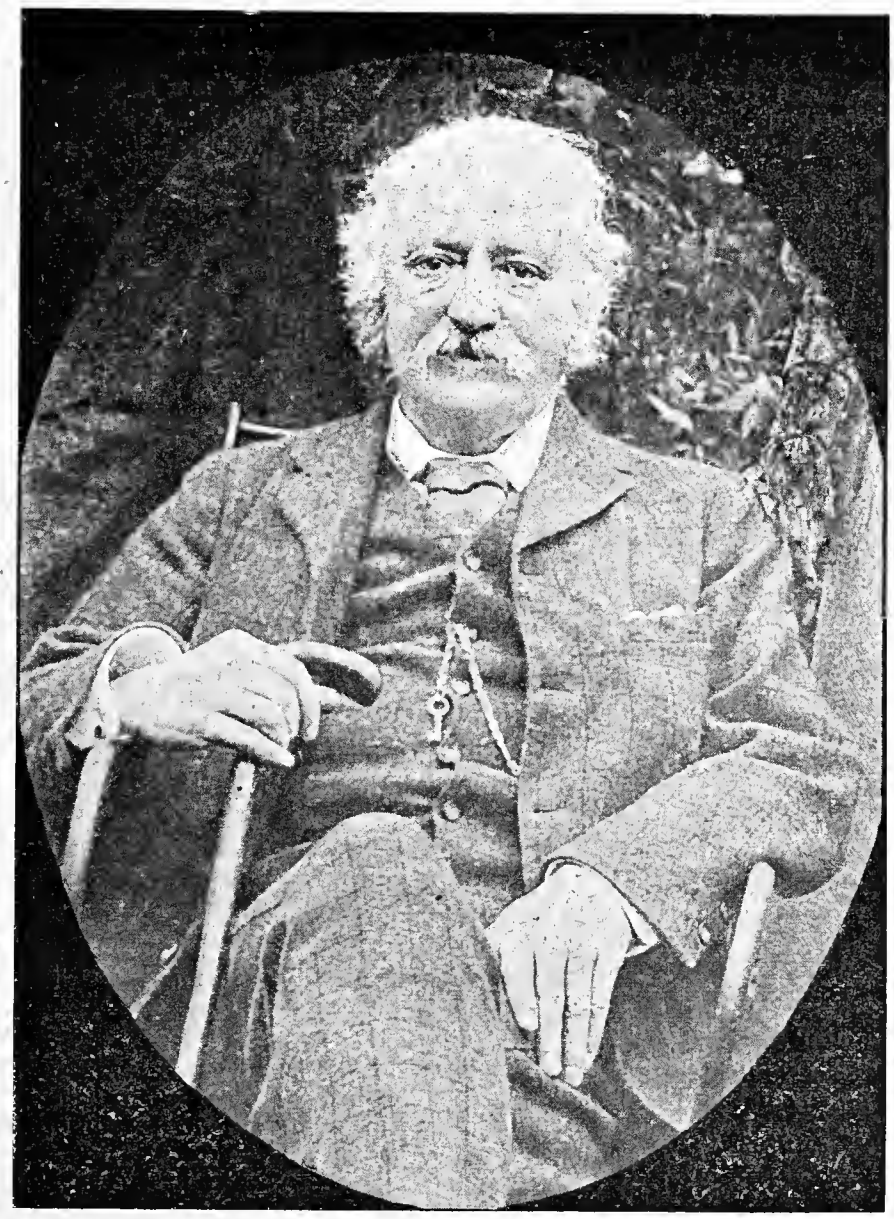

FIG. 64.—MR. T. FRANCIS RIVERS.

For a century and a half the cultivation of fruit has been carried out, and it is sufficient testimony to the excellence of the trees supplied to know that even now no signs of decrease are on the horizon. The styles of training have changed no doubt, and the output must have grown with the years, but whatever the form and whatever the number, the stamp of Rivers proclaims the quality. Frequently in cultivating the ground Roman coins of varying values have been unearthed; but, interesting though these undoubtedly are, we must hold to our preference for the gold and silver of to-day. There were pieces of money broken, bent, and clipped, with others almost perfect; but all were passed with a cursory glance, for it was from these that we were to adjourn to see the trees of all shapes and sizes, kinds and varieties, and to these it behoves a gardening journal to give the most attention.

The late Mr. Thomas Rivers did great work in the fruit world, and splendidly has his son trodden in his footsteps. If one dwell a moment on the many fruits emanating from Rivers of Sawbridgeworth one may form some conception of what has been done.

ACREAGE AND SOIL.

The number of acres actually devoted to fruit culture is about 200, but the estate is considerably larger than this, and is utilised for general farming. The advantage of this extra ground is obvious, for it provides new space on which fruit can be placed for a change of ground. As of many other crops the soil becomes "tired" of always supporting fruit, and if a change be not given there will be a certain eventual deterioration in quality. Such must not be, so the crops are changed, and what has been farm land becomes fruit garden, and *vice versâ*. So it is that year by year the same standard is maintained, and it is the constant endeavour of the chief and his two sons to keep at least at the normal level, and if possible to rise above it. Of course with such an area the natural staple varies very considerably, but almost all of it is a medium loam, which suits fruit admirably if thoroughly cultivated.

Speaking of thorough cultivation makes it permissible to mention here that when a fresh piece of ground is appropriated for fruit, the whole of it is deeply trenched and good manure added; thus abundance of soil is loosened, in which the roots may find plenty of food, and from which they come in the form of a mass of fibres. One portion of the nursery faces the south, and on this the trees make wonderful progress—not growing luxuriantly, but producing wood and buds that ripen thoroughly well. Another advantage enjoyed by this nursery is that it is close to the canal and the rail, so that despatch is rendered easy, while manure can be brought close on to the ground. At first glance the soil in places does not look very kind, but it breaks down under culture, and gives a medium than which no better could be desired for the particular purpose that it is used for.

STANDARDS AND BUSHES.

The standards of various kinds of fruits with which so much land is occupied number many thousands. Immense numbers of them are young and in the proper condition for sale, while others are considerably older, and are in profitable bearing. These comprise the leading varieties that find the greatest favour in the various markets. The most conspicuous features of these are the cleanliness of the bark, the openness of the heads, and the number of fruit buds with which each is studded. This year the crop has not been a very heavy one, but the trees promise well for another year. Pears, Plums, and Apples form the bulk of the standards observed in different parts of the nurseries, and whether young or old they look as though they are capable of rendering a thoroughly good account of themselves in the years to come. The several other kinds of fruit grown as standards occupy a considerable amount of space, and are possessed of the same pleasing characteristics.

Numerous as are the standard trees those trained in the form of bushes or pyramids are no less so. As with the standards there are trees of various ages, but there is no variation in quality, all being uniform in this respect. The regularity is very striking as one traverses quarter after quarter and finds the same conditions prevailing in each. It was some of these shaped trees that we examined at the roots, as the lifting was in progress, and were surprised at the extraordinary number of fibrous roots that each one carried. It was not a case of one being good in this respect, but all the trees looked alike. It was apparent, too, that the utmost care is taken in the lifting, for the number of fibres broken was very small, much less indeed than one would have thought from the appearance of the ground, which before the insertion of the tool, does not look very inviting, nor give much promise of clean, healthy roots. Currants, Gooseberries, and Strawberries take up proportionately large areas of ground, and are in capital form.

TRAINED TREES.

Amongst the trained trees we noticed and admired Plums, Peaches, Nectarines, Cherries, Apples, and Pears in all stages from one year old. Besides those in fan and espalier form there were gridiron shaped as well as cordons, with one or two others that are not so popular. Some varieties of each kind were particularly notable as doing better than their neighbours, but few of them leave room for much adverse criticism. The fan-shaped Peaches, Nectarines, and Plums looked wonderfully well, as did the espalier Apples and Pears. Cordons are in strong force, and the quantities of them grown show how rapidly they are advancing in public estimation. One might easily select trees here that would occupy any wall immediately, and they would commence fruiting at once, or small ones could be chosen and trained into the space they were desired to occupy. In the latter case it is obviously not desirable to crop the trees the first season or two, as this is prejudicial to the welfare of the trees.

TREES IN POTS.

The majority of people who were asked for what Messrs. Rivers were most celebrated would be unanimous in responding, "For their pot trees," and the writer feels no inclination to disagree with this verdict, for they,

as a whole, form the best feature of the establishment. Grown by hundreds in the long, light, adequately ventilated orchard houses, they are wonderful examples of what may be done with fruit trees under this system of culture. Repotting was being done, and the manner in which the roots were dragged about with chisels so as to leave room for fresh soil to be put in the new pots was enough to make one gasp with astonishment. "Only annual roots,' said Mr. Rivers, with the most perfect nonchalance as we passed to examine the Apples and Pears, loaded still with fruit. It is probable few cultivators would feel disposed to treat their trees in such a drastic manner; but the condition of those at Sawbridgeworth proves that they do not object in the slightest; in fact, they revel in the treatment that is accorded.

There are dwarf bushes, half-standards and standards, of Peaches, Nectarines, Cherries, as well as of the Apples and Pears just noted. The branches are beautifully trained, so that no obstruction of light occurs at any period of growth, and it is astounding to see the profusion of buds on every single branch, or rather growth, for they are almost too small to be called branches. The trees have produced fruit this year as they did last, and as they will have to do next, unless something entirely unforeseen occur. In comparatively small pots there are bushes of considerable size, and of course it is not possible for them to derive all the nourishment they require from such an amount of soil as that which surrounds their roots. To meet this deficiency, each one is generously fed from the surface, both by top-dressings and by waterings with liquid manure. It is more than probable that upon this feeding depends, to a large extent, the success or otherwise of the trees that are grown.

Oranges and Vines.

Before concluding these notes of Sawbridgeworth we may refer to the Oranges, of which a whole houseful are grown. Some are small and others of good size, but their culture is crowned with yearly success. Grapes are magnificent. House after house is filled with Vines that have been cropping heavily for over twenty years, and show no signs of diminishing. The bunches are made up of large splendidly coloured berries, and nowhere is there a sign of an enemy. There were hundreds of bunches hanging when this visit was paid, and all alike were excellent. With these we must stop, though much more might be said, but this shall be left to the writers of the future.—Visitor.

INTELLIGENCE IN PLANTS.

(*Continued from page* 378.)

In Spiranthus autumnalis there is a boot-shaped disc, which when touched by the proboscis of a bee instantly splits its whole length, and exudes sticky matter, to which pollen adheres. When the bee withdraws its now loaded proboscis it finds it cannot enter another flower of the same age, and is compelled to visit older ones with wider orifices until it gets rid of the pollen, when it can visit lesser ones again. This arranges for the fertilisation of older flowers by younger ones. Darwin says bumble bees begin at the lowest flower on the stem of this plant, and work upwards till they come to one they can enter, and it almost seems in this case as if the bees had some idea there was a mutual benefit to be had.

In the Listera ovata a drop of sticky water is shot out at the invading insect with great precision, and hardens rapidly. If the intruder be weakly or small it is frequently blinded, or even smothered by the explosion. This may be a blunder, and it also may be a bit of Nature's policy. We so often find that we thought was a blunder was quite otherwise, that it is best to wait for further information before libelling any of Nature's methods. The Cattleya is fertilised by the good offices of a bee, and the visitor in leaving the flower turns up a specialised tongue-like stigma called a rostellum, which exudes the sticky matter, and, as usual, in the right place.

The Australian Orchid (Coloena) makes a prisoner at once of any insect that alights on its lip, and really what happens is not yet well understood. In the Dendrobium chrysanthum there is a mechanism which raises the anther lip to have the pollen attached, but this does not always occur; and if the lip is ever raised again it rises with an impetus that sends the pollen up in the air, so that it may fall on the stigma of the same flower, and thus effect self-fertilisation.

The Angræeum sesquipedale of Madagascar has a whiplash-like nectary nearly a foot long, and the honey at the bottom of it has to be got at somehow. It is supposed there is a moth with a corresponding 12-inch proboscis. The sticky matter is round the opening into the nectary, so that this still unknown moth is a requisite here, and the fertilisation does occur. We have to imagine the moth. Here let us ask a question, and find the answer if we may. If the moth is necessary for the plant, was it made for it? Obviously the moth can do without the plant, but the plant cannot do without the moth, and what does it all mean? Is it a sort of partnership, and the partners, one or both, unaware of the fact? When a bee starts out honey gathering, how is it that it only visits one class of flower, as a rule, on that particular journey if it has no idea of its mission?

Catasetum saccatum when touched even by a hair on one of two horn-like processes shoots out the pollen, sticky end first, with great force to a distance of 2 or 3 feet if nothing intervene. Gardeners meddling with these get the discharge in their faces sometimes. The mechanism effecting this expulsion is complicated, touching the horn ruptures a disc. A Catasetum callosum shot its pollen bag on to a window a yard away, where it stuck by its own glue. Many Orchids expel their pollen thus, but there has to be that mysterious ripeness before it occurs. No discharge happens on touching the horn before it is ready.

In the Mormodes Orchid the pollen bags are at the end of a long stem, which is bent downwards and kept in that position, in spite of the growing tension caused by the growth of the plant, till the magic touch; then the usual burst takes place, and the long straining stem is suddenly released, and with the spring bends over the other way, and with that tears itself up by the roots and rebounds into the air. In one Orchid the passage into the nectary is so complicated, that the insect is a very long time in finding its way, and thus does the knowing plant gain the needful time for its sticky matter to set. These nectaries, as I have already said, do not always contain nectar, and whether the plant has so far progressed as to be able to think out a pretty little swindle or no is not quite apparent. Darwin thinks that when there is no nectar there is a compensation in some nodules or excrescences which may be food. One hardly likes to differ in opinion rom such an acknowledged master mind, but a nectary is not needed if there is no nectar, and the nodules do not explain the peculiar shape. It is true peculiar modifications of the original intent are frequent, and it may be that the owners of the nectarless nectaries have, so to speak, changed their views.

The Mistletoe is a curious illustration of this change of purpose. It produces a flower as if it was going to produce a seed in the usual way, and then it develops a sort of gimlet instead, which it bores its way into the heart of its host—usually an Apple or Pear tree, and not on the Oak, as popular fancy has it. It bores in deeper and deeper year by year, and yet it only abstracts water and the salts in it, and does not prey on its host, as is usually supposed, for its general food. In some way it provides its own chlorophyll. If you want to know what this chlorophyll is, I can tell you. *Chloro* means green, and *phyllon* is Greek for a leaf, which is not valuable information. I can tell you further that it absorbs light, many red rays, a good many blue violet ones, and some of the green and yellow rays. What it does with them, and what sustenance there is in a ray of light, is what I cannot tell you.

When you grow a plant in the dark it is not green because it cannot form any chlorophyll, which, again, is an explanation that wants a good deal of explanation. There is no chlorophyll if there is no iron about, but then nobody knows what iron is, even in Sheffield, and in fact the things we do not know are quite numerous, and grow more numerous every time we find anything out.

Amongst other things chlorophyll works a sugar manufactory, a starch manufactory, and maintains a chemical laboratory which can deal with water and carbonic acid and other chemicals, and convert them into plant substances; but to discuss chlorophyll fully would take at least one separate paper all to itself, and more, probably a dozen.

The Dodder (Cuscuta trifolia) is not so considerate to its host as the Mistletoe. I am afraid it is a bit of a thief, and prefers living at the expense of others, like certain members of the very superior human family. The seed of the Dodder has nearly forgotten how to enter the soil; it has developed a gimlet, and bores into its host, which is anything it can find that is green. It is fond of Clover, and knows the difference between that and a dry stick. The Banyan tree has discovered a way of doing without seeds; it drops a bough to the ground, which takes root, and, in time, forms a whole forest of trees, if let alone.

The Aristolochia flower is a fly trap. It secretes a nectar in a tube which the flies can smell, and on entering find a forest of hairs which easily bend inwards and let the burglar in, but as they will not bend outwards the fly has to remain and feed till the pollen is ripe and dusts it all over. Then the hairs shrivel up and the victim escapes to carry the pollen into another similar prison. The common Arum has a similar trap, but in this trap are both the male and female, so that self-fertilisation seems well provided for; but it is impossible, for the stigmas ripen first and lose their fertility, and when the anthers ripen the pollen falls on the imprisoned flies, and, as before, the hairs wither and the flies escape to carry the pollen elsewhere. Now here is a lesson not to let a first glance of things be considered decisive—that is not science. Science means seeing into things, and a first glance inside an Arum flower most people on seeing the male and female parts both enclosed in the same receptacle would say, "Oh, here self-fertilisation is carefully provided for, and well arranged, they are boxed in together for that purpose." Yet, as has been pointed out, it is made quite impossible.

But here is a nut to be cracked by those who will not believe that a plant has intelligence. The common Figwort is fertilised by wasps, and for some reason these creatures in visiting a number of flowers on

one stalk begin with the top one and work their way downwards, whereas bees begin at the bottom and work upwards. Why they choose to do this is one of the many things I do not know, but as the Figwort anthers ripen before the stigmas, it follows that the wasp coming in laden with pollen from another flower fertilises the young flower, and visiting the older flowers last, carries off from them fully matured pollen to again fertilise the younger flowers of the next bunch, which is a decided advantage. Does the wasp know and adapt its visitation to the needs of the plant, or has the plant been cute enough to observe the ways of wasps and hold out special attractions to them? I am afraid I shall have to add this to the things I do not know.

I may as well also confess I do not know why our common Milkwort should keep a sort of miniature public-house. The five stamens and the umbrella or disc over them look very like a barrel, and the doors are open to all comers. Flies of many kinds and moths come in and have a drink, and as some have to pawn their legs or wings for it, one almost wonders if the flower is strictly respectable. These legs are no use to it, however, and wasps seem to be able to tap the liquors and get away without paying anything, but when the rightful guest, a bee, comes in and gets his feet fast in the sticky mass round the barrel, he instantly pulls the shop down and flies off with the pollen to the next, for which sole purpose the said shop was erected. Why the wasp does not get the pollen and the bee does I will add to the growing list of things I do not know.—(*Paper read by* Mr. W. Pickard *at a meeting of the Sheffield Chrysanthemum Society.*)

(To be continued.)

PRUNING TREES IN PUBLIC THOROUGHFARES.

Will you kindly express an opinion on the pruning of the tree, photo of which I enclose, also one of an unpruned tree? In a road in which I have property Lime trees were planted some eight years ago, and they were in most instances, at one end at least, doing well. About six weeks ago the District Council, or its surveyor, put an ordinary employé to prune the trees, and he, with a big pair of secateurs, severed the trees in a shameful manner, cutting the branches very roughly, and leaving snags 3 to 5 inches in length. With other ratepayers I complained, and the surveyor has called in an "expert," who informed him that the trees had been properly pruned. Unfortunately the best and largest trees were all pruned, and I can only send a photo of an unpruned tree in a part of the road where the trees did not do well. Kindly let me have your opinion in an early issue.—W. J. Godfrey, *Exmouth.*

[It is not easy to judge of the matter from a photograph showing only part of the tree. though if the whole extent of the branches, mutilated or not, could have been shown, the effect might possibly be more hideous than it is now. Where trees are properly pruned in and near towns competent persons are employed by parochial or other authorities to do the work. This should always be the case. The proper name for most of the so-called pruning by "ordinary employés" is ruthless, barbarous mutilation. The non-pruned tree is pleasing in outline.]

ROYAL HORTICULTURAL SOCIETY.

October 26th.

Scientific Committee.—Present:—Dr. M. T. Masters (in the chair); Mr. McLachlan, Mr. Veitch, Mr. Douglas, Prof. A. H. Church, Mr. Shea, Rev. W. Wilks, and Rev. G. Henslow (Hon. Sec.).

Galls on Oak Roots.—With reference to the specimens exhibited at the last meeting, Mr. McLachlan observed that the name of the insect was now Biorhiza aptera, and that only one sex (the female) was known as occurring in the root-galls. As soon as it was hatched, the insect climbed to the terminal shoots and laid its eggs in the buds. The result was the common spongy gall, known as the Oak Apple. In this both male and female insects were produced, and were formerly thought to be a distinct genus, under the name Teras terminalis. The females fall down to the foot of the Oak, and lay their eggs in the roots under ground, and so reproduce the root-galls. This dimorphism is characteristic of other gall insects on the Oak.

Cattleyas sub-Pelorian.—Mr. Veitch exhibited two sprays, carrying several flowers of Cattleya labiata autumnalis, having the two front sepals assuming the form of lips. He observed that the same plant had repeated the peculiarity both last year and this, but the lip markings are now more pronounced. The specimens were received from Mr. F. R. Lloyd, of Coombe House, Croydon.

Carnation Leaves, Malformed.—Mr. Douglas exhibited leaves with peculiar horn-like excrescences on the margins. It was suggested that they might be caused by acori. They were forwarded to Mr. Michael for investigation. Dr. Masters observed that a Yucca in the Botanic Gardens, Dublin, produced very similar structures every year.

Cauliflower. Malformed.—Mr. Henslow exhibited a branch bearing a cluster of short Asparagus-like shoots, the leaves being reduced to a bracteate form, suggestive of the name of Broccoli—viz., Brassica oleracea, var. Botrytis asparagoides. Dr. Masters observed that it bore a very unusual appearance, and was really intermediate between a Cauliflower and Broccoli.

Rose Crimson Rambler.

In reply to Mr. C. D. Elliot's inquiry respecting this Rose I quote as follows. All that I vouch for is that this appears in the "Grantham Journal" of 5th October, 1895:—"It was purchased for Mr. Jenner by commission in Japan, in the year 1878, through Professor B. Smith, residing in Tokio at that time, but who was presently, if not still, at Mason College, Birmingham. Mr. Jenner was particularly pleased with its free-flowering and very striking effect, and it was grown for about a dozen years in a private garden. Then Mr. Jenner presented the entire stock to Mr. Gilbert of the Bulb Nurseries, Bourne, Lincolnshire, and he, with his consent, sold it to Mr. Turner of Slough. It was originally called The Engineer, I believe, because an engineer first brought it to Mr. Jenner's or Professor Smith's knowledge; indeed, it was actually shown as such at the Royal Horticultural Society, and received an award of merit on July 8th, 1890. Mr. Jenner consented to the name being changed to Crimson Rambler, which is most appropriate. . . . The gold medal of the N.R.S. was unanimously awarded it at the C.P. exhibition of 1893, when it was described as a climbing Polyantha Rose."

I have no idea who wrote this. The accuracy of part of it could be easily tested. It is said to be quoted from "Rosarian' in a recent number of "Amateur Gardening."—Alan Cheales.

In reply to Mr. C. D. Elliott (page 388) I may say that Dr. Ramsay is probably correct in saying that he knew this Rose forty years ago in the garden of Mr. Jenner at Edinburgh. I visited this garden shortly after Mr. Jenner's death, and Mr. Mungo Chapman, the head gardener, who is now in business at Bridge of Allan, N.B., pointed out to me the original plant, which he said had been given to Mr. Jenner by an engineer who had brought it from Japan. Mr. Jenner had named it Engineer, but it is to be hoped that the ordinary rule regarding prior names may not be enforced in this case. I think that Mr. Chapman said that someone in Yorkshire had been given a plant or plants by Mr. Jenner. Perhaps it was in this way that it came into Mr. Turner's hands. While on the subject of this Rose I may be allowed to say that it is, in some gardens, very long in coming into flower after being planted. I know of several gardens where it has been grown for some years without producing a bloom. This year I saw a plant of Crimson Rambler flowering for the first time after having been planted for three years. In many places, of course, it produces its brilliant flowers in great masses the first year.—S. Arnott.

Preparing Soil for Roses.

The season for planting is now with us, and a few notes on the subject of preparing the positions for them, either in beds, borders, or larger plots of ground, may prove useful to some who contemplate growing a selection of Roses.

Whenever Roses are planted the work should be thoroughly well done, and the first matter to attend to is the preparation of the soil. Roses absolutely refuse to succeed in poor, shallow, uncultivated ground. They cannot obtain the food they require owing to the fact that the roots have not the opportunity of ramifying in a rich fertile medium, whereby they can secure the soluble food and moisture they demand.

The plants may attempt to grow for a time simply because of the inherent vigour they possess, but ultimately they develop weakly, producing but poor wood and foliage, which may probably become a prey to mildew, especially if the plants have to experience dry hot weather followed by wet and cold. Under such conditions the blooming is at least unsatisfactory, if not an absolute failure. In order to avert such disappointing results study neither expense, time, nor trouble in giving the soil thorough and careful preparation, so as to afford the plants a good start, sending them along to become well established.

The ground intended for planting, whether of large or small area, should be thoroughly open to sunshine. It is best, however, if sheltered from rough winds. If the shelter is living vegetation, trees or shrubs, these should not be in close proximity to the Rose beds, or their roots may seriously impoverish the soil. The strong roots of evergreen and deciduous trees will chiefly prove harmful by abstracting moisture, and without a due amount during the period of active growth food in the soil is rendered unavailable.

The above points, however, having been fully settled, turn next to the digging or trenching of the soil. The ground must be well broken up to the depth of 2 or 2½ feet, not necessarily because the roots will occupy the whole depth, but to afford a suitable medium for them to ramify in if necessary. In dry parching weather of summer, when the roots can descend a little deeper, the advantage of a good moist medium is of great advantage. Another reason why a tolerably deep root run is essential is that better drainage is secured should the ground tend to be rather heavy or damp. Shallow and light soil also requires that the subsoil be made of service for the rooting generally to be carried on at a lower level where more uniform moisture prevails.

Trenching ground may be understood to mean that the surface soil and the subsoil are reversed in position by the operation. This is really the case in true trenching, and it is sometimes desirable that this should

be so, but more often than not it is undesirable, for the reason that the subsoil may be poor and very unsuited for the free and vigorous rooting of Roses. Why should the subsoil be poor? Suppose the ground has not been cultivated for more than one spit deep over a long period. The subsoil will probably be stiff, clayey, gravelly or chalky, deficient in available plant food. It requires to be broken up, intermixed with enriching material, and more or less exposed to the energising influence of the atmosphere, which will act upon it beneficially, gradually causing it to yield food by becoming ameliorated and pulverised. This takes place but slowly. It may, however, be much improved by mixing with it better material and manure.

The subsoil being well disturbed, it is not advisable to bring it to the surface, but to deal with it by the operation known as bastard trenching. This is carried out quite easily, and the ground worked two spits deep. If the plot of ground is of good size divide it into two. Along the end of one of these divisions mark out the width of the first trench. Take out the first spit and deposit it on the other half at the same end. The bottom spit may then be broken up, incorporating with it manure, soil, road scrapings, or ashes, whichever will most tend to improve it. This done, mark out the next trench The first spit taken from that deposit on the broken-up subsoil of the first trench mixing with that manure or soil for improving it. The same course of treatment must naturally follow with the others, finally finishing where the soil from the first trench lies.

Beds of small dimensions may have the top spit of soil thrown out, then break up the bottom and intermix the improving material as necessary, or place manure in layers, alternating with soil. Near the surface, however, it is better mixed. Manure in direct contact with the roots of newly inserted plants will prove injurious.

When the upper layers of soil are in good condition it is not so essential to apply manure at the time of planting, but it may with advantage be placed below. Half or thoroughly decayed manure is the best to employ. Cow manure being suitable for light soil, horse manure for heavy soil, and mixed farmyard manure for soils of medium texture. —E. D. S.

Roses for Market.

(*Concluded from page* 388.)

In dealing with the cultivation of Roses under glass, I hardly know where to commence. Young grafted plants of the Teas are used, and quite small plants of the Hybrid Perpetuals from the open ground, the last being worked upon the Manetti stock. This is by far the best stock for pot plants, and never grows so coarse as in the open. These young plants are placed into 32's, a compost of rich turfy loam only being used. When the first season's growth is finished the plants are stood in the open for a couple of months, which will bring us to the early part of September. The ripest plants are then picked out, turned out of pots, a considerable amount of the soil removed and repotted into a 6 or 7-inch size. Strong turfy loam is again the staple of our compost, a little bonemeal and pulverised cow manure being also used. Fresh soil always causes a freer and quicker formation of new roots. The plants are potted much firmer than the average amateur practises. When repotted and pruned they are stood in a cool pit and kept close for a month or so. This induces rapid root growth, and the buds soon plump up ready to burst. These earliest plants are intended to flower about Christmas, and are taken to one section of the house by the middle of October. During this stage quite enough plants for both sections can be stood into one division, which is started at a temperature of 45°, and gradually brought up to 60° Fahr.

During this time the Roses in the borders are also coming along in unison with the pot plants. The roots of the climbers being all under cover is far safer for forcing purposes than when such are planted where many roots would ramble into cold outside soil. Those upon the side walls are not so given to rambling, and will keep to the prepared border. None the less, we give a little outside protection in the shape of straw hurdles leant against the walls where no side pits answer the same purpose. By keeping off excessive wet and the direct influence of weather no harm accrues to the roots.

When the pot Roses have grown sufficiently to need more room, the backwardest are draughted out to the other section, which by that time has finished its crop of Tomatoes or other summer occupants. This section is now heated as well, but the first one, containing the most forward plants, is raised from 5° to 10°. Sometimes a house is filled with pot Roses at once, cramming these in almost as thickly as they will stand, and draughting them off to other houses as becomes necessary and the various summer crops will allow. It is a pity, and would never pay with the present low prices and keen competition, to set the plants far apart from the first, while Tomatoes and Roses go well together, and make use of the house the whole twelve months.

By regulating the temperatures of each section, and by bringing the Roses forward in batches, we get a succession of bloom. When a number of plants have given the greater part of their first crop the temperature is allowed to fall a few degrees, raising this again a fortnight after. It is surprising how much this short partial rest seems to assist in the building up of new growth, which soon comes into flower once more. But this last does not apply to the climbers.

The varieties named do not cease flowering in the same way as our summer and most climbing Roses, but they fall off in quantity at the very time there are plenty to be had under cool treatment. During the whole time of flowering growth has been forming, and can now be steadily ripened preparatory to turning the plants out upon a sheltered border beneath a wall or hedge, thus making room for the Tomatoes. It often happens that one has to select the ripest plants from the two sections, removing these only, and placing those with much young and tender growth into one section for a short time longer. At this time much more ventilation is given, but draughts are as carefully avoided as during the earlier stages. The object is to get as many of the Roses as possible in at the desired time, and yet make room for early Tomatoes, which have been growing on in 3½-inch pots, ready for use as soon as any section can be cleared of Roses.

We must now return to cultural details. From the very first an effort is made to keep a fairly uniform temperature, and upon no occasion should ventilation be accompanied by draughts. This is one of the chief causes of mildew, any sudden change being almost sure to bring on that most disastrous complaint. Liquid manures are given freely after the growth has well started, but not before; nor are these ever used at any great strength, or tied to one kind. Both cow, stable, and other drainage are used. As for artificial manures, we find none better than the best Peruvian guano, at the rate of 2 ozs. to 3 gallons of water, and some soot dissolved in the tank or tub. The latter should always be enclosed in a bag to avoid unpleasant scum. Both guano and soot water will be about the colour of sherry when fit for use, and it is far better, as well as safer, to use it weak and freely than to risk a stronger dose.

Insect foes are kept at bay from the outset, otherwise they are a great expense to keep down, and also injure the plants very much. Begin the battle early, keep a close look out, and use mild measures, then the Rose is no more trouble than other plants. It is always a good plan to damp down with liquid manures—natural—occasionally of a morning, especially if bright.

The same pot plants will do for three or four seasons, but it is well to introduce a few young ones each year, and weed out those carrying much old and sere wood.

Pruning is a most important item. The climbers are cut back rather hard directly the crop of bloom is secured. This induces more young rods from the base, and these grow on while our pot plants are giving a succession of bloom. One must not hesitate to cut back closely simply because the plants are carrying healthy foliage and growths. We cannot allow overcrowding of lateral shoots, and if cut back early, they get away from the Tomatoes in ample time to be fairly well ripened by the end of the summer. Nor do we crowd the house with Tomatoes, but use them as a catch crop, and a help towards the labour account.

Pot Roses need about half of their best wood left, cutting out all weak growth, and keeping the plants fairly compact. Those upon the side walls are pruned and tied up in the usual manner. Between the times of removing the Roses and putting in Tomatoes, give the Roses a good mulch and a thorough watering. If the Tomatoes are not in pots, you will need to mend the border a little each season; but it is far more satisfactory, except as regards the water supply, to grow these in pots, as one has the roots more under control, whereas they would grow very coarse in the unlimited root run provided by the borders.—Practice.

HERBACEOUS PÆONIES.

Your correspondent "A" (page 387) must have a singular lack of power to appreciate beauty in Nature if he disdain the lovely autumn foliage of the herbaceous Pæony. To many his "dirty brown hue" appears as resplendent tints of orange, purple, amethyst, and rich burnt sienna, with an occasional splash of warm carmine. Our fields of Pæonies in September and October cause the inhabitants of the neighbouring parishes to ask for Pæony leaves at harvest festival time to mix with their Gladioli and Dahlias for the decoration of their churches and chapels. People send us money for the foliage from places hundreds of miles away. The Pæony is beautiful in autumn, as in spring and summer; the vivid colour in the young growth as it pushes through the ground is no less charming than the picturesque hues of age. Of course when the time for rest has actually come, and the foliage has really decayed, then this beauty departs, as with other herbaceous or dying-down plants, which is a signal for the gardener to lift the plant if need be, or to clear away the dead stems and leaves. But never should the garden or the plant be robbed to any extent of the lovely autumn Pæony foliage.—Kelway & Son.

Most growers of the Pæony have too much affection for this grand flower, to think of cutting off the leaves as soon as possible after the flowers are over. It is surprising, notwithstanding, to see in some gardens the common Pæonia officinalis fl.-pl undergoing this drastic treatment year after year without apparent deterioration. I should not think of doing it, but your correspondent "A." might find it worth while trying this annually for a few years. The Pæony is very accommodating, but it is possible that the Chinese varieties would not stand such a severe trial as our old double Pæony can do.—A. Hardiman.

Notes & Gleanings

EVENTS OF THE WEEK.—Besides the meeting of the various Committees of the Royal Horticultural Society at the Drill Hall on Tuesday next, there will be numbers of Chrysanthemum shows. As a list of these is given on page 436 it will serve no useful purpose to repeat them here.

—— WEATHER IN LONDON.—On Thursday last a dense fog hung over the metropolis, and both rail and vehicular traffic were greatly impeded. It was not such a bad one as many that have been experienced, nor did it last so long, for on Friday the sun shone gloriously, and the day was quite warm. Saturday and Sunday both opened foggy, but the sun was very brilliant later. Since the latter day the weather has been clear and cool.

—— WEATHER IN THE NORTH.—Without recurrence of frost, with an occasional bright day, the last two weeks of October brought a great deal of foggy weather, with cold N.E. wind. Saturday was very unpleasant, with frequent drizzle. November opened with a beautiful day and evening; Tuesday morning was duller, but calm and dry, with the temperature 44°.—B. D., *S. Perthshire.*

—— GARDENING APPOINTMENT.—After being eight years general foreman, Mr. W. E. Humphreys has been appointed gardener to A. H. Smee, Esq., The Grange, Hackbridge, in succession to Mr. G. W. Cummins. Mr. J. Proctor, for the past six years foreman at The Warren House, Stanmore, has been appointed head gardener to W. M. Sharp, Esq., Chippenham Park, Soham, Cambs.

—— GARDENERS' ORPHAN FUND.—At a meeting of the Committee of the Royal Gardeners' Orphan Fund on the 29th ult. the Secretary announced the receipt of £457 5s. 11d., a bequest from J. W. Thomson, late nurseryman at Hayward's Heath; also the following donations, for which a special vote of thanks was accorded:—Rev. A. Lowe, Rangemore, Burton-on-Trent, proceeds of a collection at Harvest Festival, £6 1s. 6d.; Sandringham Estate Cottage Garden Society, £5 5s.; Wimbledon Horticultural Society, sale of flowers, £5; Uckfield Chrysanthemum Society, sale of flowers, £3 3s.; J. Selway, Betteshanger, £3; per T. Roberts, Local Secretary, Ramsgate, £2 1s.; Forest Hill Horticultural Society, £1 10s.; Hessle and District Horticultural Society, £1 4s. 3d.; Bradford Paxton Society, £1 2s. 6d.; C. Herrin, Maidenhead, £1; G. Carpenter, Byfleet, 10s.; H. Dunkin, Warwick, 10s.; M. Kneller, Basingstoke, 8s. It was decided to hold the annual meeting at Anderton's Hotel, Fleet Street, early in February, when the election of children to the benefits of this Fund will take place. The necessary nomination forms may be had on application to the Secretary.

—— SUNFLOWERS.—A rather amusing belief seems recently to have existed in many directions arising out of the tendency there has been this season—indeed it is generally a tendency—for the giant annual Sunflower to attain to great heights, that each one has the tallest ever before heard of. When plants reach from 9 to 10 feet in height, and have blooms something the dimensions of ordinary frying pans, then does it seem as if such plants were almost elevated to divinity and worshipped, so strong is the element of wonder they evoke. The earlier æsthetics were wise in selecting the annual Sunflower as the floral emblem of their art religion, because English people having none too much of refined or cultivated taste, and æstheticism was but art run mad, do love something big and gaudy. It may be a merit of the Sunflower that it will grow and flower where some better things will not, but the giant form is an overgrown ungainly plant at the best. Mr. Fyfe has at Lockinge what may on the other hand be described as a real beauty amongst annual Helianthuses. He obtained it a couple of years since by intercrossing the giant variety of annuus with the dwarf minimus, and thus he secured a distinct and most useful strain. The plants range in height from 3 to 4 feet, branch literally into bush form; blooms of a neat useful size, with broad effective petals, are most abundantly produced, and for cutting to set up in large vases in halls or big rooms, nothing can be more useful where a striking colour is desired. I should like to see this variety, I do not know how it is designated, put into commerce and widely grown to the displacement of the giant form, which is so useful to breed food for pheasants, but is so ungainly in gardens.—A. KINGSTON.

—— ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral meeting of the Royal Horticultural Society will be held on Tuesday, November 9th, in the Drill Hall, James Street, Westminster, 1 to 4 P.M. A lecture on "Roots" will be given at three o'clock by Professor F. W. Oliver, D.Sc.

—— DAHLIA KEYNES' WHITE.—A new Cactus Dahlia named "Keynes' White" has quite recently been honoured by two of the leading German Societies, the Verband der Handelsgärtner Deutschlands and the Werein der Kunst-und-Handelsgärtner, Berlin, with a certificate (*werthzengnisse*), unanimously awarded in both cases. The variety will be sent out by the raisers, Messrs. Keynes, Williams, & Co. of Salisbury; but in Germany, Austria, and Russia, we are informed, plants will only be obtainable through Messrs. Kohlmannslehner and Schwenke, Schöneberg, Berlin.

—— TWO HUNDRED TONS OF SEED FOR INDIA.—It will be remembered that this large quantity of seeds was ordered from Messrs. Carter & Co., by the Government of India last winter, with the idea of ameliorating the distress in districts threatened with famine. The firm has recently inspected some trials made with samples of seed from the various parcels shipped to India, in their grounds at Mortlake, the whole showing results that were considered most satisfactory. Sir George Birdwood, K.C.I.E., of the Indian Office, was present, and expressed his approval of all he saw.

—— WATERING PLANTS.—In reading the well chosen remarks made by "Epacris" under this heading, I thought to myself, do we, as a rule, see plants in better condition in private places (where the knuckling business is strictly carried out) than those of the trade growers? In the case of the latter the hose plays a prominent part, and as to individual treatment, how can a man with thousands of plants in his care stop to examine each one separately? Will somebody be good enough to tell us why the loss from overwatering is so small in the latter case, and the results so good?—A BUSY MAN.

—— ARBUTUS UNEDO.—Intending planters this autumn would do well to include in their list of hardy evergreen shrubs the Arbutus unedo, if they can find a place for it sheltered from the north and north-east winds. The plant is of rather slow growth when young, and should not be crowded among other quicker growing shrubs. A specimen here in full flower is quite an object of beauty, with its many thousands of flowers and berries. Another shrub (deciduous) is the wild Viburnum, which is plentiful in the hedgerows about here. It is worth growing for the beauty of its berries in the autumn. I have inserted some cuttings, which if taken off with a heel root easily, and soon make good plants.—THOMAS WEAGER, *Mardy, Abergavenny.*

—— HARDY BORDER FLOWERS.—Having to give lecture on hardy plants a few nights since at Ewhurst in Surrey, I was very agreeably surprised to find awaiting me an interesting and varied collection, showing how late many will bloom, and also how remarkably useful are they in garden decoration, even after some early frosts may have destroyed tender plants. These flowers were furnished by Mr. Russell, who is gardener to Miss Ewart, a member of the famous Liverpool family, who now resides in that beautiful locality, Ewhurst. There were various Helianthuses, Heleniums, Rudbeckias, Chelone barbata, perennial Asters, the noble Acanthus, perennial Phloxes, China Roses, Japanese Anemones, and numerous others. Remembering that it was so late, October 29th, I could but feel, even more forcibly than ever, how worthy of wide cultivation in gardens were hardy flowers.—A. D.

—— MEDALS AT THE ROYAL HORTICULTURAL SOCIETY.—In our report of the last Drill Hall Show an oversight resulted in the omission of the medals awarded to the exhibitors. These we give herewith. Fruit Committee.—Silver-gilt Knightian medals to Messrs. J. Laing and Sons and J. Cheal & Sons for collections of fruit; to Mr. W. Taylor, Forest Hill, for Grapes; and to Messrs. H. Cannell & Sons for vegetables; bronze Knightian medal to Messrs. J. Carter & Co. for vegetables. Floral Committee.—Silver-gilt Flora medal to Mr. W. J. Godfrey for Chrysanthemums; silver Flora medals to Messrs. J. Laing & Sons for foliage plants, H. B. May for Adiantums and Begonias, and H. J. Elwes for Nerines; silver-gilt Banksian medals to Messrs. W. Paul & Son for cut Roses, and W. Wells for Chrysanthemums; silver Banksian medals to Messrs. G. Wythes, J. Veitch & Sons, H. Cannell & Sons, and T. S. Ware for Chrysanthemums; to Miss Emmet for models of flowers, and to Messrs. W. Cutbush & Son for miscellaneous plants. Orchid Committee.—Silver-gilt Flora medal to Messrs. J. Veitch & Sons, silver Flora medal to Mr. H. J. Chapman, and silver Banksian medals to Messrs. G. Cragg and W. J. Empson, each of whom staged collections of Orchids.

—— A Double White Lapageria.—Mr. John Haigh sends us from Messrs. Crosland Brothers, florists, Sheffield, a flower of the white Lapageria in which the stamens and stigma have assumed a petaloid character. We have seen other Lapageria flowers of a similar nature but none so really double before. The change gives to the bloom a massive appearance, but does not add to its elegance. It is a really double flower and could not possibly produce seed.

—— French Marigolds. — Messrs. Dobbie & Co. write from Orpington—"We have the pleasure of sending you on 1st November a few blooms of French Marigolds to show that, although frost has worked havoc around here, these, at least, are still in the land of the living. They have been cut from a collection of 15,000 plants grown in an open field, and from which many thousands of fine blooms can still be had." [The flowers were of excellent quality, and the colours exceptionally good.]

—— Late Dwarf Beans.—A well-known gardener mentioned to me a day or two since that in spite of some early frosts which had destroyed the Runner Beans, he had still an abundant supply of Dwarf Beans outdoors. The breadth was sown late on a south border expressly to give late gatherings, and over the plants early in October a rough framework was fixed. Over this at night so soon as the temperature fell were thrown some mats, and in that way when so much harm was done to unprotected things, these Beans were saved, and they will probably, should the weather keep open, continue to crop freely until the middle of November. It would be an unusual feature to see handsome Dwarf Beans from outdoors exhibited during November, although perhaps it would be pleaded they were rather out of season.—D.

—— Fibre Plants.—The American Department of Agriculture has recently published an important work on the fibres and fibrous substances of all countries, entitled "A Descriptive Catalogue of the Useful Fibre-plants of the World." The author, Mr. Charles Richard Dodge, special agent in charge of fibre investigations in the Department, asks that any information about fibre plants known to have been employed either commercially or in what may be termed native uses, such as for rough textiles, cordage, fishing nets and lines, and basketry, that has been omitted from this work be reported to him. He would also be glad to hear of any native or aboriginal names by which fibre plants are known in the countries where they grow, which he has not been able to give. He asks, too, for notes on any errors in nomenclature, and for all such information as may enable him to prepare a revised edition of this important work, which is the outcome of a vast amount of patient labour, scientific investigation, and technical knowledge.- ("Garden and Forest.")

—— The Dead Season.—Although in Nature nothing absolutely dies, only changes, yet to our finite minds what we see just now going on around us in gardens in myriads of plants, or everywhere in trees, seems to be death, because there is such a change from universal leaf clothing to one of nakedness, and of beauty in flowers to one of barrenness. It is no mere figure of speech, therefore, to refer to the winter season in gardens as the dead season, although nothing is really dead. The plants, stems, or leaves, with flowers or seed husks, having discharged their part in the economy of Nature, are now but reverting to the elements from which they came, and by the aid of bacteria, the agency of decomposition and change, vegetable matter will soon be converted into gases or mineral substances, feeding other roots or plants and re-appearing in diverse forms and beauty the next or ensuing year. When it is possible for everyone to realise that the same process of change and reversion to original elements is perpetually proceeding in the animal world, the intellectual world will be much wiser and more sensible than it now is. But we part with life and beauty in our gardens when the dead season comes with regret. The objects which have so much interested and gratified us, vegetation and its products in all its forms, we had learned to love. These things had given charm and beauty to our lives whilst they endured. Those of us who have means alone can have them, as happily so many do, in equal beauty and loveliness in glass houses all the winter through ; but to the million such pleasures are not possible, and these have for a season—the dead season—to mourn the loss of loved and familiar friends. Perhaps it is a wise dispensation for us it should so be thus to have a short season of rest for our sentiment. Presently comes a real resurrection, though not one that is abrupt or ushered in with trump or cannon. The Naked Jasmine, the Christmas Rose, the pretty Forsythias, the humble Hepaticas and Daisies, the beautiful Crocus and the pure Snowdrop, these are the *avant couriers*, the harbingers of the new resurrection before the glories of which the dead season reluctant flies.—Gardener.

—— The Beckenham Horticultural and Gardeners' Improvement Society.—This is probably the largest Society of its kind in Kent, numbering some 300 members. It has a reading-room and excellent library, and lectures are provided at intervals throughout the season. At the last meeting (on the 29th ult.) Mr. Bayer's fine collection of Grapes was staged by Mr. Taylor, the same, with additions, to which a silver medal was awarded by the Royal Horticultural Society on the 26th ult. It comprised forty-four bunches, a remarkable display, such as has, perhaps, never been equalled at such a meeting as that at Beckenham. It was a crowded and enthusiastic meeting of earnest amateurs and able gardeners, the lecturer declaring that the Grapes were worthy of the beautiful silver medal of the local Society. The audience agreed in the "usual manner." The Society is fortunate in having such a zealous and competent Hon. Secretary as Mr. T. W. Thornton, F.R.H.S. One of the members of the Society, whose name is, but ought not to have been, forgotten, is such an ardent amateur that he does his digging with the aid of the lantern, and has won over fifty prizes this year, including several at the Co-Operative Show at the Crystal Palace. This is the substance, of which lantern "slide" lecturing and diagramatic expositions are as shadows in comparison, though these may have been helpful. The name of this Beckenham amateur should be forthcoming. A description of his ways and achievements would be interesting.

—— Chinchas Guano and Garden Manure.—That there has been a great falling off in the value of guano generally during recent years seems to be a fact that is generally admitted. This is attributed to the exhaustion of the best natural stores in those islands of Peru from which cargoes were obtained, but a new and valuable source of supply appears to have been discovered in the Chinchas Islands of a distinctly superior character, and Chinchas guano is now regarded by competent authorities, who have no interest whatever in its sale, to be the best brand now obtainable, and quite equal to that imported in the early days of the guano era. The Anglo-Continental Manure Co. (late Ohlendorff's) are importing this rich guano largely. The firm sent out a commission, consisting of Dr. Von Ohlendorff and several chemists and experts, to examine the guano deposits. The substance of their report is embodied in a miniature trade catalogue, which also includes some photographs of a rather striking nature of the Chinchas deposits and millions of pelicans. This, as also containing the analyses of Dr. Voelcker and Mr. Bernard Dyer, is worthy of examination. This is evidently a "strong" manure, and a little goes a long way. As a milder form may be preferred by many persons, a special "garden guano" has been prepared, consisting largely of Chinchas. A sample of this has been sent to us. It is perfectly dry, finely granulated, or dust-like, with the true guano aroma ; handy and cleanly to use as a top-dressing, and for quickly making liquid manure. It is about one-third less in price than the pure Chinchas, and as both are sold in small quantities, from 1 cwt. bags to 1¼ tins, it will not be difficult for cultivators to test both (and they are worth testing), as no information is so good as that which results from experiments.

—— Winter Blooming Pelargoniums. — There is a not uncommon impression that for supplying a rich showy bloom from these plants in the winter special varieties must be grown. That is, however, not so, as literally any good variety of the Zonal section will bloom as freely during the winter as in the summer if the needful conditions be furnished. Anyone who looks in at Messrs. Cannell and Sons' Swanley Nursery during the summer, where houses of Zonal Pelargoniums will be seen blooming profusely, will, if they look in there again in midwinter, see the same or similar houses full of similar plants, also blooming profusely, and will note that practically the same varieties are grown. The only difference then discerned is that whilst in the summer everything externally is in bloom, and the air is warm, in midwinter the ground may be covered with snow, hard frost may prevail, and everything vegetable apparently withered up. It is then that the glory and beauty of Zonal Pelargoniums is seen. There is usually, too, at that time of the year a richness, and even delicacy of tint, in the flowers that render the floral spectacle doubly attractive and beautiful. Such showy bloom as is seen at Swanley may be found in a lesser way in some private gardens, notably at Mr. Haywood's place, Reigate, where Mr. Salter furnishes in midwinter a most brilliant show of flowers. Plants selected from autumn-rooted cuttings, kept through the winter in small pots, shifted on into 48's, then later into 32's, or if very strong into 24's, stood outdoors in the full blaze of the sun, though best plunged in ashes, kept well watered and pinched to produce sturdy bottoms, got in under glass in September, allowed to come away freely at the end of the month, getting a little weak manure water, get into rich bloom in November, and are gloriously beautiful in a moderate temperature all the winter.—A. D

—— WEIGHT OF MARROWS.—In reply to your correspondent, "H. T.," I might say that I have lately cut three Marrows from one plant of Sutton's Long Green, weighing respectively 60 lbs., 47 lbs., and 18 lbs., or a total weight of 125 lbs. This is the heaviest Marrow that has been known in this district.—R. FILKINS, *St. Mary Cray, Kent.*

—— OCTOBER WEATHER AT DRIFFIELD.—Mean temperature at 9 A.M. (corrected), 49·06°. Wet bulb, 47·12°. Mean maximum, 56·2°; mean minimum, 41·06.° Highest, 64·4° on the 20th; lowest, 25·2° on the 14th. Mean of maxima and minima, 48·63°. Mean radiation temperature on the grass, 36·09°; lowest, 18·4° on the 14th. Rainfall, 1·865 inch. Number of rainy days, thirteen. Greatest amount on one day, 0·64 inch on the 14th.—W. E. LOVEL, *Observer, York Road, Driffield.*

—— THE CALIFORNIAN ORANGE CROP.—The Orange crop of California for the coming season, according to conservative estimates based on the present condition, will amount to from 7000 to 8000 carloads, as against 5000 carloads last year. As 300 boxes are required to fill a car. this means an increase of from 600,000 to 900,000 boxes of this fruit. Other authorities consider 4,500,000 boxes as not too high an estimate for the amount of this season's output. California Oranges. from last season are still offered in the Eastern States in the choicest collections of fruits; and in rich quality these rival Rodi Oranges, the celebrated summer fruit from the Mediterranean. Since the first shipments of new crop Oranges from the Pacific coast are expected in New York during November, the likelihood is strong that California Oranges will hereafter be in market throughout the entire year.—("Garden and Forest.")

—— RUDBECKIA GOLDEN GLOW.—We have to thank Mr. Wolley-Dod for his interesting and valuable contribution on page 380. The cottage gardens in Malpas, which, as I have seen for myself, are greatly influenced by having so eminent a flower lover in the parish, are to be envied by many of greater pretensions in the possession of this Rudbeckia. I believe it was Messrs. Pitcher & Manda who brought it to the notice of flower growers as a new plant only a year or two ago. In view of Mr. Wolley-Dod's explicit statement, it cannot be called a novelty in the strict sense of the word, but it is practically a "new plant" to the great bulk of growers of hardy flowers. It is satisfactory to hear it so well spoken of after long experience of its qualities.—S. ARNOTT.

—— ZONAL PELARGONIUMS IN WINTER.—Elsewhere than at Swanley, where a splendid show of Zonal Pelargoniums is a standing attraction, I have nowhere seen such a truly beautiful display of these tender flowers as Mr. Salter has produced at Woodhatch. For plants in 6-inch pots, and for splendour of bloom, the house of these there now really represents a triumph of culture. No wonder visitors, gardeners or otherwise, on looking into the span house where these beautiful plants are, are amazed at the wondrously rich and lustrous colouration seen. There are white, pink, salmon, carmine, magenta, rose, scarlet, crimson, and other shades, the trusses large, and pips of the finest. It is, all the same, very easy to have such a show of Zonal Pelargoniums, for cuttings taken from the old plants are put in in February, rooted, grown on, finally get into 6-inch pots, being firmly potted with a good compost; stood outdoors in the sunshine, kept pinched and watered, then let come away end of August and housed in September.—A. D.

—— TREES DAMAGED BY LIGHTNING.—During the thunderstorm in the N. of London, on July 21st, a Poplar in Clissold Park, Stoke Newington, was damaged in a rather unusual way. The tree, a large one, stood on the edge of a gravel walk; and a low (9 inch) rail of 1 inch iron, which divided the footpath from the adjoining grass (and which was supported for most of its length by dwarf iron posts) had been driven into the tree so as to support the extremity of the rail. There was, therefore, virtually a long horizontal conductor connected to earth at every 8 feet, ending in the tree. When the storm-cloud came near, there was an explosive discharge, *not* at the top of the tree, nor even at any of its branches, but from about 6 inches above where the rail entered, up to about 4 feet 6 inches above the ground; there the outer rough bark was blown off for about 3 feet high by 1 foot broad; along the middle of this the inner soft bark had been grooved (as is often the case with Poplars) and separated from the trunk of the tree. We did not see the tree for two days, and doubtless the edges had been touched, but we noticed one feature to which we desire to call special attention, so that others may see whether the fact we noticed is, or is not, exceptional. The frayed edges on one side of the groove were attached by their upper extremities, and those on the other side by their lower ones—not without exception, but probably six fragments out of seven followed this rule. Of course, this suggests the passage of two currents in opposite directions. We express no opinion, and make no assertions; we merely record what we saw, and ask all who see a tree which has been grooved by lightning, to examine the edges carefully, and report the result. It is, we think, not much use looking at Oaks, as they seem to be generally burst asunder as by an internal explosion.—("Symons' Meteorological Magazine.)

CORNUS.

THOUGH one or two species of this genus are passable as flowering shrubs, it is more for the sake of the foliage and coloured bark that the "Dogwoods" are grown. From a garden point of view they may be divided into three sections—flowering, ornamental foliage, and coloured stemmed.

Of the first section C. florida is possibly the best. It was known to English gardens before the middle of the last century. Early in the present century it was figured in the "Botanical Magazine," t. 526. In the account given with the figure it is stated that the plant from which the flowers were taken for figuring was growing in the Duke of Marlborough's garden, and was 15 feet in height with a spread of 18 feet, a trunk 6 feet high before it branched, 2 feet in circumference a yard from the ground.

Specimens of anything near those dimensions are rarely, if ever, seen now. The most likely reason for this is that it is only in warm and favoured localities that this species does well, plenty of sun heat being required to thoroughly ripen the wood. The flowers are whitish, and 2 to 3 inches across. In autumn the leaves turn to a brilliant red before falling.

C. mas, although not ranking among the best of flowering shrubs, is worth growing both on account of its earliness and the freedom with which the flowers are produced. It makes an upright growing bush with stiff twiggy growth. The flowers are small and yellow. They are produced in clusters from almost every node on the young wood. In a mild spring the earliest flowers open about the end of February, and flowering continues for several weeks It is an European species.

The Japanese C. kousa is said to rival C. florida. As yet it is little known in this country, but if it does not flower more freely than that species it will never become very popular. A dwarf species from Canada, C. canadensis, is useful for planting in damp places in the rock garden. It grows but a few inches in height, and each stem is terminated with a head of small flowers enclosed by a number of rose and white bracts. A figure of this may be seen "Bot. Mag.," t. 880.

Of the ornamental foliage section more can be said, as several very beautiful foliage shrubs belong to the genus. Of C. mas there are several variegated forms, the most distinct being C. mas variegata, and C. mas aurea elegantissima. The former is in habit like C. mas. The leaves are 2 to 3 inches long by three-quarters of an inch wide, with green centres and wide silver margins.

C. mas var. aurea elegantissima is widely different in habit. The branches are pendulous, the leaves small, 1 to 1½ inch long by half to three-quarters of an inch wide, varied in colour, some deep yellow, some with green centres and deep yellow margins, others with green centres and mottled brown and red margins, others green mottled with brown, and yellow and red margins. During summer a plant which is growing freely is a very pretty sight.

C. candidissima variegata has pale green leaves with silver margins. The habit of this is very similar to that of C. mas. C. alba var. Spæthi is by far the most beautiful of the variegated Cornus, and is one of the very best foliage shrubs. It makes a spreading bush a few feet in height. The leaves are about 4 inches long by 2 or 2½ wide, having a green centre and broad yellow margin, the centre part suffused with a lighter shade of green and bands of gold. Towards autumn many of the leaves turn red.

C. alba var. sibirica variegata is a silver variegated form, with leaves about the size of the preceding: it is well worth growing, but is not to be compared with the former variety. C. macrophylla has handsome green foliage. The leaves often measure 6 inches or more in length by 4 in width. It is quite distinct from any other species. C. macrophylla variegata is perhaps better known as C. brachypoda variegata The leaves of this are not nearly so large as those of the type, and many appear to be more or less deformed; it is, however, a pretty white variegated shrub. When young it is a little tender. It grows until late in the year, and frosts sometimes damage the soft ends of the shoots; as it gets older it grows slower and stands better. A large plant 10 feet or more in height is to be seen in the Coombe Wood nursery of Messrs. Veitch & Sons.

Of the coloured-stemmed section much could be said. With the exception of the coloured-stemmed Willows possibly no shrubs make a finer sight on a sunny day in winter than some of the Cornus. Whether grown by the water side, in beds, irregular masses for cover, or as groups in the shrubbery, they are equally effective. C. sanguinea is perhaps the best known. This is often used as a cover plant, and as an undergrowth in plantations; it has red bark. In autumn the leaves turn a fine bronzy red on the upper surface, the under surface being silvery. C. amomum, C. Baileyi, C. Nuttalli, and C. stolonifera, all American species, have bright red bark, as also has the Northern Asiatic C. alba and its varieties. A charming picture may be had in spring if an undergrowth of Snowdrops be made to beds of these red-stemmed shrubs. A variety of C. stolonifera, which has yellow bark, is in cultivation, but is not well known as yet.

Given fairly good soil all can be grown with little trouble, and even in poor sandy soil C. sanguinea and several others give satisfactory results. Whether for large or small gardens, for growing singly, in small or in large masses, these shrubs will be found equally useful.—W. D.

VEGETABLES FOR HOME AND EXHIBITION.

Celery.

(*Continued from page* 359.)

Planting is the next important operation. Abundance of moisture and an ample supply of well-decayed manure are absolutely necessary to produce examples of the best quality. In the formation of trenches opinions differ considerably, some growing their Celery in single trenches, others making them to accommodate two, three, and even six rows of plants. It seems to be entirely a matter of opinion, for if all other conditions are favourable Celery of equal merit can be grown in trenches containing six rows of plants, as in one only accommodating a single row, whereas the former method is economising space and lessening labour, which in many gardens is a matter for consideration. Trenches should run in a northerly and southerly direction, and the soil thrown out to a depth of about a foot. If the trench be wide the soil excavated and formed into a sloping back will prove an admirable place for growing Cos Lettuce.

The soil in the trench must be well broken up, in order to render it friable, and a good layer of well-decayed manure should be forked in. The plants must be carefully removed from the nursery bed with good balls of earth adhering to them, taking great care that the soil is not dry. Plant with a trowel about 9 inches apart, allowing 15 inches between the rows; this is, of course, if the trench contains more than one row of plants. Water freely as planting continues if the soil be at all dry, as neglect in this respect causes a check which often proves disastrous. Continual supplies of water must be given till the plants are thoroughly established, as the Celery plant in a wild state is a sub-aquatic. An occasional soaking with soot water or liquid manure will prove beneficial; but it should not be applied too often, as it is apt to cause rank growth.

Earthing is the next important operation, and should be performed at intervals. Growers for exhibition often wrap brown paper bands round the plants prior to earthing in order to facilitate the bleaching process, and, choosing a few plants, pay more careful attention to these than to the main crop. Care should be taken that the plants are perfectly dry when the earthing is commenced, as any moisture inside the leaves is naturally kept there when the soil is pressed round them, and causes decay. Next remove all sucker growths carefully that may be growing from the base of the plants; and thirdly, tie the leaves up loosely with bands of matting. Break up the soil well, and work it carefully round the stems with the hand, not packing it tightly, or covering above halfway up at the first earthing. The operation may be repeated on two more occasions, allowing about a fortnight between.

When four or six rows are grown in a trench, a quicker method of earthing is often adopted. Two boards the width of the trench are placed on edge between the rows; the space between them is then filled with soil, and the boards being drawn out the soil is worked round the plants with the hands; the boards are then placed in the next row, and the operation is repeated. Protection during severe weather is necessary, and for this purpose a thick covering of dried bracken, where it can be obtained, is admirable, and failing that, strawy litter from the stock yard serves the same purpose.

The well-known Celery fly appears to be the worst pest that attacks the crop, and the larva of this being a leaf-mining grub, working its way under the thin outer tissues, it is difficult to destroy by any application. Prevention is better than cure, and endeavours should be made to debar the female from depositing her eggs on the leaves, by covering them with something that is distasteful to her. A light dusting with soot or dry lime in the early morning, when the dew is on, will do this, but the application must be repeated. If traces of the pest are noticed, it is the best plan to go carefully over the plants and pinch all that are affected, in this manner destroying the grub. I may add that amongst the many varieties of Celery now in the market, the wants of growers for home and exhibition may be supplied by growing to perfection such kinds as White Gem, Sulham Prize Pink, and Major Clarke's Solid Red.

Celeriac, or the Turnip-rooted Celery, is a delicious vegetable in the hands of a good cook, and at some tables it is highly prized. It is easy to grow, and as a long season is necessary seeds should be sown in heat early in March, following the same mode of procedure as recommended for Celery. Any light well-worked soil that has previously been enriched with manure will be suitable, and disperse the plants on the surface at a distance of about a foot apart. Apply water liberally during dry weather, and keep the surface soil well stirred. Take care that all side growths are constantly removed, and before severe weather sets in the crop may be lifted and stored in sand, the outer leaves only being removed. If cultivated in this way there will be no difficulty in producing an abundance of this vegetable, the good qualities of which are, perhaps, not very widely known, or it would be more often met with in gardens.—Grower and Judge.

THE CAMBRIDGE BOTANIC GARDEN.

One of the first lists of plants which I had the opportunity of using for reference in the early days of my horticultural novitiate was the "Hortus Cantabrigiensis," by James Donn, "a catalogue of the plants cultivated in the Cambridge Botanic Garden." It was an edition prepared by Frederick Pursh, a really useful reliable list, containing a large proportion of the plants in cultivation at that date (1819). The preparation of a similar list at the present time would be a formidable undertaking, but an example of the progress made in the past seventy-eight years is afforded by a comparison between the numbers of Ferns grown there when the catalogue was issued and in the present year. An opportunity for making this comparison is at our command, for a list of Ferns and Fern allies cultivated in the University Botanic Gardens, prepared by Mr. R. I. Lynch, the Curator, was issued in January, 1897. From this we gather that upwards of 600 species or varieties are now included, whereas in the catalogue of 1819 the number was 151. If all other groups of plants have been increased in the same proportion, the number of forms included in the old catalogue (about 10,000) would now be advanced to an enormous total. Unquestionably the collection has been greatly increased during the eighteen years Mr. Lynch has held his office, for he brought to his work a critical knowledge of plants that few men have the chance or inclination to acquire. Occasional visits at wide intervals have enabled me to watch the progress of this interesting garden, a most satisfactory advance being remarked each time; but the improvement seemed even more notable on a recent inspection, the only regret attached to which was the inability to spend a longer time in a close examination of the collection.

The extent of the garden at Cambridge does not admit of much attempt at landscape effects, yet there are several attractive features that might rival others on a larger scale. The most notable is the lake, the margins of which are well planted, and an island in the centre is admirably furnished with vegetation down to the water's edge. Very conspicuous on the bank are huge plants of the giant Polygonum sachalienense, which are well adapted for such situations and are seen to the best advantage at a moderate distance across the water, towards which the stems slightly bend, showing their broad ovate leaves very distinctly. In a moist soil, if liberally supplied with autumn dressings of old manure, this plant makes surprising growth every year, and increases rapidly, after the manner of its smaller relative, P. cuspidatum. It is quite hardy, as indeed might be expected from its home in the island of Saghalien, north of Japan. The vigorous growth of the stout succulent stems had caused it to be recommended for cultivation as a fodder plant, but they are not very tempting as a green food. Near the Polygonum is another fine waterside plant which forms a grand bank. This is a slender growing narrow-leaved Willow, that has been grown in the Cambridge collection for some years, and which is regarded as a variety of Salix purpurea. It appears to be of rather dwarf habit, but free, with a slightly drooping tendency.

Perhaps the most majestic plant for the margin of a lake or other piece of water is Gunnera manicata, which grows uncommonly well on the bank quite near the water. It is a stronger plant than G. scabra, and generally proves more satisfactory in cultivation, though the latter is possibly better known. The deeply lobed leaves on long stout leafstalks, like giant Rhubarb, have a very imposing effect. To succeed with the Gunneras they should have a sheltered situation—a moist, well-dug, and fertile soil, with liberal dressings of old thoroughly decayed manure in the autumn or winter. Some slight protection is advisable, a layer of either straw or leaves placed over the crowns being sufficient.

Near the Curator's house is a remarkable specimen of an interesting plant, Ephedra distachya, which is about 15 feet in diameter, and probably the finest example in cultivation. The rigid leafless habit, somewhat like the common Broom, is suggestive of a very different type of vegetation from that which we are accustomed to seeing at the present time. It is included in the family of Joint-Firs, botanically known as Gnetaceæ, which seems to be a kind of intermediate link between the Conifers and other flowering plants. The only near relatives are the Gnetums, perhaps the best known being Gnetum Gnemon, the seeds of which, like those of the Ephedra, have been used for eating when roasted.

Around the glass houses on the sunniest side are narrow borders, in which Mr. Lynch has succeeded in growing a number of succulent plants, chiefly species of Opuntia, very vigorously, and with a little protection in winter they are carried through severe weather safely, and appear, in fact, perfectly at home. Many other plants thrive in this dry warm position, notably Portulacas, of which the numerous varieties prodnce a charming display of colour. As regards curiosities, the following may be noted. In one corner is the Caper plant, Capparis spinosa; then we observe a strong plant of Vitis Coignetiæ, remarkable for its handsome foliage. A large example of the Coral plant both grows and flowers freely, the distinct crimson flowered Gerbera Jamesoni, with many other plants of interest.

A few yards takes the visitor to the rockery, where the occupants are very numerous, and all distinguished by some character of flowers or habit that render them attractive in no ordinary degree; the collection has, in fact, been very carefully formed, and with a critical knowledge of the plants adapted for such a position. A graceful, free-growing, and floriferous plant which occupies a good deal of space on the rockery is

Hedysarum, or Desmodium multijugum, which has long spikes of bright purple flowers, very distinct and effective. Near this is the blue-flowered type of Campanula isophylla, a charming little plant well adapted for culture in pots suspended from the roof of a greenhouse or in a window. The white variety is, perhaps, even a greater favourite—in fact, few plants are more popular in cottagers' windows. Mr. Lynch claims having first brought this plant into general notice, and he certainly did a service to many thousands of humble admirers of flowers who can only indulge their tastes in a very moderate way; and this Campanula being of easy growth, readily increased, and free-flowering, rendering it suitable for all, it might be as appropriately named the "Window Campanula" as C. pyramidalis is termed the "Chimney Campanula."

The Cambridge collection of hardy herbaceous plants is a good one, and includes large numbers of distinct, effective, or interesting plants. The various late flowering members of the family Compositæ were chiefly in evidence at the time of my visit, and amongst these were a trio of Sunflowers that possess more than ordinary value as garden plants. Helianthus mollis is one of these, a North American prairie species, with medium size flowers freely produced, and soft silky leaves. H. argyrophyllus is another elegant plant, with abundant flowers and silvery leaves; and the third is H. cucumerifolius, extremely free and graceful, though the flowers are small.

Concerning the plants in the handsome range of houses a long chapter might be written, but a few notes must suffice. One fact strikes a horticultural visitor, and that is the great advantage, where a large collection of valuable plants is grown, in having the houses connected by a corridor. In many large establishments on the Continent this is the rule, but in British gardens it is more customary to build the ranges of glass in such a way that any particular house is only reached by passing through the others, or, what is worse still, houses are isolated singly or in blocks. When a series of houses are arranged at right angles to a corridor which connects their ends, the advantage in regard to the working routine, the transference of plants from one house to another in severe weather, and in other ways, are so obvious that it is surprising this system is not more generally adopted. At Cambridge the corridor is about 100 yards long, and is rendered very ornamental by a collection of climbing plants trained up the wall and over the roof, narrow borders at the sides being occupied with various dwarfer flowering plants. Amongst the climbers the most notable at the time of my visit were Solanum jasminoides, which was flowering profusely, its trusses of white flowers forming graceful festoons from the roof; and Ipomæa Bona-Nox, a most beautiful and interesting plant; the pure white corollas are nearly 6 inches in diameter, round, and flat, with a long slender tube. For a warm conservatory or the cool end of a stove this beautiful climber is admirably suited, and in common with many of its relatives it succeeds in a compost of light turfy loam and peat with sufficient sand to keep the soil sweet and free from stagnation.

The small plants of Todea barbara, occasionally seen in collections of Ferns, are not particularly attractive; but in huge specimens like that in the temperate house at Cambridge (or in the corresponding house at Kew), the characters of the plant are fully developed, and it appears to much better advantage. It is like a dwarf Tree Fern, and produces peculiar stump-like stems of enormous size. The specimen at Kew is said to have weighed 15 cwt. when imported in a dry state, and the Cambridge plant looks even larger than that; while we have heard of one sent to the Continent which weighed 23 cwt. We are so accustomed to regard the Todeas as choice Filmy Ferns to be preserved with the utmost care under glass cases, that it seems difficult to imagine the gigantic T. barbara (fig. 65) as a relative of the justly named T. superba. T. barbara is a native of Australia, where it is often found on banks in gorges where moisture and shade provide the plant's chief requirements.

FIG. 65.—TODEA BARBARA.

Wreathing one of the pillars in the same house with an abundance of bright green foliage and a profusion of purplish blue flowers was an old favourite—namely, Maurandya Barclayana, which is sometimes seen formally trained over a small trellis in a greenhouse or conservatory, but rarely in the free style now noted, which suits it admirably. To many present-day amateurs this graceful plant is quite unknown, yet it is of such easy growth that it might be included in any collection. It is a native of Mexico, and a member of the family Scrophulariaceæ, and though too tender to stand an average British winter out of doors, yet it will thrive in sheltered positions during the summer months as well as many other Mexican plants. Any ordinary light compost suits it, and it can be increased readily by seeds or cuttings. Asparagus retrofractus, which covers a neighbouring pillar in the same house, is a distinct and graceful plant, the needle-like leaves being produced in a regular radiating manner from the stems. Datura Knighti, with its enormous trumpet-shaped double pendulous flowers, has an imposing appearance. Where there is plenty of space, this Datura, with the powerfully fragrant single flowered D. suaveolens, and the scarlet D. sanguinea, can be grown with satisfaction either in pots or planted out; but they require liberal treatment in respect to manurial supplies, with hard pruning and a period of rest.

But we must hasten on, noting by the way the choice collection of healthy Ferns which fill one house, the Palms and larger growing tropical plants in the lofty stove, the charming Nymphæas and other aquatic plants in a tropical tank. To the collection of succulent plants a long time could be devoted, for this is a department to which the Curator has given close attention for years. Both at Cambridge and Kew large numbers of seedlings have been raised, and the miniature plants are making good progress, many being great raritics, and some exquisite examples of vegetative symmetry like crystallised plants.

To conclude these notes reference must be made to a most interesting plant, which is shown in the house devoted to Mosses and Liverworts, a collection of the minute forms of plant life that is seldom seen in cultivation, even in botanic gardens. The plant in question is the so-called "Luminous Moss," Schistostega osmundacea, that in an early stage of its existence produces a tiny green film-like growth near the surface of the substance upon which it is growing, generally on moist banks, rocks, or in caverns. From some strange arrangement of the cells this reflects the light falling upon it when seen at the proper angle, and the reflected light has a phosphorescent appearance, the Moss itself seeming to be emitting light, as if it were a kind of vegetable glow-worm. The effect is very peculiar, as if it were a kind of vegetable glow-worm, the little greenish fragments glittering with a weirdness rather suggestive of the electric X-rays. What can be the purpose of this peculiarity is beyond my imagination to conceive, but it is only one of the singularities the student of plant life is constantly observing, and Shakespeare might well have been a naturalist when he wrote "There are more things in heaven and earth, Horatio, than are dreamt of in your philosophy."—L. CASTLE.

CHRYSANTHEMUMS

Chrysanthemum Shows.

As is usual at this time of the year we have received numerous intimations of Chrysanthemum shows which are to be held during the coming season. Space, however, can only be found for mentioning those that have been advertised in our columns. If any have been omitted we shall be glad to add them to the following list. We append the names and addresses of the various Secretaries.

Nov. 5th and 6th.—Altrincham.—A. Hay, Navigation Road, Altrincham.
,, 9th and 10th.—Kingston.—E. H. Douet, Ortner, South Terrace, Surbiton.
,, 9th and 10th. Leeds.—J. Campbell, Methley Park, Leeds.
,, 9th, 10th, and 11th.—Royal Aquarium (N.C.S.).—R. Dean, Ranclagh Road, Ealing.
,, 9th, 10th, and 11th.—Birmingham.—J. Hughes, 140, High Street, Harborne.
,, 10th and 11th.—Bournemouth.—J. Spong, Lindisfarne Gardens, Bournemouth.
,, 10th and 11th.—Hanley.—J. and A. Kent, Hanley Park.
,, 12th and 13th.—Bradford.—R. Eichel, 16, Westcliffe Road, Shipley.
,, 12th and 13th.—Eccles.—H. Huber, Hazeldene, Winton, Patricroft.
,, 12th and 13th.—Sheffield.—W. Housley, 177, Cemetery Road, Sheffield.
,, 17th and 18th.—South Shields.—B. Cowan, Harton, South Shields.
,, 17th and 18th.—Hull.—E. Harland and J. Dixon, Manor Street, Hull.
,, 17th and 18th.—Bristol.—E. G. Cooper, Mervyn Road, Bishopston, Bristol.
,, 17th and 18th.—Rugby.—W. Bryant, 8, Barby Road, Rugby.
,, 17th, 18th, and 19th.—York.—J. Lazenby, 13, Feasegate, York.
,, 18th and 19th.—Bury St. Edmunds. G. A. Manning, "Bury Post," Abbeygate Street, Bury St. Edmunds.
,, 19th and 20th.—Bolton.—J. Hicks, Markland Hill Lane, Heaton, Bolton.
,, 25th and 26th.—Leamington Spa.—L. L. Lawrence, 76, Parade, Leamington.

National Chrysanthemum Society.

On Monday afternoon last the Floral Committee of this Society held a meeting at the Royal Aquarium, Mr. T. Bevan occupying the chair. There was a very good display, and the Committee awarded first-class certificates to the undermentioned novelties.

G. J. Warren.—A very large, fine, pale yellow sport from Madame Carnot. Shown by Mr. W. Wells.

Mrs. G. W. Palmer.—A rosy bronze sport from Mrs. C. H. Payne. Also from Mr. Wells.

Lady Isabel.—Immense incurved, broad petals, deep flower; colour blush white, base flowers pure blush pink. Also from Mr. Wells.

Lenaivee.—Large loose spreading Jap, long fluted petals, incurving at tips; white edged pale rose. From Mr. Ollerhead.

Mrs. F. A. Bevan.—Pretty incurving Jap, long and slightly recurving petals, incurving at the ends; colour deep flesh pink, paler reverse. From Mr. W. J. Godfrey.

Geo. Foster.—Large, compact, incurved Jap, broad tightly incurving petals; colour rich yellow. Also from Mr. W. J. Godfrey.

Mrs. Chas. Birch.—Large incurved Jap, with tightly incurving and somewhat narrow florets, which are slightly hirsute; colour white edged pale rose lilac. Shown by Mr. W. J. Godfrey.

Mary Molyneux.—Very large, handsome, incurved Japanese of grand quality, with long, broad, curling, and incurving petals; colour inside rose pink, with pale silvery rose pink reverse. Exhibited by Mr. N. Molyneux, Rooksbury Park, Fareham.

Mrs. N. Molyneux.—Massive incurved flower, very deep and globular; petals arranged rather irregularly; colour creamy white. From Mr. N. Molyneux.

The R.H.S. Award of Merit.

Would it not be well for the R.H.S. to make a change in the system in which the award of merit is frequently made? I am referring to the case when two or more growers exhibit the same variety of plant or flower, and each share the honour. Would it not be better that the award be made to the best specimen? I will illustrate a case. On the 28th October I placed before the Floral Committee of the N.C.S. blooms of the Chrysanthemum Lady Ridgway, to which a F.C.C. was awarded. Someone connected with another firm of growers, gathering that these blooms would be placed the next day before the Floral Committee of the R.H.S., also sent blooms of the same variety, and although these said blooms were only one-third of the size of those which I exhibited, the firm shares equal honour with myself, who really won the award of merit. I think it is time for some such change to be made as I have suggested.

You omit two varieties of certificated Chrysanthemums from the report last week—Madame Phillippe Rivoire and Lady Byron.—W. J. Godfrey.

[Only one, Mr. Godfrey. Mistakes are sometimes made by the most careful and watchful of men. Lady Byron was shown by our correspondent. It is well known as a charming white Japanese variety.]

Chrysanthemums in Surrey.

Having just recently seen three of the finest collections of Chrysanthemums in the county of Surrey, I do not fear to assert that had we in London or elsewhere a county competition, Surrey would occupy a very forward place in it. All of these collections were the property of private growers. The three seen would indeed be hard to beat. They comprised Mr. Tate's, practically as seen last year, champion collection at Woodside, Leatherhead, grown by that veteran, and probably one of the ablest cultivators of to-day, Mr. Mease, whose flowers just now are a treat to see. Then came Mr. T. B. Haywood's superb collection at Woodhatch, Reigate, grown so finely by Mr. C. J. Salter, were arranged in long lean-to's, and mixed up of Japs, incurveds, Anemones, and reflexed. Not only are the blooms of splendid form, but the show is almost a brilliant one.

The third is a less known, but still a splendid collection, grown at Bramley Park, Guildford, for Colonel Ricardo by Mr. H. Paddon, who is also a first-class man, as his grand blooms testify. I found on the 29th ult.—and what magnificent weather there was on that day—these two latter collections to be rather more forward than was the Downside lot seen on the 30th, also a brilliant day. No doubt the others' positions, especially that their houses are lean-to, are warmer, and therefore rather more forcing than is the Downside locality. There the plants are in large span houses, and as Mr. Mease is such a first rate judge as to time, no doubt he will occupy a prominent position as an exhibitor again this year.—A. Dean.

Chrysanthemums in Italy—Rust and Royalty.

Your issue of October 21st was to me more than especially interesting, as it touched on two subjects which have troubled me considerably this season—viz., Chrysanthemum leaf rust and damping of the flowers. The first I do not remember having observed before, and the second has given me little trouble in former years.

The earliest signs of leaf rust I noticed about the middle of September last, there having been previously much rain, and the plants being continually in a saturated condition; feeding I had practically not begun. I immediately syringed all the plants with the old remedy for mildew—viz., sulphur and lime boiled and then diluted. This I did as well as possible with an ordinary syringe, without unfastening the plants from the strained wires, but the parts of the leaves most affected, being the under sides, were more or less untouched by the solution.

Like your correspondent, Wm. Taylor, Niveus I find the most affected with this disease, and I enclose an affected leaf of the variety mentioned. I may also remark that Niveus has mostly damped its flowers with me, although generally it has seemed a grand doer here as in America.

The wood of the Chrysanthemum in this part of Italy does not ripen and remains soft for nearly three parts of the stem. The same applies to Tomatoes, and after a few days' rain the fruit becomes black and the plants rotten. Generally speaking, Chrysanthemums and Tomatoes grow double the height to those in England, although the former are strangely capricious in this respect, but the vegetation is always quick and sappy.

From what I observed when in England, I do not think that in nine cases out of ten—like your correspondent Mr. G. Parrant—overfeeding is at the root of the mischief. It has seemed to me that overwatering, insufficient ventilation and heat when the blooms are expanding, are the chief causes for this distressing disease.

Whether leaf rust has had anything to do with the damping of some of my blooms this year I cannot say, but I should not be surprised were this so, but the rust disease will receive more attention from me another year, and I take this opportunity, if I may, to thank Mr. Abbey for the trouble and pains he has taken in observing the evil, and for suggesting remedies. Sulphide of potassium and the Bordeaux mixture I have always found a splendid cure for mildew of the foliage.

It may be of interest to some of your readers to hear that an exhibition of Chrysanthemums is to take place at Pallanza on the 6th, 7th, and 8th inst. It is the first, I understand, of the kind on the Lake Maggiore, and judging from the number of entries already to hand, promises to be a great success. The gardener of the King of Italy, who cultivates thousands of plants in pots, will be largely represented, and it is hoped that the Queen's mother, the Duchess of Genoa, will be able to open the exhibition. It is needless to add that any English "Mummers" will be cordially greeted, and blooms welcomed.—H. Briscoe-Ironside, *Fallanza, Lago Maggiore, Italy.*

[We are much obliged to Mr. Briscoe-Ironside for his interesting communication, but fear the invitation to his Chrysanthemum compatriots comes rather late for acceptance. Some will see it on the 5th, but many not till the 6th inst. The infested leaf is sent to Mr. Abbey, who will report thereon in due time. A short character sketch of the Italian show would be acceptable.]

Chrysanthemums at Exmouth.

The grand display of Chrysanthemums at the present time at this famous nursery is one of finest exhibitions ever seen in England. In making such an assertion I am not unmindful of extensive and magnificent displays that will be admired during the present autumn in many private and trade establishments. These will, in a vast number of cases, be exceptionally fine, the blooms consisting of a large number of old and tried sorts, with a few, perhaps, of the newer and more recent introductions. Such collections will exhibit good culture, good taste in the selection of sorts, and much judgment in arrangement, so that the special beauty of each variety may be seen at a glance.

At Exmouth are some 6000 plants, almost all novelties of the last two years' introduction, including many seedlings of Mr. Godfrey's own raising, some of which are being proved the second year, ere finally chosen for propagation and distribution. The older sorts are chiefly grown outside in beds for stock purposes, whilst large beds, too, are devoted to a number of free bush blooming varieties for cut flowers. I had hoped when I called a few days ago I should have seen the collection at its best, and I must say I was not disappointed, and although some 600 show blooms had already been cut, but little appreciable difference was made to the magnificent display. And such blooms! The number of first-class certificates already secured by Mr. Godfrey this season, and the grandeur of the blooms he has staged, give evidence of culture, selection, and setting.

Among those to which my attention was called M. Calvat's Topaze Orientale is a new incurved of great distinction, a large flower well up, of a clear sulphur yellow, somewhat in the way of Lord Alcester in form but much superior, the breadth of petal being specially noticeable. Clara Jeanne (Jap) has grand flowers of an apricot orange, in form somewhat resembling Viviand Morel. This will doubtless prove better for cutting purposes than the exhibition boards. Rose Queen (Jap) is a new seedling of Mr. Godfrey's, a free and splendid grower, flowers of large size and lovely form; colour pale rose shaded with salmon; a very deep and full bloom, the petals slightly reflexed. Admiral Ito, a new variety from Japan, is an immense flower of a clear canary yellow, with a soft shade of carmine on the outer edges of the florets, in form resembling Viviand Morel but of much stouter substance. George Foster is a grand bloom of deep canary yellow, globular, with broad florets slightly incurving. G. Gover is another of Mr. Godfrey's seedlings, being a bright rose colour with silvery reverse, large and full, and of good habit. Flamingo is of American origin, deep crimson, very promising, one of the very darkest forms yet seen. Madame Gustave Henry (Calvat), is a very large white flower, with a creamy shade in the centre, fine habit.

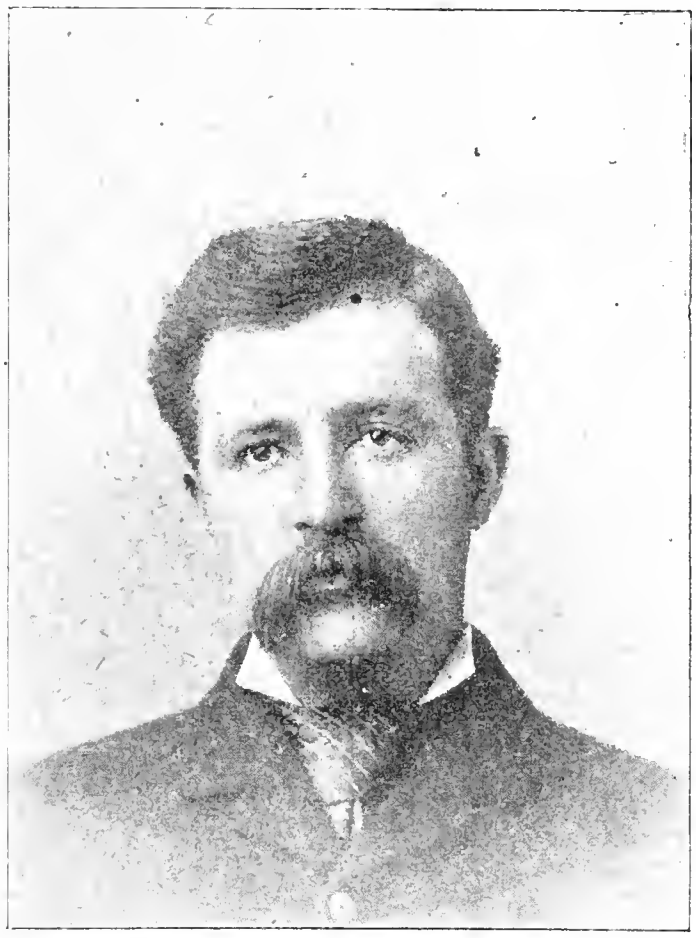

Fig. 66.—Mr. W. J. Godfrey.

Ma Perfection (Calvat), incurved Japanese, splendid pure white, broad florets; a very noticeable flower. Modesto is a magnificent bloom, of rich yellow colour. Mrs. J. P. Bryce, bright crimson, with an old gold reverse; grand form and habit. Belle Mauve is represented by many plants having large and deep blooms, which are of a delicate lavender mauve, without any shading. Ella Curtis is a striking flower, rich old gold colour, with broad petals, measuring on the plant 10 inches in diameter and 8 inches deep. Lady Ridgway, a peculiar shade of crimson carmine with buff reverse, of handsome form. Mrs. Mayling Grant, in form resembles Mons. Chenon de Leché, but stouter and bolder; the centre of the bloom is yellow fawn, shading to salmon apricot. Madame J. Bernard, creamy white; a beautiful flower, one of M. Calvat's last year's introductions, and must not by any means be overlooked. W. R. Prince makes an immense bloom, bright yellow edged with carmine; a great improvement on Sunflower. Dorothy Seward, a large reflexed flower of great depth, bright terra-cotta red, retains its distinct colour to the last.

Pride of Exmouth is here in large numbers. The blooms are of large size, full and deep, the outer florets drooping in a charming manner; the colour is very delicate white, shaded with a clear bright pink. Mrs. Hume Long, bright rosy pink with silvery reverse; the florets are very long, and twist from the centre in a most even manner. Madame Philipe Rivoire, pure white, broad florets, large and full. Sunstone, straw yellow tinted with apricot; very large blooms and of fine form. Exmouth Yellow and General Rocke, deep amaranth; will be heard of again. Mrs. J. Lewis, milk white, full and deep; this is one of Calvat's introductions. Lovely (new), immense blooms of fine form, broad florets of creamy yellow; very good.

Western King, of American introduction, is a good incurving Japanese of the purest white, deep and massive, but hardly up to the requisite size, Wilfred H. Godfrey, rich bronze yellow, large florets, and of good substance. Croada may be best described as an easily grown Mrs. Wheeler. Mrs. F. A. Bevan, is rich pink with long tapering and drooping florets; Mons. Edouard André, carmine red with old gold reverse, petals broad and incurving; King of the Yellows, the richest yellow of the incurved section; Madame E. Roger, sea green incurved Jap; Australian Gold, a yellow of first-class importance; John Neville is like Sunflower, but of a bright chestnut red colour. H. T. Wooderson much resembles Mrs. Harman Payne, but is much more chaste and refined. N.C.S. Jubilee is a clear rosy pink, deep and full. Yet another is Philip Mann, crimson maroon, form of Sunflower, good size and habit. The foregoing will give some idea of the many novelties of sterling merit that are to be seen here. A large number have yet to arrive at their best, and if considered worthy will be kept and tried again for another season.

Adjoining the Chrysanthemum show house is the Carnation house, 150 feet long by 20 feet wide, filled with plants in the best health and vigour, and producing flowers in great abundance. Many are of Mr. Godfrey's own fertilising and raising, and the results are of a pleasing and satisfactory character. Here I noticed Lady Doreen Long, bright yellow with carmine mottling; Pride of Exmouth, flesh pink with smooth edge, nearly as large as a Malmaison; Mrs. Hunter Little, pale salmon pink; Vicar of Exmouth, bright scarlet, in every way superior to W. Robinson; Lady Gertrude Rollo, rose pink, a charming form. An American form is Mrs. McBurney, delicate salmon, very full and of a fine habit. A number will doubtless receive names as the blooms open, for the type seems unusually fine and free.

Of the Zonal Pelargoniums I can say little or nothing at present. In a very short time there will be a sight of dwarf Callas such as cannot perhaps be seen in any other establishment. Just on the point of leaving this grand sight, I am informed that a telegraphic message is to hand from London, stating that Mr. Godfrey has this week been awarded ten first-class certificates and a silver-gilt Flora medal, a sufficient proof of the excellence of those I have attempted to describe.—S. B.

[In consideration of Mr. Godfrey's prominence as an exhibitor, and his services in the Chrysanthemum and Carnation worlds, we have pleasure in presenting herewith (fig. 66) his portrait.]

Amateur Chrysanthemum Growers

Mr. Needs of Heath View, Horsell, has for some years been known as a skilful grower of these favourite autumn flowers, and much interest is taken in his productions as the season comes round. His well-known devotion is almost a byword around Woking, and, moreover, his example and ever-ready advice have caused others to take up their culture with no little success. At the Chrysanthemum show at Woking the productions of these gentlemen will make the amateur classes interesting and instructive, showing what may be achieved by those with limited time and accommodation if they give their minds to the work and persevere to the end. Mr. Needs' house this week presents the same as is usual at this season—a crowd of well grown plants and highly finished blooms. There is little need to move about to see them, so well is the group arranged, and so little space is unoccupied that two persons can hardly stand with comfort inside. Several varieties are late in opening; but this will answer his purpose very well, as he hopes to compete in more than one show, most probably in open classes, success in this section having crowned his efforts in two previous seasons. By doing so he has, perhaps, done as much for the amateur novice as by his cultural example, the classes reserved for them being more open. The most striking flowers at present are Edith Tabor, Miss Elsie Teichman, M. Georges Biron, Australian Gold, Mutual Friend, Modesto, Lady Byron, Charles Davis, Eva Knowles, Mrs. J. Lewis, and Sunflower

Westhall, Byfleet.

To frequenters of Chrysanthemum shows at the Crystal Palace, Westminster Aquarium, Kingston, and a few local shows where first-class blooms were always to be seen in the highest stages of perfection, a few years ago the name of Mr. G. Carpenter, then gardener to Major Collis Brown, was familiar. For a season or two that name has been missed at all these exhibitions, and unfortunately we are not likely to be again charmed with the results of his skill at these or other shows in future. What visitors to shows will lose can only be estimated by those who have seen the magnificent lot of plants he has now in flower, some 800, comprising the cream of the newest and older varieties of Japanese and incurved, arranged in along the back wall of the entire range of new vineries recently erected under Mr. Carpenter's supervision. It would be a difficult task to select fifty of the best during a short visit, so good and even do they all appear, but the following were noted as remarkable:—

Lady Byron, Pallanza, Phœbus, E. Molyneux, Modesto, Mrs. G. W. Palmer, a bronze sport from Mrs. Harman Payne, but without the coarseness so often observed in the original form; Miss Elsie Teichman, Madame Carnot, Madame G. Henry, Frank Hardy, Mrs. J. Lewis, Wm. Seward, exceptionally deep coloured; Sunflower, A. G. Hubbuck, Mrs. G. Carpenter, Hairy Wonder, Madame Campion, Mrs. F. A. Bevan, Marjory Kinder, M. Georges Biron, Thomas Wilkins, Miss Ella Curtis, one of the most striking novelties of the season; International, and Charles Davies.—VISITOR.

BAGLAN HALL.

BAGLAN HALL, the pretty Welsh seat of Mrs. Llewellyn, is at the present time worthy of a visit by all interested in the queen of all autumn flowers. The energetic young gardener, Mr. Gilbert, having served under Mr. Lees in the gardens at New Barnet previous to his coming into Wales, is naturally an enthusiast on Chrysanthemums. That all their requirements are fully understood is proved by the strong stems, fine leathery foliage, and the still finer flowers, these being of the very best—large, solid, graceful blooms, without any trace of coarseness.

We noted some fine examples of Australie, Mrs. W. H. Lees, A. H. Good (magnificent yellow). Mrs. G. W. Palmer, the bronze sport from Mrs. C. H. Payne, has produced some excellent blooms. Elthorne Beauty and Simplicity are grand varieties, the latter being the most perfect white we have as yet seen. A good yellow was noted in Sunstone. Mrs. J. Lewis and Mrs. C. Blick are both fine white varieties. Wood's Pet is a pleasing flower, while Mrs. G. Carpenter, John Aplin, and Calvat's Boule d Or, are all in good form.

Other varieties that are well timed and of good promise are Mons. Chenon de Leché, Thos Wilkins, Mrs. A. H. Weeks, Primrose League, Mons. Chas. Molin, W. G. Newitt (very fine), Mutual Friend, Mons. Gustave Henry, Col. Smith, Mdlle. Marie Hoste, Louise, Phœbus, Duke of York, Madame M. Ricaud, Mrs. C. H. Payne (grand), M. Jerrard, and Modesto. Oceana is developing some fine blooms, as also is Australian Gold. At Baglan the last mentioned variety comes a more refined and better shaped flower from late buds, but loses somewhat in size.—EXILE.

CHRYSANTHEMUMS IN THE ISLE OF WIGHT.

YARBOROUGH HOUSE, BRADING.

MR. GEO. BURT, gardener to J. Darley, Esq., has a very fine collection again this season that has been visited by a large number of growers throughout the Island. The collection is especially interesting, not only because it contains over thirty of the newest and best varieties that have been added this year, but on account of Mr. Burt having a large number of seedlings of his own crossing from some of the latest new varieties that promise well.

Mr. Burt has been successful in obtaining crosses between Madame Carnot and Edith Tabor, and also from Mrs. W. H. Lees and Mrs. Smith Rylands, which nearly all show their parentage in the foliage and stem, but it is very interesting to see how they differ in height, one from Edith Tabor being only about 18 inches high, and producing a fine flower of a deeper yellow than its parent, while another is nearly 7 feet high, and showing a creamy white flower such as may be expected from Edith Tabor × Madame Carnot. It is too early at this date to pronounce any opinion on their merits, but one or two of them at present are very promising, and will, no doubt, find their way into commerce.

Amongst the forwardest of the newer varieties are Mrs. S. C. Probin, a fine solid incurved Jap of a clear soft pink; Mrs. C. Keyser, yellow splashed red; Mrs. D. Dewar, white; Simplicity, another fine white; Mrs. C. Orchard, deep primrose; Mr. G. Langdon, long petals splashed chestnut red on a yellow ground; Elthorne Beauty, pink; Mrs. Hume Long, Oceana, fine yellow; Mrs. F. A. Bevan, Pride of Exmouth, Modesto, Australian Gold, Mons. Hoste, Arona, Edith Tabor, Miss Elsie Teichman, Mrs. John Shrimpton, Matthew Hodgson, Hairy Wonder, and Eva Knowles. Mr. Burt has also a pink sport showing from Madame Carnot, but it is not quite forward enough to describe it correctly. It appears to have a lavender shade suffused with pink.

WOODLANDS VALE, NEAR RYDE.

There is a very good collection of varieties in this very pretty and well kept place, but Mr. Heath is to be condoled with on account of the ravages of the new disease, Puccinia Chrysanthi, or Chrysanthemum rust. Mr. Heath has no idea whence it came, but it is virulent in its course, and scarcely one has escaped. It is my first acquaintance with the fungoid pest, and the figures and description in the *Journal of Horticulture* a short time back give one an idea of its character, but in reality it is much worse than it appears in the woodcut. The prolific spores that fall from the under sides of the leaf smother everything, being of a brown snuff colour.

Notwithstanding this drawback, Mr. Heath has some very fine flowers of both incurved and Japanese varieties. Amongst the best of the former are Chas. Curtis, Major Bonnaffon, Mrs. J. Gardiner, Jeanne d'Arc, Lord Wolseley, Madame Darier, and Golden Empress. The best of the Japs are Western King (very fine), also Phœbus, H. L. Sunderbruch, Mdlle. Marie Hoste, Sunflower, Edith Tabor, Mrs. H. Cheesman (very fine white), Australian Gold, L'Iscre, Viviand Morel, and others.

MORETON, SANDOWN.

Mr. H. Love has again a dwarf, bright, and interesting collection of the cream of the newest and some of the best of the older varieties, and no doubt some of the honours of the N.C.S. and other exhibitions will fall to his share. Among his best are Yellow Madame Carnot, coming several shades darker than Australian Gold, Royal Sovereign, very fine; Lady Hanham, good; Sunstone, Mrs. Hume Long, Viscount Roger de Chezelles, Simplicity, good; Pride of Exmouth, Modesto, Mrs. C. Orchard, Elthorne Beauty, Mons. Hoste, Mons. E. André, Beauty of Teignmouth, Edith Tabor, Mons. Chenon de Leché, and Phœbus.

OSBORNE HOUSE, COWES.

Mr. G. Nobbs, gardener to her Majesty the Queen, has been very successful again this season in producing a splendid show of fine exhibition blooms. Notable amongst the rest are Mrs. H. Weeks (very fine), Mrs. Hume Long, Reine d'Angleterre, Charles Davis, Mrs. Briscoe Ironside, Phœbus, Madame Paul Lacroix, very pretty creamy white, with a canary yellow shade in the centre; Mrs. W. H. Lees, Hairy Wonder, Madame Ad. Moulin, H. T. Drewett, International, Viviand Morel, Ed. Molyneux, Duchess of Wellington, Etoile de Lyon, Edith Tabor, Modesto, Col. Chase, and Amiral Avellan. The incurved are represented by some good blooms of Robert Petfield, Lord Wolseley, Prince Alfred, Madame Darier, and others.

SALTWOOD, EAST COWES.

The winner of the Isle of Wight challenge cup last season—Mr. Butler, gardener to S. Bird, Esq.—has consequently made a name and reputation for himself throughout the Island, which will be worthily upheld by his collection this season. The Japanese are large, solid, and bright; and the incurved of excellent quality. Among the best of the former are Oceana, grand; Lady Ridgway, tawny buff and red, a huge spherical bloom in the way of Australie; Mrs. H. Weeks, Lady E. Smith, large solid white incurved Jap; Mons. Chenon de Leché, Edith Tabor, Simplicity, Graphic, Australie, fine; Pride of Exmouth, very fine; Thos. Wilkins, Mrs. W. H. Lees, Phœbus, Mons. E. André, Pride of Madford, fine; Modesto, H. Jacotot Fils, Mons. Hoste, fine; Mrs. Hume Long, W. Wright, two very large fine pinks; J. Bidencope, Mutual Friend, and Hairy Wonder.

Conspicuous among the incurved are Duchess of Fife, very large and fine; Chas. Curtis, Major Bonaffon, Robert Petfield, Mrs. R. C. Kingston, Princess of Wales, and the various types, including Richard Parker, true; Globe d'Or, Ma Perfection, true, incurved here; Perle Dauphinoise, large, rather long but pointed florets; Harold Wells, very broad florets, rather loose in the centre; Wm. Tunnington, Nil Desperandum, and others.

LADY HARPER CREWE'S, EAST COWES.

There is a very select and good collection grown here by Mr. Joblin, the gardener, which includes, amongst others, some of Calvat's new varieties of this season. Conspicuous in the collection are N.C.S. Jubilee, a very fine, large incurved Japanese, soft silvery pink; Iserette, buff and terra cotta; Mrs. J. Lewis, a grand addition to the whites, a much improved Mdlle. Marie Hoste; Baronne A. de Rothschild, rather quilly; Australian Gold, Edith Tabor, Pride of Madford, Lady Byron, Thos. Wilkins, Phœbus, Madame Carnot, Robert Owen, Chas. Davis, Viviand Morel, William Bolia, International, and Amiral Avellan.

CLARENCE HOUSE, EAST COWES.

Mr. Martin, the very energetic gardener here, has got a very useful collection of the popular flower, which includes some very good Japs, and also incurved. Chas. Curtis, Miss M. A. Haggas, Lord Wolseley, Mrs. Heales, Queen of England, Emily Dale, Baron Hirsch, Bonnie Dundee, Lucy Kendall, and Madame Darier, are the best of the latter; and Western King, Louise, Modesto, Phœbus, Reine d'Angleterre, L'Isère, Edith Tabor, Mrs. Rd. Jones, Mrs. H. T. Drewett, Mons. Hoste, Oceana, Col. Chase, Alice Seward, and International the best of the Japs.—C. ORCHARD, *Bembridge, I. W.*

CHRYSANTHEMUMS IN THE NORTH.

WITHIN the limits of a day's drive round Hessle the following establishments are well worthy of a visit—Welton House, Brantinghamthorp, Swanland Manor, Tranby Croft, Hesslewood, Hessle Cliff, and Woodleigh. The Hull Chrysanthemum Society is largely indebted to these places for filling up the local classes with the magnificent miscellaneous groups, Chrysanthemum groups, and cut blooms which have made the Hull Show famous. Having accepted a cordial invitation to spend a day in the district, by arrangement the evening previous I met the gardeners in charge of the above places at the bi-monthly meeting of the Hessle Gardeners' Improvement Society. This arrangement simplified the programme for next day, so that much more ground was covered than would otherwise have been possible.

WELTON HOUSE, BROUGH.

On entering the gardens here we found ourselves facing an entire reconstruction of the glass department, wisely directed so that no break in the supplies is experienced. Two fine ranges of plant houses, with some forcing houses, are already completed, and an extensive vinery is in course of erection. The plant houses are already furnished with the fine specimen plants which find their way to the York and other northern shows. Of Chrysanthemums we found a well-grown collection, including large bush plants specially grown to furnish the conservatory in the new year. That fine variety, Mrs. R. C. Kingston, now generally distributed, and nearly everywhere giving great promise this year, was one amongst several other seedlings now under trial. Mr. Lawton speaks highly of the quality of a Japanese variety of a rich apricot colour, but at the time of my visit the blooms were not far enough advanced for comparison with the standard varieties; its constitution and habit, however, are everything which can be desired. Another incurved seedling,

having a constitution equal to Mrs. R. C. Kingston, but much dwarfer in habit, was developing blooms of the character of Robert Cannell in its best form, the individual florets of a good length and firm smooth texture, incurving perfectly ; the colour a warmer and altogether richer tone than Nil Desperandum.

The following varieties were conspicuous in the general collection :—John Lightfoot, Madame Carnot, Chas. Shrimpton, Stressa, Thos. Wilkins, Chas. Lawton, M. Chas. Molin, H. L. Sunderbruch, and Madame Ad. Chatin.

Brantinghamthorp.

This estate is situated four miles from Welton, through a beautiful country, the roads flanked with thriving plantations in the full glory of their autumn tints. At the entrance to the gardens we were met by Mr. Hotham, the gardener, who has long devoted his attention to the Chrysanthemum, the beautiful coloured Mrs. R. King having originated as a sport under Mr. Hotham's care. Here we found about 400 fine plants. The Queen and Princess of Wales types are fully represented, both sections giving promise of perfect development. Jeanne d'Arc, Brookleigh Gem, C. H. Curtis, Mrs. R. C. Kingston, and Lord Rosebery were all very promising. Fine blooms among the Japanese were numerous, specially worthy of notice Rose Wynne, Duke of York, Hairy Wonder, Good Gracious, Souvenir de Petite Amie, Phœbus, Robt. Owen, Edith Tabor, Chas. Shrimpton, International, Pride of Madford, and Maggie Blenkiron.

Elloughton Vicarage.

On our return journey we called to view the Rev. E. Bennett's collection of bush specimen Pompons. This gentleman is an enthusiastic amateur gardener, who personally carries out all the most important cultural operations in connection with his plants. The flowers are chiefly used for the decoration of his own church, but the plants have also repeatedly made their mark at the Hull Chrysanthemum Show, and been greatly admired there as examples of good cultivation. Free-blooming varieties of good habit are selected, and the plants again show vigorous health, promising a fine display of bloom.

Swanland Manor.

This is the charming residence of Sir Jas. Reckitt, and those who know Mr. Wilson, the popular head gardener, recognise him to be a genial good fellow, and those who meet him in the exhibition arena, especially in grouping, after the awards have been made, have also good reasons to remember him with respect. Mr. Wilson does not grow a large number of plants, but the selection of varieties and the manner in which they are kept in hand display good judgment.

The buds are well timed and were opening freely, the following being noteworthy :—Western King, Mephisto, La Esmerelda, Australie, Graphic, Milano, Miss Elsie Teichman, Lady Byron, Simplicity (grand), Phœbus, Mrs. Gower, La Moucherette, M. Demay Taillandier, Modesto, E. Molyneux, Mrs. Briscoe Ironsides, Falka, Australian Gold, Pride of Exmouth, Directeur Tisserand, and Robert Owen. Mr. Leadbetter was waiting my arrival at Swanland, where after partaking of Mrs. Wilson's bounteous hospitality, we were soon on our way again.

Tranby Croft.

Here we met another contingent of mummers from the Beverley district, and we had to hurry to the Chrysanthemums. The iucurved varieties were classified in the different types ; standing in single rows in the early Peach houses the plants received an abundance of light and a free circulation of air all round them. The buds of the Queen and Princess of Wales type gave every indication of developing blooms of the highest grade. In the general collection of incurved D. B. Crane, John Fulford, Mr. James Murray, Mrs. R. C. Kingston, Lord Rosebery, Jeanne d'Arc, and Brookleigh Gem were very promising.

In the Japanese the following were noted for evidence of high finish : —Miss Rita Schroeter, Duke of York, Mrs. J. Lewis, Edith Tabor, Niveus, Australian Gold, Pride of Exmouth, Pride of Madford, Lago Maggiore, E. Molyneux, President Carnot, Gustave Henri, M. Demay Taillandier, Major Bonnaffon, Mrs. G. Newitt, Emily Silsbury, and Thos. Wilkins.

Hessle Wood.

Another sharp drive landed us at the entrance to the gardens of F. R. Pease, Esq., where I found Mr. Picker in consultation with his employer *re* extensions in the glass department. After being introduced to that gentleman, and my business explained to him in the most courteous manner, he postponed the matter in hand, and accompanied us all round the garden, displaying the greatest interest in everything. Coming to the Chrysanthemums, which, like everything else at Hessle Wood, are well looked after, I found the following varieties most noteworthy :—Nianza, Milano, Lago Maggiore, M. Demay Taillandier, M. A. de Galbert, Duchess of Wellington, Simplicity, Ed. Molyneux, Louise, Pride of Madford, Oceana, M. Ad. Chatin, Australian Gold, Edith Tabor, Pallanza, Madame Carnot, John Seward, and Chas. E. Shea.

Hessle Cliff.

This is the residence of Mrs. Whitaker, and her gardener, Mr. Jarvis, is well known as one of the best cultivators in this neighbourhood, and at present holds the very handsome challenge trophy of the Hull Society for the best group of Chrysanthemums. We found plants at all heights, cut-backs, tops, and naturally grown, many of the rooted tops not more than 9 inches to a foot high, cut-backs nearly as dwarf, carrying remarkably well developed flowers, the following varieties showing up prominently :—Mrs. E. T. Trafford, Viviand Morel, Phœbus, Pallanza, Boule d'Or (Calvat's), Louise, and some wonderful plants of W. H. Lincoln, carrying seven or more fine blooms, with Souvenir de Petite Amie, scarcely inferior. In the incurved grown in the ordinary way, the Teck family promised well, as did the Princess of Wales type.

Woodleigh.

The residence of A. Smith, Esq. (gardener, Mr. Mason), a close neighbour of Mr. Jarvis, was included in the day's programme, but much to my regret the shades of evening were falling before we had finished inspecting the Hessle Cliff collection, and by the time we reached Woodleigh it was quite dark, and we were unable to find Mr. Mason. I cannot close these notes without expressing the deepest gratitude to all for the kindness and hospitality on every hand, which made a hard day's work one of the pleasantest experienced by—A Yorkshire Gardener.

Notes from the Far North.

Now that the shows are getting close at hand one gets interested regarding the prospects of the well-known champions, and begins to wonder how their plants are looking. Naturally one feels a special interest in those within the circle of one's own neighbourhood. We therefore took the liberty of calling the other day at Rossie to see the plants grown by Mr. David Nicoll, who has gained a more than local reputation as a Chrysanthemum grower and exhibitor. We were highly delighted to see his plants so healthy and promising, the majority of them evidently having their buds well timed. They have made strong growth, splendid foliage, and although they seemed tallish as a rule, they were well ripened and surmounted by plump, promising buds.

The autumn has been a capital one in this locality for ripening the wood, and we shall probably see a large amount of blooms above the average in quality at our northern shows this year. There is not the danger in our colder climate of getting the wood over-ripened which growers further south have to fear. Mr. Nicoll includes in his collection a goodly number of the novelties, as well as the older sorts, which come up to the exhibition standard.

Australie, James Bidencope, Le Moucherotte amongst the coloured varieties are very promising ; also Mons. Chenon de Leché, very dwarf in habit and most distinct in colour. Amongst the yellows we observed Sunstone, very strong ; Modesto, gorgeous colour, extra ; Phœbus and Oceana, a pair of splendid varieties, which will be popular ; Edith Tabor, a refined and lovely bloom ; and last, but by no means least, the yellow Carnot, with nice promising buds. Whites were in abundance, such high-class sorts as Mutual Friend, Simplicity, Mrs. J. Lewis, Mrs. W. H. Lees, Mdlle. Thérèse Rey, Madame A. Chatin, Madame Carnot, and many more, which it is not necessary to enumerate here. Taken over all, the collection bears ample proof of careful and intelligent culture, and we doubt not will give a good account of themselves on the exhibition boards. —Albyn, *Perth.*

Liverpool Chrysanthemum Notes.

In the course of a week or so we shall be launched into the midst of the Chrysanthemum fray, which is sufficient in itself to tax all the energies of our best growers. I have—for this season at all events—departed from my usual custom of sending early notes on our best collections, from the fact that the truest idea cannot be guaged of their qualities at the present time, and as they are more susceptible to damp in some places than others, the inferences drawn cannot always be accepted as quite correct. I hope, however, to deal with several collections later on, also to notice some that have not been mentioned in these pages, but who, if not exhibitors, are equally worthy of mention.

Of the season itself nothing but good can be written. We have had fine growing weather, and a dry autumn ; but perhaps the greatest wonder of all has been the almost entire absence of the usual autumnal gales, which have in former years caused the greatest havoc amongst the plants. The usual older varieties are in capital form, and I have already noticed some excellent new ones, but of these I must speak anon. Our exhibitors, Messrs. Carling, Haigh, Vaughan, Eaton, Burden, Williams, Osborne, and Greene, are all up to the usual standard, and should give an excellent account in the best of company.

The opening exhibition in our district is the Blundellsands, Waterloo, and Seaforth, a Society which has made much progress within the past few years, and which is held on November 5th and 6th. Liverpool are subject to the City Council for the use of the handsome St. George's Hall, than which no finer place can be found in which to hold the autumn show, and it is to be sincerely hoped that visitors will support the Committee to the best of their bent, and I feel sure they will not be disappointed with the splendid display arranged by the second city in the kingdom. Music of the highest class has been arranged for, and the show promises to be one of great excellence in flowers as well as fruit. The grand challenge cup, value 20 guineas, and 10-guinea money prize, which was won last year by Mr. Townshend, gardener to Col. Lloyd, Aston Hall, is already the topic of the day, and Mr. Townshend will have to be specially good to retain it this season as his own property. With these few notes I leave the issue at stake, confident that the Judges appointed will work to the satisfaction of all exhibitors. I may add that the date fixed was November 10th and 11th, but the hall not being available the dates have been altered to the 9th and 10th November, as advertised in your columns, so will exhibitors and visitors kindly make a note of this ?—R. P. R.

SHOWS.

TORQUAY.—October 27th.

The Torquay District Gardeners' Association held a most successful show on Wednesday, October 27th. One of the principal features was a well filled class for table decorations, there being ten entries. These occupied one end of the hall with beautiful effect. Mr. P. W. Bushby (Mr. F. Peacock, gardener) won the first prize with a light and tasteful arrangement, Lady Macgregor (Mr. Davis) running him very close for second. A most striking arrangement was that of Mrs. Wilson with Gloriosa blooms and Grasses. The groups were grand, that of Dr. W. Ford Edgelow (gardener, Mr. L. R. Prowse) receiving the N.C.S. silver medal in addition to the money prize given by the Association.

The chief honours in the cut bloom classes were secured by the Rev. H. Hutchins (Mr. J. Hill), Mrs. J. Wright (Mr. W. H. Peale), and Mrs. T. Barkley (Mr. R. W. Hodder), the latter showing splendid blooms cut with long stems, in vases.

The trade growers were in strong force, Mr. W. J. Godfrey staging a large number of novelties, as did also Mr. Wells of Redhill and Mr. Gee of Teignmouth. Mr. W. B. Smale was represented by a grand bank of bloom, prominent among which were Mutual Friend, Lady Byron, and Mrs. H. Weeks. Messrs. Curtis, Sanford & Co., Ltd., with Chrysanthemums and other plants; Horn & Sons, Burridge & Sons, Tuplin and Sons, R. Veitch & Son, R. Beachey & Co., and W. Allward also exhibited, as did Miss Lavers, Capt. W. Fane Tucker, and Lady Macgregor. The Salon Orchestra attended, and the receipts at the door far exceeded those of any previous show. The arrangements were carried out by an efficient Committee and Mr. F. C. Smale (Hon. Sec.). The balance in hand at the end of the year is expected to reach £50.

BATTERSEA.—October 29th and 30th.

This exhibition, which was held in the Battersea Town Hall on the above dates, is always very interesting, especially from the amateur's point of view. The major portion of the prizes are competed for by residents in the immediate neighbourhood, and whose conveniences are exceedingly limited, while their inconveniences are more than proportionately great. Bearing this in mind, nothing but congratulation can be offered, for the flowers were, in almost all cases, highly creditable. The Battersea Society is not a very old one, but since its inception it has done much to foster and to extend the love of gardening in the district. The monthly meetings are most successful gatherings, and these, with the arrangements of the show, are admirably managed by the Hon. Secretary, Mr. J. O. Langrish, who works thoroughly well for a good cause.

There were a few open classes, of which one of the chief was for a group of miscellaneous foliage and flowering plants. This, unfortunately, only brought forth two competitors, who each showed creditably. The premier position was assigned to Mr. Carter, gardener to P. Purnell, Esq., Streatham, and the second to Mr. J. Portbury, Putney Heath. Mr. J. Freneh, gardener to Mrs. Barclay, Ambleside, Wimbledon, staged well in the class for eighteen Japanese, and well deserved the first prize. Amongst his best blooms were Simplicity, Australie, Mutual Friend, Pallanza, Mrs. C. Harman Payne, Mrs. H. Weeks, Edwin Molyneux, and Australian Gold. Mr. J. Portbury was a fair second. Mr. J. French was also first for twelve Japanese in not less than eight distinct varieties. Messrs. J. Brown and J. Portbury were second and third as named.

The flowers staged by Mr. J. Brown, Norman Road, Wimbledon, in the class for six Japanese, distinct, were of excellent quality. The varieties represented were Phœbus, Viviand Morel, Lady Byron, Mutual Friend, Col. W. B. Smith, and Beauty of Teignmouth. The second prize went to Mr. J. French, and the third to Mr. J. Portbury. For a similar number of incurved flowers, Mr. J. French, with fair examples of Mrs. R. C. Kingston, Jeanne d'Arc, C. H. Curtis, Madame Darier, Lord Wolseley, and Brookleigh Gem went to the front. Mr. J. Portbury was again second.

For a group of Chrysanthemums, arranged in a space of 6 feet by 6 feet, Mr. W. H. Riddle, Wandsworth Common, was a capital first. His well-grown plants carried fine flowers. Mr. C. Hemstead was a good second, and Mr. J. Daniel third. In the class for a smaller group of Chrysanthemums, the prizewinners were Messrs. A. W. Bolton, W. A. White, and W. J. Stringer, each showing creditably. It is impossible, considering the pressure on our space just now, to name the prizewinners in the numerous amateurs' classes, though we noticed some charming flowers in several of them.

Miscellaneous exhibits were fairly numerous and of average quality. The principal display in this section of the show was made by Mr. Robert Neal, Wandsworth Common, who arranged a large group. Amongst the many well-grown plants were Palms, Ferns, Ericas, Bouvardias, Marantas, Cyperus, and Chrysanthemums. Having been carefully arranged, these looked very well. Mr. N. Davis sent several handsome Japanese varieties, as did R. Garton, Esq., Worplesdon Place, Guildford. In each case the flowers were of good size, clean, and well coloured.

BRIGHTON AND SUSSEX.—November 2nd and 3rd.

This was well up to the average, but we did not think the exhibits quite equalled those of last season. Groups were good; so, too, were the cut flowers, but there was a lack of any special feature, and these have now become a great attraction to this exhibition. For a group, 12 feet in diameter, Mr. G. Miles, Dyke Road Nursery, Brighton, was well ahead, the group being enlivened by dwarf Crotons, Dracænas, and Caladiums at the base. Mr. Miles was also well in front for a smaller group, again putting up a very tasteful arrangement. For a group of 9 feet diameter Mr. W. E. Anderson, gardener to B. Parish, Esq., Melodia, Preston Park, won with a graceful exhibit, and good flowers. In the two last classes Mr. J. Hill, gardener to W. Clarkson Wallis, Esq., Springfield, Withdean, was a close second, and was most successful in the classes for plants, winning first for four standards, for one ditto, for four dwarfs, for four Pompons, and for a specimen pyramid.

Mr. T. Fairs, gardener to R. Cloves, Esq., Hassocks, was second for four standards, and first for four pyramids. Throughout the show plants were good. The first prize for an amateur's group was secured by Mr. C. F. Gillam, 75, Waldegrave Road, Preston, who also secured the Society's silver medal.

For thirty-six Japanese there were twelve competitors. Mr. J. R. Heasman, gardener to Mrs. Oxley, Fenn Place, Turner's Hill, Sussex, was placed first, his best six being Phœbus, Madame Carnot, Modesto, Western King, G. J. Warren, and Mrs. C. Keyser. Mr. J. Stredwick, Silverhill Park, St. Leonard's-on-Sea, was just beaten by Mr. T. Davey, gardener at St. Leonard's Forest, Horsham, for second place. For twenty-four Japanese, Mr. Wallis, gardener to Mrs. Mews, Hartfield, won, Mr. Davey again following. Mr. Wallis was also ahead for twelve incurved, being followed by Mr. J. R. Heasman. Mr. Harris, gardener to Lieut.-Colonel C. P. Henty, Arundel, was a good first both for twelve Japanese and six incurved varieties; while Mr. T. Davey, St. Leonard's Forest, Horsham, won for six Anemone-flowered and for six reflexed.

Apples and Grapes were the chief features here, dessert Apples being particularly good. For three bunches of any white Grape Mr. W. Taylor, gardener to C. W. Bayer, Esq., Tewkesbury Lodge, Forest Hill, won with some well-finished bunches of Muscat of Alexandria; Mr. Harris, gardener to Mrs. Eversfield, Denne Park, Horsham, following. Mr. Taylor was also first for three bunches of black, staging Alicante in a well-finished condition; and again for three bunches of Gros Maroc. For three of any black variety Mr. J. Gore, Polegate, won with Gros Colman. For four dishes of dessert Pears, and also for two ditto stewing Pears, Mr. G. Goldsmith, gardener to Sir E. G. Loder, Bart., Horsham, was ahead in very strong competition. Four dishes of dessert Apples brought out no less than seventeen competitors, Mr. G. Goldsmith winning with Blenheim Orange, Cox's Orange Pippin, King of the Pippins, and Ribston Pippin, all in good form and highly coloured. Mr. G. Duncan, gardener to C. J. Lucas, Esq., Warnham Court, Horsham, was second.

Among the miscellaneous exhibits, not for competition, Messrs. Balchin & Sons must not be missed. Fruit, flowers, plants, and a most gracefully decorated kiosk were the chief features. Messrs. Cheal and Sons, Crawley, and Messrs. Cannell & Sons, Swanley, also made good stands. Some beautiful Violets came from Mr. House, Bristol, but these we may perhaps note more fully when space is not so crowded.

SOUTHAMPTON.—November 2nd and 3rd.

The annual Exhibition of the above Society was held in the Skating Rink as in former years. The Rink was well filled, cut blooms and groups forming the principal features of the show. The first named consisted chiefly of Japanese, although incurved were well represented. Under the management of Mr. Fuidge, the popular Secretary, and working Committee, the arrangements of the show were carried out in a most creditable manner. Fruit and vegetables were well staged.

The principal class in the cut blooms was for eighteen Japanese, distinct, which brought nine competitors, the first prize falling to Messrs. Elcombe & Son, Romsey, with bright, fresh, and well arranged blooms of Pride of Exmouth, C. H. Payne, A. H. Wood, Australie, Graphic, Lady Ridgway, Reine d'Angleterre, Dorothy Shea, Mrs. Lees, President Nonin, E. Molyneux, Mons. Hoste, C. Davis, Phœbus, Chenon de Leché, Viviand Morel, Oceana, grand; and M. E. Rosette. Second, Mr. G. Nobbs, gardener to her Majesty The Queen, Osborne, Cowes, I.W. Third, Mr. R. West, gardener to H. J. Wigram, Esq., Northlands, Salisbury.

For the same number of incurved, distinct, Mr. F. G. Foster, Brockhampton Nurseries, was a good first with small but well finished blooms of the following:—C. H. Curtis, Mrs. R. C. Kingston, J. Agate, Miss D. Foster, Duchess of Fife, Miss V. Foster, Baron Hirsch, Madame Darier, Mrs. J. Murray, Globe d'Or, Empress of India, Princess of Wales, Brookleigh Gem, Mr. J. Kearn, Bonnie Dundee, Prince Alfred, Jeanne d'Arc, and Yvonne Desblanc. Mr. J. Agate, nurseryman, Havant, was a good second, and Mr. R. West third. For eighteen blooms, not more than two of any one variety, the first prize went to Mr. W. Goss, gardener to W. G. Roy, Esq., Beams, Marchwood. Mr. R. West was a good second, and Mr. J. Nobbs third.

In the class for twelve Japanese, distinct, Messrs. Elcombe were first, staging blooms similar to their other first collections. Second, Mr. L. Dawes, gardener to P. Ogilvie, Esq., Rosecroft, Hambledon. Third, Mr. G. Nobbs. For the same number of incurved, distinct, Mr. R. Woodfine, gardener to Col. Boyd, Emsworth House, Emsworth, was an easy first, staging blooms of good quality. Second, Mr. R. West. Third, Mr. J. Agate. For the best single bloom of Japanese, Mr. H. M. Mose. Belmont Nursery, Sholing, was an easy first, staging magnificent Viviand Morel. Second, Mr. L. Dawes, with Duke of York. Third, Mr. G. Nobbs, with C. Davis. Amateurs were not very well represented, but Mr. H. H. Lees, 54, Cedar Road, Southampton, showed some splendid blooms, taking the prizes in all classes.

For the best collection of Chrysanthemums grown in pots, arranged in a space measuring 10 feet by 6 feet, quality and general effect only to be considered, brought four competitors, but Mr. C. Hosey, gardener to J. C. E. D'Esterre, Esq., Elmfield Hill, was a long way ahead with a splendid group, and well arranged; Mr. G. Brixey, 44, Liverpool Road,

second. For a single and four specimens Mr. H. G. Holloway, gardener to Mr. A. Brown, Hill Farm Dairy, was easy first. Mr. E. Carr, gardener to W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke, and Mr. C. Hosey second and third in the order named.

CROYDON.—NOVEMBER 2ND AND 3RD.

THE Public Halls, Croydon, were brightly beautiful on the above dates, when the Croydon Chrysanthemum Society held its tenth autumn show. The number of exhibits was very large, and in several of the classes the pointing was extremely close. We must congratulate the Secretary, Mr. Beckett, on the arrangements, and particularly on the punctuality with which the judging was commenced. Other secretaries might well take an example from Croydon in this respect. We give below notes of a few of the chief classes.

The chief class was for thirty-six cut blooms of Japanese Chrysanthemums in not less than twenty-four distinct varieties. This was open to the whole of England, and a 25-guinea challenge cup went with the premier prize. The cup can only become absolute property of anyone winning three times out of five. Needless to say the competition between the seven exhibitors was very keen, Mr. E. Mills, gardener to Frank Lloyd, Esq., Coombe House, Croydon, eventually securing the coveted position. The flowers were generally of good size, a few being small, but all were fresh and well coloured. The varieties comprised G. J. Warren, C. Davis, Miss Elsie Teichman, Prefet Robert, Mons. Chenon de Leché, Edith Tabor, Madame Carnot, Mrs. C. Harman Payne, Louise, Phœbus, Hairy Wonder, Mons. Panckoucke, G. C. Schwabe, Viviand Morel, Mutual Friend, Lady Byron, Vicomte Roger de Chezelles, President Borel, Graphic, Australie, Edwin Molyneux, Sunflower, John Seward, Madame Carnot, and H. L. Sunderbruch, some of course being in duplicate. The second position was assigned to Mr. D. Gibson, gardener to J. B. Johnstone, Esq., Kingston-on-Thames. The flowers were equally fresh and clean and beautifully coloured. Amongst the best were Mrs. H. Weeks, Australian Gold, Phœbus, Duke of York, Madame Carnot, Mutual Friend, and Mons. Ch. Molin. Mr. D. Gooch, gardener to T. Wickham Jones, Esq., Selhurst, was third, and Mr. W. King, gardener to J. Colman, Esq., Reigate, fourth, both staging handsomely.

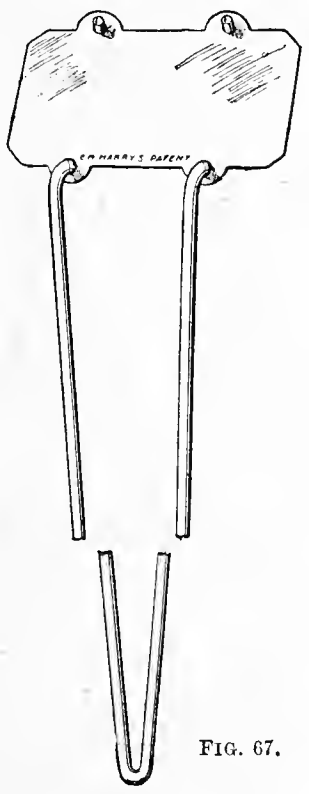

FIG. 67.

For a group of Chrysanthemums, arranged in a semicircle of 10 feet by 5 feet, there were six competitors, each showing well. Mr. A. Sparshott, gardener to Mrs. Hill, Park Hill Rise, was first with splendidly grown plants carrying good flowers. Mr. C. Lane, gardener to E. H. Coles, Esq., Caterham was second; and Mr. D. Gibson a creditable third. Mr. G. H. Cooper, Sydenham Road, was the only exhibitor of four trained plants, and received the premier award. For a smaller group, Mr. R. Gladwell, gardener to S. Smith, Esq., South Norwood, was first; Mr. G. Lewry, gardener to Mrs. Blake, Duppas Hill, second.

Two exhibitors brought eighteen distinct incurved. Mr. W. King secured the leading award with a stand composed of Empress of India, C. H. Curtis, R. Petfield, Lord Wolseley, Violet Tomlin, Globe d Or, Major Bonnaffon, Prince Alfred, Mrs. Heale, Queen of England, Mrs. R. C. Kingston, Bronze Queen of England, Mons. R. Bahuant, Brookleigh Gem, Mrs. D. B. Crane, John Lambert, Jeanne d Arc, and Lucy Kendal. The second went to Mr. G. Prebble, gardener to M. Hodgson, Esq., Shirley.

For six incurved, one variety, Mr. G. Prebble was first with Jeanne d'Arc, and Mr. W. Hattin, gardener to A. Smith, Esq., second with Baron Hirsch. Mr. H. Reddin, gardener to J. W. Bird, Esq., West Wickham, sent half a dozen splendid singles, and received the first prize. There were three stands of six Japanese, one variety, the first prize going to Mr. S. Mills with beautiful examples of Mons. Panckoucke; Mrs. Smith being second with Mons. Chenon de Leché, and Mr. L. Gooch third with Phœbus. For two vases, each containing six blooms, Mr. J. Slater, gardener to F. Smith, Esq., Park Hill Road, was first, Mr. G. Cooper second, and Mr. F. Smith third.

In the class for eighteen incurved, in not less than twelve varieties, Mr. G. Prebble was first, and Mr. J. Munro, gardener to J. Bucknall, Esq., Beckenham, second. Mr. R. Gladwell was first for twenty-four Japanese, in not less than eighteen varieties, with some excellent flowers. The varieties represented were Phœbus, Duke of York, Edith Tabor, Edwin Molyneux, Louise, Madame E. Capitante, Primrose League, Thos. Wilkins, Australie, C. Davis, Dorothy Seward, Mrs. C. Blick, Mons. Panckoucke, Mons. Chenon de Leché, Viviand Morel, Col. W. B. Smith, President Borel, Oceana, Souvenir de Petite Amie, Louise, and Charles Davis. The second prize went to Mr. E. Mills.

Besides the classes already referred to there was a division confined to single-handed gardeners and amateurs residing within a 5-mile radius of the Croydon Town Hall. In these there were some charming exhibits, and amongst the chief prizewinners we observed Messrs. N. Wrightson, A. Dyer, W. D. Asquith, W. Hattin, A. Osmond, C. Stew, T. Williams, H. Reddin, C. Perrett, W. Watson, H. C. Crook, F. T. Wright, and A. G. Lipscomb.

Miscellaneous exhibits were very numerous and of excellent quality. They were, too, thoroughly well diversified, and consequently the interest in them was much enhanced. We must give them in brief, as is our almost invariable rule at this season of the year. Messrs. J. Peed and Sons, Norwood, sent a collection of Apples and plants of Begonia Gloire de Lorraine; Messrs. J Laing & Sons, Forest Hill, splendid Apples, Pears, and miscellaneous flowering and foliage plants: Mr. W. Wells, Japanese Chrysanthemums in fine form; Messrs. J. Cheal & Sons, Crawley, richly coloured Apples and Pears; Mr. T. Butcher, Croydon, floral decorations; Messrs. G. Bunyard & Co., Maidstone, beautiful Apples; Mr. H. Anstey, Norwood, floral designs; and Mr. J. R. Box, Croydon, Apples.

BLACKHEATH.—NOVEMBER 3RD AND 4TH.

THIS Show was held, as in former years, at the Rink, Blackheath. The groups appear to have grown numerically, but the effect produced by the exhibitors was not by any means pleasing, being much too crowded and formally arranged. The cut bloom classes are always a strong feature at this Show, and the present occasion was no exception to the rule. The decorative classes were also a good feature.

The premier honours for a group of Chrysanthemums, arranged in a space of 50 superficial feet, were awarded to Mr. A. Hollands, Lee Park Nursery, Lee, for a very bright group, comprising both Japanese and incurved varieties. Mr. E. Dove, gardener to W. E. Fry, Esq., Bickley Hill, secured the second position with a group of very fine plants, the arrangement being the best in the competitive classes, but it lacked the freshness so visible in the first prize group. Mr. T. Dobson, gardener to F. J. Preston, Esq., Lee, was third.

The groups of flowering and foliage plants were beautifully arranged. First honours fell to Mr. J. Lyne, gardener to H. F. Tiarks, Esq., Chislehurst, with an effective display of Orchids, Crotons, Aralias, Palms, and other flowering plants. Second place was awarded Mr. G. B. Lees, gardener to R. De Quincey, Esq., Chislehurst, for a very effective exhibit.

The class for eighteen Japanese and eighteen incurved varieties brought out a good competition, the premier award going to Mr. T. Robinson, gardener to W. Lawrence, Esq., Hollingbourne, for a very even exhibit, the incurved being neat and well finished. The best blooms were Madame Carnot, Pride of Madford, Eva Knowles, Mons. Hoste, Phœbus, and Edith Tabor in the former section, while the latter contained good flowers of J. Agate, Chas. H. Curtis, Empress of India, Madame Darier, Jeanne d'Arc, and Robert Petfield. The second prize was awarded to Mr. Walter Harvey, gardener to R. B. Martin, Esq., M.P., Chislehurst, who had a very strong stand of Japanese, but the incurved were considerably weaker. The third prize was allotted to Mr. J. Lyne, who must have run the previous exhibitor very closely.

The first prize for twenty-four Japanese, distinct, was awarded to Mr. J. Blackburn, gardener to J. Scott, Esq., Chislehurst, for a very fine exhibit. Violetta, Col. W. B. Smith, Madame Gustave Henry, Mutual Friend, Eva Knowles, Primrose League, and Viviand Morel were the most notable varieties. Mr. J. Blackburn was again successful in the class for twelve Japanese, distinct, with a fine even exhibit. Mr. Chas. Dann, gardener to R. J. Balston, Esq., Maidstone, second. Mr. Ed. North, gardener to J. Wells, Esq., Catford, third.

Mr. W. Harvey was placed first for twelve incurved varieties, distinct, having Chas. H. Curtis, Lord Wolseley, Jeanne d Arc, John Doughty, and Mrs. J. Kearn, good; Mr. J. Lyne second, with a less even exhibit. In the class provided for reflexed varieties, Mr. R. Leadbetter, gardener to A. G. Hubbuck, Esq., Chislehurst, was well ahead, followed by Messrs. J. Lyne and T. Couldry, gardener to W. H. Sedgwick, Esq., Grove Park, in the order named.

Mr. C. Jordan, gardener to H. Hoskier, Esq., Hayes Common, was most successful in the class for six blooms, one variety, coloured, with very fine blooms of Phœbus. Mr. E. Russell, gardener to T. Pim, Esq., Crayford, second. The latter exhibitor was placed first for six blooms incurved, one variety, with fine Chas. H. Curtis. Mr. G. B. Lees, gardener to R. De Quincey, Esq., Chislehurst, second with Baron Hirsch. Mr. E. Dove, third.

A large group of Chrysanthemums, interspersed with Palms and Crotons, came from Mr. H. J. Jones, Ryecroft Nursery, Lewisham. The exhibit was arranged in Mr. Jones' well known artistic style, and presented a very bright and attractive appearance. A group of miscellaneous plants from Messrs. Cutbush & Sons, Highgate, comprising Gloire de Lorraine. Begonias, Ericas, Oranges, Chrysanthemums, and Palms proved a very attractive feature of the show. The stage was prettily decorated with Palms, Crotons, Dracænas, Ferns, and a variety of autumn-flowering plants by Messrs. J. Laing & Sons, Forest Hill. Mr. Wm. Wells, Redhill, exhibited a fine stand of Japanese blooms, also bunches of single and decorative varieties.

HARRY'S "IDEAL" LABEL.

MR. G. H. HARRY of Brockley has sent us a label (fig. 67) which almost, but not quite, explains itself in the annexed illustration. The inventor claims for this label neatness, cheapness, durability, and convenience for writing. It differs from other labels of the same general character in what may be termed the plate being moveable for the purpose of writing the names. That is so. It is easily removeable, and appears firm when fixed; also the twin stem when forced into the soil does not show the least disposition to twist round, but the name faces the direction required The "Ideal" label is made in different sizes and patented.

THE YOUNG GARDENERS' DOMAIN.

Bothy Customs—"On Duty."

As a bothyite I am of opinion that "Well-Wisher's" remarks (page 384) are not all that could be wished for by the young gardeners of to-day. Some head gardeners seem to regard the young men under them as their personal servants. While in a previous situation I was asked to sing at a concert. This I consented to do, so was placed on the programme; but as I was leaving the bothy the head gardener returned from his evening drive, he called to the man on duty, who happened to be attending to the fires, so I was then ordered, though "off duty," to take out his horse, and do other work, and break an engagement that I was fully entitled to make. As regards the reference to the young gardeners who were off duty being sent to the station on Christmas morn to unload slack, I will only say that if "Well-Wisher" approve, as he seems to do, such procedure, I think he should change his *nom de plume*. —M. T. Saunders.

Malmaison Carnations.

So popular has the Malmaison Carnation become that in many large establishments we find houses devoted entirely to the cultivation of the several varieties. Where this is the case their management is much easier than when grown with other plants, and when well grown they are unsurpassed by any other flowering plant in cultivation. They may be grown so as to produce a succession of their delicioously sweet-scented flowers for the greater part of the year.

So far as my experience goes the best mode of propagation is by layers, which operation may be carried out at intervals, commencing as soon as the first flowers are over. A range of cool frames will be found suitable for layering. The first point, and a very important one, will be to secure some good fibrous loam of a sandy nature, using two parts of this, chopped fine, with one of leaf soil, one of peat, and about one-quarter of the whole of silver sand. The plants should have been previously taken out of their pots and plunged in a somewhat slanting position, when it is much easier to get the young growths down for layering. The foliage is stripped from the fourth joint downwards, commencing the cut just below the fifth joint, upwards through the fourth, peg down with the tongue open, and make as firm as possible with the fingers. Select only healthy growths for layering, and shade from the hot sun. Give, however, as much light as possible, and keep the frames closed for about a week, when air should be given freely. A gentle dewing over with a syringe will prove beneficial at this stage, but afterwards every effort should be made to prevent moisture coming into contact with the foliage. At this stage they will require very careful watering.

When sufficiently rooted they may be potted singly into large 60's using a compost similar to that advised for layering, with the addition of a small quantity of mortar rubbish. Place the plants again into the cool frames near to the glass, keep these rather close for a few days, and shade from hot sun. When root action has again commenced admit air freely. In about a month they ought to be ready for repotting—the strongest plants into 7-inch, and the remainder into 6-inch, which will be quite large enough for flowering. Use a compost of three parts good fibrous loam, one of peat, and about the same quantity of sheep manure dried and rubbed fine, with wood ashes, and one-quarter of a part of mortar rubbish, charcoal, and silver sand. Give chemical manure as soon as the plants have filled the pots with roots about once a fortnight, and an occasional watering of clear soot water.

When required for winter flowering these plants are placed in 9 and 10-inch pots, using a compost similar to that used for the previous potting. The young growths are neatly staked, and any kind of artificial feeding is withheld until the flower-buds appear. The three essentials to success are watering, potting, and abundance of air in favourable weather. Houses in which Malmaisons are growing should be made as light as possible, with top and side ventilation at each side of the structures; blinds are also necessary to protect the flowers. The temperature I have seen them do best in when growing is about 40° to 45° at night and a little higher during the day. The flowering house should not fall below 50° at night. When in flower bees must be excluded from the houses, as they destroy the scent and shorten the duration of the flowers.

Owing to the dryness of the atmosphere red spider will be rather troublesome; green fly will also attack the plants, and do a considerable amount of damage in a very short time. Either of these pests should be quickly eradicated, either by fumigating or syringing with some approved insecticide. Any diseased plants ought to be removed from the healthy ones, and either destroyed or put into a separate house to flower, removing also all decayed leaves as soon as discovered. Malmaisons are, I believe, more subject to fungoid diseases than any other Carnations, and therefore need more careful attention. I am of the opinion that by keeping the plants rather dry during winter, but not allowing them to suffer for want of water, will act as a good preventive. I may add that the preceding notes are the result of practical experience, and will, I hope, be of assistance to readers of the Domain.—J. F. D., *Yorkshire*.

Blossom and Bees.—A Pear tree is now in full bloom in a gentleman's kitchen garden, situated within about a mile and a half of Leeds Town Hall. The tree has been visited daily for a week past by bees, which have been observed carrying pollen into their hives, kept in a neighbouring garden. Summer must linger long in these northern latitudes.

HARDY FRUIT GARDEN.

Strawberries.—The oldest beds of Strawberries should, if they are not profitable to retain, be pared off, and the ground dug deeply or trenched, adding a liberal quantity of manure. It is not advisable, if it can be possibly avoided, to plant on the same ground at once or in the spring. The ground will better suit some other crop.

Healthy quarters or beds of Strawberries not older than three years may be retained another season. Clear off at once all superfluous runners and large shabby leaves; remove also young plants which have rooted between the rows, preserving the best, if further stock is required, for spring planting. Lift these carefully with a trowel, and plant 6 inches apart in small beds on a piece of good ground. Fork up strong, deep-rooting weeds; but disturb the ground no further, as digging between rows of Strawberries injures the roots, the largest proportion of which are near the surface. They are fibrous, and very numerous. The best method, therefore, of finishing off the beds, giving them a neat appearance, and at the same time benefiting the plants, is to afford a rich and liberal dressing of decayed manure.

Young Plantations.—Recently planted quarters may be lightly hoed over to destroy seedling weeds and promote growth of the plants. Any runners which may have extended ought to be cut off. Mulching these with manure at the present time will scarcely be necessary.

Raspberries.—Where the old bearing canes of Raspberries have not been cut away since fruiting these should be removed now, cutting them close to the base. The weakest of the current year's canes may also be thinned out, leaving four to six of the strongest for next season at each stool. The canes will require shortening to the tops of the trellis or stakes in the course of the winter. Finally remove weeds of large growth and apply a heavy mulch of farmyard manure without previously digging the soil between.

Preparing Soil for Planting Fruit Trees.—Every preparation ought to be made for the season of planting fruit trees which is now close at hand. The soil in most cases requires to be dug deeply, not necessarily trenched, so as to bring unfit soil to the surface, burying the good below. When ordinary deep digging in the usual method is scarcely sufficient, the plan of bastard trenching may be adopted, this insuring that the present position of the layers of soil will remain the same, but well broken up. A depth of 2 feet of well-worked soil is ample, though when light and dry it might be deeper with advantage. If fairly rich and fertile the addition of manure in the course of preparation will not be essential. Poor ground ought to have some well-decayed material intermixed with the soil as stirring and breaking up proceeds. When light and sandy, strong loam or pulverised clay may with advantage be added to give it a more holding character.

Clayey and adhesive loams are difficult to deal with in a limited period of preparation, because such land always wants time for the influences of weather to assist cultural operations in the work of pulverisation. If land cannot be brought into fair condition for planting to take place in autumn it is better to defer planting until spring, or even the next season, in the meantime giving every attention to cultivation, so that its physical character may be permanently improved.

Lime is an excellent material to apply to strong and stubborn soils. It helps largely in breaking down quickly their cementing and adhesive qualities, rendering them workable and more finely divided.

Preparing Stations.—It is not essential to prepare the soil for a greater width than necessary when planting in isolated positions. Stations may be prepared 6 to 9 feet in diameter, according to the size of trees employed. Dig out the soil two spits deep, break up the bottom and return the soil, adding a little manure if poor, but preferably some rich loam with a little wood ashes worked in. This will improve the surface for planting the trees. The preparation necessary in forming a station brings the soil above the surrounding level. It is, therefore, desirable to finish some time before planting in order that the soil may become partly consolidated.

Preparing Borders.—Borders for fruit trees usually require to be of the same width as height, when the trees are on free stocks, and cover a space as wide as the wall is high. Few wall tree borders need be wider than 10 feet. Half that distance will do for cordon trees planted 2 feet apart. The soil should be improved by trenching and working in some good soil to lighten or enrich it. If drains are necessary these should be 4 feet deep and 15 inches asunder. Draining is only necessary when the natural escape of superfluous water from the surface soil cannot take place.

FRUIT FORCING.

Cucumbers.—To keep the plants in a healthy fruitful condition the night temperature should be maintained at 65°, 70° when mild, and 60° in the morning when sharp frosts occur, 70° to 75° in the daytime by artificial means, advancing to 80°, 85°, or 90° or more from sun heat. Whenever the weather is favourable a little air may be admitted at the top of the house, being careful not to lower the temperature or admit a cold current of air, as that cripples the foliage. It is better when the

weather is cold to shut off the top heat for an hour or two when the sun is powerful than to admit air when the winds are sharp. On the modern system of growing Cucumbers this practice obtains the year round, and in winter time little or no air may be necessary for weeks or months on the older, and, as we consider, better practice of ventilation. The paths and walls will need damping in the morning and afternoon on fine days, but the syringe must not be used to the foliage unless the days are exceptionally bright, and then soon after midday. The water or liquid manure given to the roots must be of the same temperature as the house, as also must the soil applied to the beds.

Autumn-fruiting plants are now in full bearing, and having plenty of stamina in them, and not being overcropped, will continue to bear good fruit a considerable time longer. It is also necesary to remove the fruit as soon as it becomes a useable size, and all deformed fruit when seen, as these needlessly weaken the plants. Attend to the plants once or twice a week for the removal of bad leaves, stopping irregular growths, and cutting out superfluous, keeping the foliage moderately thin. If mildew appear dust the affected parts with flowers of sulphur, or form this into a paste with skim milk, and brush a little on the hot-water pipes. The fumes given off act against red spider and white fly, but aphides and thrips should be subdued with vaporisation of nicotine essence or fumigation with good tobacco paper or the advertised substances, which are generally safer and thoroughly effectual.

Winter-fruiting plants are far the most difficult to manage. The great thing is to get them well established and furnished with sturdy growths and thick leathery leaves, letting the shoots advance well up the trellis before stopping them, training the side growths evenly, and not more closely than to allow of the foliage being well exposed to light. Stop the side growths after a few good leaves are made, and the growths issuing from the wood left will show plenty of fruit, and such may be stopped one or two joints beyond it. This will secure foliage for accelerating root action and the proper nourishment of the fruit. To insure the fruit swelling it is sometimes necessary to have recourse to fertilising the flowers, but allow few or no male blossoms or tendrils, removing them as fast as they appear, for they only weaken the plants. Add fresh soil to the ridges or hillocks as the roots protrude, and be careful not to overwater, affording a supply only when needed.

Peaches and Nectarines.—*Earliest Forced Trees in Pots.*—For securing very early fruit the trees are unquestionably best grown in standard form in pots, and the stems varying in height so that they will accord with the incline of the structure, and thus have their heads well up to the light. The very early varieties do well under this method of culture, as from the pinching they have blossom buds on the younger wood, and these are not liable to drop as are those on the first made wood of the previous year through over-development. Such varieties as Alexander, Waterloo, Early Louise, Early Leopold (an excellent variety for affording abundance of pollen from for fertilisation purposes), Hale's Early, and Stirling Castle Peaches, with Cardinal, Rivers' Early, Lord Napier, Goldoni, and Stanwick Elruge Nectarines answer for early forcing and give a good succession of fruit. A three-quarters span-roof house facing south, provided with top and front ventilation, and four rows of 4-inch hot-water pipes—two along the front and two next the path on the front side of the house—cannot be bettered for very early forcing, the back wall being utilised by growing Tomatoes against it, and when the Peach trees are withdrawn, as they may be after the weather becomes settled in June, the front of the house can be occupied with Tomato plants grown in pots for the purpose.

Earliest Forced Planted-out Trees.—These must be put into proper order and the house made as clean as possible. Afford inside borders a due supply of water, and if the trees are weakly give liquid manure, but not too strong, which will conduce to a more vigorous expansion of the buds as well as better setting and swelling of the fruit in the early stages. The house closed at the middle of the month must not have the temperature in the daytime above 50° without giving air, admitting this whenever the weather is bright, employing fire heat only to exclude frost, for the slower the trees are excited the stronger will be the blossom. Syringe the trees moderately in the morning and early afternoon of fine days, otherwise damp the paths occasionally so as to secure a fair amount of atmospheric moisture. Outside borders should be well protected with about 4 inches thickness of leaves, with a little litter over them to prevent their displacement by wind.

Succession Houses.—The trees casting their foliage must not be hurried by removing the leaves forcibly, but admit air freely at night, keeping the houses rather close in the early part of the day, and by maintaining a dry atmosphere, seek gradual maturation, when the foliage will part freely from the trees. When the leaves are all down, unfasten the branches from the trellis, perform any pruning required, cleanse the house thoroughly, paint the woodwork and trellis if necessary, and dress the trees with an insecticide. Secure the trees to the trellis, leaving room in the ligatures for the branches to swell, as tight tying is one of the most prevalent causes of gumming. Remove the surface soil down to the roots, and supply fresh loam rather stiff, containing a judicious amount of some approved fertiliser. Give a thorough sup ly of water to inside borders of houses with fixed roofs; but it is better to remove the roof-lights and allow the borders to become thoroughly soaked by the autumn rains, which will not do any harm, but great good where the drainage is efficient.

Any lifting and root-pruning of trees, not in a satisfactory state, should be attended to whilst the leaves are upon the trees, not, however, until the foliage becomes mature, and then acting with dispatch. If fresh trees have to be introduced, this should be done when they are safe for removal—namely, when the leaves are nearly off the trees. The best description of trees for planting in houses are those three or more years trained to walls or to trellis under glass, and prepared by annual or biennial lifting. Such trees transplant safely with abundance of fibres. Carefully planted they can be forced the first year with every confidence of a crop if not started before the new year, not brought on too rapidly. It is always desirable to select trained trees in bearing in preference to planting young ones that are not furnished with some bearing wood; but if young trees must be planted, select such as have a well-furnished base, free from gum, not very strong in the wood, and that well matured.

Late Houses.—The fruit, except a few of the latest varieties, is now perhaps gathered, and the wood that has borne fruit and is not required for extension should be cut out, as nothing is so prejudicial as too much wood. If the trees are young and not ripening the wood well, form a trench about one-third the distance from the stem the trees cover in height of trellis, and down to the drainage, so as to detach the roots, and after remaining open a fortnight, fill the trench firmly, adding calcareous matter to the soil if deficient of that substance. This will check the tendency to late growth and induce wood ripening. The surface soil should be removed down to the roots in the undisturbed portion as soon as the leaves fall, supplying fresh material, or replacing the old soil after adding some calcarcous matter, and give a good watering. The trees will then push fresh roots and ripen the wood, but the lifting or interference with the roots inside the trench must not be practised whilst the wood is soft and the leaves green and sappy, or the check will cause the wood to shrivel. Trees judiciously operated upon at the roots invariably set the blossoms well after operations of this character, the roots in lifting being laid in carefully in fresh compost and kept near to the surface. This is a great point in Peach and Nectarine cultivation.

THE BEE-KEEPER.

Examination of Hives.

It is a good plan at this season to make a thorough examination of all hives that are exposed to the weather. Those which are placed in properly made bee houses will be secure, but as these are in the minority when compared with the thousands of hives that are exposed to all winds and weather, it behoves bee-keepers to pay particular attention to the condition of their hives before severe weather sets in. As the fact is well known, directly a stock of bees become saturated with moisture from any cause, they will at once begin to deteriorate, and if steps are not taken to remedy the evil they will succumb. Prevention, however, is better than cure, and the present spell of fine weather is favourable for putting all hives in such a condition, that, let the weather be what it will, the inmates will be secure.

In the first place, each hive should be examined separately, and if the wood is in sound condition the bees need not be disturbed. The hive should then receive a coat of paint made from the best white lead, which may be obtained in small quantities ready prepared for use. This is a much better plan for amateurs to adopt than to procure the white lead and oils separately, as it often ends in failure. Paint made from white lead is preferred to the numerous mixtures often recommended for various purposes, as it will withstand frost and snow, rain and sunshine, better than anything else.

After the first coat of paint has become dry it will be advisable to fill all the small crevices round the sides of the hive with putty. This should be well pressed in with a knife, or some other suitable tool. Afterwards another coat of paint will, in the majority of cases, be sufficient to make the hive waterproof. After this date the bees will not be on the wing much, so no fear need be entertained of causing an injury to them by carrying out this operation.

It will not be advisable to paint the alighting boards unless they are fixtures, but if deemed necessary it should be delayed till late in the afternoon, when there is no further danger of the bees leaving their hive; the paint will then become dry by the following morning.

This shows the advantage of loose floorboards, as the hive may be quietly lifted off and placed on a clean floorboard without disturbing the bees. The spare board can then be removed to a dry place and painted as far as necessary, and be given to another colony a few days afterwards, when the paint has become dry and the unpleasant smell has passed away.

Making Roofs Waterproof.

It is important that the roofs of all the hives should be made thoroughly waterproof. But how is this to be done? someone may ask. As many have found to their cost, it is much easier said than done. Although it seems a very simple matter, I must own to have had more difficulty in this respect than in any other branch of bee-keeping. If the roofs are made of wood, and are waterproof for a year or two, they usually crack after an excessively dry summer, and then something more than putty and paint is required to keep the hive dry. This may be done by taking a piece of thin calico, slightly larger than the crevice through which the moisture gains access; well saturate it with paint and place it over the damaged part, and no further leakage will occur.

If the roof is badly affected similar material, treated in the same manner, and strained over the whole of the roof, will make it quite rainproof, and if painted once a year will last for a long time without removal. Another excellent plan is to cover the roof with a sheet of thin zinc, and if carefully put on will last as long as the hive. It must not be nailed on the top but only at the edges, otherwise the nails will in course of time become loose and the roof will no longer be rainproof. The zinc must be cut off close to the bottom edge of the roof. If turned underneath for 2 or 3 inches the moisture will condense on it, and the hive will seldom be dry. I lately examined several hives that had been treated in this manner with the above result. The overhanging zinc was removed as advised, and dry coverings placed on the top of the frames, which had the desired effect, and have since kept quite dry. This shows the necessity of carrying out the work in a proper manner, and is mentioned to prevent others making a similar mistake.

The corrugated galvanised iron, too, is a good substitute for wood and zinc, and as it does not fit so closely on the frames to which it is secured, it provides ample ventilation on the top of frames.

Dampness in Hives.

If the above instructions are carried out there will be less danger than formerly of the interior of hives being damp. Dampness in hives is the forerunner of many diseases, and no stock of bees will remain healthy long if steps are not taken to remedy it. Many colonies of bees which would otherwise have been strong and healthy the following spring are lost annually from this cause alone, and next to foul brood it is the chief danger in bee keeping to guard against. If the weather is severe, although they may have ample stores, they soon succumb; and if they do not they gradually dwindle away, so that by the following spring few bees will remain; these will, doubtless, have dysentery in a bad form, and if left to take their chance will make no headway.

When this is found to be the case, which is more often from carelessness than any other cause, the bees should be placed in a dry hive, and carefully fed with warm syrup, or be united to another stock. In numerous instances I have known bees to forsake their hive in a body, and cluster similar to a swarm in early spring.—An English Bee-keeper.

TO CORRESPONDENTS

All correspondence relating to editorial matters should, until further notice, be directed to "The Editor," **8, Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Chrysanthemum Leaves (*Inquirer*).—The leaves arrived too late for microscopic examination and the publication of the results in the present issue. In the meantime you cannot do wrong by dusting the plants with anti-blight powder.

Plants on Vine Border (*W.*).—Many gardeners resort to the practice of placing plants on inside Vine borders, not because they approve of such practice, but because necessity compels. They have to supply the plants without other structures being provided for growing or preserving them. Any kinds of plants on the border, either in winter or summer, more or less act to the "detriment of the crop of Grapes," as the soil is deprived of the action of air and light, besides being kept to a greater or lesser extent constantly wet. Gardeners, as a rule, are only too glad to keep the inside borders clear or solely devoted to the Vines, but from press of plant space many are obliged to act otherwise in the worthy endeavour to meet requirements in respect of both plants or flowers and fruit, and it is creditable to them that such a large number succeed so well.

Drying Orchid Flowers (*J. B., Wilts*).—If you wish to simply dry the flowers flat, there is nothing to beat the ordinary pressing between sheets of the best blotting paper. White is the best, but it must be of good absorbent quality. But possibly you wish to retain the shape of the flowers as well as their colour, in which case you must proceed differently. Procure some of the finest white sand; ordinary silver sand is much too coarse. Wash it thoroughly in clean boiling water, to remove any small insects and dirt, then spread it on sheets of zinc or some other metal, and dry it thoroughly. This cleansing and drying of the sand is most important, as without it the flower will be spotted. Procure boxes of suitable size and depth, according to the number of flowers, and place an inch of the prepared sand in the bottom. Lay the flowers on this, at a considerable distance apart, in as natural a position as possible. Then, with a fine sieve—or, with care, you may do it between your fingers—fill up all hollow parts of the flower, such as the labellums, and gradually cover them with the sand, taking great care that the segments are not displaced. When all are covered, place the boxes in a cool, dry room, and in about a month the flowers will be dried sufficiently, and may be taken out for your specimen cases, or whatever you require them for. The flowers will not, of course, be so bright as the natural tint, and some kinds are much more satisfactory than others. They should not be cut until they are fully developed, but before the colour begins to fade.

Vineries Infested with Mealy Bug (*J. S., Wales*).—There are few things so difficult to get rid of as this pest when it becomes thoroughly established. The practice we have followed very successfully was to syringe the Vines thoroughly as soon as the Grapes were cut, with a mixture of softsoap, soda, petroleum, and water. The water was at a temperature of 130°, 2 ozs. of softsoap dissolved in a 3-gallon watering-canful, also half an ounce of washing soda, then a wineglassful of petroleum placed in, and by filling the syringe quickly and forcing it back into the vessel a few times, the oil was mingled with the water. This done the syringe was filled and the contents forced on the Vines, the next syringeful being forced into the watering-can, then the next over the Vines, and the following one into the vessel, and so on. The object is to keep the oil mixed with the solution, and to wet every part of the Vines and house by syringing both ways. In three or four days repeat the dressing, and again at a similar interval. When the leaves are ready to fall take them off the Vines and burn them, and when the Vines are pruned subject the prunings to a similar ordeal. Then wash the woodwork with soap and water, using a brush; the glass with clear water. Limewash the walls. Remove the loose bark from the rods, not, however, peeling them into the live bark, and wash them with either a solution of soluble petroleum, according to the instructions supplied with the article by nurserymen and horticultural sundriesmen; or with a preparation of 2 ozs. caustic soda, and 2 ozs. of commercial potash, dissolved in 1½ gallon of boiling water, applying with a brush at a temperature of 130°. If you reach every mealy bug or its eggs with either of these applications you will do well, and end the trouble, but the pest lurks in all kinds of places, such as in dry soil near hot-water pipes, in fissures anywhere, and the under sides of dry shelves. The surface soil of the border must be cleared away, and a top-dressing given of fresh turfy loam. If any bug come next year, vaporise with nicotine at intervals of about ten days or a fortnight a few times, and that will clear out the pest. Of course, it must not be reintroduced.

Stubborn Pear Trees (*Newhurst*).—Your first thoughts were best. The "stunted" condition of the trees is the result of their large size when planted, and their comparatively weak root power. It is impossible to take up such trees without leaving at least half of their root fibres behind them, and the proportion of loss is far greater when the lifting is done—as is not uncommon—somewhat roughly. The balance between roots and branches was destroyed with the spade, and the larger the trees are the longer the time needed for restoring the lost equilibrium. Because the roots were so severely shortened in the autumn the branches ought to have been cut back in the spring to good wood buds, even if there were blossom buds beyond them. If, as appears to have been the case, there were many of these, the cutting back to small wood buds below them was the more necessary for obtaining free growth extension. Do this now. Wherever a branch from which extension is desired terminates in a bold oval shaped blossom bud, search for a small growth bud on clean wood below the terminal and shorten the branch to this bud; it may be a mere speck, yet capable of producing a shoot in the spring, which a terminal bud is not. Moreover, if the branches are numerous, or within a foot of each other, cut out some of the weaker or more stubborn looking entirely, even if they are studded with blossom buds. Your first object must be to encourage extension growth. There will be more than enough blossom buds after the pruning advised. If any young shoots have been made this summer, cut these back to the best buds on the soundest wood in each case. When growth is fairly starting in the spring, sprinkle the soil over the roots and for a little distance beyond them with nitrate of soda, at the rate of 1½ oz. to the square superficial yard, and on the approach of hot weather in summer mulch from the stems outwards to a foot beyond the extension of the roots with 2 or 3 inches of somewhat lumpy manure for conserving moisture and preventing the surface soil shrinking and cracking. If the mulching is applied in spring it will exclude the sun's warmth and defer root action. Admit the warmth by hoeing frequently in bright weather, not mulching till growth is free and the sun becomes exhausting. By blackening the cold clayey soil with soot in the spring it will be warmed the sooner. If the uppermost roots are about 4 inches below the surface do not add any more soil. With good root action and free growth you need not trouble about a little stock exposure. The branches must be free from scale or other incrustrations. If you have any doubt about this send us a small sample with spurs or blossom buds. It is gratifying to feel we have been able to add to the pleasures of your life, apart from putting a little money in your pocket, but this in itself is not infrequently a factor in human happiness. Carry out the instructions we have given with judgment and without fear, and you will be the gainer in the end, even if you sacrifice a few dozens of blossom buds now.

Inarching Vines (*W. S. J.*).—Lady Downe's and Gros Colman will do excellently for inarching with Muscat of Alexandria and Madresfield Court. Both stocks are good growers, and cater well for the scions you propose. This we have proved by experience, and with satisfactory results. We have also seen several instances of success in the hands of others when the Vines employed as stocks were healthy.

Victoria Medallists of Honour (*J. V.*).—The names of the selected medallists were:—J. G. Baker, Prof. I. Balfour, P. Barr, A. F. Barron, E. J. Beale, W. Boxall, G. Bunyard, W. Bull, F. W. Burbidge, W. Crump, R. Dean, G. Dickson, Rev. H. H. D'Ombrain, M. Dunn, C. T. Druery, Rev. Canon Ellacombe, H. J. Elwes, Prof. Michael Foster, J. Fraser, G. Gordon, J. Heal, Rev. George Henslow, H. Herbst, the Very Rev. S. Reynolds Hole, Sir Joseph Dalton Hooker, Rev. F. D. Horner, J. Hudson, Miss Gertrude Jekyll, P. Kay, J. Laing, C. Maries, J. McIndoe, H. E. Milner, E. Molyneux, G. Monro, F. Moore, Dr. D. Morris, G. Nicholson, J. O Brien, G. Paul, W. Paul, T. F. Rivers, Hon. Walter Rothschild, F. Sander, Baron Schröder, J. Seden, N. N. Sherwood, J. Smith, M. R. Smith, W. Speed, A. W. Sutton, O. Thomas, D. Thomson, W. Thompson, H. Turner, Miss Ellen Willmott, G. F. Wilson, Rev. C. Wolley-Dod, J. Wright, and G. Wythes.

Pruning Maiden Fruit Trees for Double Cordons and Pyramids (*G. N. S.*).—1, Cut the trees intended for double branched cordons at a promising bud with another equally prominent just below it on the opposite side at about 9 inches from the ground, and when the buds start rub off all but the growth from those two, or the most promising that push on opposite sides of the stem. It is not advisable to originate the growths nearer the ground, nor have them over a foot from it. The trees intended for pyramids should be cut down to 15 or 18 inches from the ground, always to a good bud well situated for forming a leading growth. This will cause side shoots to push sufficiently near to the ground for forming the base. The leader may be stopped at about a foot of growth, and the side shoots, not too many, say three to five, will form the framework of the tree. 2, Of the Apples you name King of the Pippins makes the best cordon, but if you desire higher flavour Cox's Orange Pippin will afford it, this variety making excellent and productive cordons on the Paradise stock, but requires a warm soil or substratum. King of the Pippins does well on a cool base. 3, The Plums you name—Victoria, Kirke's, Gisborne's, Czar, and Monarch, answer either as cordons or pyramids. It is a question of management.

Names of Fruits.—*Notice.*—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*J. C. D.*).—1, Withington Fillbasket; 2, Lady Henniker: 3, Hoary Morning; 4, Belle Dubois; 5, Mère de Ménage; 6, Golden Winter Pearmain. (*R. J. R.*).—1, King of the Pippins: 2, Cellini. (*J. Brown*).—1, Beurré Hardy; 2, Doyenné Boussoch; 3, Beurré de Capiaumont.

Names of Plants.—We only undertake to name *species* of plants, not varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*J. C.*).—The varieties of Crotons sent are all the outcome of florists' skill. If you send specimens to such a firm as Messrs. Veitch & Sons, who grow a large collection, they will name them for you by comparison. (*A. K.*).—Sternbergia lutea. (*C. H. W.*).—1, Colletia spinosa; 2, Jasminum Sambac flore-pleno. (*Orchidman*).—A charming variety of Cattleya labiata.

SANITARY SCIENCE.

What strides this has taken since our childish days! How much greater value is now set on human life, and in consequence how the span of that life is prolonged What care is exercised for us and over us; even if we are indifferent ourselves the law steps in and insists on precautions and remedies that till of late years were optional. We may live under a paternal government; let us be thankful we do, and show our thankfulness by aiding, rather than hindering, in the execution of those schemes for our own good and the good of those around us. Few families escape attacks of illness—illness that is often preventible—and how in many cases have we to mourn the loss of those near and dear, their untimely loss; we mean children in their youthful vigour, and men and women in their prime.

Country folk are often found who aver with scorn that nothing would prevail to make them live in close-smelling towns, where neither air, food or drink, could possibly be had fresh; and yet we are obliged to confess it—in sanitary matters our town friends are often ahead of us who dwell amid green fields and by running brooks.

True, town air must always be a good deal vitiated by the fumes issuing from thousands of chimneys, and by heavy mists and fogs that the smoky atmosphere will not allow to rise and pass away; but although the air may not be all we can desire, yet when it comes to a system of drainage, as a rule the town beats the country hollow.

In the matter, too, of scavenger work, all is done methodically and with a wholesome dread of the sanitary inspector's eye. The water supply has been undertaken by the municipal authorities; it is carefully analysed, tested again and again at intervals, and though occasionally, as at Maidstone just now, a fearful blunder may be made about the water, on the whole the consumer may be pretty sure his water is wholesome. He has, too, a plentiful supply for domestic purposes, and conveniently handy.

In case, too, of infectious complaints, the hospitals are open and free, and there is always the hope that the outbreak of any complaint may be confined to the patient who was removed in an early stage to comfortable quarters, where all that science and nursing can do will be done. Now, in the villages and solitary farm houses there is still much to do. Take the water supply alone. How often it is sadly defective, both as to quantity and quality!

There is not public enterprise enough for waterworks, and each house and each group of cottages has to depend on a well or spring, very much on the surface, water easily contaminated by dangerous matter from foldyards, cesspools, and badly arranged pigsties and other worse abominations. Then again, the supply (pure or otherwise) is by no means certain. We have known cases of water having to be led ten miles to satisfy the stock on a 1400 farm! What would happen in case of fire? Nothing could absolutely be saved. We know of another farm where the available supply was a large pond (which got very low and dirty in summer), and a pump where the water was highly impregnated with iron, so much so as to seriously disagree with most bipeds, and which put all the horses sadly out of condition.

Much is written and said now about impregnated milk. Certainly on some farms the poor cows do not have much chance of any fairly pure water. Whether their huge bodies act as filters, and enable the milk supply to be pure and wholesome, is a subject we had rather leave alone, it is too wide and too vast for us.

There was an Act passed in 1885 regulating the condition of dairies, cow houses, and milk shops, and insisting upon the registration of such people as cowkeepers or milk sellers. Now, certainly as far as we know, no retail milk dealers ever receive either a visit from an inspector or are registered. This may be all right in the main, but it leads to much carelessness in (1) the housing of the cows, (2) the storing of the milk. The water, too, used for cleaning pails and pancheons is anything but free from suspicion; and it is a well-known fact that milk is one of the most easily tainted of foods, and has often, alas! been the vehicle for carrying deadly disease. We have been interested lately in seeing a bottle of impurities extracted from milk in a Swedish creamery. The milk is forced through a layer of fine granite, which is afterwards purified by fire, and the wonderful and curious sediment was an object lesson indeed.

Of course in the case of private milk sellers we do not look for such excessive care, but we do ask that ordinary precautions should be used, ordinary cleanliness, attention to cow house and dairy, and to the water supply. So much waste is often permitted by the percolating of the liquid part of manure, a most valuable substance in the right place, and a most pernicious one in the wrong. Some farmyards are so badly constructed that this waste seems inevitable; others, again, are fitted with tanks and cesspools. In buildings which are unguttered there is waste in several ways. We lose the excellent soft water, which is often so bountifully provided; we allow it to dilute our manurial agents, and the drip from the eaves is highly detrimental to brick and woodwork. The ordinary farm labourer is a bit stolid, and will allow and enjoy his pig much nearer his back door than is good for health. We suppose the constant play of fresh air round the cottage minimises the bad smell, or habit becomes second nature.

There is often far too much carelessness as to the disposal of such dead animals that are not worth taking to the fellmongers. These possibly are thrown into a corner of the stackyard, to become the source of a great nuisance, if not danger.

Of course it is a difficult thing, well nigh impossible, to put all farm buildings into good sanitary condition. Landlords fight shy of improvements which bring them no present benefit, and the farmer is still less willing to lay down good money on another man's property.

How many stables do we find dark and ill-ventilated? This is, however, quite as much a town as country failing. A horse is peculiarly susceptible as to its bronchial arrangements, and many a case of "roaring" or broken-windedness can be traced to a close foul stable. No animal can thrive in dirt or discomfort, in extremes of heat or cold; but we speak often to very deaf ears.

There is a very wide field for reform in the treatment of several complaints incident to cows and sheep. In cows particularly there exists a severe form of lung consumption; often even when suspected the ailing animal is not separated from the rest of the herd till too late. Of abortion we hope to deal in another article—it, alas! is far too prevalent. If the inspector gets wind of it, he looks after the scabby sheep. But there are several other ailments that call for timely attention and isolation that pass all but unnoticed.

We think liver complaint is confined to man, and some will be surprised to hear what a victim the barndoor fowl is to this disease. So it is; but as a fowl is not ruinous matter, we advocate for the stopping of the spread of this complaint a sharp knife.

WORK ON THE HOME FARM.

The summer of St. Luke has extended into November, and has proved a friend indeed to the farmer of arable lands. Such a fine dry October without, absolutely without, frosts we cannot remember, and when we come to look back to our experience of last year, with its constant waterfall, heavy labour bill, and disastrous effects, we have much to be thankful for at the present time.

The late Wheat is going in splendidly; in fact, on light soils the conditions are almost too dry, and may tend to encourage the growth of such small weeds as the Poppy and the wild Convolvulus, which like a fine dry seed-bed; so we must keep a sharp look-out in February, and miss no opportunity of giving the young Wheat a light harrowing, which will kill the weeds while they are small and in the first leaf.

Though it would be bad policy to neglect any crop if it is worth growing at all, yet the prospect of fair if not good Wheat prices for at least another twelve months gives encouragement to every farmer to lay out both money and time in the attempt to produce a good crop. The early sown Wheat has come up quickly and well, and has made a most satisfactory start.

The trade for pigs is very slow. This is partly owing to swine fever restrictions, but more to a likelihood of a scarcity of pig food Potatoes are such a miserable crop that even the chats and cut tubers will be scarce and dear; this, added to the higher price of barleymeal and sharps, will have a depressing influence on store pigs. There is, however, a great probability of pork being dearer as Christmas approaches. We must remind our readers that attention is most important in pig-feeding. The animals should not have more food given them than they will quickly clean up; and instead of filling the trough morning and evening, as so many people do, the pigs should have five or six meals per day—small quantities at regular intervals. They should never be kept waiting beyond the usual time, but fed to the minute; they will thus keep quiet, and not fidget about and get agitated at being kept waiting. "A contented mind is a continual feast," and it goes a long way towards the fattening of all animals.

OUR LETTER BOX.

Fowls Picking out Each Other's Feathers (*W. Smith*).—Fowls in confinement are much addicted to this habit. Watch the birds on a sunny day (unseen by them), and you will probably detect the culprits. Remove them and place them in coops for a few days. Probably all the fowls will be found to be troubled by "nits,' this is the beginning of fowl pecking. Give plenty of green food, such as Cabbage and Turniptops, a fresh supply of dry earth and lime for dusting purposes, and if the fowls be very full of vermin dress with some harmless insect powder, which any chemist will supply.

REMARKS.

24th.—Cloudy early; almost cloudless from 10 a.m.
25th.—Fog early, clearing about .30 a.m., and sunny after.
26th.—Rain from 6.30 a.m. to 10.30 a.m.; almost continuous faint sunshine from 11.30 a m., but spots o rain at 1.30. p.m.
27th.—Dull, with more or less fog almost throughout, but a gleam of sun at 2 p.m.
28th.—Fog all day, slight for several hours in the middle, with the sun showing through.
29th.—Fog early, with sun visible; bright sun from 11 a.m. to sunset.
30th.—Fog till 11 a.m, with the sun visible; then bright sun till about 3 p.m.; fine night.
Another fine week, with more fog than usual.—G. J. SYMONS.

Journal of Horticulture.

ROOT-PRUNING AND OTHER JOTTINGS.

IN the busy round of daily labour connected with the gardener's art, each season has its own particular work, and thus time flies, as the world, like the gardener's work, is ever changing, decaying in one direction, springing into new life in another. Autumn and winter are seasons when vegetation recoups itself—by partial rest—for the work of another year; but while Nature rests the gardener must work, and, to some extent, bend her changing moods to his will, if the golden harvest is to follow. Look at those fine pyramidal and bush-shaped Apple trees beside the garden walk. How rampant the shoots have grown! What has Nature been doing here? Why does she refuse to give us fruit?

The above is the gist of a little homily delivered to me a few days ago by an intimate friend. Because, good friend, said I, you have treated her harshly. You have given the roots of those trees plenty of room to ramble at will, while you have tried to keep the branches within too limited a space. You have pruned hard and often, but the strong shoots still come, and will do, till you alter your tactics. There are two courses open to you; choose the one which, under the circumstances, you think the better. Remove the alternate trees, thin freely the branches of those left, and for the future keep them fully exposed to the glorious sunshine. Nature will show you that she appreciates your kindness, and will not withhold her reward. "Ah!" he exclaimed, "but the trees are so near to the walks that they will soon grow beyond bounds, and I should also like to retain that nice row of them intact. In other words, I must restrict them to the space they now occupy as regards their diameter, and I only want them to grow a little higher." Very well, you must then resort to another plan. Look at the main branches, they are too close together; they must be thinned with no unsparing hand. Cut some of them out till those left are at least 18 inches apart. Now fetch the spades and forks, and let us see what the roots are like. One of my old masters, years ago, gave me a good drilling at this kind of work, and the smell of the upturned soil always gave me an appetite for it—the work.

We dig out a trench 3 feet from the tree stem and 2 feet in depth, but few roots are seen. The forks are next handled to break down the wall of soil in front, so as to get nearer the tree stem, and soon we come upon long straggling roots with little fibre. These are carefully pegged back if thin enough for the purpose; the stronger ones we work round, picking out the soil with the forks. This goes on for a time, till a good trench surrounds the tree, and the ball stands in "splendid isolation." Next we meet with very strong roots, going down straight into the subsoil. These are severed with the spade or mattock, at a point where they penetrate the subsoil. As the stem of the tree is neared fibrous roots become more plentiful, and it is apparent that our hitherto radical plan of action may be altered. The ball of earth now extends for 15 inches round the tree stem; the surface of this is removed till a mass of roots is found, and then we are ready for filling in the trench.

The soil is rather heavy, so we obtain a few broken bricks or tiles, shovel more soil from the bottom of the trench, and ram the bricks firmly into the bottom of it. "Ah!" says my friend, "they won't get through that easily." A layer of leaves are next placed over the bricks, the ends of the roots cut with a sharp knife (making an upward cut), and a few inches of good soil placed upon the leaves and trodden firmly. We find a little fibrous loam handy, so a layer of this is next added, and some of the roots spread upon it, taking care to notch several of the stronger ones. More soil is added, the fresh loam being placed around the roots, and the old employed to fill the interstices. Thus the work goes on, layer after layer, the roots in each case being spread out to their fullest extent, brought up nearer to the surface, and covered with soil pressed moderately firm.

When completed the soil formed a mound a few inches above the surrounding ground line, and was left rough on the surface. I hinted to my friend that he might leave it in that state, to become sweetened and aërated till sharp frosts threatened, then a few inches of half-decayed manure placed over the soil would give the roots near the surface the protection needed.

My object in penning the above notes was that, as I thought perhaps there might be some other fruit trees in various parts of the country which were not satisfactory, the Editor of "our Journal" might think the notes worth printing. My old master used to pin his faith on practising that kind of work upon strong growing fruit trees, and I think he knew what he was about, at least I am sure he did when I remember the fine crops he grew. Another old plan he used to be very particular about doing was to unnail the Peach shoots as soon as the leaves had fallen, and let them hang away from the wall, the main branches being secured here and there. "A capital plan is this, my lad," he used to say, "for it helps to ripen the young shoots all round, keeps the buds back so that they do not burst into flower very early in the spring, and therefore they escape to a great extent injury by frost." Before the shoots were unnailed, if any trees had grown too strongly, a trench was taken out around it, and from 1 to 3 feet from the stem (according to the size of the tree), the points were cut with a sharp knife, and the soil replaced and pressed down firmly. In fact we were always pulling the roots of fruit trees about in the autumn.

Sometimes we went into the orchard or fruit plantation, and set to work in earnest there. If we came across a tree that looked stunted, though not particularly old—one that looked starved—a trench was soon taken out round it; sometimes this was 5 or 6 feet away from the trunk, and more than 2 feet in depth, Some good manure was then placed in the bottom, a layer of soil added, then another layer of manure, and so on, till the hole was filled in. Any soil left was scattered about in all directions, and a coating of real good manure spread upon the ground as far as the branches extended. The weakest of the trees were treated in this way, and many others received heavy waterings with liquid manure, for we had several cesspools which required emptying about that time. The liquid in them was strong too, so strong that we seldom ventured to apply it at full strength, but generally diluted it with an equal part of water.

I remember once after watering some Ribston Pippin Apple trees in the way above described they bore some grand fruits the following season. A dish of these easily won first prize in the class for dessert Apples at our local show (which was famed for its Apples). Some of the old gardeners said our "Ribstons" were so good that they ought to have been sent to one of the "big London shows;" we might even have got a medal for them. My old master was one of the ancient school (in some things), for he used to take such pride in his wall trees; he would have the young branches start from just the right point; it was useless to suggest how quickly we might cover the space by bringing a shoot "a little way round" to fill up a blank; the look he gave the one who made the suggestion usually prevented him from taking a similar course the second time. "No; I must have a shoot just there, and you must keep cutting the leaders back till the required shoot comes." These were not exactly the words the master used, but they show what he meant—he had the gift and language, and put the matter quite forcibly.

Old unfruitful wall trees were not tolerated long in that garden. When they ceased to be fruitful, up they came without much mercy being shown them, and some of the very best new varieties speedily took their place. When this sort of thing did happen there were no half measures about the work. Holes 5 feet in diameter were taken out, they were generally made 3 feet in depth, and then given 6 inches of drainage in the shape of rubble and broken bricks; after these bricks were covered with old turf, some of the old soil was placed over it, and then the young trees were planted entirely in good turfy loam. It was something like loam, too, that we used to get there; so full of fibre, and quite a good "holding" soil. I remember many things that my old master used to believe in; he held strong opinions about pruning; but I must stop now.—WORKING GARDENER.

THE LANGUAGE OF PLANTS AND FLOWERS.

I TRUST no reader will imagine, after reading the above heading, that I am going to indulge in a series of poetic quotations from some popular "Language of Flowers." Those dainty little collections of poems and sentimental phrases suit well the taste of many in the "gushing days of early youth," but as the years roll on we all, I think, take a more practical view of life, and thus become interested more particularly in things which lead to progress, and increase our knowledge of the wonders of the universe.

It is, therefore, my intention to endeavour to show what practical lessons we can learn from the appearance of plants and flowers under various circumstances, for observant cultivators have long ago discovered that their appearance at various times and under differing conditions show plainly what is, or has been, amiss with them. Let us just take a case which is apparent to all, and then pass on to deal with others which require the exercise of close observation to detect. If on a hot summer's day we find the leaves of a plant drooping—or, as we term it, flagging—while the soil is dry, such a plant is asking in unmistakeable language for water; the constant stream of liquid passing through its cells has been reduced to its lowest possible ebb, its motive force has gone for the time, and unless attention is quickly given the energies of that plant are permanently enfeebled. Those who by experience and observation have learned to read the language of plants, even as they learn to read a book, know these things at a glance, and act quickly when mistakes are discovered.

Again, there are times when the leaves of plants droop while the soil in which they are growing is quite wet, yet here the leaves present to a close observer quite a different appearance from those which droop through dryness of the soil. The too wet soil causes many of the white tender root points to decay, and thus lessen the supply of food, or manure water applied in too strong a form will have the same effect. There is yet another instance of leaf drooping which differs from either of the above, and which may be more quickly set right. It is that of a plant under glass flagging during bright sunshine, when the roots are perfectly healthy and in the right condition in regard to moisture. This usually takes place after dull periods, or when the sun bursts out with stronger force than usual, and shows that evaporation from the leaves is taking place more rapidly than the roots can supply the needed moisture. Shade the leaves, and thus lessen evaporation, and they quickly resume their natural appearance. To the observant gardener they said quite plainly—in their language—"Give us shade."

Take another phase of the subject—the watering of delicate plants, or of more vigorous ones in a critical stage of their development, such as Chrysanthemums when unfolding their florets. A good waterer studies not only the appearance of the soil, but also of the plants. Many a time he will be in doubt as to whether water is really required, and a glance at the foliage quickly decides his plan of action. And yet he would be unable to thoroughly explain the precise way in which he gleaned this "revelation" from the leaves, though he might tell you he noticed an indefinable something about them which the trained eye understood, if the brain did not. There are, however, many instances in which vegetation speaks quite plainly, even to eyes that are not highly trained.

Go into a neglected garden, or badly cultivated field in summer time when the crops should be looking their best, what a sorry plight either presents. The crops are poor and poverty stricken in appearance, while the weeds are rampant, robbing the ground of much of the food it contains. To the gardener who practises good culture such struggling crops cry in unmistakeable terms for food, for space free from noxious weeds. Look also at the stunted trees in many an English orchard, stunted through starvation combined with a neglect to thin the branches. Manure and a free circulation of air are the things they ask for; give them that which they crave, and they will in due time reciprocate the kindness.

Strange as it may seem to some, it is none the less true that only a few years ago I met with fruit growers in Kent who still clung to the doctrine that fruit trees did not need manure. But it is right to add that were some of the "old school," who were not noted for the high quality of their produce. I think there are few readers of the *Journal of Horticulture* who do not know that—when the land has been properly prepared before being planted—young trees do not require manure till they begin to bear good crops, but if it is then continually withheld stunted growth and unsaleable fruit will in time be the result.

Fortunately, however, there is a brighter side to this subject, for plants, trees, and flowers show quite as clearly when they are being well treated as when they are neglected. The vigorous crops of vegetables which have been well attended to during every stage of their development show by their glossy leaves, stout stems, and shapely roots or tubers, that they will yield a bountiful harvest. The well-tended orchards and fruit plantations, which are now yearly increasing in number, give—if we take the average for a number of years—a return for the labours bestowed upon them such as few other crops will yield. During a plentiful season, when the brightly streaked or golden fruits are weighing down the branches, a gladness pervades the land, for if rightly disposed of it means abundance of delicious food for millions. Even in seasons when fruit is somewhat scarce we have to some extent a consolation, for England would not be half so fair without her fruit trees at blossoming time.

The numerous flowers, too, which are cultivated solely for their beauty have a fine language of their own, and when that language bursts forth in all its beauty at some critical time, or in some almost forsaken spot, its influence cannot be withstood by the hardest and most callous natures. To the hardened criminal it speaks of the green fields and flowing streams of innocent childhood days, and the mind is instinctively uplifted at the thought. To the sick and suffering in many a home of poverty flowers speak, and inspire with a magic spirit of hope.—H. D.

WATERING PLANTS.

"A Busy Man" (page 431) inquires why the per-centage of loss among market growers' plants is so small and the results so good. To answer this question fully would require a lot of space, but there are several things that lead up to it.

In the first place, market growers' plants, as a rule, are graded; each batch of plants is in the same size pots, and one is almost a fac-simile of another. But there is a more important point than this. Any man of experience in plant growing can easily tell by the appearance of such as Pelargoniums, Chrysanthemums, and many others, whether or not the plant is dry at the root. The thing is to get into the habit of thinking, and acting quickly and decisively. The hand and head must work together, and one might almost say that a practised eye sees through the ball of soil contained in a flower pot. There is a lot of time wasted in private gardens by the knuckling process, as your correspondent terms it; but I imagine that the promiscuous use of the hose would not lead to the splendid results one may daily see in Covent Garden.

I recently saw a collection of some 20,000 Heaths that were being prepared for sale at a large market-growing establishment, but I can answer for the fact that each one of these had for months been separately examined before water was given. The collective mode of treatment that a market man can practise simplifies his work considerably, and I do not speak without experience in market work; but "A Busy Man" may rest assured that well considered culture may go on, notwithstanding the fact that the hose is used pretty freely.—H. R. R.

BUNYARDS'.

Good Fruit and no Fever at Allington.

A song for dun October,
That tints the woods wi' broon,
And fills wi' pensive rustling
The wooded dells aroon'.
While lintie, merle, and mavis
Nae langer pipe wi' pride,
Nor larks wi' song salute us
Aboon the green hillside.

It is old-fashioned, I believe, to begin an article with rhyme, and still more so to end with it. And yet—well, stand on the "green hillside" of Allington, gaze round on the beautiful wooded landscape, rich with the browns and yellows, the chromes and coppers, of early autumn, and the searching lines force themselves out. Below lies the stricken town, but it has no air of melancholy. Cheerful and bright it looks under the October sun, making the best of misfortune as bravely as its inhabitants are doing.

The Red Light Extinguished.

Danger? A fig! If there were danger in entering Maidstone then would the present writer have something to boast about; but there is none—not a shred; not a particle. And as for Allington—why, the place is two miles away, with a distinct water supply, a wholesome situation, and as fine, invigorating an air as anyone need wish to breathe. It is strange to hear that a buyer from Bunyards' has cancelled a good order because—mark the reason—he does not care to have trees from a neighbourhood where there is fever! It would be as reasonable to refuse to buy sugar at the Army and Navy Stores because a plant in the Drill Hall was attacked by green fly. Injustice would be done to a good old firm and to a distinguished fruitarian if this example (which is based on complete lack of knowledge) were followed. Nothing kills like ridicule, and floods of it ought to be poured on people who display such unreasonable nervousness.

Visitors to Bunyards' need not go near Maidstone unless they wish. Practically, the nursery has a station of its own. "Ah!" someone may remark; "and that station is Barming, where the fever is bad." Another baseless objection. The station for Barming village is East Farleigh, and the L.C.D. station of the former name is probably two miles away. A good two miles, judging by the vigorous remarks of people who get out at Barming station under the impression that they are at the village. Nothing of the sort; they are at Bunyards'. There, close to the line, is a private gate, and a civil porter lets you through it. Once across the portal you have acres of trees all around you, and a wholesome fruit atmosphere, healthy, inspiriting, driving away with a rush all unworthy fears.

A Tree Transformation—Axes and Brains.

A beautiful nursery this. For a full mile along the railway it stretches, the front most tastefully and handsomely adorned with shrubs. It stretches away in all directions, bounded by a distant tree in one quarter, by a wood in another, and so on. The whole affair spells progress. Not so many years ago three parts of it was simply a wood. Axes got loose in the wood, so did brains. The axes did not scatter the brains (there is too much of that lop-sided system at work in the world), but the brains guided the axes. That is why scores upon scores of acres have been so marvellously transformed. They are wood now, if you like to look at it in that way, for far as the eye can reach almost there is nothing but trees, full of health and full of vigour; but the millions of fat buds bristling among and through the yellowing leaves tell of a new order of things. Their mission is a higher one than that of the old-time trees. They yield the magnificent fruit that carries the name and fame of Kent all over the United Kingdom. That forlorn looking bush, now drooping its aging foliage, gave a Bismarck the size of a teapot, and the drift of trees on the right yielded the Gascoynes of which the huge size, splendid shape, and brilliant colour have been the admiration of fruit growers everywhere.

Double Working of Fruit Trees.

The fruit trees, which stand in serried ranks at Allington, represent the finest material which high skill and good Kent soil can produce. When the axe was done with, spade and pruning knife came in, and there were brains behind them too. There are differences, because individual varieties have their special characters, but the differences are in habit of growth, not in health. Standard D'Arcy Spices, beside Ecklinvilles, show marked differences, the former being one of the weakest of growers, the latter one of the strongest, but the one is as clean and sound as the other. In connection with this point of relative vigour, it is instructive to observe the enormous care and time devoted to overcoming the weaknesses of varieties, especially by double working. Some varieties almost refuse to make standards. Neither coaxing nor pushing will get them up. Such awkward customers are conquered by grafting them standard high on more kindly sorts, but it all means time and labour, which again means money. To begin with, there is the stock proper (let us say the Crab), then there is the secondary stock (Ecklinville, for example). The Crab has to be produced, then the Ecklinville has to be thoroughly established on it, so by the time the graft can be put on six or seven years have elapsed, and more time still is needed to make a tree ready for sale. Buyers do not always think of these things when comparing the price of good trees and rubbish.

Some of the Apples.

And what about varieties? Sit down, puzzle your brains, and when you've made what you consider to be a complete list, you will discover

that they are all here, and plenty besides. Too many. Yes ; too many for the growers as well as the bewildered publie ; but it is the demand whieh regulates the supply. Belle de Pontoise is in very fine condition and promises well. Some people talk about Bismarck going down hill (it has perhaps become affeeted with the general "deeay" of some pessimist), but the signs of it are not apparent at Allington. Gascoyne's has been mentioned; its condition is remarkable. Hambling's Seedling goes down in the notebook at once, and before you are half way round the fruit room stations have been allotted in the garden at home to James Grieve, Lady Sudeley, Mrs. Barron, Newton Wonder, Christmas Pearmain, Allington Pippin, Bow Hill Pippin, Royal Jubilee, and Wealthy. James Grieve is mentioned as an "Early Cox's." Hum ! that must be pondered a little. Happy thought—try one. Verdiet—flavour good, Apple an aequisition, but (and somebody smiles) not *quite* up to the mark of the rare old champion. Nottinghamshire ought to be grateful to Kent for the way in whieh it advances the elaims of Newton Wonder. The examples of the latter are a sight to see. (Mem.—Half a dozen stations for this grand late sort.) Lord Derby and Lane's Prince Albert show well, and King of Tompkin's County is beautifully represented. A fine poor soil Apple this. There are splendid "Mothers" and "Mabbott's," and noble examples of fifty other good sorts, but type waits for no writer.

Old and New Pears.

Doyenné du Comiee is prominent amongst the former, rest assured. Truly, a splendid Pear. One of the happy band that possess both a future and a past. Emile d'Heyst is exeellent too, a most useful variety, whieh is steadily making its way. Amongst the less known sorts Beurré Fouqueray has strong claims, and so has Conference, but a speeial word must be said for Fondante de Thirriott. It is eharged with juiee, and has a flavour of its own. It has not perhaps the rich aroma and delicaey of Doyenné du Comice or Marie Louise, but a more refreshing Pear does not exist. Marguerite Marrillat is making progress, and will be more and more grown as time goes on. There are few early Pears so good. Of later varieties Le Leetier is one of the best.

The genial guide, Mr. Bunyard's right hand man for many a year, truthfully remarks that an Oetober afternoon is not enough to see everything. In the goodness of his heart he says something about "a week." But would the "Thirriotts" last out? I doubt it. Still, fever or no fever I shall go again.—W. Pea.

ROYAL HORTICULTURAL SOCIETY.

Drill Hall.—November 9th.

The exhibition at the Drill Hall on the above date was one of the smallest on reeord. The amount of bare spaee was considerable, but eannot be a matter for surprise when the number of other fixtures on the same day are borne in mind. Eaeh section was small, and there were only two or three large colleetions in the show.

Fruit Committee.—Present: P. Crowley, Esq. (in the ehair); with the Rev. W. Wilks, and Messrs. G. Bunyard, A. H. Pearson, A. Dean, W. Iggulden, C. Herrin, F. Q. Lane, J. Smith, R. Fife, G. Norman, G. W. Cummins, and J. Wright.

Very little produee was plaeed before the Committee on this oecasion. Mr. G. Wythes sent a brace of his new Cabbage, Wythes' St. Martin s, evidently a seleetion with a little of the Colewort eharacter in it. Requested to be grown at Chiswiek.

Mr. Owen Thomas sent a box eontaining two dozen splendid Cueumbers. The variety was raised at Frogmore between Roehford's Market Cueumber and Dickson's All the Year Round. It ereated a very favourable impression, and the Committee desired to see fruits early in the eoming year. The variety is named Frogmore All the Year Round.

Messrs. Hartland & Sons, Cork, sent Apples of Munster Pippin, very large, clearly striped, and mottled with red and yellow, but the Committee thought the variety could serve no useful purpose.

Mr. W. Iggulden sent four market baskets of Gros Colman Grapes, weight 48 lbs., grown in ordinary field soil in one of his vineries at Frome. The Grapes were splendid in size, uniformity and eolour, and a silver Banksian medal was unanimously awarded.

Mr. W. H. Divers sent from Belvoir Castle upwards of thirty dishes of Pears, elean and exeellent fruit throughout ; such a meritorious exhibit of Pears is rarely seen from a private garden. A number of bright John Downie Crabs seattered on the eloth between the dishes imparted a pieturesque appearanee to the collection. A silver Banksian medal was unanimously awarded.

Messrs. Harrison & Sons, Leicester, sent a collection of Beets under twenty names, but the Chiswiek trials have proved that one name answers for several varieties of Beet. The exhibit was good, and a bronze medal awarded.

Fruit Flavour Classes.—The first prize for a dish of Apples went to Mr. T. Turton, Maiden Erlegh, with Cox's Orange Pippin. Mr. G. Woodward was seeond with Ribston Pippin. In Pears the prizes went to Mr. G. Woodward with Doyenné du Comice, and to the Rev. H. S. Palmer, with Glou Morçeau.

Floral Committee.—Present : Mr. W. Bain (in the ehair) ; with Messrs. J. D. Pawle, J. T. Bennett Poë, C. E. Pearson, J. F. MeLeod, J. Jennings, C. J. Salter, J. H. Fitt, C. Jeffries, E. Mawley, and R. M. Hogg.

Mr. R. Gulzow, Bexley Heath, sent to the Drill Hall a large group of seedling Dracænas. The plants shown comprised many that were distinct from existing varieties, and several were of fine quality. Unfortunately, the dulness of the weather and the position in which the plants were placed made it impossible to see the colours properly (silver-gilt Flora medal).

Messrs. H. Low & Co., Upper Clapton, sent a small collection of Carnations. Mr. C. Caddell, The Gardens, Camfield, Hatfield, showed Chrysanthemum Ellen Lady Clark, a new white variety. Messrs. W. Balchin and Sons, Hassocks Nursery, sent Diplaeus rubrum and D. Jubilee. Messrs. J. Veiteh & Sons, Chelsea, staged Aster grandiflorus and Wallflower Parisian Early.

Very fine was the exhibit of Chrysanthemum blooms staged by Mr. G. Wythes, gardener to Earl Percy, Syon House, Brentford. Each flower was shown on a long stem, and the effeet was very good. Both Japanese and incurved varieties were represented, and amongst the best may be noted, of the former, Miss M. Blenkiron, Royal Sovereign, Viviand Morel, Mdlle Marie Hoste, Charles Blick, Florenee Davis, Edwin Molyneux, Amos Perry, Australie, Graphie, Miss Elsie Teichmann, H. L. Sunderbrueh, Col. W. B. Smith, Mdlle. Thérèse Rey, and Pride of Madford. Of ineurved varieties there were Emily Dale Improved, Lord Alcester, Brookleigh Gem, Mrs. Dixon, Golden Beverley, Mrs. S. Coleman, Jeanne d Arc, Madame Darier, and Golden Empress (silver Banksian medal).

Mr. W. J. Godfrey, Exmouth, sent a few Chrysanthemums, quality taking the place of quantity. The flowers were large without being eoarse, and the eolours were elear and beautifully developed. Amongst others were W. H. Godfrey, Lady Northcote, Duke of Wellington, Admiral Ito, George Gover, Mrs. M. Grant, Beauty of Adelaide, and Mrs. Chas. Keyser.

A. Kingsmill, Esq., Harrow Weald, send fruiting pieces of Vitis heterophylla humilifolia, of whieh the profusely borne berries are slatish to bright blue, with darker spots. Mr. W. Bain, gardener to Sir Trevor Lawrenee, Bt., Dorking, sent Sonerila in variety, with Chrysanthemums bronze Mrs. J. Gardiner and Brnant.

Mr. R. Owen, Maidenhead, sent a small collection of Chrysanthemums, including ineurved, Japanese, and Anemone flowered varieties. Mr. J. Russell, Richmond, exhibited a eapital colleetion Ivies, including dwarf plants, bushes, and standards (silver Banksian medal).

In addition to the exhibits that have been noted above, there were several others, mainly of Chrysanthemums in small numbers. As none of them was of speeial merit it would serve no good purpose to particularise.

Orchid Committee.—Present : H. J. Veitch, Esq. (in the ehair) ; with Messrs. J. O'Brien, De B. Crawshay, H. J. Chapman, F. J. Thorne, T. W. Bond, W. H. Young, J. Jaques, C. Winn, S. Mason, R. Courtauld, H. M. Pollett, W. Thompson, and T. B. Haywood.

Mr. Smith, Orchid grower to the Right Hon. Joseph Chamberlain, Highbury, Birmingham, sent half a dozen Orchids, eomprising a variety of Cattleya labiata, C. Fabia, C. Mrs. Endieott, C. marseillensis, with Lælio-Cattleyas Sallieri and Semiramis (silver Banksian medal). Messrs. W. L. Lewis & Co. ,Southgate, sent a number of plants of Lælia præstans, of whieh this firm has a eharming type (silver Banksian medal). Messrs. H. Low & Co., Upper Clapton, sent Vanda eœrulea, Calanthe Veitchi alba, with a few Cypripediums in variety. Messrs. F. Sander & Co., St. Albans, exhibited some eharming Orehids, ineluding Lælia autumnalis delieata, a few varieties of Cattleya labiata, C. aurea, Lyeaste Skinneri, Cypripedium insigne Sanderæ, Dendrobium Johnsoniæ, and Lælio-Cattleya broomfieldiensis (silver Banksian medal).

Messrs. J. Veitch & Sons, Ltd., Chelsea, were not largely represented by Orchids, but the plants were very interesting. There were Lælio-Cattleya Deeia, L.-C. Lady Rothschild, L.-C. Pallas, L.-C. Statteriana, Cattleya Portia, C. Eurydiee, Lælia Novelty, with Cypripediums Niobe, Euryades, and Tityus (silver Flora medal). G. Shorland Ball, Esq., Ashford, Wilmslow, sent a small eollection of Orchids in whieh Cypripediums were most conspicuous. The varieties were of good quality (silver Banksian medal).

Certificates and Awards of Merit.

Calanthe Veitchi alba (H. Low & Co.).—This is a pure white form of the type, and is very rarely seen (award of merit).

Cattleya Fabia (J. Smith).—A grand hybrid from a cross between C. labiata and C. aurea. The sepals and petals are rich rose, and the superb lip is velvety crimson, paling towards the margins (first-class certifieate).

Cattleya labiata Lewisi (W. L. Lewis & Co.).—The sepals and petals of this variety are pure white, as is the fimbriated edge of the lip, the central portion of whieh is maroon (award of merit).

Chrysanthemum Admiral Ito (W. J. Godfrey).—This is a reflexed Japanese of fine form. The colour is very pale orange with yellow tips (award of merit).

Cypripedium Heeanum magnificum (G. S. Ball).—A beautiful variety. The petals and poueh are green suffused with brown. The dorsal sepal is green at the base and pure white beyond. There is a broad brown band running down it (award of merit).

Dracæna indivisa var. (R. Gulzow). — A handsome green-and-white leaved variety (award of merit).

Sonerila Lady Burton (W. Bain).—A silvery leaved form with green venations. The flower is pink (award of merit).

Wallflower Parisian Early (J. Veiteh & Sons).—A large flowered dwarf growing annual variety. The colour is yellow and yellowish brown. The plants shown were from seeds sown in May (award of merit for the strain).

ORCHIDS

Cœlogyne Sanderæ.

This is a very charming Orchid, and is distinct from all the other species of Cœlogyne. As may be seen by a reference to the woodcut (fig. 68) the flowers are small, and are produced on an erect spike. The petals and sepals are creamy white, with a faint tinge of lemon yellow. The lip is white, with a beautifully fringed margin, orange yellow centre, surrounded with longitudinal ridges of brown hair-like filaments. When it was exhibited by Messrs. F. Sander & Co., St. Albans, in 1893, it received the first-class certificate of the Royal Horticultural Society. This information will probably be of interest to others as well as "Geo. Browne," who has written to us on the subject.

Cœlogyne fuliginosa.

This is not a very showy species, but the dusky looking flowers are very distinct, and are produced two or three on a spike, though only one of these is expanded at a time. The sepals are almost white in ground colour, the petals narrow and thread-like, reflexed at the tips; the lip has a brownish front lobe and central lines of the same colour, from which the species takes its name. The pseudo-bulbs are each about 3 inches in length, shining green, and connected with a wiry rhizome. Its culture is not difficult, and it thrives in a shady, warm house. It is not always as free-flowering as one could wish, but always grows at a great rate. It is a native of Northern India, and was first introduced in 1838.

Cattleya Bowringeana violacea.

This is quite distinct from the typical C. Bowringeana, and makes a nice companion plant, though it is not so showy. The sepals, petals, and lip are rose suffused with violet, the tubular lip having a blotch of the same colour in the front. C. Bowringeana is, unfortunately, one of the worst of town Orchids, and growers in the neighbourhood of London have great difficulty in preserving any of them from the fog. For this reason it should be kept warm in such localities in order to bring out the blossoms early.

Odontoglossum Edwardi.

Although the individual blossoms of this species are small, their distinct and showy colour, and the handsome appearance of the long branching spikes, make it a favourite wherever grown. In habit it is quite distinct from the majority of the genus, the smooth oval pseudo-bulb being about 5 inches high, the deep green foliage attaining considerable height. The spikes occur at the base of the bulbs in the sheath formed by the leaves; they appear at various times during late summer and autumn, and are usually in flower during winter. Plants that are strong and well grown produce immense panicles a yard and upwards in height, freely branched and many-flowered.

The colour is a bright magenta or puce, the lip having a yellow centre, and the blossoms are sweetly scented. It is a native of Ecuador, and thrives well in a cool moist house all the year round. It usually commences growing early in spring, soon after the blossoms are past, and the progress of the growth is rapid, provided the atmosphere and temperature are kept right, and the plant otherwise treated judiciously. When the pseudo-bulb is nearly finished the flower stems show, and during the time this is forming the plant has the dual strain of the advancing spikes and finishing bulbs.

This is the time when most water will be required, but it is a rather thirsty plant all the year round. The only time a slight diminution is necessary is just after the blossoms are past, but even then the bulbs must be kept plump. The roots are large and fleshy, much more so than most other kinds, and like a very rough and open description of compost. Good fibrous peat in lumps as large as a Hazel nut, and clean freshly gathered moss in equal proportions suit it well, but to keep it aërated and open a liberal addition of charcoal broken in lumps may be made.

Turn the plants out of their pots very carefully, as they are easily damaged by undue disturbance, and if the roots are much entwined about the inside of the pot the latter should be carefully broken. The roots may be reintroduced with the pieces of potsherd attached, and the bases of the pseudo-bulb should be kept a little above the rim of the pot, filling up with the compost and finishing in a clean convex line. After repotting, which should take place after the growth has made considerable progress, allow rather less moisture than usual at the roots, but keep the atmosphere very moist. Syringing is not advisable during dull or damp weather, but light dewings are helpful on hot days.

Besides being of assistance in keeping the atmosphere right, it helps also to keep insects at bay. Scab and red spider are the most frequent pests, but these are easily kept under with ordinary vigilance. A house that always seems pleasantly cool on entering from outside is rather difficult to arrange in very hot weather, but this is the best place for O. Edwardi. It is not much use attempting to keep it at any stated figure, but as near 60° as possible is the most suitable day temperature, dropping a few degrees by night. Even in winter very cool treatment is not advisable, as while the spikes are advancing the plants are easily checked.

Shade and free ventilation are also essential, and in winter a nice light position should be allowed. Its habitat is high up on the Andes

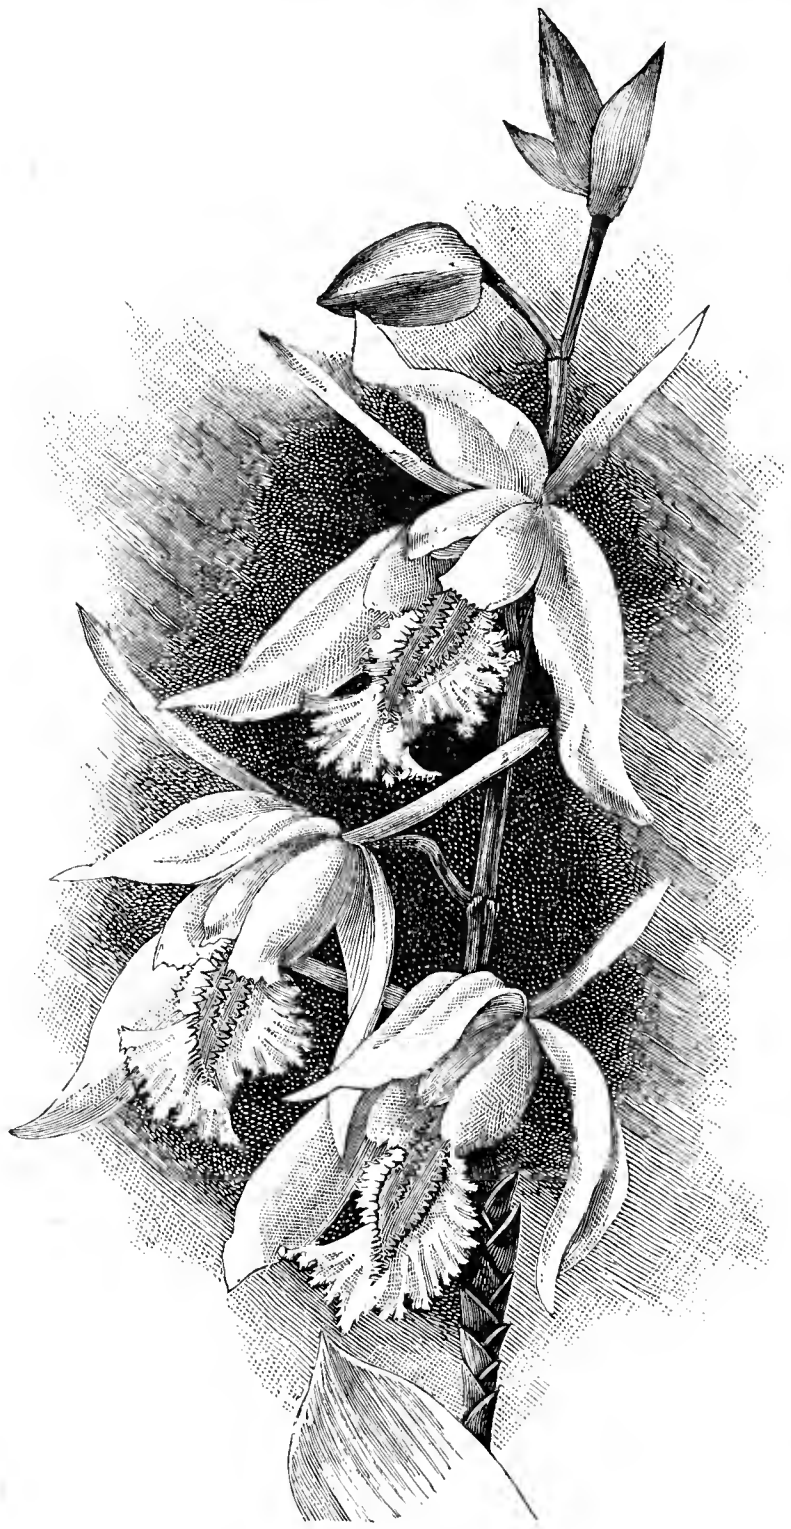

Fig. 68.—Cœlogyne Sanderæ.

of Ecuador, where it was discovered some seventeen years ago by a German collector, Edward Klabret, after whom it was named by Reichenbach. Few varieties of it are known, and these principally differ from the type in the size of the flower, which varies from three-quarters of an inch to nearly double that width. These last well in good condition, and the plants are useful for indoor decoration. It first flowered in this country at Wilton House, Southampton, in the collection of Mr. H. J. Buchan.—H. R. R.

THE LAST FLOWERS OF AUTUMN.

Roses are blooming very late this year; but the weather is growing perceptibly colder, and their season will soon be past. Yesterday (November 7th) I gathered a bouquet of several of the finest varieties, including Marie Van Houtte, which is always with me the latest flowering of all the Teas; Caroline Testout, a splendid variation from La France; Clara Watson, one of the grandest of the Hybrid Teas; A. K. Williams, which still retains, under most unfavourable atmospheric conditions, its beautiful form and brilliant complexion; Viscountess Folkestone,

which has not yet forfeited its charming fragrance; Madame Pernet Ducher; Niphetos, heroically blooming on the south wall of my garden; and Souvenir de S. A. Prince, which, without any protection, is achieving similarly gratifying results. The absence of frost, notwithstanding the prevalence of a strong east wind, may account for this long continuance of bloom.

I have an Auratum Lily at present in flower, the latest I have ever seen in any garden; but the blooms, of which there are twenty-one, have not their normal brightness of aspect, and are limited in dimensions. Nevertheless, from a distance it has a striking effect. The white flowers of a very late speciosum Kraetzeri are wrestling with the winds. Sweet Peas, single Dahlias, and "early flowering" Chrysanthemums still appear to flower with considerable facility, and will, no doubt, continue to do so until the full severity of winter has come. Even then Jasminum nudiflorum will console us, and the Snowdrop and Crocus will not be far away. —DAVID R. WILLIAMSON.

GROS COLMAN GRAPES AT COBHAM.

A FEW years ago Mr. A. A. Bennett, of Cobham, Surrey—a worthy member of a respected family of land-owning farmers there—was impelled to depart from the beaten track and indulge a little more freely than before in his taste for gardening. He started with small houses, and these answering, he erected larger. Altogether there are about twenty now; as compact a block and as well occupied as anyone could desire to see. He was fortunate in securing as a cultivator such a sound gardener as Mr. J. G. Smith. Not the Vines only, but various plants grown for cut flowers—and notably, perhaps, Freesias—are entirely creditable to all concerned.

The vinery (of which we give a photo) is a span-roof structure, rather flat and low, its dimensions being 160 feet by 20. It is one of three similar houses erected in 1888, which, not being intended for vineries, were not provided with any front ventilation, and not very much at the ridge; in spite of this drawback the Grapes have always coloured fairly well, the berries being of good size.

The Vines were planted 3 feet apart in 1892, having been raised from eyes the previous season. They made good growth to the top of the house and part of the way down the opposite side of the roof, the canes being well ripened, and at pruning time were allowed a length of 3 feet from the first training wire.

The following season, 1893, they carried 832 lbs. of Grapes, and at the winter pruning were left with an extension of rod of about 3 feet, the crop in 1894 weighing 3144 lbs. In 1895 with rods 2 feet longer, 2702 lbs. were cut, the reduction in weight being accounted for by the smaller bunches, which, however, were of a good saleable size. The following year, 1896, fruiting to the top of the available space, the weight amounted to 2920 lbs. The total length of rod is 10 feet from the first wire to the apex of roof, and about 2 feet from the surface of the border to the first wire. The other houses have borne weights very similar to the above, the three houses varying but very little.

The borders are composed of the natural soil, which before the Vines were planted was trenched about 5 feet wide on each side of the house, road sidings and burnt garden refuse being mixed in as the work proceeded. An additional width of 2 feet was added in 1894, and now the border extends the whole width of the house.

It will, perhaps, be assumed that the soil is naturally an ideal one for Vines. As a matter of fact it is so sandy that half the gardeners in the kingdom would have voted for its removal and the making of new borders of sound turfy loam. There is one great advantage of sandy soil—namely, that it can be generously fed without souring. What has been used in feeding in what are known as the Ashford Vineries we are unable to say, but there were bags of steamed bonemeal about—a better fertiliser, perhaps, than everybody comprehends. Whatever may have been used, and assuming that the crop this year equals that of last, over 5 tons of Grapes have been taken from the house in as many years, which is not bad for sandy soil.

The Vines have been under the care of Mr. Smith the whole of the time. The photo (page 459) was taken for Mr. A. A. Bennett by Mr. Walter Johnson, Cobham.

POTENTIAL PLANT FOOD.

THERE is very little plant food in sandy soils, but what there is is readily available. In clays there is more potential plant food, but not so readily available. In order to make it useful the soil requires more tillage. This is an important means of releasing plant food which otherwise might remain locked up, as it were, in the soil. The question of moisture is, however, quite as important. Water is the medium by which the soluble food in the soil passes into the root-system of plants, thence to the stems, leaves, and every part requiring development. An excess of soluble plant food applied to the soil when the latter is in a very dry state would prove injurious to the tenderest rootlets because there would not be a sufficient amount of water present to dilute the soluble food, making it safe for the roots to receive. It is well known to gardeners that highly concentrated liquid manure is injurious if given when the soil is dry to plants in pots.

Taking the soil as a whole there is an enormous amount of dormant food in it. Of the most important essential food constituents for the maintenance of vegetable life, potash occupies a leading place. It has been computed by reliable authorities that in the first 8 inches of an average soil there are 16,000 lbs. of potash per acre, 3000 lbs. of nitrogen, and 4000 lbs. of phosphoric acid. In the second 8 inches there are over 4000 lbs. of nitrogen, 2000 lbs. of phosphoric acid, and nearly 7000 lbs. of potash. These experiments were carried out with soils of very different character. Peat soil contained much humic matter; sandy soil had but little.

The results show conclusively what an enormous amount of food in a potential form lies at hand. Soil cannot really be exhausted. When any particular plot of ground is said to be exhausted of plant food, it is frequently more to the point to say that all its available food is exhausted. In a soil of a mixed character tillage will help largely in restoring fertility, rendering hitherto dormant constituents readily available.

Besides these enormous stores of food in the soil, there are other sources from which essential elements for the nutrition of plants are derived. The nitrogen added to the soil by the growth of leguminous plants is one instance, another is the stores of food brought by rain to the earth.—E. D. S.

KALES AT CHISWICK.

A LARGE collection of Kales has been grown at Chiswick this year. These are indispensable winter vegetables, but in the case of several varieties, especially those with bluish green leaves, a fungus or something else has literally eaten them up in the summer. Of such kinds as the Ragged Jack, Asparagus, Delaware, Buda, and Lapland Kale, not a plant is left, while one stock of Cottagers' Kale is half destroyed, as are most of the plants of Chou de Burghley. Generally, however, the Cottagers' Kales have escaped, while the several stocks of Scotch Curled Kale appear uninjured; the same may be said of Chou de Milan, Variegated Kale, the Dwarf Purple Arctic Kale, and the Portuguese Cabbage, Couve Tronchuda.

Several members of the Fruit and Vegetable Committee (Mr. H. Balderson presiding) examined the collection on Friday last, and while they found a few stocks worthy of three marks (* * *) of merit, many were disappointing. Scores of plants of "hearting" Kale had no hearts in them. Scores more of so-called Dwarf Curled Kale were neither dwarf nor curled; while not a few of the tall kinds were characterised by irregularity—in lankiness, and there was not very much to see about them beyond long stems.

Granted that the site and soil were not well adapted for the several plants, and that many of them would have been much better in the firm, thin soil of an open field, it was all the same clear that several of the stocks or strains were far from being so pure as they ought to be, and it is evident that there were "rogues' among those plants from which the seed was saved. That the soil is not accountable for all the irregularities was evident from those stocks which were pure; and these, perhaps, showed to the better advantage by contrast with the others.

It should be said that the site of the trial had for many years been occupied with fruit trees. These had been cleared out; and the ground trenched 2 or 3 feet deep. This had to be done in the process of levelling and securing uniformity in depth after the digging up of the trees, and for clearing out the roots. It could not be regarded as an ideal preparation for Kales for growing sturdily, and passing the winter. Still, there is no denying the fact that it was as fair for one stock as the other. Those which obtained *** were as follows:—

Cuthbertson's Curled.—Dark green, well curled, and stock "true."

Bryden's Selected Curled.—Good substantial plants, and all nearly alike.

Veitch's Variegated Kale.—Fine plants, colouring well, and far in advance of any other stock.

Dobbie's Victoria Curled.—The most densely curled of all, all the plants alike; a true and excellent stock.

Chou de Milan (Watkins & Simpson).—Fine plants, yielding abundance of produce, and all true.

Cottagers' Kale (Watkins & Simpson).—An equally fine and characteristic strain of this serviceable winter vegetable.

Culzean Castle Curled (Hurst).—A fine, hardy looking stock of the "old Scotch," and quite pure.

Late Hearting Kale (Hurst).—Less curled than the foregoing, but dwarf, sturdy, robust, and well hearted.

Dwarf Purple Arctic Kale, from Messrs. Barr & Dobbie, was awarded two marks (**). It is very dwarf and hardy looking. It is singular that the green form was not represented.

Two stocks of Brussels Sprouts were examined, but the plants were driven out of character by the deep-rooting medium in which they were grown.

Four varieties of Potatoes were cooked, and two marks of merit given respectively to Vert's Jubilee and Sutton's Supreme; but it was the opinion of the Committee that the season had been the reverse of favourable for the development of high quality in Potatoes, and this year's trials could scarcely be regarded as conclusive.

Notes & Gleanings

EVENTS OF THE WEEK.—For yet another seven days the rush of Chrysanthemum shows will continue. Southwards there are indications of the coming peace, but in the North the meetings continue with unabated vigour. A list of several of the shows will be found on page 455.

—— WEATHER IN LONDON.—During the closing days of last week and on the opening one of this the weather showed practically no variation. The nights and mornings were fresh and the days warm. Monday morning, however, brought a change in the form of rain, which fell for several hours. In the evening there was a most uncomfortable drizzle. On Tuesday it was foggy and damp, while at the time of going to press on Wednesday it was bright and fine.

—— A MILD AUTUMN. — At the Chrysanthemum Show, held at Exmouth on the 28th and 29th ult., several collections of vegetables, containing good and fresh samples of Green Peas, Scarlet Runner Beans, and Tomatoes, all grown in the open, without the least protection. In Mr. W. J. Godfrey's miscellaneous exhibit of cut flowers a good collection of single and Cactus Dahlias and Sweet Peas were noticed; and at the Exeter Show, held on the 4th and 5th inst., Mr. Godfrey again made an extensive show of these flowers, all grown in the open, with no protection.

—— WOLMER FOREST.—We learn that the Guildford Natural History Society has decided to present a petition to the Commissioners of Woods and Forests praying that Wolmer Forest may be reserved as a sanctuary for wild birds, in which they, their nests, and eggs may remain unmolested throughout the year; that it may not be let at any time for game preserving, or for any purpose inimical to bird life; and that it may remain in perpetuity as a national memorial to the greatest naturalist England has produced—Gilbert White, of Selborne. Such a recognition, the Society urges, would show that the admiration of Gilbert White was not verbiage merely, but that it took so practical a shape as to be of value to the naturalist and the English-speaking race for all succeeding time. The Society does not desire to interfere with the use of the Forest for military manœuvres.

—— HESSLE GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—A meeting of the above Society was held on November 2nd. Mr. Geo. Wilson, Swanland Manor, occupied the chair, and Mr. Geo. Picker, gardener to F. R. Pease, Esq., read a practical and interesting paper on "Salad Plants and their Culture." The essayist gave a descriptive list of the different plants used for salads, with a short cultural account of each, and also the manner of dressing them. The hearty and humourous discussion which took place at the conclusion of the essay, together with the large attendance, showed to what an extent the subject was appreciated. The Secretary, Mr. J. Barker, Prestongate, Hessle, showed finely flowered plants of Dendrobium Phalænopsis Schröderianum, Cattleya labiata, Cattleya gigas minima, and C. aurea, arranged on the table with Cocos Weddelliana and Ferns. Mr. Blakey exhibited a fine variety of Cattleya labiata, and Mr. Coults Chrysanthemum General Rock, a new variety, and one that has evidently come to stay. Votes of thanks to the essayist and Chairman terminated the meeting.—G. W. G.

—— POTATO GROWING EXPERIMENTS IN CUMBERLAND.—At the County Council Dairy School and Experimental Farm at Newton Rigg, Penrith, Mr. W. T. Lawrence (the Principal) has just concluded some interesting experiments in Potato culture. Six plots of one-twelfth of an acre each were under trial. Dung alone (on plot 6) produced the best results, though half-dung, with half artificial manure (plot 5) followed closely with both Bruce and Abundance, and beat dung alone with the Up-to-Date variety. The artificial mixture used on plot 3—1¼ cwt. nitrate, 2 cwt. kainit, 5 cwt. superphosphate, costing 23s.—was used as a standard Potato manure for the soil at Newton Rigg—a firm loam (more kainit would have been included in a lighter soil), and the yield of this plot was not much less than that of the dunged plots. Evidently the extra 2 cwt. of kainit given to plot 2 was unnecessary, but the omission of a potash manure altogether, as was tried on plot 4, was disastrous, the yield being no more than on the unmanured plot. Up-to-Date was far and away the heaviest cropper, and the tubers were clean and of excellent quality. Abundance yielded rather better than Bruce; but the latter had far less disease than either of the other varieties.

—— SUTTON'S PEERLESS MARROWFAT PEA.—This Pea was shown in splendid condition at Sevenoaks Show, November 2nd. Although classed as a main crop, for late work it can be thoroughly recommended. These alluded to were grand dark bright green pods containing from eight to eleven peas of remarkable size and splendid flavour; in fact, I have not tasted a better Pea this season. It grows about 3 feet high, and is of a robust habit and most productive. Another recommendation is, it never is attacked by mildew.—RUSTICUS.

—— THE LATE MR. E. J. BAILLIE. I was grieved to see the account of the death of Mr. E. J. Baillie. It has been my pleasure to have known him upwards of twenty years. I have had several appointments to meet him to take part in public meetings, and my experience was the more you knew of him the better you liked him. He was not frightened of work, and if we were all to take pattern from his perseverance, many of us would be better gardeners than we are. I felt I could not let this opportunity pass without saying a word of respect for one who has given sound advice to many a young gardener, owing to which they have become a credit to the profession.—F. COULDREY.

—— PHILADELPHIA BOTANIC GARDEN. — At the meeting of Councils' Committee on city property Dr. William Pepper, on behalf of the Philadelphia Commercial Museums, made a request that 40 acres of ground along the west bank of the Schuylkill be transferred to the Institution, to be used as a botanical garden. This plot of ground was dedicated for park purposes by an ordinance of Councils on July 6th, 1883, but has lain useless. Dr. Pepper said that a museum of science and arts is to be erected near here at a cost of 2,500,000 dols., ground having been broken for one wing of the building, and it is desired to make the Botanic Garden an adjunct to the museum. The matter was referred to a sub-committee.

—— MELON THE MONARCH.—There is no scarcity of good flavoured Melons, but the best I have tasted is Monarch. It is an oval shaped green fleshed variety, with very thick melting flesh, good specimens weighing from 4 to 6 lbs. It is later in ripening than most varieties, but this is an advantage where a house is devoted to them, as if planted with others it prolongs the ripening season, and being such a good keeper it is excellent for autumn use. Everyone has his favourite variety of Melon. Some prefer a large and others a small variety. Flavour is the one important thing to be considered, and whatever else any variety has to recommend it, if lacking in quality it should not be grown again. Others we grow, and excellent in every way, are Earl's Favourite, The Countess, and A1. —J. F. G.

—— THE DAHLIA SEASON.—There seems to be no end to the Dahlias in the South this season. I understand in some parts of the country the frost has cut them to the ground, and the tubers are ripe and stored away. But we could cut a cartload of magnificent blooms. Varieties of the Cactus, such as Cycle. Starfish, J. E. Frewer, Beatrice, Ensign, Bertha Mawley, Princess Ena, Bridesmaid, Matchless, and others, are nearly equal to any we have exhibited this season. We could make up stands of the Show and Pompons quite equal in neatness, if not in size, to any I have seen this year. They present such a charming appearance that one has to pause to realise if it really is the month of November. There has not been frost enough to hurt a single plant, and to look at our bed of about 400 plants in one mass of bloom it appears more like September than only eight weeks prior to Christmas. I should be greatly interested to know how our brethren have fared right and left of us.—J. WIGGINS, *Fair Oak, Bassaleg, Newport, Mon.*

—— PRESERVING GREEN IN PLANTS.—Mr. Albert F. Woods of the Division of Vegetable Physiology and Pathology, United States Department of Agriculture, describes in the "Botanical Gazette" a novel method of preserving the green colour of plants for exhibition purposes. The principle involved is to bring about a combination of the chlorophyll in the cells of the plant with copper. The resulting compound, copper phyllocyanate, is practically insoluble in any of the ordinary preserving media except strong alcohol, and is not destroyed by light. The resulting green can scarcely be distinguished from the normal chlorophyll green. The process described is a somewhat complicated one. After removing the air as completely as possible from the surface and from the intercellular spaces by immersion in 90–95 per cent. alcohol, or by means of the air-pump, the tissues are placed in a 5 per cent. solution of glycerol containing enough dissolved copper sulphate or copper acetate to give it a bluish tint. The uncombined copper is dissolved out by a dilute glycerin-formalin solution, and the object may be preserved in this solution or in any of the usual media except strong alcohol.—(Nature.)

—— Victorian Era Exhibition.—We are informed that Mr. T. S. Ware, Tottenham, has been awarded a diploma for a gold medal at the Victorian Era Exhibition, Earl's Court, for planting the Imperial Gardens with plants and shrubs.

—— Royal Meteorological Society.—At the ordinary meeting of the Society, to be held at the Institution of Civil Engineers, Great George Street, Westminster, on Wednesday, the 17th inst., at 7.30 p.m., the following paper will be read :—"Results of a Comparison between the Sunshine Records obtained simultaneously from a Campbell-Stokes Burning Recorder and from a Jordan Photographic Recorder," by Richard H. Curtis, F.R.Met.Soc.

——, South Wales Weather.—Total rainfall for the month 3·44 inches, which fell on eleven days, with a maximum of 1·17 inch on the 15th. Average maximum temperature for the month, 58°; highest reading, 74° on the 1st. Average minimum, 39°; lowest reading, 24° on the 12th; below freezing point on four dates. There were four sunless days. The wind was in the N. and N.E. on nineteen days. Very wet in the middle of the month, but nice and dry, with cold strong winds the end of the month.—Wm. Mabbott, *Dowlais*.

—— Sussex Weather.—The total rainfall for the past month at Stonehurst, Ardingly, Sussex, was 0·34 inch, being 3·61 inches below the average of the Mid-Sussex district, and the driest October in a seventeen years' record. The heaviest fall was 0·9 inch on the 2nd and 15th. Rain fell on five days. The maximum temperature was 66° on the 19th, the minimum 37° on 8th, 12th, and 13th. Mean maximum 56·21°, mean minimum 44·14°, mean temperature 50·17°, which is 2·25° above the average. A fine month, but for many things a good rain is much wanted.—R. I.

—— October Weather at Hodsock Priory.—Mean temperature, 48·6°. Maximum in the screen, 67·2° on the 17th ; minimum in the screen, 29·1° on the 6th ; minimum on the grass, 20·8° on the 6th. Frosts, in the shade, one ; on the grass, sixteen. Sunshine, ninety-two hours, or 29 per cent. of the possible duration. Rainfall, 0·97 inch ; difference from average, 1·81 inch. Rain fell on fourteen days. Rainfall since January 1st, 18·51 inches ; difference from average, 2·58 inches. A fine month ; only twice in the last twenty-two years have we had less rain.—J. Mallender, *Worksop*.

—— The Weather Last Month.—October was dry, without any severe frost here, and tender flowers, such as Dahlias, were quite uninjured at the end of the month. The wind was in a westerly direction thirteen days. The total rainfall was 1·08 inch. This fell on seventeen days, and is 2·00 inches below the average for the month. The greatest daily fall was 0·35 inch on the 15th. Barometer (corrected and reduced), highest reading 30·623 inches on the 21st at 9 A.M. ; lowest, 29·436 inches on the 15th at 9 A.M. Thermometers : highest in the shade, 68° on the 19th ; lowest, 29° on the 6th. Mean daily maximum, 56·00°. Mean daily minimum, 41·03° ; mean temperature of the month, 48·51° ; lowest on the grass, 26° on the 6th ; highest in the sun, 115° on the 5th. Mean of the earth at 3 feet, 51·22°. Total sunshine, 128 hrs. 15 min. There were four sunless days.—W. H. Divers, *Belvoir Castle Gardens, Grantham*.

—— Weed Laws.—There is entirely too much law in our country. Everyone is to get rich by law—and law is to protect us from every evil. The State—whatever that may be—is to do everything for us. But when we put these laws into effect the absurdity becomes manifest. Among the daily news in the public prints is an account of a Potato patch that was so remarkably healthy that the plants were loaded with blossoms. It was reported to the County Inspector of Weeds that an outrageous growth of weeds was suffered to flower in the man's field. The inspector issued the usual citation to abate the nuisance. It was at the expense of some time and considerable chagrin that the guardian of the farmers' fields learned that the flowers were a legitimate part of the Potato plant.—("Meehan's Monthly.")

—— Malicious Damage.—Charles Clifton, of Rye Park, was charged with damaging with intent to steal growing Chrysanthemums, the property of William Dyke, at Rye Park, on October 22nd. Defendant pleaded guilty. William Dyke said he kept a nursery at Rye Park. On Saturday, October 23rd, he went into the Chrysanthemum house, and saw that some of the plants had been damaged, and the blooms taken away. He suspected the defendant, and sent for a policeman, and with him went and saw defendant. The latter said it was three boys who were at work at the brickfield who did the damage, but on the boys being fetched he admitted doing it himself. Witness put the damage at 6d. The Bench fined the defendant 6d., damage 6d., and costs 8s. 6d.—("Herefordshire Mercury.")

—— The Tupelo Tree.—One of the rarest trees in ornamental gardens is the Tupelo Tree, botanically, Nyssa sylvatica. Few trees can compare with this in rich autumn colouring, and the form of the tree is generally beautiful. In summer time, the rich, glossy, green leaves would make a beholder believe himself to be in an Orange grove. It is rare, says an American contemporary, because of the belief that it is difficult to transplant ; but, in our experience, we find it no more difficult, when nursery-raised trees are employed, than the majority of trees. The same objection was made, a few years ago, to the use of Oaks ; but experience has shown, that when intelligently planted, nursery-raised Oaks or the Tupelo Tree are about as safe as Maples or Poplars would be.

—— Ammonia in Plant Culture.—While the ordinary kerosene emulsion and solution of copper have proved an immense boon to the cultivator of fruits and trees in the open air, they are usually objectionable to the small amateur flower grower, to whom something clean and easily applied to small plants is a greater advantage. For these, the various insecticides and fungicides for sale by the florists offer some good recommendation. Where these are not to be had, it is said that a wash of ammonia is effective. As the ammonia bottle is now one of the supplies of every well-ordered household, it may be put into use readily. All these articles, however, require some little care in their first application. One should always try a little at first on some plants that are of no considerable value before risking them in a wholesale way. For instance, the scale on Orange leaves and the leaves of Oleanders, or the leaves of some similar plant affected with any kind of insect, can be tried first. If no injury follows, then it may be applied on a somewhat more extensive scale. A few plants and a brush to paint with, a considerable quantity can be gone over in a short time.—("Meehan's Monthly.")

—— The English Sparrow.—In America the English sparrow is developing one good feature in his much abused character. At Highland Park, Ill., he is deserting the frequented streets, and congregating in vast numbers in the neighbourhood of lawns where the wire grass, also known as crab grass, is plentiful. At this season of the year, where this grass is abundant and where the lawns have not been watered, its presence is readily noticed even at a distance by the large brown patches caused by the dying out of this grass, which is an annual. The unusual drought of the past two months has kept the lawn grass proper, the blue grass, and Clover, whose tops had been killed back by the crowding of the spreading crab grass, from springing up, as is its custom when invigorated by the autumn rains. Thus the space occupied by the crab grass is more plainly visible than customary. On these brown spots at different times of the day may be seen sparrows by the hundreds. They seem to confine their manœuvrings entirely to these brown spots, and to be busily engaged in picking up something. There can be no question but that they are eating the seed of this grass. Let us all wish them hearty appetites.

—— Caper Culture.—The Caper industry of Roquevaire, in the Department of the Bouches-du-Rhône, presents an interesting case of co-operation undertaken chiefly with the object of insuring the maintenance of the reputation of a locality for the quality of its produce. The Caper producers of Roquevaire have combined in order to counteract the depression of prices induced by the action of the local trade, which mixed Algerian and Spanish Capers of inferior quality with those bought in Provence. Roquevaire contains some 3000 inhabitants, and nine-tenths of the Caper producers of the commune have engaged to deliver their whole production to the syndicate, and, according to a contemporary, the experiment is said to have proved completely successful. The Caper is the floral bud of a bush (Capparis spinosa) which has been cultivated from time immemorial in Provence. This bud is picked when very small by women at intervals of five or six days during the season, which lasts from the end of May till the beginning of September. The Capers are put into wine vinegar, and steeped for two or three months, after which they are delivered to the Association, by whom they are sifted and then replaced in vinegar, and kept in barrels until sold. The Capers are classified in six qualities, the finest being worth about £4 per cwt., and the inferior sort about 10s. The net produce of the sales is divided among the members proportionately to the amount and quality of their deliveries. In 1893 the members of the syndicate picked 1659 cwt. of Capers, and their sale produced £3115. This allowed of an average of 4d. per lb. being handed over to the members in 1894. Before the syndicate was established the trade only paid 2¾d. and 3d. per lb. In the season 1894-95, however, the syndicate could only distribute 3½d. per lb., owing, it is said, to the outside trade delivering mixed Capers under the name of Roquevaire Capers, and thus lowering the prices in the consuming markets.

CARTON, MAYNOOTH.

(In Autumn Dress.)

On an ideal autumn day, such as is rarely vouchsafed to us in mid-October, a run is made for scenes familiar, yet ever fresh and ever new. Some few days, indeed, of glorious weather had left our roads in prime condition for those who favour the pneumatic tube, so mounting our wheel, and away we are, soon bowling along through North Kildare. Encountering no stones to rattle our bones, or aught, as a matter of fact, to warrant any anxiety, quite consistent with those who depend upon that frail air cushion, the trip from start to finish is one of unalloyed enjoyment. Ere reaching the demesne, from the high-level road pretty peeps are afforded of the picturesque Rye valley. The river, to give it its due, but little more than a tortuous stream, meanders away on the left to quaint old Leixlip past an ancient moss-covered mill with its water-wheel, which has furnished to artists a subject for their easels as frequently, perhaps, as the famous old Nant Mill in Cheshire.

One wonders to see such a profusion of Blackberries adorning the hedgerows practically unheeded by bird or biped, but they have been late in ripening this year, and with the advent of October there is some fairy lore amongst our peasantry which makes them forbidden fruit. Their luscious appearance, however, tempts one to dismount and sample them, but either the fairies or the frost have run away with all flavour, so we pedal on to Carton, entering by a back lodge, which gives the longest stretch of road to cover and provides the most satisfying natural scenery *en route;* such, indeed, as one would scarce expect to find from a bird's-eye view of the comparatively flat surrounding country. The aforesaid Rye, however, which bisects the estate has at some remote period washed its way by a dynamic force no longer displayed, and uncovered stupendous masses of rock to charm the latter-day landscape eye. This part of the demesne is a feature in particular, but others there are at every turn inimical to all hurry in reaching the gardens.

There was a little doubt when the encircling belt of timber came into view as to whether the stormy winds which blew a week previous had not robbed the scene of its autumn glory. Such, happily, was not the case, and after an exchange of compliments with the guardian of the gate, one has fairly entered fairyland viâ a glade gorgeously canopied with the gifts of our all too brief Indian summer. The Lady Fern, with the more common Lastrea, are still fresh beneath the shade, and a rather striking undergrowth is afforded in places by the common Privet with a season's growth springing from old stems cut back to the ground level. Gaining higher vantage ground immediately over the deep natural ravine, where the Rye rolls lazily, "The Turret" offers a resting place, and possibly the finest view in the whole demesne. Here a halt is made to absorb the beauty of the scene. Apparently, Nature has exhausted her colour box upon a picture so daring in its grandeur that my poor pen may not presume to portray it. From below comes up the sound of murmuring waters: nought else to break the hush which reigns save the low-whispering foliage. Who could tell of such things, which are as much felt as seen?

Time flies not here; just runs with the current of one's thoughts; but we are again awheel, and away along the upper carriage road, silently passing the only specimen of our species yet in evidence since entering, who is too absorbed in his own way, apparently the way to extract rabbits from a bank, to see us. As he casts no furtive glances the occupation is doubtless legitimate. What a fine picture the old tower makes to-day perched on the highest ground in the Park! The view is a distant one, but sufficiently near to see that some bold plantings recently made in its vicinity are well planned. Down a smooth decline of the smoothest of roads the lake is reached, and running past it on a parallel course a stop is made on "The White Bridge" for a full length view of it. Distance lends enchantment, for although a closer inspection would reveal where an early frost has caught and curled the foliage of the Dogwood, from here the banks are ablaze with crimson-tipped bushes, whilst a towering mass of old gold reveals the presence of the Horse Chestnuts in the cottage grounds, a veritable Klondike of colour.

As this day, and practically this paper, is devoted to autumn tints, one must make a passing mention of the Stag's-horn Sumachs in the same picturesque nook. They are not seen to-day as there are limits to mileage even if measured by a cyclometer, but this particular foliage from this particular place has been seen to vie in brilliancy with Poinsettia bracts. The contiguity of the water may possibly account for this.

Descrying the portly figure of an old retainer silhouetted against a pier of the Maynooth Lodge gates our wheel is spun in his direction, and from here it is pleasant to note how the Limes composing the long avenue to Maynooth have increased in stature. This avenue should, in the course of a few years, be one of the most perfect of its kind, the broad road and liberal grass margin upon which the trees are set well back being the right and proper thing planters are not always prone to adopt, although but few could fail to see the mistake afterwards. Returning eastward the gardens are reached and Mr. Black is found. There is plenty to see, to talk of, and to talk over, but not even the glories of some well-flowered Cattleya labiata must clash with autumn tints. Ampelopsis Veitchi on the wall, around an old arched entrance, is in superb colour. Passing the Pergola fine Beeches stand out here and there in grand attire, and here it may be again remarked in the neighbourhood of water, in which Mr. Black points out one of Marliac's hybrid Nymphæas bristling with buds, doomed, we fear, to remain as such till they disappear.

One particular feature, quite in keeping with our theme, remains to be noticed—viz., a number of Pampas Grass in full plume raised from seed by our enthusiastic guide. All these seedlings partake more of the light and graceful character of Arundo conspicua than of the stiffness of the type, and some of them are as novel as most of them are distinct, ranging in habit from dwarf to tall, and varying in colour from silvery white to pale purple, the most remarkable being one of a yellow shade, shot with a tint of pale green. Examples of Prunus Pissardi, planted some years ago, are now assuming a tree-like form, fully bearing out the good character it came to us with. But the brightness wanes as the curtain of night descends, our wheel awaits to bear us from "The dear old-fashioned place, with all its constant nameless grace."—K., *Dublin.*

Chrysanthemum Shows.

As is usual at this time of the year we have received numerous intimations of Chrysanthemum shows which are to be held during the coming season. Space, however, can only be found for mentioning those that have been advertised in our columns. If any have been omitted we shall be glad to add them to the following list. We append the names and addresses of the various Secretaries.

Nov. 12th and 13th.—Bradford.—R. Eichel, 16, Westcliffe Road, Shipley.

„ 12th and 13th.—Eccles.—H. Huber, Hazeldene, Winton, Patricroft.

„ 12th and 13th.—Sheffield.—W. Housley, 177, Cemetery Road, Sheffield.

„ 17th and 18th.—South Shields.—B. Cowan, Harton, South Shields.

„ 17th and 18th.—Hull.—E. Harland and J. Dixon, Manor Street, Hull.

„ 17th and 18th.—Bristol.—E. G. Cooper, Mervyn Road, Bishopston, Bristol.

„ 17th and 18th.—Rugby.—W. Bryant, 8, Barby Road, Rugby.

„ 17th, 18th, and 19th.—York.—J. Lazenby, 13, Feasegate, York.

„ 18th and 19th.—Bury St. Edmunds.—G. A. Manning, "Bury Post," Abbeygate Street, Bury St. Edmunds.

„ 19th and 20th.—Bolton.—J. Hicks, Markland Hill Lane, Heaton, Bolton.

„ 25th and 26th.—Leamington Spa.—L. L. Lawrence, 76, Parade, Leamington.

Chrysanthemum Leaf Rust.

The leaf of the variety of Chrysanthemum Niveus sent to the Editor by Mr. Briscoe-Ironside from Italy, and referred to in the *Journal of Horticulture*, page 436, is infested by the Chrysanthemum leaf-rust fungus, Trichobasis (Uredo) Chrysanthemi, the Puccinia or teleutospore stage not having been reached—indeed the only Puccinia Chrysanthemæ yet recorded to have been seen is that shown on page 381 at E, fig. 57.

Mr. Briscoe-Ironside's specimen accords almost exactly with that first noticed in England on August 21st, and examined by me on the 26th of that month. The pustules of the Italian specimen are, however, somewhat larger, yet the uredospores coincide in conformation and size. The Isle of Man specimen also agrees with these, all having uredospores only, and still retain vitality, eagerly pushing germinal tubes on a fresh Chrysanthemum leaf. Bisulphide of calcium solution, if it actually reached the pustules, evidently had produced no injurious effect on the rust or uredospores, and no trace of either lime or sulphur could be discerned; therefore it, as suggested by Mr. Briscoe-Ironside, may not have been distributed on the under side of the leaves to which the pustules in his case are solely confined.

The Kent and Somerset specimens were much the worst affected by rust, as alluded to on October 21st, page 380, the under side of the leaves being a mass of pustules run together, and some even present on the upper surface. In the Somerset specimen was found the teleutospore, part of the leaf being shown at A, fig. 57, page 381; but, as Mr. C. Orchard observes, page 438, the disease is "really much worse than it appears in the woodcut. The prolific spores (uredo) that fall from the under side of the leaf smother everything, being of a brown snuff colour."

Thus rust breaks out almost simultaneously in Berks, Kent, Somerset, Isle of Man, New Jersey (United States), Italy, and Isle of Wight. Albeit, the Berkshire specimen was first noticed, and as such gives prominence in the illustration on page 381.

I offer no comments on the appearance of the rust, the evidence being lacking of its introduction from the United States. It certainly is distinct from any Trichobasis or Uredo found on Compositæ in this country, and may ultimately, as I regard it now, be admitted an evolved form of Puccinia Artemisiæ, or, as suggested by more recent investigation of P. compositarum, a somewhat common parasite on the "Hard Head" or Black Knapweed (Centaurea nigra), the difference between which and P. tanaceti does not appear on investigation.

In a somewhat varied and lengthened experience in gardens, extending to fields and woods, I have always found cleanliness the best precursor of health, but I repudiate the commonly regarded proclivities of plants to disease as predisposed by grave cultural defects. The enemy we have to face is a living thing reproduced by spores, and must be annihilated if possible. I may, perhaps, refer to "damping" as an alleged cause of the attacks another day. In the meantime I am much obliged to correspondents for specimens and observations.—G. ABBEY.

An Amateur's Chrysanthemums.

I HAVE recently seen a good instance of what a persevering man can do in the culture of Chrysanthemums who has no special knowledge, appliances, or even a structure for flowering the plants in. Mr. James Dickson, a plumber of Dover Road, Northfleet, Kent, attempted the culture of a few Chrysanthemums last year. He was so far successful that he produced a large bloom of Viviand Morel which was very creditable. He also succeeded well with Mdlle. Lacroix, Lord Alcester, and Mons. Bernard, Mrs. Dixon, and others.

He sheltered his plants under some temporary lights in his back yard. The plants were saved in their flowering pots through the winter, and new stock secured in spring by dividing the suckers, potting and growing them in good material, eventually placing them in 8 and 9-inch pots. Viviand Morel again took the lead, a disbudded plant of this variety furnishing three splendid deeply coloured blooms from terminal buds. Another plant was not so freely disbudded, smaller blooms, but useful, being the result. The three large blooms were 7 inches across, and considering the experience and means of the grower, extremely satisfactory to him. He also produced good blooms of the old, tall, 8 feet variety, Madame C. Audiguier, Lord Alcester, incurved; Mons. R. Bahuant, Mrs. Dixon, Mons. Bernard, W. G. Newitt, W. H. Lincoln, Gloriosum, and several others. The warm days of October assisted the plants materially, which practically developed their blooms in an outdoor temperature and with abundance of air.—E. D. S.

Chrysanthemums at Earlswood.

THE seeker after novelties will find at Mr. W. Wells' establishment at Earlswood one of the finest and most extensive collections of new Chrysanthemums in the trade. Both in number of varieties and in high average quality there is little to be desired, and the cream of the collection is housed in a large span-roofed greenhouse, 160 feet in length by 22 feet in width.

Of fairly recent introduction there are several varieties that maintain the first impressions that were formed of them. But those of 1897 from Mons. Calvat are equally so, if not better. In the narrow limits of a short notice like this it is impossible to do justice to raiser and grower alike, and so only a few brief notes can be spared, as there are others from different sources that will also claim a few words. Directeur Liébert is a very fine globular Japanese, with medium grooved florets, large in size, and of a deep lilac mauve. Then N.C.S. Jubilee is a noble incurving flower; colour, pale lavender pink, with broad florets, having a silvery pink reverse. For solid compactness of build, largeness of size, we specially recommend Madame Ferlat, a grand white incurved Jap, and Mdlle. Lawrence Zédé, of similar type, but violet amaranth in colour, and reverse of silvery pink. Mons. Massange de Louvrex is a new yellow. Souvenir de M. F. Rosette, deep plum coloured amaranth, big and solid. Werther is a fine rosy purple incurved Japanese, with silvery turnover. Surpasse Amiral, deep rich yellow. Princesse de Galles, a long petalled white Japanese. Congrès de Bourges, deep purple: and others of the present season are Souvenir de Malines, Madame X. Rey Jouvin, Madame A. Rousseau, Madame G. Bruant, which we think have already been described in these columns. The green incurved Japanese Madame Ed. Roger is effective and well coloured, and promises well as a curiosity, and close at hand is a truly grand novelty, by name Mdlle. Lucie Faure, of incurving Japanese build, solid, closely built, and massive; colour, pure white. Vicomte Roger de Chézelles is golden bronze, and Mons. W. H Fowler, a pearly silvery pink, shaded rose, must be the last.

From other sources there are plenty of beautiful large white show flowers in the Japanese section whose purity of tint make them welcome to those who require first-class varieties of that colour. Mrs. C. Blick, Pride of Maidenhead, Mutual Friend, Mrs. H. Weeks, Madame Ph. Rivoire, Snowdon, and the charming Simplicity, of American origin, with its lengthy florets and great size. Western King, Princesse Hélène, C. B. Haywood, Emily Silsbury, and Madame Louis Remy, a white sport from Mrs. C. Harman Payne, must not be forgotten in this shade. Yellows are also plentiful, and comprise all that is newest and best. Mdlle. Lucie Matthieu de la Drome is a closely built incurved, florets narrow, colour pale golden yellow. G. J. Warren is immense, a fine pale yellow counterpart of Madame Carnot, from which it is a sport. There are many splendid blooms of this novelty. Sunstone, rather tall in growth, is a beautiful shade of apricot yellow. C. A. Owen, a deep rich golden hue. Modesto needs no description, neither does Royal Sovereign. Mons. Frederick Daupias, C H. Curtis (incurved), Ella Curtis, a golden yellow Japanese, dusted carmine; and a very fine one called Georgiana Pitcher, a large globular Japanese, rather broad, grooved florets, colour pale canary yellow with silvery yellow reverse, are all conspicuous; and in the same colour Edith Tabor, Occana, and a few more will show how well and effectively the golden flower is sustained in its primitive hue.

Still continuing our observations on the Japanese—and the collection is almost wholly devoted to that section—Parachute, a very pretty flower of old rose shaded carmine and almond, and having long drooping florets, occupies a high place in our estimation. Lady Hanham, a beautiful salmon and rosy sport from Viviand Morel, does likewise. Madame E. Testout and Mrs. G. W. Palmer both appear to be the same rosy bronze sport from Mrs. C. Harman Payne, the former having originated in France last year, and the latter here in England. Royal Standard is a very fine velvety crimson, with a gold reverse. Pride of Madford is large, and Australie, a companion flower, keep up the reputation of our Colonial enthusiasts. J. B. Yvon is a pale yellow shaded old rose, another sport from Viviand Morel; and somewhat deep in tone, but of similar form, is Julia Scaramanga, of the same parentage.

Incurved in good form were Mrs. R. C. Kingston, D. B. Crane, Wm. Tunnington, Jerle Dauphinoise, golden ochre yellow; and one in particular, Lady Isabel, a really fine variety, deep in build, and very compact, having rather broad florets, colour silvery blush, will be a welcome addition to this somewhat ancient type.

Here and there, interspersed throughout the collection, were numerous unnamed seedlings of promise, many of which are from Australian seed, but at present only on trial. Hairy noveltics are represented, but not largely, nor can we record any very striking additions to the Anemone classes. In one of the houses there are some pretty bushes of single varieties, such as Purity, Miss M. Anderson, Miss Annie Holder, Rev. W. E. Hemfrey, Virgin Queen, Rose Pink, Gus Harris, Miss Chrissy, and Miss Rose.—P.

Chrysanthemums for the Masses.

IF anything were ever provided for the masses which they thoroughly appreciated, it is the display of Chrysanthemums in several of the London parks. Go east or west, you will find in several of these rendezvous crowds of people making their way to the Chrysanthemum house. Year by year the same goes on—the interest never seems to flag, but rather to be increased with each succeeding autumn. It was said by many when the scheme was first instituted that the ardour of seeing the Mums would live but a season, whereas it has lived beyond several, and continues to grow.

The County Council of London is a much maligned and criticised body, but for these annual displays of this popular flower, as well as for the generous policy that has been adopted with regard to our parks and open spaces, it can receive nothing but commendation. See how these public resorts have improved in the past five years! How much more pleasant it is now in our parks and on our commons than formerly! Everything about them has improved, and on every side there appear indications of advance.

For years they were charming enough in the spring with their bulbs, and in the summer with their flower beds, but it was not until the Chrysanthemums came that people were attracted to them in thousands during the autumn. One occasionally hears some hypercritical person mutter about the expense. But no one should consider the comparatively small cost when it is remembered how much pleasure they give to thousands of Londoners whose homes preclude the possibility of Chrysanthemum culture. No; rather than condemn, one should thank the Council for the excellent work it is doing in placing before all who like to go the lovely displays of autumn flowers.

If they could not see them at the parks it is practically certain that they would not see them at all, for despite the number of shows that are annually held all could not go. In Battersea Park alone 7000 or 8000 people have passed through the house in one day. Then Victoria and Southwark, with their thousands of neighbours, have their annual show, and the people flock in multitudes. I feel quite sure that if the Council were to stop the shows London would rise in open revolt.

I am a dweller within hail of Battersea, and never allow a season to pass without at least one glance through the house, and often I have been several times. Going year after year one may see the same people hurrying along to fall into the line within the Frame Ground gates. Once this stage is reached the progress is slow—painfully slow—while outside of the house, but quite fast enough while inside and the flowers are before. Then there is no rushing but a steady flow towards the outlet, and one may see the faces of the visitors brighten under the humanising influence of the beautiful flowers. The eyes sparkle with pleasure as a particular variety takes more than ordinary attention. May the County Council continue the excellent work of educating the masses if it cost a little more than it does at present, for few will be grumblers while many will receive benefit.

This year's exhibition as Battersea is a very beautiful one, and just about the average of former years. Upwards of 2000 plants have been grown by the Superintendent, Mr. F. J. Coppin, but all are, of course, not brought into the house at once. Instead of this, as plants pass their best they are removed and fresh ones substituted, thus prolonging the display over several weeks. The major portion of the plants are in one broad bed, but on the other side of the path on a rather high stage, small flowering varieties have been stood, and by their freshness and grace add decidedly to the general effect.

The shape of the house is hardly such as to permit of the best effect being secured, as it only allows one straight path, but the system of arranging the plants is a good one. Of course the tallest are at the back, and the dwarfest in front, and by careful selection an undulating surface has been given. The colours, too, have been judiciously selected with a view to creating a fine general impression. Some day, perhaps, the Council will erect a new house at Battersea to be utilised for Chrysanthemums in the autumn, and later as a winter garden. It would most certainly be appreciated by everyone.

As I cannot see that it would serve any particularly useful purpose to give lists of names, I shall omit them. Everyone knows the Morels, the

Rochers, the Sunflowers, the ——. But enough; let those who have not been and can, go to Battersea, and see for themselves to what perfection Chrysanthemums may be grown—a place that is low and damp, overhung by splendid trees, and being within the valley of Father Thames, in the track of London's best and densest fogs. They will, one and all, be delighted with what is to be seen, and will acknowledge what skill and attention must have been devoted to the plants to secure such fine results.

Then there are other displays for dwellers in the various parts of the metropolis. Everyone who knows Chrysanthemums has heard of Mr. Moorman, for he has been amongst them for very many years. He has a grand show at Victoria Park, as have Mr. Melville at Finsbury, and Mr. Curle at Southwark. All these I know are good. What Mr. Pallett has at Waterlow I do not know, but perhaps some resident will send notes to the Journal, so that, if there be a good show, "honour may be given to whom honour is due."—SOUTH LONDONER.

RYECROFT CHRYSANTHEMUM SHOW.

THIS exhibition is now being held in the Ryecroft Nurseries, and differs material from most other shows. Of this one no schedule is issued, there are no classes, there is only one competitor, and, moreover, there is no charge for admission. Everyone is welcome who cares to go, and each is asked in return, not, as might be expected, to purchase plants, but to give a trifle in aid of the funds of the Royal Gardeners' Orphan Fund. Surely no one after a free Chrysanthemum feast would not respond to such an appeal! Hundreds, probably thousands, of people go, so that the takings in the boxes ought to amount to something substantial.

Besides this suggestion there is one regulation, and that is that visitors must not touch the flowers. They may go as often as they like, and stay any length of time provided they do not want to twist the blooms about for closer inspection. A modest rule this to govern an exhibition which comprises something over 7000 plants of all sizes and varieties. Is there anyone who does not know the owner, manager, and sole exhibitor at this annual display? Not one; for there cannot be a chrysanthemumist in the United Kingdom with whom Mr. H. J. Jones is not familiar in name, if not in person.

No one must expect, when they make the journey to Ryecroft, to find the Japanese section in one place, the incurved in another, the Anemones in a third, and so on through all the stages of the Eastern flower. Nothing of this nature is attempted, the whole being grouped with a view to insuring the best effect, which would not be if the sections were kept to themselves. In one particular the very greatest care is exercised, and that is in the placing of the several colours. The most strenuous endeavour is made to so dispose the plants, that while each flower stands out strongly and effectively, it, at the same time, assists in emphasising the best points of its neighbours.

As a whole the collection is a splendid one, and comprises representatives of almost all the known varieties. The flowers generally are just below average size, and the colours are not of the cleanest. These two facts are easily accounted for by the wretched atmosphere in which they are grown. It does not militate in the least against the production of stock, or affect the health of this in the least; but its effects are seen on every hand amidst the flowers. Each year the task of producing blooms of the highest quality becomes more and more difficult, and the results achieved are in all respects praiseworthy, all things considered.

The provincial grower has much in his favour in the purer atmosphere, whose beneficent influence on the flowers can never be overstated. But Mr. Jones is enterprising, and we shall probably be hearing that he has "flitted" from the region of bricks and mortar to the land of green fields and waving pastures. Let us hope if this supposition become a reality he will still maintain the glories of Ryecroft unaltered, and only utilise the country place for insuring the most perfect blooms for exhibitions away from home. Others besides the people of Lewisham could not easily forego the pleasure of their annual visit to Ryecroft show.

How is it possible for anyone to make a selection from such a vast array of beauty? Here are Ryecroft seedlings, there other English products, while yonder may be seen the results of the foreigner's labour. Some are excellent, others good, while there are a few from the Continent that are most hopelessly bad. They have no quality in their flowers, either of colour, form, or substance. Their destination is the rubbish heap, and they are not fit even to adorn this. But the good ones are good and the excellent ones are excellent, whether they be English or French, and these compensate for the deficiencies of their neighbours.

Of course it is the bounden duty of every writer to name a few as being of superlative merit, and so a start must be made at once, and as it is new we will commence with Mrs. A. Cross. This is a charming bronze yellow incurved Jap of splendid form and substance. A very full flower of a soft primrose hue is Mrs. L. Humphrey, while the immense yellow-floretted Ella Curtis are now comparatively well known. Mrs. S. W. Palmer, the sport from Mrs. C. Harman Payne, seems free from that coarseness for which the latter is so renowned. A lovely flower is Mrs. Coleworth Bond. The colour is soft flesh pink, and the bloom is of good size. Crown of Gold, a yellow incurved Japanese of great promise. Hairy Wonder and one or two other hirsute varieties are in grand form. Then there are Madame Cordery, Master H. Tucker, King of Buffs, Lady Hanham, Simplicity, Mrs. Richard Jones, President Nonin, Western King, Robert Powell, Vicar of Bray, N.C.S. Jubilee, Mr. Hugh Crawford (lovely delicate yellow bronze incurved Jap), Mons. Panckoucke, white and yellow Carnots, with Pride of Ryecroft, a primrose sport from Niveus that will in all probability make itself known for market purpose. It is wonderfully free flowering, and the shade is one that is always popular.

This is not all, for there are incurved and several others, but as the Japanese are the most sought for we will confine our selection to them. If anyone wish more names let him make the journey for himself, for a personal examination and selection must obviously be better than one made by proxy.—JAP.

GRANTULLY, WEST HARTLEPOOL.

THE following notes from Mr. T. Smith, Secretary to the Hartlepool Gardeners' Mutual Improvement Society, are interesting, and will prove of service to growers in similar late districts. The disastrous gale in June appears to have made its effects felt over a wide area in the North of England. Mr. Smith states: "Personally I suffered a great deal from the disastrous gale on the 14th of June. I had the majority of my plants in their permanent places, and a great many had not a leaf left on them, besides losing their tops. Then the long spell of dry weather set in, and in spite of copious syringing twice a day, they made growth very slowly. About the middle of August we had three weeks of wet weather, which rushed a lot of them into growth, with the result that many are late (notably the Queens), with soft, sappy tops, and I am very much afraid the flowers will be poor—in fact, all my Queens are terminal buds, which is not much use in this district.

"To come to the new varieties, the most promising are Mrs. J. Lewis, (second natural crown), Pride of Madford, Australie (very tall), Mrs. J. Shrimpton (stopped March 15th), John Seward, Phœbus, a lovely variety. On the other hand, Baron Ad. de Rothschild is a complete failure: Modesto, too late. With Australian Gold I am completely puzzled. I had nine beautiful clean second crown buds on three plants, and I have not a bloom larger than a cricket ball. Mrs. H. Weeks, stopped March 10th, I did not take the bud until the 25th of September, but they have done very well since I took them indoors, and are now showing colour.

"Of the new incurved, Duchess of Fife, stopped 15th March for second crown, I have not got it taken yet (29th October). Mrs. F. Hepper is too late, but Bonnie Dundee is all right. Perle Dauphinoise and Ma Perfection I can form no opinion of as yet. J. Agate and C. H. Curtis are promising, so are the Princess of Wales group; also the Tecks. For the late district we have here I enclose a few dates for stopping for second crown buds. Tecks, 1st March; also C. H. Curtis and J. Agate. Queens, 15th March. Princesses are best rooted in November, and grow for first crown.

"In the Japanese section a very good guide is to stop a month before the date given by the southern growers. For instance, Madame Carnot, middle of April is the time generally given. I stop it the middle of March. It is a variety that does not do well here. I have six plants, but the most promising are on the second natural crown."

CHRYSANTHEMUMS IN THE NORTH.

I AM again indebted to Mr. R. M. M'Intosh for an interesting report on the Chrysanthemums around this important centre, which states that the season has been a trying one in that neighbourhood. The extreme and prolonged drought in the early stage necessitated close attention to syringing and watering, and great mischief resulted from the effects of the never-to-be-forgotten hurricane in June. The second growth was, however, formed under more favourable conditions; but since the buds were taken a second spell of drought probably accounts for a large percentage of hard buds. There are several establishments in the vicinity where good collections are grown for home display and not for competition, and will prove well worthy of inspection, notably the following:—Escrick Park, Heslington Hall, Lincroft, Deighton Grove, and The Retreat. The following growers represent the exhibitors:—

ELM BANK.

Mr. Dickinson, gardener to W. B. Richardson, Esq., has a very fine collection of about 600 plants, and doubtless will have some excellent blooms by the middle of November. Mutual Friend is really splendid. Mdlle. T. Rey, F. Wells, Hairy Wonder, President Borel, Prefet Robert, Mr. W. H. Lees, Mrs. C. H. Payne, Sunflower, Major Bonnaffon, Madame E. Capitant, Mons. Demay-Taillandier, Viviand Morel, C. Davis, Madame M. Hoste, International, C. Shrimpton, Avalanche, Colonel W. B. Smith, and H. L. Sunderbruch are fine; C. H. Curtis and Mons. Bahuant very good, as are most of the incurved. Australian Gold seems to be fastidious in bud-taking, for those taken at the beginning of August are too hard to open well; others taken three weeks later seem too late. Mr. Dickinson thinks it is too pale in colour to become popular.

HOLGATE LODGE.

Mr. Everard, gardener to Mrs. Gutch, suffered severely from the storm, but has done all that can be done to encourage the plants to recover from its effects. Amongst the new varieties Western King looks very promising, as do Eltham Beauty, a pretty rose colour; Phœbus, Madame E. Capitant, Mons. Chenon de Leché, Boule d'Or (Calvat), Mons. Panckoucke, Mrs. W. H. Lees, Mdlle. T. Rey, Madame Carnot, Miss M. Blenkiron, and Viviand Morel. Amongst the incurved R. C. Kingston is very fine. All the Queen family seem right to time, while the Princess of Wales section are rather late. Mr. Everard is always well to the front with specimen plants. This year his collection is specially interesting, containing very fine specimens of C. H. Curtis and J. Agate carrying fifty blooms each.

OUSECLIFFE.

Mr. R. Dobson, gardener to R. Lawson, Esq., has most of the approved kinds. Those conspicuous are Louise, Mons. Demay-Taillandier, Colonel T. C. Bourne, Mons. Chas. Molin, Mutual Friend, Mrs. Chas. Blick, Pride

of Madford, Philadelphia, Australian Gold, Australie, G. C. Schwabe, and perhaps the most striking of all, Edwin Molyneux. When well grown, as it is here, there is no flower more telling.

North Riding Asylum.

Mr. R. M'Intosh has a good collection of standard varieties. The best are Madame Carnot, Mons. Panckoucke, Boule d'Or, Phœbus, Frank Wells, Souvenir de Petite Amie, Mons. C. H. Payne, Louise, International, Viviand Morel, Prefet Robert, President Borel, Van den Heede, Col. W. B. Smith, D. Shea, Rose Wynne, Wilfred Marshall, and Kentish Yellow. Some varieties that were very fine last year are showing hard buds. There are also a considerable number that were cut back on the 1st of June, a portion of which are allowed to grow at will, the rest disbudded in the usual way. The following varieties thus treated make nice dwarf plants with good blooms :—W. H. Lincoln, Phœbus, Souvenir de Petite Amie, J. Shrimpton, Louise, Niveus, Viviand Morel, C. Davis, Etoile de Lyon, Madame E. Capitant, and Col. W. B. Smith. Amongst incurved varieties, Baron Hirsch and Mons. R. Bahuant are very fine, but too early. J. Agate, Mr. Gardener, and Ch. H. Curtis are very promising.

Nostell Priory.

Mr. Easter is this year growing 200 bush plants, which promise remarkably well for decorative and cut flower purposes. About 250 plants are also grown for large blooms, but these received a severe check from the severe gale which played such havoc at York and elsewhere on the 16th June last, losing the greater part of their foliage. The second growth is moderately strong, short jointed, and well ripened. The incurved have come well to time and are freely developing their blooms. As Mr. Easter does not exhibit he has not grown any novelties in this section, but the standard varieties, both here and in the Japanese section, will make a fine display. Emily Silsbury, Lady Byron, and Mutual Friend are especially noteworthy.

Green Royd, Brighouse.

Mr. Barber, the gardener here, holds a capital record as an exhibitor. He grows about 200 plants, all Japanese, but is careful about adding new varieties to his collection until they have established a reliable record. He reports that the outlook this season was never more promising, and praises very highly Emily Silsbury, W. H. Lees, Phœbus, Mrs. H. Weeks, Amiral Avellan, Australian Gold, Edith Tabor, Lady Byron, and Pride of Exmouth.

Thornbury, Bradford.

Here we found a well-grown lot of plants, about 200 strong, including an interesting selection of newer varieties. Noticeable for high quality were Australian Gold, Modesto, Edith Tabor, Boule d'Or (Calvat's), Mons. Gruyer, Mutual Friend, Oceana, Phœbus, John Seward, and John Shrimpton. In the incurved the Queen family on second crowns, C. H. Curtis, Bonnie Dundee, Globe d'Or, were developing finely. Mr. Wardman, who has charge here, has just passed his plants through six consecutive days' and nights' fog, and as he is situated within the Bradford smoke radius some anxiety on his part as a young cultivator was experienced on account of damping, but careful ventilation and watering, with a little fire heat, have kept the blooms steadily progressing, and thus averting all danger.—A Yorkshire Grower.

SHOWS.

DEVIZES.—November 2nd.

The annual autumn exhibition was held as usual in the Corn Exchange, a capital site for such a meeting. Mr. J. King, Devizes Castle Gardens, in conjunction with Mr. J. A. Randell, who acts as Hon, Secretary, manage entirely this Society, which has for its main object the assistance of the various charities—a commendable object, and one which not only merits but receives support.

With the exception of two or three classes devoted to Chrysanthemum groups and baskets of hardy autumn foliage, the whole of the show was composed of the cut bloom classes, and a capital exhibition it was in this section. The principal class was that for twenty-four incurved, distinct, for which the sum of £10 was offered as the leading prize. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate, just succeeded in winning the premier position with a stand of medium sized beautifully finished examples. The varieties were :—Back row : Mr. J. Kearn, M. P. Martignac, Globe d'Or, Mrs. R. C. Kingston, Major Bonnaffon, J. Agate, Lord Wolseley, C. H. Curtis. Middle row : Violet Tomlin, richly coloured ; Jeanne d'Arc, Princess of Wales, very fine ; D. B. Crane, Mrs. Heale, Madame Darier, Empress of India, and John Doughty. Front row : Queen of England, Miss M. A. Haggas, Barbara, R. Petfield, Mrs. S. Coleman, Mr. J. Gardiner, Novelty, and Golden Empress. Mr. W. G. Adams, 89, Clarendon Road, Southsea, was an exceedingly close second with blooms lacking just a trifle in freshness, but in other respects an exhibit worthy the reputation of the cultivator. Mr. W. Robinson, gardener to the Right Hon. Lord Ludlow, Haywood, third, with smaller examples.

Mr. Salter was again the premier prizetaker in the class for a dozen incurved specimens with similar varieties and blooms to those in his previous prizewinning stand. Mr. Robinson a good second.

Japanese blooms were grandly represented. For twenty-four Mr. Salter once more secured the leading award with commendable specimens of the following varieties, all of which were grandly staged :—Back row : Mrs. J. Lewis, grand ; Australie, Mrs. C. Orchard, Mrs. H. Payne, Lady Byron, E. Molyneux, rich ; Edith Tabor, and Pride of Exmouth. Middle row : Charles Davis, Mrs. C. Blick, Pride of Madford, Miss Elsie Teichmann, very fine ; Viviand Morel, Australian Gold, beautifully coloured ; Mutual Friend, and Lady Hanham. Front row : M. C. Molin, Madame Ad. Chatin, Chenon de Leché, J. Wilkins, M. Gustave Henry, Lady Ridgway, deep and massive ; Phœbus, and A. H. Wood. Mr. F. S. Vallis, Bromham Fruit Farm, second with richly coloured specimens, indifferently staged. Mr. W. Robinson third.

For twelve Japanese incurved, Mr. Salter followed up his previous success, staging typical examples in the best possible manner. Messrs. Robinson and Vallis followed in the order here given. For twelve Japanese, confined to cultivators in Wilts, Mr. Robinson won the premier award with grand examples, Mrs. J. Lewis being extra fine. Mr. H. Clack, gardener to Lieut.-Col. C. E. Colston, M.P., Roundway Park, second with fresh, if smaller, examples of popular varieties. Anemone varieties were magnificently staged by Messrs. Salter, Robinson, and Clack, the prizes being secured in the order here given.

Miss Mary A. Buchanan, Poulshot Rectory, secured the premier award for one basket of hardy autumn foliage and berries—a pleasing arrangement. Miss Marjorie Carless, Long Street, Devizes, second.

COVENTRY.—November 2nd and 3rd.

The third annual exhibition of the Coventry Chrysanthemum Society took place on Tuesday and Wednesday, November 2nd and 3rd. There were 115 entries, and the number and quality of the exhibits were far in advance of the previous years. The show was opened by John Gulson, Esq., who was supported by C. J. Murray, Esq., M.P., and Lady Murray. Mr. Gulson, in spite of his eighty-four years, gave a charming address on the cultivation and nature of flowers in general, and Chrysanthemums in particular, tracing their origin from the earliest times until to-day. Mr. Murray, M.P., having moved a vote of thanks to Mr. Gulson for his instructive and able speech, the show was declared open.

The chief prizes for Chrysanthemums were taken by Sir Richard Moon, G. Singer, Esq., J. K. Starley, Esq., T. Browett, Esq., S. Loder, Esq., A. Smith Rylands, Esq., W. Herbert, Esq., and W. F. Wyley, Esq. Many of these exhibitors took prizes for groups and foliage plants, and the general arrangement of the Hall was very striking. In the open class for a group of Chrysanthemums arranged in a space of 50 square feet the first prize went to Sir Richard Moon; the second to G. Singer, Esq., and the third to T. Browett, Esq. For a group of foliage plants the first and second prizewinners maintained their positions, the third going to Messrs. Kimberley & Son. For twenty-four Japanese A. James, Esq., was first; W. Herbert, Esq., second ; and C. A. Smith Rylands, Esq., third. In the class for a similar number of incurved the premier position was secured by E. Loder, Esq.; followed by C. A. Smith Rylands, Esq., and G. Singer, Esq., in the order named. Lord Leigh showed a very fine collection of fruit and vegetables (not for competition)—viz., Grapes, Apples, Pears, Onions, Cauliflowers, Carrots, and Tomatoes – all of which were artistically arranged by Mr. Martin, the head gardener. Sir Richard Moon also staged a fine collection of fruit, and the Secretary of the show (Mr. F. Curtis) exhibited a fine stand of horticultural sundries. The whole exhibition was in every way a great success, and reflected much credit on the Secretary and Committee, who had worked hard for that end.

SEVENOAKS.—November 2nd and 3rd.

The thirteenth annual exhibition was held in the Club Hall at Sevenoaks, a place not half large enough for the splendid exhibits to be seen to advantage. This is the only fault to be found with this popular show. It is well managed and beautifully arranged, and, what is more, everything was of excellent quality. It was favoured also with glorious weather, and the success was a record. Mr. S. Cook, the enthusiastic Secretary, and his Committee are to be congratulated upon the satisfactory management. It is gratifying to learn a good balance is the result of their labours.

The principal feature of the show was the competition for the challenge cup, value 20 guineas, which was first offered in 1895, and that year won by Mr. A. Hatton, gardener to Mrs. Swanzy, The Quarry, Sevenoaks. Last year it was wrested from him by Mr. W. Tebay, gardener to Mr. Rycroft, Everlands, Sevenoaks. This year Mr. Hatton again won with a most superb group splendidly arranged and well finished—a popular win. Second, last year's winner with also a splendid group, a little lacking in freshness in the blooms. Third, the worthy Secretary, gardener to De Barri Crawshay, Esq., who also showed a grand group. Fourth, Mr. A. Gibson, gardener to J. F. Burnaby Atkins, Esq.

Specimen plants were well done also, as were cut flowers. The leading prize for specimens, first Mr. Hatton ; cut blooms with foliage plants arranged for effect, Mr. S. Cook first ; single specimens, first Mr. Hatton. For twelve Japanese, in eight varieties, first Mr. Tebay ; twelve incurved, distinct, first Mr. A. Gibson ; twelve incurved, eight varieties, first Mr. Cook ; twelve Anemones, first Mr. J. Brooke. The competition in cut flowers was very keen. The various classes for table plants, Primulas, Pelargoniums, cut flowers brought forth some spirited competition.

Fruit and vegetables were well shown, more particularly the latter. Mr. F. Seale exhibited a splendid collection of Dahlia flowers ; quite a feature for so late in the season. He likewise decorated the platform with plants and autumn foliage, which was most effective. The decision of the Judges gave the greatest satisfaction, which is always pleasing to relate.

CARDIFF.—NOVEMBER 3RD AND 4TH.

THE eleventh exhibition of the Cardiff Chrysanthemum Society being held on an earlier date this year, resulted in a little falling off in the number of entries, and, unfortunately for the Society, several well-known growers and exhibitors in the district were unable to compete. However, the larger Park Hall was well filled, and the excellent blooms staged were deserving of the highest praise. Messrs. W. Clibran & Sons sent several handsome Chrysanthemums.

The principal class was that for twenty-four blooms, distinct, and for which the Society, in addition to the money prize, offered a challenge cup, value 5 guineas, the same exhibitor to win the cup twice. Sir Charles Phillips, Bart. (gardener, Mr. Dumble), having been victorious in 1896, again proved himself invincible, thus becoming the owner of the cup. His blooms of Japanese and incurved were alike very fine. Japanese: Mrs. W. H. Lees, Beauty of Teignmouth, Australian Gold, Graphic, Charles Davis, Madame Carnot, Viviand Morel, Phœbus, Edith Tabor, Australie, Pride of Exmouth, and Dorothy Seward. Incurved: Charles Curtis, Mr. J. Murray, Globe d Or, Mons. R. Bahuant, George Haigh, J. Agate, Robert Petfield, Major Bonnaffon, Golden Queen, John Doughty, Lord Alcester, and Queen of England. R. W. D. Harley, Esq. (gardener, Mr. Robinson), was a creditable second.

In the class for twenty-four Japanese, not less than twelve varieties, open only to those within twelve miles of Cardiff, a silver cup, value 4 guineas, was given by Messrs. Case Bros. There were three lots staged. R. A. Bowring, Esq. (gardener, Mr. Joy), was a splendid first. There were four competitors staged in the class for twenty-four Japanese, distinct, all showing remarkably fine flowers, which for freshness and colour would have been hard to beat. Mrs. Llewellyn, Baglan Hall (gardener, Mr. Gilbert), was awarded premier honours. His stand was composed of Simplicity, M. Gerard, Phœbus, Australie (superb), A. H. Wood, Mrs. J. M. Lewis (very fine), Eva Knowles, Pride of Exmouth, International, Mons. Chenon de Leché (grand), Madame Carnot, Mrs. G. W. Palmer, Hairy Wonder, Elthorne Beauty, Mdlle. Thérèse Rey, Mons. Chas. Molin, Mrs. W. H. Lees, Oceana, Mons. Hoste, James Bidencope, John Seward, and Primrose League. Mr. Joy was a good second. The best bloom in the show (Phœbus) was in this stand, and received the certificate of the National Chrysanthemum Society. Mr. J. Robinson was third.

Mr. Dumble, gardener to Sir Chas. Phillips, Bart., was a splendid first for twenty-four incurved blooms, with Chas. Curtis, George Haigh, Mr. J. Kearn, Mr. J. Murray, Globe d'Or, Lord Wolseley, J. Agate, M. R. Bahuant (back row); John Doughty, Golden Empress, Prince Alfred, Empress of India, Robert Petfield, Major Bonnaffon (middle row); Mr. F. Hepper, Brookleigh Gem, Lord Alcester, Violet Tomlin, Jeanne d'Arc, Lucy Kendall, Princess of Wales, and Golden Queen. Mr. Robinson was second. Mr. Gilbert was to the front in the class for twelve Japanese distinct, Mr. G. W. Drake, Cardiff, being a good second. In a similar class for twelve incurved, Mr. Dumble took first place, and Mr. J. Robinson second. For twelve blooms of Japanese, in not less than six distinct varieties, Mrs. Llewellyn (gardener, Mr. Gilbert) was again first.

Groups of foliage plants and Chrysanthemums were set up by two exhibitors only. Mr. W. Treseder was well to the front with a group that contained many fine blooms. J. E. Gunn, Esq. (gardener, Mr. McLew), was second with a pleasing arrangement. In the class for a group of Chrysanthemums arranged for effect, Mr. E. Jenkins, Richmond Road, arranged a very good group. J. P. Hacquoil, Esq., was a fair second. Mr. McLew and Dr. J. Lynn-Thomas were successful for the best group of miscellaneous plants. Table plants, Cyclamens, Primulas, and Roman Hyacinths, as well as bouquets, wreaths, and crosses, were admirably shown, as were fruit and vegetables.

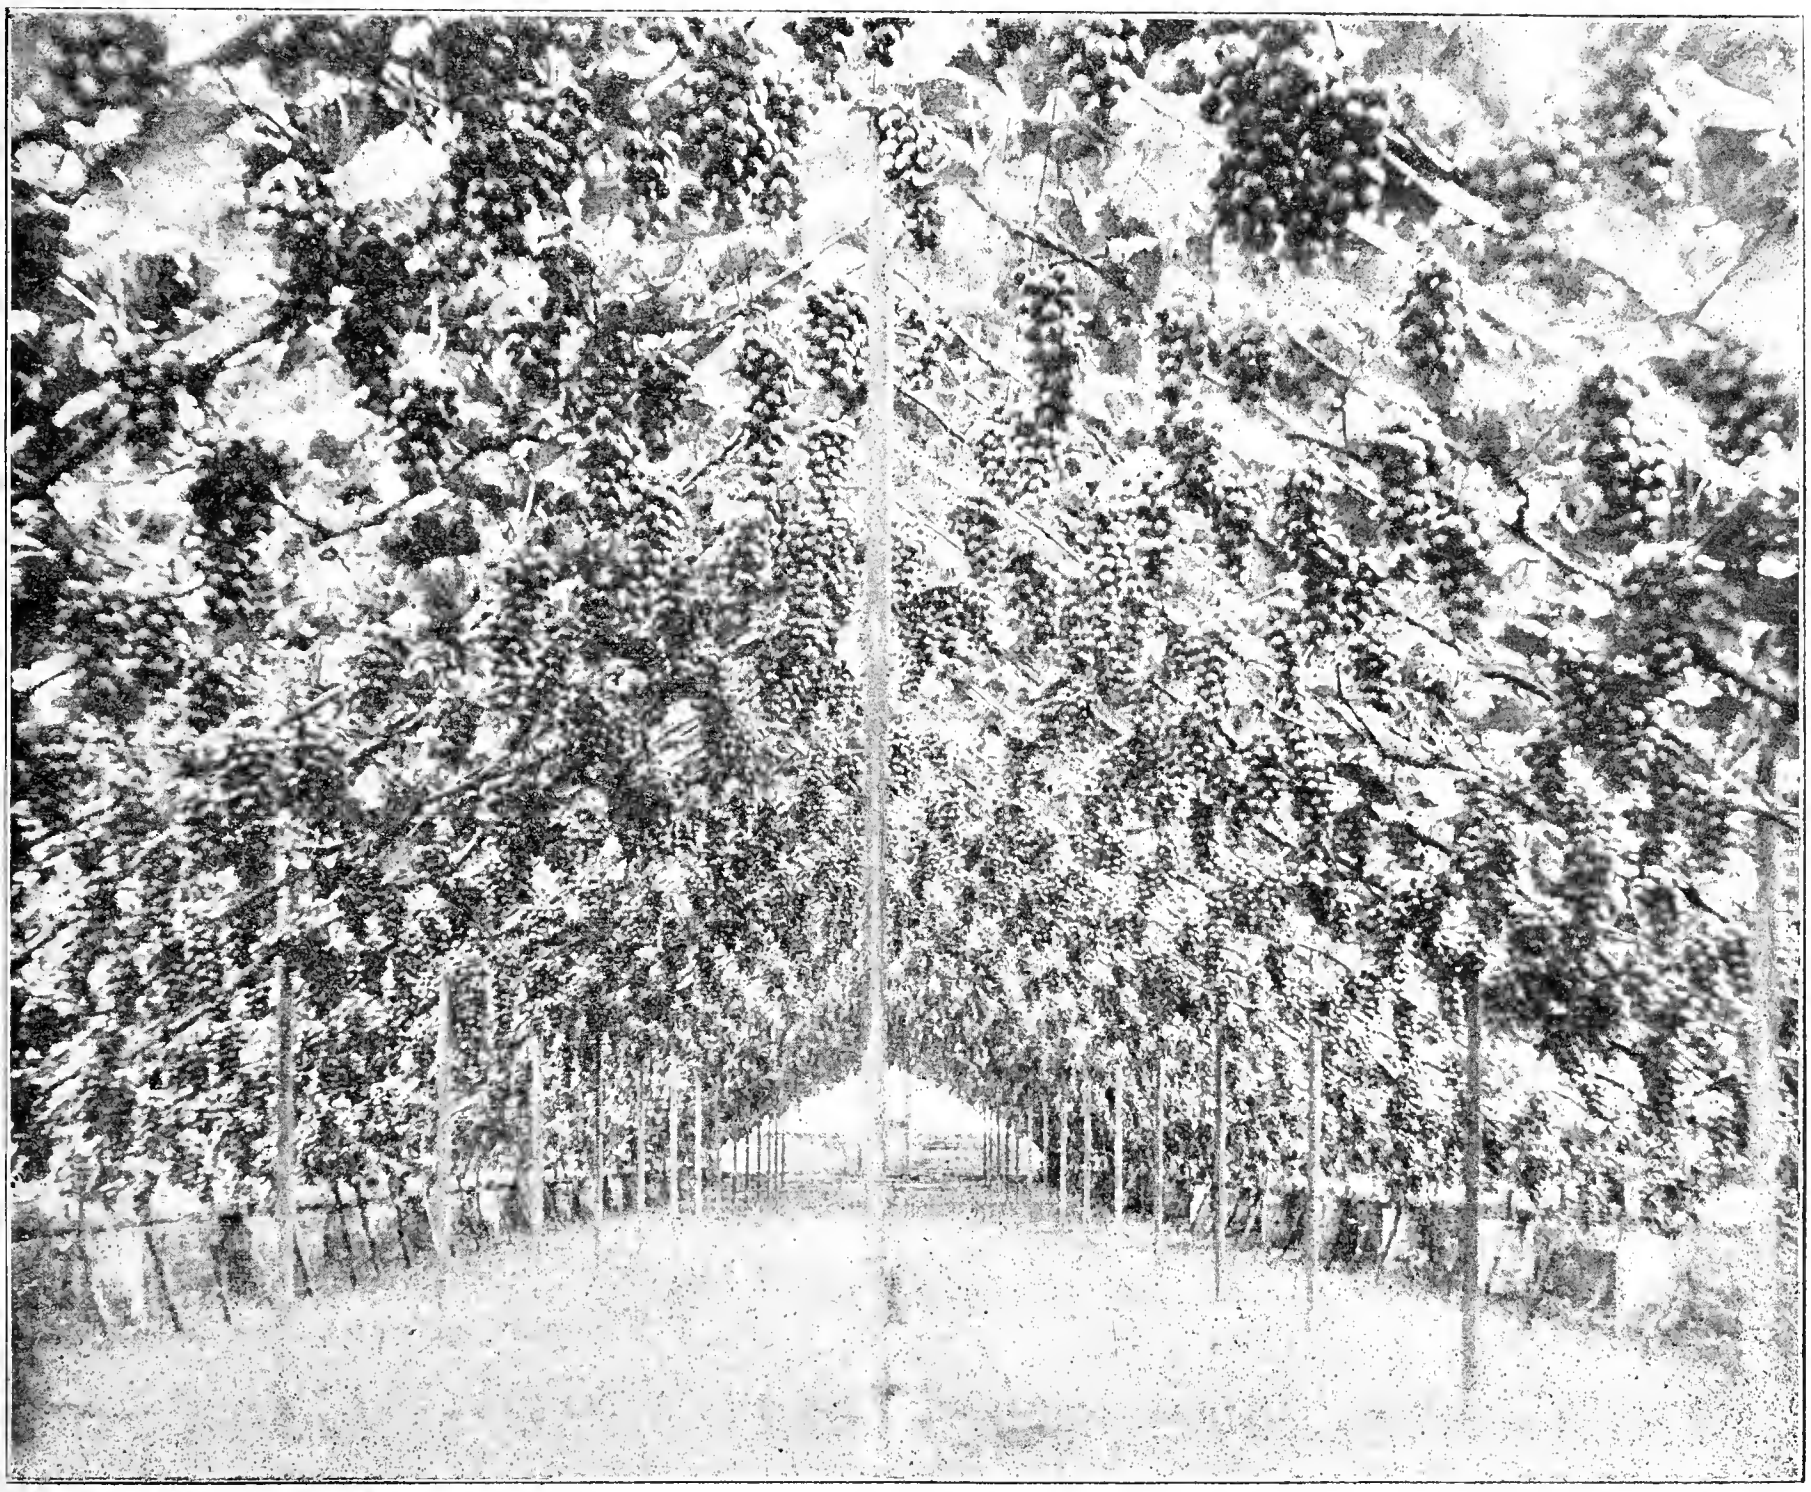

FIG. 69.—A GROS COLMAN HOUSE—ASHFORD VINERIES, COBHAM. (*See page* 452.)

Photo by Mr. Walter Johnson.

BRIXTON.—November 3rd and 4th.

Another successful show was held on the above dates at the Town Hall, Streatham. Chrysanthemums were the chief feature, but in addition there were splendid exhibits of fine-foliage plants, Orchids, Palms, and Ferns; also vegetables, remarkable for quality, and excellent fruit.

In the class for a group of Chrysanthemums arranged for effect the competition was very good, that staged by Mr. Howe, gardener to Henry Tate, Esq., Park Hill, Streatham, being considered to be the best ever put up in the district. Mr. Mursell, gardener to Mrs. Burton, Leigham Court Road, was second, followed closely by Mr. Poulton, gardener to C. T. Caley, Esq. The first prize for six untrained plants was awarded to Mr. Mursell. For six trained specimen plants Mr. J. Weston, gardener to D. Martineau, Esq., Clapham Park, was first, but was beaten in the class for four trained Pompons by Mr. Gedner. For three trained plants (Pompons excluded) Mr. F. Gilks, gardener to A. Morris, Esq., was first, having good, well bloomed plants of Colonel W. B. Smith and Viviand Morel.

For twenty-four Japanese cut blooms Mr. Mursell secured first prize with a splendid collection of good and even blooms, which included the leading varieties. Mr. Poulton, and Mr. Millsom, gardener to G. A. Payne, Esq., were second and third respectively. For an equal number of incurved blooms the competition was not nearly so keen, and Mr. Howe easily took the lead. Mr. Mursell was first for six blooms of Lady Byron, also for a similar number of Modesto.

For twelve Japanese cut blooms, distinct, Mr. W. Gray, gardener to L. Hansard, Esq., was first, and Mr. Farrow, gardener to G. R. Peerless, Esq., secured first for six varieties. For twelve blooms of incurved, Japanese varieties, Mr. Mursell was again first. There was a strong competition for the prizes offered by Miss Sherwood for a basket of Chrysanthemums arranged with foliage, Ferns, and Grasses, Mrs. Strugnell, Brixton Hill, gaining first with a pretty arrangement of yellow blooms of various shades, closely followed by others of merit.

Messrs. J. Peed & Sons had, "not for competition," a large group of Chrysanthemums, also Begonia Gloire de Lorraine, besides choice bouquets, crosses, and sprays, and some good blooms of their new Chrysanthemum Lady Freake. Mr. T. E. Knights had also some good arrangements in cut flowers.

DUBLIN.—November 3rd and 4th.

The advance shown on this side of the Channel in Chrysanthemum culture is, so far as big blooms are concerned, more noticeable in the direction of refinement than in that of mere size; for instance, the run made upon Etoile de Lyon has diminished and our growers have practically relegated anything so coarse to obscurity. In a look round the large hall of the Royal Dublin Society's premises upon the second day we were agreeably surprised with the freshness of both cut blooms and plants. This being the winter show of the Royal Horticultural Society of Ireland the popular flower, if predominating, does not monopolise attention, and although fruit, outside of trade exhibits, was not a strong feature, one may safely say that so far as vegetables are concerned at this season exhibits both in quality and quantity made a record.

Any drawback previously experienced by city folk in reaching the rendezvous, situated on the southern outskirts, is now bridged by the electric tram service, and although the huge building may not be perfect for an exhibition in which the largest amount of staging is done upon flat tables, the advantage of room is not to be overlooked, there being, as a worthy old gardener remarked, "lashins of room and to spare." On entering the hall one could not but feel how much of the good effect noticeable was due to the large plant groups set up at the far end by some of the leading local trade growers, and these being in competition in a special class may commence our critical surveys.

Group 1, to the right, and to which the premier honour of the Society's silver medal was awarded, was set up by Messrs. Chas. Ramsay & Sons, of the Ball's Bridge Nurseries. Nothing could be finer than the highly finished background of Palms used in the staging of this exhibit. Among the lesser things sloping down to a bold fringe of Maidenhair Ferns were plants of Latania aurea, and having said that it is a novelty, there is but little more to be said of it; not so, however, with Begonia Gloire de Lorraine, which was liberally used, and appears to be a winter flowering plant of sterling merit. Various Orchids completed the brightening up of this, the premier exhibit in its class. Turning to group No. 2, set up by Mr. R. Jameson, of the Sandymount Nurseries, there was no question but what his bronze medal was well earned; the margin between this and the first prize group was so narrow that one felt the happier in not having to bear the onus of the judgment. The third group at this end of the hall was contributed by the Messrs. Browett of Kingstown; this chiefly consisted of the greenery of Palms, brightened up by crimson-tinted Dracænas. Totally different, yet equally good in its way, was a well-filled corner of hardy shrubs and Coniferæ grown in pots, staged by Mr. Watson, of the Clontarf Nurseries, being, if more modest, both suitable and seasonable.

Coming to what is now the chief end and aim of a winter show—the Chrysanthemum—plants were not so largely represented as usual. In Class 1, for a group not to exceed thirty pots, but in which Palms or other foliage plants are admissible, Lord Ardilaun's prize was easily taken by Mr. Goff, gardener to Mrs. M'Cann of Simmonscourt Castle, the veteran Mr. M'Kenzie of Willow Park Gardens having to be content with second place, Mrs. M'Comas (gardener, Mr. Coghlan) being third. For a group of well grown plants arranged on a space of 50 superficial feet Mrs. M'Cann was again to the front, showing up well; also in the smaller plant classes, to which no disparagement is intended in passing at once to the possibly greater attraction of cut blooms. The Waterhouse cup for thirty-six in twenty-four varieties, half incurved and half Japs, was carried off by Mr. J. L M'Kellar, gardener to Lord Ashbrook, whose strength laid in his incurved blooms, amongst which a superb bloom of C. H. Curtis was judged to be the best incurved in the show, The Queen and Australian Gold being very conspicuous among the Japs; Mr. Crawford, for Gertrude, Countess of Pembroke, showing some fine Japs in this class, and obtaining second; R. de la Poer, Esq. (gardener, Mr. Fernie), third.

A 10-guinea challenge cup, known as "The Gardener's Prize," for twenty-four Japs was awarded to Mr. Mitchison, gardener to the Hon. Colonel Crichton, whose massive blooms from Kildare were a treat, Lord Ashbrook and Lady Pembroke succeeding in respective order. A big order was forty-eight Japs, distinct, and here Mr. Crawford concentrated his strength, and won the 10-guinea prize, Colonel Crichton and Lady E. Howard-Bury following.

Smaller classes for blooms in the various sections were fairly well filled with good fresh blooms, six of C. H. Curtis, as shown by Lord Ashbrook, in the class for six incurved, being most captivating, and one was pleased to see that grand old Jap Edwin Molyneux shown by Mr. Crawford with six matchless blooms. Class 19 was for a vase of blooms, each different, cut to show not less than 12 inches of stem above the vase. One can say but little about them, for on the second day their glory had departed. Thus treated, and in regard to their staying powers being of such brief duration, the utility of this class is questionable. Looking back over the Japanese, Mr. Mitchison's noble bloom of Mrs. W. H. Lees was the premier bloom of that section.

Messrs. Dicksons, Ltd., Chester, were represented by a hundred dishes of Apples and Pears, in as many varieties, the most noticeable among the former being fine samples of Emperor Alexander and Hormead's Pearmain. Messrs. Alex. Dicksons of Newtownards set up a similar table of 160 dishes, having in the centre their last Irish Rose trophy (Dublin, 1897) as a gentle reminder of their inimitable stands so often seen here. Horticultural sundries were well to the front, and helped considerably to fill space. A class for table decorations was well entered, but calls for but little comment, autumn tints being the predominating element.

LEWES.—November 3rd and 4th.

This was a surprisingly successful little exhibition when we remember that it clashed with the neighbouring town of Brighton. Some of the best exhibits were six untrained plants from Mr. Smith, gardener to C. R. Kemp, Esq., Bradford Lodge, Lewes: also six large-flowered plants from Mr. J. Carley, gardener to R. H. Powell, Esq., Lewes. A group of 60 square feet found Mr. Stroud, gardener to F. Verral, Esq., Southover, well in front, and the Society's certificate of merit was awarded to this as being the best group in the exhibition. Mr. Head, gardener to A. Russell, Esq., Priory Villa, Lewes, won for a group of stove and greenhouse plants.

Cut blooms were both numerous and good. Mr. J. Coles, gardener to F. H. Walker, Esq., Highly Manor, Balcombe, won for twenty-four Japanese, staging some really grand flowers; Mr. M. Tourle, gardener to F. Barchard, Esq., Little Horsted, taking first place for twenty-four incurved, and also for twelve ditto. Mr. Tourle won for a specimen incurved with C. H. Curtis, one of the finest flowers we have seen; and for a Japanese with Eva Knowles. The best box of twelve Japanese came from Mr. J. Harwood, gardener at The Court, Seaford.

Mr. C. Watkins, gardener to W. L. Christie, Esq., Glynebourne, Lewes, won for three bunches of Grapes; Mr. F. Thomas, Polegate, first for three dishes of dessert Apples and for a similar number of culinary ditto. The best tray of vegetables (open) came from Mr. C. Watkins. This division was strongly contested, and contained many good trays in special classes.

WOKING.—November 3rd and 4th.

A very bright and excellent show was this, held in the Public Hall on these dates. The exhibits seemed to be limited to Chrysanthemums exclusively, so far as the competing classes were concerned, except in the groups a few foliage plants were effectively introduced.

There were two classes for groups, the largest making a bold show. The first place in this competition was taken by Mr. Tomlin, gardener to Mrs. Goldingham, Chertsey. His plants and flowers were good, and neither too thickly nor formally displayed. The second prize was taken by Mr. Seabrook, gardener to R. M. Stevens, Esq., Woking; rather a large one, and very flatly or stiffly arranged, the plants being too crowded. In the other class, the best and a by no means overloaded group came from Mr. Hoar, gardener to L. Bircham, Esq., Woking. There were several others, and the various groups helped the show materially.

The chief class for cut flowers was that for the challenge vase, a very fine bowl, won on this occasion by Mr. Jinks, gardener to Edgar Bruce, Esq., Walton. This comprised twenty-four Japanese and twenty-four incurved. His best blooms of the former were Madame Carnot, Viviand Morel, Edith Tabor, Yellow Madame Carnot, Mons. Chenon de Leché, Beauty of Teignmouth, Phœbus, Hairy Wonder, E. Molyneux, Modesto, Mdme. A. Chatin, and others; and of incurved there were C. H. Curtis, Prince Alfred, Major Bonnaffon, Rena Dula, J. Agate, Queen of England, Lord Wolseley, Violet Tomlin, and various others of very good form. Mr. Gaymor, gardener to Mrs. Anderson, Waverley Abbey, Farnham, was second, and Mr. Tomlin third.

Without doubt the finest Japanese flowers were found in the class for twenty-four blooms, Mr. H. Paddon, gardener to Col. Ricardo, Bramley Park,

having a capital lot quite of the best class. Here were Phœbus, Pride of Madford, Pride of Exmouth, Modesto, Australie, M. Chenon de Leché, Lady Hanham, Mrs. Weeks, Graphic, Mrs. J. Lewis, Mdlle. Gustave Henry, Madame Charles Molin, Lady Ridgway, and Madame M. Ricoud. Mr. Shoesmith of Woking came second, having also excellent flowers, including such well-known varieties as Australie, Phœbus, Mr. A. C. Hubbard, Pride of Madford, Thomas Wilkins, Mrs. J. Lewis, and M. Chenon de Leché. Mr. Osman, gardener to Lawrence Baker, Esq., Chertsey, was third.

There was no corresponding class for twenty-four incurved, but in one for twelve blooms Mr. Paddon was again first, having good Globe d'Or, Mrs. R. C. Kingston, C. H. Curtis, Golden Empress, Lord Wolseley, Lord Alcester, Princess of Wales, D. B. Crane, Queen of England, Jeanne d'Arc, Lucy Kendall, and Violet Tomlin. Mr. Jinks was second, having Perle Dauphinoise, very like an incurved Japanese, in his dozen. Mr. Basill, gardener to D. H. Evans, Esq., Pangbourne, was third. Mr. Slann, gardener to H. W. Lillem, Esq., Horsell, had the best twelve Japanese, including very nice flowers of A. Avellan, Miss Elsie Teichman, Pride of Madford, Oceana, Phœbus, Australie, Dorothy Seward, and Edith Tabor. Mr. H. A. Needs, a well-known amateur, was second, having, with others, good C. A. Davis, Sunflower, Madame Carnot, Miss A. Teichmann, and Phœbus.

In the class for six Japanese Mr. C. Heal, Compton, was first; Mr. Hainge, gardener to W. May, Esq., second; and Mr. Tomlin was third. Mr. Osman had the best six incurved, and Mr. Tomlin, with Globe d'Or, the best six of one variety. There were some other small classes. The show bids fair to become a large one in time, but the Public Hall cannot expand correspondingly.

WOLVERHAMPTON.—November 3rd and 4th.

The fifth annual exhibition was held in the Drill Hall on the above dates, and proved superior to the predeccssors in all respects. This is largely due to the efforts of the persevering Hon. Secretary (Mr. J. H. Wheeler) and his efficient Committee.

The groups of Chrysanthemums arranged for effect were a prominent feature, and reflected much credit on the exhibitors. The premier prize in the group class, occupying a space not to exceed 10 feet by 7 feet, was deservedly awarded to Mr. J. F. Simpson, gardener to C. T. Mander, Esq., The Mount, Tettenhall; the second to Mr. S. Whitehouse, gardener to W. P. Baker, Esq., Avenue House, Tettenhall; and the third to Mr. T. King, gardener to S. T. Mander, Esq., Wightwick Manor. In the groups of Chrysanthemum and foliage plants intermixed the first prize was secured by Mr. G. Bradley, gardener to Miss Perry, Wergs Hall, for a very effective display The second and third prizes were most creditably won by Mr. J. Minton, gardener to T. Sander, Esq., Oaken, and Mr. C. Raffill, gardener to Alderman G. Thompson, Dudley.

For a single plant of Japanese Chrysanthemum the first prize was accorded to Mr. C. Raffill, and the second to Mr. U. Jones. For one plant of incurved the positions were reversed. For one plant of Pompon the first prize was secured by Mr. U. Jones, the second by Mr. J. F. Simpson, and the third by Mr. C. Raffill.

The chief feature in the show was evidently the large and grand display of both the Japanese and incurved cut blooms. The first prize for twenty-four incurved, in not less than eighteen distinct varieties, was awarded to Mr. J. H. Goodacre, gardener at Elvaston Castle, with fine blooms of Mrs. R. C. Kingston, Mrs. C. H. Payne, C. H. Curtis, Queen of England, Globe d'Or, John Doughty, John Lambert, Robert Petfield, Lord Alcester, George Haigh, Empress of India, Perle Dauphinoise, Baron Hirsch, Mrs. S. Coleman, Jeanne d'Arc, D. B. Crane, Miss V. Tomlin, Miss M. A. Haggis, Rose Owen, Princess of Wales, and Madame Darier. The second prize was secured by Messrs. J. R. Pearson & Sons, Chilwell Nurseries, Notts, with also a meritorious stand, and the third prize by Mr. Silas Cole. For twelve blooms of incurved, distinct, Mr. Goodacre was again to the front, the second prize being awarded to Mr. J. Parkes, gardener to W. Roberts, Esq., Ferndale Pedmore, Stourbridge, and the third to Mr. P. Blair of Trentham Gardens.

The Japanese section was in strong force, and the coveted first position was deservedly awarded to Mr. Samuel Bremmell, gardener to H. H. France Hayhurst, Esq., Overley, Wellington. His varieties were Viviand Morel, Edith Tabor (2), Commandant Blussett, Mons. Chenon de Leché, Colonel W. B. Smith, Mutual Friend, Mrs. W. H. Lees, Pride of Madford, Amiral Avellan, Australian Gold, Queen of Buffs, John Shrimpton, Modesto, Primrose League, Miss A. H. Payne, Miss Rita Schroeter, Graphic, Lady Ridgway, Beauty of Teignmouth, W. G. Newitt, and Mons. Panckoucke. The second prize was secured by Mr. G. Burrows, gardener to W. G. Phillips, Esq., Berwick House, Shrewsbury. The third Messrs. J. R. Pearson & Sons. For twelve blooms the first prize was accorded to Mr. J. H. Goodacre; and the second and third prizes to Messrs. J. Parkes and J. R. Pearson & Sons as in the order named.

For twelve blooms of Anemone Chrysanthemums Mr. W. Shingler was placed first; and Mr. J. Justice, gardener to Sir Richard Temple, Kempsey, Worcester, the second position; whilst Mr. E. Simpson, gardener to Lord Wrottesley, Wrottesley Park, was placed third. Mr. J. H. Goodacre was awarded the premier prize for the best incurved bloom with Mrs. S. Coleman, and Messrs. J. R. Pearson had the premier Japanese in a fine bloom of Phœbus.

For the most artistically arranged vase of Chrysanthemum blooms the first prize was awarded to Mr. James Hughes, florist, Tettenhall Wood; the second to Mr. C. Raffill, and the third prize to Mr. J. E. Knight, Wolverhampton. Hand bouquets were very well shown by Mr. J. E. Knight; Mr. Richard Lowe, Wolverhampton; and Mr. S. Postings, gardener to Mrs. Wight Boycott, Rudge Hall. The response to the offer of the Mander Jubilee prize of £5, given by Mrs. C. T. Mander for the best twelve vases of Chrysanthemum blooms with long stems, three in each vase, in twelve distinct varieties, not less than 1 foot in height, was well contested by Mr. E. Simpson, Mr. J. H. Simpson, and Mr. G. Bradley with excellent examples, and artistically arranged, the prizes being awarded as in their order named.

Messrs. Jones & Sons, Shrewsbury, exhibited (not for competition) an interesting arrangement of Cactus and Pompon Dahlias, shower bouquets, and other floral devices. Mr. Richard Lowe had a stall of fruit and cut flowers for sale, the proceeds to be devoted to the Gardeners' Royal Benevolent Institution. Both fruits and vegetables were splendidly shown.

PORTSMOUTH.—November 3rd, 4th, and 5th.

The Portsmouth Society held its eleventh annual exhibition on the above dates at the Victoria Hall, Southsea, and so large were the entries that an annexe from the gallery had to be utilised for the fruit and the splendid collection of vegetables in competition. The body of the Hall was flanked with the miscellaneous and Chrysanthemum groups, and the centre tables filled with the classes for cut blooms, bouquets, table plants, and Primulas, the end of the Hall next the orchestra being occupied with the table decorations. With such doughty champions in the Chrysanthemum world as Messrs. Penford of Leigh Park, Havant, and Mr. J. Agate of the same place, quality of cut blooms may be assured. The exhibits of Mr. W. Adams in the incurved classes, and Mr. Burridge in the groups, were worthy of their reputation, while the amateurs came out very strong indeed, Mr. C. White being especially successful.

The leading prize was of the value of £10 for the first for forty-eight cut blooms, twenty-four Japanese and twenty-four incurved. In this Mr. Penford, gardener to Sir F. Fitzwigram, Leigh Park, Havant, put up a very fine stand, consisting of the following varieties—Japs: Mrs. J. Lewis, Phœbus, Pride of Exmouth, Edith Tabor, Lady Ridgway, Mrs. W. H. Lees, Mrs. Carpenter, M. Gustave Henry, Hermann Kloss, V. Morel, Australie, J. Shrimpton, Madame Carnot, Modesto, Mons. Chenon de Leché, Primrose League, Violetta, Mons. Panckoucke, Mrs. R. Jones (good), and Chas. Davies. The twenty-four incurved, in eighteen varieties, were Violet Tomlin, Duchess of Fife, R. C. Kingston, Major Bonnaffon, Dorothy Foster, Globe d'Or, Jeanne d'Arc, Golden Queen, Robert Penfold, J. Agate, Madame Darier, Mrs. Robinson King, Empress of India, Lord Rosebery, Lord Wolseley, Chas. Curtis, Alfred Salter, Austin Cannell, and Queen of England. Mr. J. Agate was second with an excellent stand.

In the open class for twenty-four Japs Mr. Penford was again first. The second prize was secured by Mr. J. Agate. Mr. R. Woodfine, gardener to Col. Boyd, Emsworth, third.

In the class confined to Portsea Island for twenty-four incurved, in eighteen varieties, Mr. W. G. Adams, Southsea, was first with a highly finished stand, comprising Major Bonnaffon, Lord Wolseley, Globe d'Or, Queen of England, Bronze Queen, C. H. Curtis, R. C. Kingston, Princess of Wales, C. B. Whitnall, Lucy Kendall, Violet Tomlin, Madame Darier, Jeanne d'Arc, Brookleigh Gem, Prince Alfred, Golden Queen, Miss Haggas, and Empress of India. The second prize was awarded to Mr. C. White, St. Vincent Road, Southsea, with a good stand, Chas. Curtis, Baron Hirsch, and Madame Darier being the best; the third going to Mr. Dimmick, gardener to Mrs. J. Young, North End.

In the open class for twenty-four incurved Mr. Penford was to the front with a splendid exhibit. The second was awarded to Mr. J. Agate, and the third to Mr. F. G. Foster. In the class for twenty-four Japs, confined to Portsea Island, Mr. W. G. Adams was first with an excellent stand of fresh fine blooms of the leading varieties. Mr. Steptoe, gardener to T. Williams, Esq., Southsea, was second; and Mr. J. Burridge third, both showing well. For twelve Japs Mr. C. White was first, Mr. J. Chatfield second; and for twelve incurved Mr. Steptoe was to the front with highly finished blooms. The other classes for Anemones and Pompons, and also the amateurs' and cottagers' classes, contained some very meritorious exhibits, which reflected great credit on the growers.

For a group of Chrysanthemums arranged in a space of 60 square feet, interspersed with foliage plants, Mr. Burridge, North End, was awarded first with a light elegant arrangement containing some fine Chrysanthemum blooms, and nicely finished with Maidenhair Ferns. Mr. W. Rooke, Esplanade Hotel, Southsea, was second, and Mr. Joyce, gardener to Captain Lancaster, third. For a group of miscellaneous plants, flowering and foliage, Mr. Burridge was again first. For a vase containing twelve blooms with foliage, Mr. Steptoe was first with the variety Thos. Wilkins, and for a bouquet of Chrysanthemums, Mr. Mills Florence Road, Southsea, first. Mr. Burridge second.

In the non-competitive exhibits was a fine collection of Japanese from Messrs. W. & G. Drover, Fareham. Mr. J. Agate staged a stand of the new varieties raised by Mr. N. Molyneux, Rookesbury. The classes for vegetables were well filled and the quality excellent.

The exhibition was opened by the Mayoress; and with an energetic and business-like executive with Mr. Mark Gill, T.C., as President, and Mr. W. H. Berry as Secretary, receiving the support and countenance of Mr. F. Power, and other members of the Corporation, this resuscitated Society, once so prosperous, ought to be firmly established and supported by the neighbourhood.

ASCOT.—November 4th and 5th.

The Ascot Society held its annual exhibition at the Grand Stand Ascot. This is a splendid place for an exhibition, there being abundance of space for the amusements which the Hon. Secretary and the Committee provided. Fruits and vegetables were well staged. Messrs. J. Laing and Sons sent a collection of Apples and Pears (not for competition).

In the open class for twenty-four Japanese, distinct, Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate, was awarded first with grand flowers of Mrs. J. Lewis, Australie, Mrs. C. Orchard, Mrs. C. H. Payne, E. Molyneux, Edith Tabor, Pride of Exmouth, C. Davis, Mrs. C. Blick, Pride of Madford, Elsie Teichmann, Viviand Morel, Australian Gold, Mutual Friend, Lady Hanham, Phœbus, Mons. C. Molin, Madame A. Chatin, Mons. Chenon de Leché, Thos. Wilkins, Lady Isabella, Lady Ridgway, and A. H. Fewkes. The second prize went to Mr. F. Cole, gardener to Sir George Russell, Bart., M.P., Smallfield Park, who had in Mrs. J. Lewis the premier bloom. Third, N. L. Cohen, Esq. (gardener, Mr. A. Sturt), Round Oak, Englefield Green; and fourth, A. Gilliat, Esq. (gardener, Mr. A. Johnson), Duffield, Stoke Pogis, Slough.

For twenty-four incurved Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, was first with small but very neat blooms. His best were C. H. Curtis (premier incurved), Jeanne d'Arc, Mrs. R. C. Kingston, George Haigh, Princess of Wales, Mons. R. Bahuant, Queen of England, Globe d'Or, Prince Alfred, Baron Hirsch, Miss Haggas, Novelty, Robert Petfield, Golden Empress, Lord Wolseley, Rose Owen, Ami Hoste, Mrs. Heale, Violetta, Golden Queen, Empress of India, and Perle Dauphinoise. Mr. Salter was second with larger flowers, but one or two were past their best. Mr. Jones, gardener to Miss Wyburn, Hadley Manor, Barnet, Herts. was third; and Mr. Short fourth. There were nine competitors.

For thirty-six cut blooms (eighteen Japanese and eighteen incurves) confined to the district, Mr. W. Lane, gardener to Miss Durning Smith, King's Ryde, Ascot, won easily with the best stands in the show. The Japanese were Viviand Morel, Phœbus, C. Davis, Madame Carnot, Beauty of Teignmouth, Graphic, Mrs. J. Lewis, E Molyneux, Mrs. C. H. Payne, Mons. Chenon de Leché, grand; Edith Tabor, Australie, Duke of York, Louise, Oceana, Commandant Blusset, and Lady Northcote. Incurved: Empress of India, Major Bonnaffon, Queen of England, John Doughty, C. H. Curtis, Mrs. R. C. Kingston, grand; R. Petfield, Ami Hoste, Violet Tomlin, Mrs. J. Kearn, Novelty, Globe d'Or, Flora Macdonald, Lucy Kendall, Miss Haggas. Jeanne d'Arc, and Madame Darier. Second, Mr. W. L. Farmer, Wendlesham.

Mr. W. Wilson, gardener to R. C. Christie, Esq., Ribesden, Windlesham, was first for twelve incurved, distinct; Mr. Fred Heereman, gardener to Lady Isabella Keane, Rose Mount, Sunninghill, second; and Mr. W. Hawthorne, The School, Ascot, third. For twelve Japanese Mr. Wilson led again, Mr. Heereman second, Mr. White, gardener to Dowager Marchioness of Cunningham, The Mount, Ascot, third.

The class for groups of Chrysanthemums and foliage mixed brought out four competitors, Mr. W. Farmer first, Mr. Heereman second, Mr. Lane third. For a group of Chrysanthemums Mr. Lane won with a magnificent group, second Mr. W. Hawthorne, third Mr. H. White.

HARROGATE.—November 4th and 5th.

The third show under the management of the Harrogate Paxton Society was held in the fine Winter Gardens, recently built, and admirably adapted to the purpose. The earliness of the fixture told against the quality of the cut blooms, but in all other respects the show was a decided advance on the previous ones.

Four fine groups of Chrysanthemums were staged. The first prize went to Mr. Townshend, gardener to E. B. Faber, Esq., Belvedere, Harrogate. Mr. J. Pettinger, of Strawberry Dale Nurseries, secured the second prize with a neat arrangement, but his individual blooms lacked the size and freshness of those in the winning collection. Mr. J. A. Schofield, Pannal, was third; and the Rev. T. Sheepshanks, Harrogate, fourth. In the miscellaneous plant groups Mr. Townshend was again first; the Rev. T. Sheepshanks second; and Mr. Pettinger third. The Chrysanthemum plant classes were decidedly weak, and call for no special reference.

The first prize for twenty-four incurved blooms, in not less than twelve varieties and not more than three of any one variety, went to Mr. Ketchill, gardener to Mr. Charles Simpson, Ackworth Moor Top, who staged Vice-President Jules Barigny, M. R. Bahuant, Baron Hirsch, Globe d'Or, Mrs. R. C. Kingston, Madame Darier, Brookleigh Gem, Jeanne d'Arc, D. B. Crane, Violet Tomlin, Robert Petfield, John Salter. Messrs. H. Clark & Son, Rodley, were second, there being only two stands in competition. Mr. J. W. Backhouse, Beverley, won first prize for twenty-four Japanese, not less than twelve varieties, and not more than three of any one variety, with the following:—Mrs. C. H. Payne, Simplicity, Duke of York, Eva Knowles, Niveus, Edith Tabor, Emily Silsbury, Colonel W. B. Smith, C. Davis, Hairy Wonder, Thérèse Rey, Sunflower, Mrs. E. G. Hill, Viviand Morel, and Dorothy Seward. Mr. S. Haldane, Hull, was second, showing Simplicity, Phœbus, and Edith Tabor very fine. Mr. S. Dawson, Otley, was third.

Bouquets and epergnes for dinner table decoration were shown in excellent taste by Messrs. A. Hall and W. Bonsal, Harrogate. Fine collections of fruit were exhibited. Mr. A. E. Brotherton, Arthington Hall; Captain Greenwood; the Marquis of Ripon; J. W. Lee, Bedale; Messrs. Winterburn & Son, Whixley, and Mrs. Whitham, Harrogate, also showed. Messrs. Backhouse & Son, the York Nurseries, exhibited a fine representative collection of Apples, not for competition.

HIGHGATE.—November 4th and 5th.

The thirteenth annual exhibition was held in the Northfield Hall, and proved a great success. The groups of plants were numerous and well arranged. The cut flower classes were well filled, and the quality throughout excellent. The Hall, and a tent erected outside, were filled, in fact crowded. The decorative section of the show was keenly contested, there being nearly twenty distinct classes devoted to this purpose. Extreme pressure on our space this week prevents any detailed account being given of them, suffice it to say they were a very attractive feature of the show, and greatly appreciated.

A remarkably fine set contested the premier class for a group of Chrysanthemums, to occupy a space of 60 square feet. Mr. Jas. Brooks, gardener to W. Reynolds, Esq., J.P., Highgate, was placed first with a magnificent group, containing good flowers combined with nice arrangement. Mr. J. Tubbs, gardener to H. G. Regnart, Esq., Highgate, second with a bright and fresh display. Mr. F. Gilbert, gardener to W. A. Sewell, Esq., Shepherd's Hill, third, with a pleasing group of dwarf plants. Mr. J. Brook was again successful for a group of Chrysanthemums and foliage plants of a similar size, exhibiting a very artistic arrangement of Chrysanthemums, intermingled with Ferns, Palms, Crotons, and Grasses. Mr. J. Tubbs secured second place with a fine display, but a little weak in the flowers, otherwise the group was good.

Mr. Jas. Brooks was deservedly awarded first prize for six trained plants, staging remarkably fine plants in first-rate condition, Madame B. Rendatler, Chinaman, and Maiden's Blush being most noteworthy. Mr. F. Gilbert was second with much smaller plants. Mr. Jas. Brooks was the only competitor for six trained Pompons, and was awarded the first prize with well grown plants of a dwarf type of training. Mr. J. Brooks was again first for a single trained specimen, showing Col. W. B. Smith. Mr. Gilbert was a very close second with a fine plant of J. Shrimpton; Mr. G. Saunders, gardener to W. Hayes, Esq., Highgate, third.

The premier cup class for forty-eight cut blooms, Japanese, was awarded to Mr. Jas. Brooks, gardener to W. J. Newman, Esq., Totteridge, for a grand exhibit. The blooms were remarkably fine. The best were Madame Carnot, Modesto, Madame Gustave Henry, grand; Australie, Pride of Madford, Duke of York and Phœbus. Mr. J. Sandford, gardener to G. W. Wright-Ingle, Esq., North Finchley, second with good specimens of Eva Knowles, Phœbus, Mrs. W. H. Lees, Mons. Chenon de Leché, Reine d'Angleterre, and Viviand Morel.

In the class for eighteen Japanese and a similar number of incurved, Mr. E. Rowbottom, gardener to Mrs. Williams, Hornsey, was first with an even exhibit, the incurved being perhaps the finer. Mr. E. Rowbottom was again first for twelve blooms of each section, staging very good incurved. Mr. J. Brooks, Totteridge, was placed first for twenty-four blooms, Japanese, with a strong stand, Pride of Madford, M. Demay-Taillandier, Australie, Madame Carnot, and Chas. Davis were especially fine. Mr. E. Rowbottom was second, with a weaker display. Mr. J. Sandford was well ahead for twelve Japanese, distinct, followed by Mr. E. Rowbottom. The Pompons made a very fine display, the whole of the exhibits being clean and bright. Mr. A. Page was placed first for twelve triplets, with a very strong stand. Mr. T. L. Turk, gardener to T. Boney, Esq., Highgate, was second, and Mr. A. E. Turk, gardener to F. B. Roberts, Esq., Highgate, third. A keen competition was brought out for twelve blooms pure yellow Japanese. Mr. J. Sandford securing the blue ribband with magnificent blooms of Phœbus. Mr. A. Page, gardener to A. L. Reynolds, Esq., North Finchley, with a fine twelve, comprising three varieties. Mr. J. Brooks, Totteridge, third. For twelve incurved varieties, Mr. J. Sandford was placed first with good Lucy Kendall, Brookleigh Gem, and Jeanne d'Arc. Mr. C. H. Martin, gardener to Mrs. Langton, Hendon, second.

WOOLWICH.—November 5th.

The Woolwich Horticultural Society does not concentrate its resources on one or two shows a year, but has monthly meetings at which certificates are awarded for meritorious produce. Still the public is given an annual treat in the form of a Chrysanthemum show, and the Drill Hall is admirably adapted for the purpose. Vehicles can be drawn in and loads of plants taken where they are required. On the opening day of the show the long rows of tables furnished with excellent cut blooms, flanked with groups along the sides of the building, produced an imposing effect. The shows of the Society have been larger and better yearly for four years, and the one under notice was much in advance of its predecessors.

Though the groups have never been so good before, they were, as a whole, too stiff and formal. Most of the plants were made to stand as straight up as soldiers at a review, and the stakes to which the blooms were secured were in most cases far too obtrusive. Moreover, many of the pots were obtrusive too, notwithstanding that other kinds of plants were permitted for the margin. These, in some cases, were employed, but not always effectively. It may be that some exhibitors of Chrysanthemum groups have neither Ferns nor foliage plants; and in such, or any cases, it seems a pity that evergreens are not allowed. A fringe of say, Mahonia aquifolia, would have a far better appearance than irregular sized pots, and add materially to the pleasing effect of groups, if not look better than some of the tender exotics employed for the purpose.

The first prize in the open class for groups was, we believe, won by an amateur, Mr. Edwards, evidently not because his blooms were the best, though they were good, but because of the taste displayed in arrangement, and the bold yet pleasing effect as a whole. The second prize group of Mr. Tomalin, gardener to S. White, Esq., Crayford, contained finer blooms, and there its merits ended. The third prize exhibit of Mr. Russell, gardener to T. Pim, Esq., Crayford, was similar in character.

In the cut bloom classes the many stands of Japanese made a fine display, and the competition in most classes was very keen. Good stands of incurved, Anemones, reflexed, and Pompons were also well worthy of the prizes they won. Mr. Dodd, gardener to Mrs. Champion, Frenches, Redhill, won the N.C.S. medal with twenty-four Japanese blooms, distinct, closely followed by Mr. Blackburn, gardener to J. Scott, Esq., Chislehurst, and Mr. Simon, gardener to W. W. Mann, Esq., Bexley.

Mr. T. Osman, gardener to L. J. Baker, Esq., Chertsey, was the premier winner with incurved blooms, similar positions being occupied with large Anemones and Pompons by Mr. Dodd, and reflexed blooms by Mr. Leadbetter, gardener to A. G. Hubback, Esq., Chislehurst. There were, of course, many other classes and prizewinners, but only the general character of the show can be indicated. It should be stated, however, that the premier blooms in the open classes were Mr. Jeyes' Mrs. H. Weekes (Japanese), and Mr. Worthington's C. Curtis (incurved); amateurs, Mr. Simon's Australie (Japanese), and Mr. Russell's C. Curtis (incurved), all very fine indeed. The Committee, with the courteous Honorary Secretaries, Messrs. R. C. Wilson and R. J. Worthington, are to be congratulated on the results of their labours.

WATERLOO.—November 5th and 6th.

On Friday and Saturday last the annual show in connection with the above Society was opened by R. Attwood Beaver, Esq. Mr. W. Tunnington and Mr. R. Pinnington, the Judges, also addressed the assemblage on the excellence of the Show. As compared with former years not only were the entries more numerous, but the exhibits were of much excellence; and it is a pleasure to know that the inhabitants of the district are able to make such a fine display when one takes into consideration that the gales coming up the river Mersey often sweep all before them.

The principal prizewinner of the day was Mr. H. Cliffe, gardener to J. Lawson, Esq., who succeeded in securing the two silver goblets presented by Isaac C. Glover, Esq. The prizes were for twelve incurved and twelve Japanese, not less than nine varieties of each, and for a group of Chrysanthemums arranged for effect. In the former he just held a slight lead with better finished blooms over his opponent, C. McLaren, Esq., a good third being staged by Mr. Rice, gardener to D. Fernie, Esq. Mr. McLaren turned the luck for twelve incurved.

Of the other cup class Mr. Cliffe was an easy winner with a group of plants that were simply perfect in arrangement and models of good cultivation, and Mr. Cliffe was a worthy recipient of the two cups, which he now wins outright. Mr. Hardy, gardener to Mrs. Pegram, and Mr. Rice staged extremely well for second and third positions. Mr. Cliffe was also successful in many leading classes with plants of excellent culture. Messrs. Rice and McLaren and Hardy were very conspicuous winners in other classes.

The groups of Chrysanthemums arranged with foliage plants were very numerous, the first prize, staged by Mr. P. H. Clare, gardener to J. B. Colton, Esq., although not having the best advantage in the matter of light, was very worthy of the first prize awarded. Miscellaneous plants of all kinds helped to make a bright effect. The baskets of Chrysanthemums (more especially the first prize, arranged by Miss E. Lawson, which was a bold attempt with large varieties of pink and white well handled in every detail) were noticeable, the sprays being also choice. In the open classes for twelve incurved and twelve Japanese the division was a very close one, Mr. P. Greene, gardener to Thomas Gee, Esq., Allerton, winning from Mr. Haynes, gardener to Mrs. Nicholson, Wavertree. Mr. Cliffe was a good third. In the two former stands the blooms were exceptionally good and well staged. Fruit was sparsely staged and not of the highest quality. The amateur classes were not so well represented as the Committee would wish.

If civility and hard work go to make up the success of a show the Society is more than fortunate in having J. M. Smythe as Chairman, G. W. Ashton, a splendid Secretary, and I. C. Glover as Treasurer, every one of whom stimulates exhibitors and Committee with an earnestness worthy of the highest praise. The Committee and friends were indebted to Mr. Glover for the handsome luncheon provided.—R. P. R.

LIVERPOOL.—November 9th and 10th.

On Tuesday the finest show ever held under the auspices of the Liverpool Horticultural Association was opened in St. George's Hall, The staging of former years had been departed from, and a grand series of groups of very improved style were arranged down the centre. On each side of these were tables with fruit and small plants, whilst the extreme wall sides were taken up by other groups and foliage plants. As mentioned in my notes a week ago, the greatest interest was centred in the challenge vase class for forty-eight cut blooms, incurved and Japanese, last year's winner being Mr. R. C. Townshend, gardener to Col. Lloyd, Aston Hall, Shrewsbury; he was easily beaten for the coveted honour by many points by that well-known and excellent grower, Mr. George Burden, gardener to G. B. Cockburn, Esq., Lingdale Lodge, Oxton, Cheshire, with certainly the greatest lot of blooms he ever put up, and so the Committee's handsome vase is left in the same position as regards its destination for another season.

In the Japanese the back row consisted of Edith Tabor, E. Molyneux, Simplicity, Mrs. C. H. Payne, Charles Davis, Duke of York, Marie Hoste, Viviand Morel. Second row: Mrs. H. Weeks, Thomas Wilkins, James Bidencope, Lady Ridgway, Violetta, Modesto, Australie, Robert Owen. Front row: Phœbus, Lady Hanham, Mdlle. Thérèse Rey, G. C. Schwabe, Australian Gold, Col. W. B. Smith, Mons. Chenon de Leché, and Mrs. J. Lewis. Incurved: Jno. Lambert, Empress of India, P. Dauphinoise, Lord Alcester, Chas. Curtis, Queen of England, Major Bonnaffon, James Agate, W. Tunnington, Mrs. Robinson King, Robert Petfield, Miss M. A. Haggas, Ma Perfection, Golden Empress, Violet Tomlin, Jeanne d'Arc, Madame Darier, Princess of Wales, John Salter, Miss Lucy Kendall, Hero of Stoke Newington, Brookleigh Gem, Mrs. Heale, and Baron Hirsch. Mr. Townshend was extremely good in size, but not bright enough, whilst the incurved were much behind. The best in the stands were Pride of Exmouth, Richard Dean, M. Chenon de Leché, Mutual Friend, Ernest Cannell, Graphic, Duke of Wellington, B. D. Crane, and Duchess of Fife. Mr. J. Heaton was a very close third with many choice flowers, Lady Ridgway, Phœbus, Graphic, Australie, Mr. H. Cheesman, Madame Darier, Mrs. R. C. Kingston, and Lucy Kendall being the best. Mr. George Haigh, gardener to W. H. Tate, Esq., Highfield, Woolton, was a fine fourth.

The first prize group of Chrysanthemums and foliage plants was staged by Mr. T. Gowen, gardener to J. A. Bartlett, Esq., Mossley Hill. Other cut bloom classes were of a high standard, the only weakness being amongst the incurved classes. Trained and specimen Chrysanthemum plants were much improved. Fruit was not only abundant but highly coloured, the Grapes being specially fine. Owing to the show being held immediately before going to press a full report will appear next week.

KINGSTON.—November 9th and 10th.

The twenty-first annual show was held, as in former years, in the Drill Hall, Kingston. Groups were good, but the cut bloom classes are always the strongest feature, and the present occasion was no exception to the rule. Under the management of Mr. E. H. Douet (the Hon. Secretary) and a hard-working Committee, the arrangements of the show were carried out in a most efficient manner.

The chief class was for forty-eight cut blooms, distinct, twenty-four incurved and twenty-four Japanese. This was open to all England, and a champion challenge vase, value 25 guineas, was the first prize in this great class. Needless to say, the competition between the five exhibitors was very keen, Mr. F. King, gardener to A. F. Perkins, Esq., Oak Dene, Holmwood, Surrey, eventually securing the coveted award. The flowers were of good size, fresh and rich in colour. The varieties comprised—Japanese: Mrs. J. Lewis, Australie (premier bloom), Phœbus, E. Molyneux, Madame Carnot, Silver King, Pride of Exmouth, Eva Knowles, International, Mons. Chenon de Leché, Viviand Morel, Edith Tabor, Charles Davis, Mrs. C. Blick, Mons. Ch. Molin, Mutual Friend, Modesto, Mdlle Thérèse Rey, Mons. Hoste, Viscountess Hambledon, Mrs. A. G. Hubbock, Australian Gold, Simplicity, and Mons. Marcus Ricaud. The incurved were Duchess of Fife, Lord Rosebery, Lord Alcester, J. Agate, Globe d'Or, Mrs. R. King, W. Tunnington, C. H. Curtis (premier bloom), Robert Petfield, Ma Perfection, Percy Surman, Major Bonnaffon, Empress of India, J. Lambert, J. Salter, Jeanne d'Arc, Bonnie Dundee, G. Haigh, Queen of England, Brookleigh Gem, Golden Empress, C. B. Whitnall, Miss M. A. Haggas, and Lyne junior. Mr. S. J. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, was an exceedingly close second; his best Japanese were Mons. Chenon de Leché, Mrs. A. G. Hubbuck, Australie, Phœbus, and Edwin Molyneux. Charles Curtis, Lady Isobel, Duchess of Fife, Violet Tomlin, and Hero of Stoke Newington were the most conspicuous incurved. Mr. W. Jinks, gardener to Edgar Bruce, Esq., The Beeches, Walton-on-Thames, was a very good third; he lost points with his Japanese, but the incurved were of good quality; and Mr. J. Quarterman, gardener to V. C. Smith, Esq., Cobham, fourth.

Valuable prizes were offered for thirty-six Japanese, distinct, and five heavy stands were staged. Mr. W. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, was first with a grand stand. His best blooms were Mrs. H. Weeks, Madame Carnot, Edith Tabor, Viviand Morel, Australie, A. H. Wood, Charles Davis, and Mrs. G. Carpenter. Mr. S. J. Hunt was a close second, and Mr. F. King, third.

For a group of miscellaneous plants to contain not less than twenty-five Chrysanthemums, and to occupy a space not exceeding 84 superficial feet, Mr. J. Portbury, Ripon House, Putney Heath, was first with a light and striking arrangement. Mr. D. Gibson, gardener to J. B. Johnson, Esq., Coombe Cottage, Kingston Hill, was second with a fine but much heavier arrangement. Third, Mr. G. Springthorpe, gardener to W. A. Bevan, Esq., Kingston.

In the class for twenty-four incurved, distinct, Mr. F. King again took the lead with a fine even stand; C. H. Curtis, D. B. Crane, Queen of England, J. Doughty, Major Bonnaffon, Lord Rosebery, and M. A. Haggas were the best. Mr. S. J. Hunt was second, and Mr. W. Higgs third. Six heavy stands were staged in the class for twelve Japanese, distinct, Mr. D. Gibson gaining the first prize with Phœbus, Mutual Friend, Duke of York, and others. Mr. G. Springthorpe was an excellent second.

Mr. J. Quarterman was well first with six Japanese; Mr. S. Mileham, gardener to A. J. Miller, Esq., Leatherhead, being second, and Mr. W. Brett third. For six Japanese, one variety, first Mr. Higgs with a grand stand of Madame Carnot; second Mr. Springthorpe with Phœbus, and third Mr. F. King with Mrs. W. Weeks.

In the class for twelve bunches of single Chrysanthemums, four very pretty exhibits were staged. Mr. G. W. Forbes, gardener to Madame Nicols, Regent House, Surbiton, was first with a splendid stand; Mr. S. Pead, gardener to R. S. Bond, Esq., Surbiton, second; and Mr. A. Felgate, gardener to the Duchess of Wellington, third. Eight stands were staged for six incurved, one variety. Mr. S. J. Hunt was first with Duchess of Fife; Mr. F. King second with C. H. Curtis, and Mr. Brett third with the same variety.

ROYAL AQUARIUM. November 9th, 10th, and 11th.

The chief exhibition of the National Chrysanthemum Society was held, as formerly, at the Royal Aquarium. The show is always remarkable for the keenly contested classes; but on this occasion, though there was no falling off in the quality, there appeared a slight diminution in many of the chief classes. The whole show has, however, proved itself worthy of its national character.

It is always regrettable when so many important shows are held on the same day, but this is more particularly the case when the Royal Horticultural Society and the National Chrysanthemum Society clash. If it were unavoidable nothing would be said, but the dates of the R.H.S. are fixed and published so early, that the Executive of the N.C.S. might easily choose another day. Let us hope they will avoid confliction in 1898.

The competition for the challenge trophy was not very keenly contested, the Bromley and District Society proving the victors. The blooms in the Japanese section were, reading from left to right—Back row: Madame Carnot, Australie, Phœbus, Duke of York, Mrs. Weeks, International, Chas. Davis, Mutual Friend. Second row: Viviand Morel, Primrose League, Etoile de Lyon, Thérèse Rey, J. Bidencope, A. Gold, Graphic, Mons. Chenon de Leché. Front row: Elsie Teichmann, G. C. Schwabe, Modesto, Milano, Simplicity, Matt. Hodgson, Edith Tabor, and Mrs. C. Blick. Incurved—Back row: Chas. H. Curtis, Mrs. J. Kearn, W. Tunnington, Empress of India, Mons. Desblanc, Major Bonnaffon, Robert Cannell, Duchess of Fife. Second row: J. Agate, Robert Petfield, Golden Empress, Lord Alcester, Ma Perfection, Violet Tomlin, Mrs. R. King, George Haigh. Front row: Mrs. R. C. Kingston, J. Doughty, Queen of England, Mrs. Coleman, Mrs. Heale, Miss Haggas, Princess of Wales, and John Lambert.

There were four competitors for thirty-six blooms incurved, distinct; the flowers, in nearly all cases, being well finished and fresh. Mr. W. Mease, gardener to A. Tate, Esq., Leatherhead, was first with a very even exhibit. His blooms were—Back row: Duchess of Fife, Violet Foster, J. Agate, Dorothy Foster. Major Bonnaffon, Mrs. R. C. Kingston, Wm. Tunnington, Lord Alcester, Lady Isobel, Robert Petfield, Chas. H. Curtis (grand), Ma Perfection. Second row: John Doughty, Empress of India, Lucy Kendall, M. P. Martignac, Queen of England, Violet Tomlin, John Lambert, Lord Rosebery, Golden Empress, Globe d Or, Jeanne d Arc, Robert Cannell. Front row: Princess of Wales, Brookleigh Gem, Empress Eugénie, George Haigh, Bonnie Dundee, Noel Pragnell, Princess Beatrice, Mrs. Hepper, Alfred Salter. Mrs. Heale, C. B. Whitnall, and Miss Haggas. Mr. W. Higgs, gardener to J. B. Hankey, Esq., Leatherhead, second, having good blooms of Duchess of Fife, Chas. H. Curtis, J Agate, Etoile d'Or, Lucy Kendall, and Princess of Wales. Mr. H. Butcher, gardener to C. J. Buss, Esq., Smeeth, third. Mr. J. Robinson, gardener to W. Lawrence, Esq., Hollingbourne, fourth.

A keen competition was brought out in the class for forty-eight Japanese, distinct, Mr. W. Mease again proving victorious. His blooms were—Back row: Madame Carnot, Etoile de Lyon, Mrs. W. H. Lees, M. de la Rocheterie, Baronne Ad. de Rothschild, J. Brooks, Mrs. C. H. Payne, Viviand Morel, M. Panckoucke, Eva Knowles, Pride of Exmouth, A. H. Wood, Lady Hanham, Simplicity, Australie, Yellow Madame Carnot. Second row: Phœbus. Mrs. Dewar, Julie Scaramanza, Mutual Friend, Mrs. G. Carpenter, M. Hoste, Chas. Davis, Mrs. Chas. Blick, M. Chenon de Leché, A. Gold, E. Molyneux, Mrs. J. Lewis, M. Gruyer, Edith Tabor, M. Hoste, Lady Ridgway. Front row: Mrs. Weeks, M. Ch. Molin, Colonel Chase, Sunstone, Mdlle. M. A. de Galbert, Modesto, Madame M. Ricoud, Baron Tait, Niveus, Mrs. Briscoe-Ironside, Madame Gustave Henry, N.C.S. Jubilee, Miss Elsie Teichmann, Robert Powell, Robert Owen, and Viscountess Hambledon. Mr. H. Perkins, gardener to Hon. F. W. D. Smith, M.P., Henley-on-Thames, secured the second place with a very good exhibit. The best flowers were G. J. Warren, Mutual Friend, Pride of Exmouth, Primrose League, and Australian Gold. Mr. P. Waterer, Fawkham, an amateur, third, with a much weaker display; Mr. J. McLeod, Dover House, fourth.

In the nurserymen's commemorative class, to consist of twenty-four Japanese and twelve incurved blooms, Mr. W. Wells of Earlsfield secured premier honours. His flowers were Calvat's Australian Gold, Madame Deis, Mdlle. Lucie Faure, Edith Tabor, M. Hoste, Mrs. J. W. Barks, a buff bronze sport from Edith Tabor; G. J. Warren, Gertrude Salter, Georgina Pitcher, Lady Hanham, Ella Curtis, Mrs. J. Lewis. Second row: Simplicity, Madame C. Krasty, Phœbus, N.C.S. Jubilee, Mons. Chenon de Leché, Souvenir de Madame F. Rosette, Mdlle. Laurence Zede, Papa Veillard, Surpasse Amiral, Australie, Mrs. Chas. Blick, Mrs. F. A. Bevan. Incurved.—Perle Dauphinoise, Duchess of Fife, Dorothy Foster, D. B. Crane, Ma Perfection, Lady Isobel, Emile Konin, Madame Ferlat, Mrs. R. C. Kingston, Lucille, M. de la Drone, Violet Foster, and Chas. H. Curtis. Mr. Norman Davis second, with good blooms of President Nonin, Australie, John Seward, Mrs. Hermann Kloss, Madame Laurence Zede, Mrs. R. C. Kingston, Chas. H. Curtis, Dorothy Foster, and Duchess of Fife.

In the class for thirty-six blooms, Japanese, red, yellow, and white for the Turner Memorial challenge cup, Mr. Norman Davis was placed first with a fine stand composed of Phœbus, John Neville, Western King, A. H. Wood, Beauty of Castlewood, Madame Thérèse Rey, Edith Tabor, Dorothy Shea, Mrs. H. Weeks, Modesto, R. Dean, and Madame Carnot. Mr. W. J. Godfrey, Exmouth, was placed second with fine blooms of Mrs. Weeks, General Roberts, Sunstone, and Modesto.

For twenty-four incurved blooms, distinct, Mr. F. G. Foster, Brockhampton Nurseries, Havant, was well ahead, the blooms were Lady Isobel, C. H. Curtis, Dorothy Foster, J. Agate, Mrs. R. Kingston, Ma Perfection, Violet Foster, Duchess of Fife. Mr. J. Kearn, Lord Rosebery, Queen of England, Globe d Or, Empress of India, R. Cannell, Major Bonnaffon, W. Tunnington, Bonnie Dundee, Princess of Wales, Lucy Kendall, Golden Empress, Camille Flammarion, Mrs. S. Coleman, Rena Dula, and Jeanne d'Arc. Mr. J. Robinson came second with neat flowers, a trifle weaker than the first prizewinner; his best blooms were Duchess of Fife, W. Tunnington, Chas. H. Curtis, Owen's Crimson, and Empress of India. Mr. C. W. Knowles, gardener to Mrs. C. Egerton, Roehampton, third.

In the class for twelve incurved flowers, distinct, Mr. J. W. Barks, gardener to P. Ralli, Esq., Cranleigh, was easily ahead. His blooms were Empress of India, Lord Wolseley, J. Agate, Golden Empress, Lord Alcester, Princess of Wales, Miss M. A. Haggas, Mrs. R. C. Kingston, Violet Tomlin, Mrs. S. Coleman, Mrs. Heale, and Lucy Kendall. Mr. F. King, gardener to Mrs. M'Intosh, second. Mr. A. J. Driver, gardener to the Misses Davis, Stonehouse, third.

A strong competition was brought out for twenty-four Japanese, distinct. Mr. W. Messenger, gardener to C. H. Berners, Esq., Ipswich, was first with a very heavy exhibit. The varieties were Madame Carnot, Etoile de Lyon, Edith Tabor, Mrs. C. H. Payne, Simplicity, Mons. Ed. André, Modesto, Australie. Second row: M. Chenon de Leché, M. Panckoucke, International, Madame G. Henry, E. Molyneux, H. H. Spencer, Madame Ad. Moulin, Phœbus. Front row: A. H. Fewkes, Rose Wynne, President Borel, C. Davis, A. Gold, Mrs. C. Blick, Ialene, Snowdon. Mr. R. Kenyon, gardener to A. F. Hills, Esq., Woodford, was a close second. His best flowers were M. Panckoucke, Madame Gustave Henry, Mutual Friend, Milano, John Seward, M. Hoste, and Australie. Mr. H. Butcher third; Mr. F. King, gardener to Mrs. M'Intosh, Romford, fourth.

Twenty-two competitors contested the class for twelve Japanese, distinct. Mr. W. Messenger secured first place. The varieties were—Madame Carnot, E Molyneux, Modesto, Australie, Mrs. C. H. Payne, Australian Gold, International, Madame G. Henry, Phœbus, Elsie Teichmann, M. Ed. André, and Edith Tabor; Mr. H. Shoesmith, Claremont Nursery, Woking, second, Australie, Madame Gustave Henry, Mr. A. G. Hubbock, Mrs. H. Weekes, and M. Chenon de Leché being the best blooms; Mr. R. Kenyon, third, with a very bright exhibit.

For six incurved blooms, one variety, Mr. W. Tebay, gardener to Mrs. Rycroft, Sevenoaks, was placed first with magnificent specimens of Charles H. Curtis; Mr. F. King, second, with the same variety; Mr. G. Foster, third.

The specimen trained plants were a very fine feature, the whole of the plants being very fresh and bright. In the class for six trained plants Mr. D. Donald, gardener to J. G. Barclay, Esq., Leyton, was placed first with grand plants. The varieties were Florence Percy, John Shrimpton, John Lightfoot, Col. W. B. Smith, Gloriosum, and Wm. Tricker. For four trained plants Mr. F. Gilks, gardener to A. Morris, Esq., Streatham Hill, was awarded first with good plants of Col. W. B. Smith, Emily Silsbury, Viviand Morel, and Mrs. E. W. Trafford. Mr. W. Davey second. For six standard trained plants Mr. Donald repeated his former success, having good plants of Miss Alice Luckman, William Tricker, Eva Knowles, Cleopatra, Chinaman, and Col. W. B. Smith.

Mr. W. Davey, gardener to C. C. Paine, Esq., Haverstock Hill, was awarded first for four trained standard plants The best were Colonel W. B. Smith and Stanstead Surprise. For a single specimen plant Mr. Donald was first with a grand plant of Colonel W. B. Smith. Mr. D. Donald scored again with six trained Pompons, the plants being very fresh and large.

There were three competitors for the group of Chrysanthemums arranged with foliage plants. Mr. J. Spink, Summit Road Nursery, Walthamstow, was first, with a fine group, well arranged; Mr. W. Howe, gardener to H. Tate, Esq., Streatham, second, with a well-arranged exhibit; Mr. Ed. Dove, gardener to H. E. Fry, Esq., Bickley Hall, third

A class of twenty-four dishes of Apples, to illustrate the progress made during her Majesty's reign, was not very keenly contested. Mr. J. McKenzie was awarded first prize for a grand exhibit; his fruits were remarkably fine. The best dishes were Gloria Mundi, Mère de Ménage, Lady Henniker, Bismarck, Warner's King, Emperor Alexander, Wealthy, Belle de Boskoop, Peasgood's Nonesuch, Golden Noble, and The Queen. Mr. H. Berwick, Sidmouth, second with a good, well-coloured exhibit, lacking the size of the winners. Mr. A. J. Thomas, Rodmersham, third.

The classes for decorative purposes appear to be growing rapidly in popularity, the whole of them being well filled and forming a very attractive feature to the show. The exhibits of fruit and vegetables were staged in St. Stephen's Hall, and made a very noteworthy display. The Grapes were a very good feature, while the classes for Potatoes called out a very strong competition.

A magnificent group of Chrysanthemums, beautifully arranged with Palms, Crotons, and Ferns, was set up by Mr. H. J. Jones, Lewisham. The arrangement and harmonising of colours left nothing to be desired: probably the finest arrangement of Chrysanthemums ever staged at this exhibition. Madame Edmond Roger, President Nonin, Simplicity, Yellow Madame Carnot, N.C.S. Jubilee, Lady Hanham, and Modesto were very fine. The same exhibitor also staged a large table of Chrysanthemums in vases. Mr. Norman Davis, Framfield, also excelled himself in a grand exhibit of cut Chrysanthemums arranged in gigantic vases, each receptacle containing one variety. The blooms were grand, and arranged with coloured foliage, Palms, Ferns, and foliage plants, had a remarkably fine effect. Some gigantic blooms of Madame Carnot, Western King, Phœbus, King of Plumes, Sunstone, Australian Gold, and Richard Dean were staged.

Mr. W. Wells, Earlsfield Nurseries, produced a fine display of plants, comprising all sections of the Chrysanthemum, the singles and Japanese being very conspicuous, Mrs. Chas. Blick, Madame Ferlat, Mons. Chenon de Leché, Parachute, C. A. Owen, Madame Ed. Roger, and Mdlle. Laurence Zede, being very good. Messrs. H. Cannell & Sons, Swanley, had one of those characteristic displays so famous at this exhibition. The collection of Zonal Pelargoniums was unique; the huge bunches of flowers, combined with such a variety of colours, has seldom been equalled. A collection of Cannas also contributed a very bright corner to the exhibit. The Chrysanthemums comprised the new varieties, such as Madame Ferlat, Leocadie Gentils, Mdlle. Laurence Zede, President Nonin, Mrs. Geo. West, Khama, Queen of Portugal, and Swanley Giant.

Messrs. J. Laing & Sons exhibited a very pretty table of plants and fruit. Palms, Bouvardias, and Carnations predominated in the former, while excellent examples of Apples and Pears completed the display. The most noteworthy dishes were Beauty of Kent, New Hawthornden, Lane's Prince Albert, Blenheim. Mr. W. J. Godfrey, Exmouth, had a very fine display of Chrysanthemums and Carnations well arranged. The blooms of Australie, Milano, Duchamel, M. Demay-Taillandier, Miss D. Shea, Vicomte Roger de Chezelles, Lovely, Modesto, Pride of Exmouth, and Mrs. Malling Grant were superb.

Messrs. W. Cutbush & Son, Highgate, exhibited an attractive group of Chrysanthemums, Carnations, Gloire de Lorraine Begonias, and a few dishes of good Apples, the whole finished off with Palms, Ferns, and flowering plants. Mr. Robert Owen, Maidenhead, exhibited a large table of cut flowers, the seedlings being a very prominent feature, Owen's Memorial, Lady Phillips, Duke of Wellington, and Dr. Albin Munier being notable.

Messrs. Sutton of Reading exhibited a remarkably fine collection of Potatoes, the main varieties being staged in large groups, while the fancy varieties were placed in small baskets. The leading varieties were Reading Russet, Sutton's Perfection, Harbinger, Reading Hero, Early Regent, Magnet, Triumph. Mr H. Berwick produced a very fine show of Apples and Pears. The former were clean and well coloured. The most conspicuous were Newton Wonder, Wellington, Cox's Orange Pippin, Blenheim Pippin, Cox's Pomona, Waltham Abbey Seedling, Wealthy, and Wellington. A table of Apples from Messrs. S. Spooner and Son, Hounslow, presented a very bright and fresh appearance. The examples were well coloured and staged in great variety.

A pretty exhibit of Chrysanthemums and winter flowering Carnations came from Reid's Nursery, Beckenham Hill; the Carnations were very clean and bright. Mr. T. S. Ware, Tottenham, staged a fine table of Chrysanthemums, dotted in a bed of Maidenhair Fern, having a very pleasing effect. Messrs. Crane & Clarke, March, exhibited a group of winter flowering Carnations. Mr. B. Ladhams, Shirley, staged Golden Elsie Chysanthemum in good form, also a variety of hardy flowers.

ISLE OF WIGHT.

THE Ryde Chrysanthemum Show was held on November 2nd and 3rd in the Town Hall, and the exhibits were unusually good. The principal prizewinners were Messrs. T. W. Butler (who won for the second year in succession the challenge cup, which now becomes his own), W. H. Jobling, W. Heath, F. Francis, S. Prismall, E. G. Brett, C. Price, E. C. Goble, and E. V. Matthews. Mr. M. Silsbury received the I.W. Horticultural Improvement Association award of merit for his seedling bloom of Lady Isabel. Mr. T. W. Butler received the Association certificate for cultural merit. Mr. E. C. Goble, F.R.H.S., staged a miscellaneous group, consisting of Orchids (in variety), Palms, and Ferns, not for competition.

The Isle of Wight Chrysanthemum Society held its thirteenth exhibition at Newport, on November 4th and 5th. The entries were not so numerous as last year, but of superior quality. The I.W. Horticultural Improvement Association certificates were secured by Messrs. T. W. Butler, W. Scott, W. G. Denness, E. W. Shepard, W. Matthews, and J. J. Linington. The principal prizewinners were Messrs. T. W. Butler, C. Martin, G. Freeland, A. F. Wolfe, E. W. Shepard, W. E. Wickens, F. Miller, W. H. Jobling, J. J. Linington, J. R. Gould, W. Matthews, W. G. Denness, J. Love, H. Snellgrove, J. Chiverton, C. Coombes, and W. J. Broadwater. The specimen plants were especially noteworthy. Mr. W. Scott staged a plant of Sœur Dorothee Souille, about 20 feet in circumference, and with over 200 blooms, of good size and quality. Mr. J. J. Linington had a huge E. S. Trafford, and Mr. E. W. Shepard a magnificent plant of W. Tricker.

The Shanklin Chrysanthemum Show was held on November 4th and 5th. The exhibits were more numerous and of better quality than last year. The prizewinners in the various classes were Messrs. H. Love (who secured the I.W. Horticultural Improvement Association's certificate for cultural merit), W. Heath, F. Silsbury, C. H. Snook, S. Prismall, Chas. Orchard, E. Rayner, G. Kingswell, A. W. Kingswell, W. Howard, and M. Silsbury. The latter obtained the I.W. Horticultural Improvement Assscіation award of merit for his seedlings Chrysanthemum Nina Dabbs.

The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Warburton's Hotel, Newport, on Saturday. Dr. J. Groves, J.P., B.A., presided over a large attendance of members. Mr. J. Barkham, F.R.H.S., gave a thoroughly practical discourse on the "Cultivation of Chrysanthemums for the Amateur," dealing with every branch of "Mum" culture.

The injuries caused to trees by the caterpillar of the wood leopard moth were discussed, a specimen being sent to the meeting by one of the members. The value of the worm-eating slug (Testacella haliotidea) was also discussed, one of the members having found by observation its value to gardeners. Several new members were elected.

FRUIT TREES ON COTTAGE WALLS.

I KNOW of no more pleasing sight than that of a cottage wall clothed with fruitful trees, and if you come to talk to the occupier you will find that he has reasons to thank the man who foresaw the results and planted the trees. The other day when looking over a cottage garden I noticed espalier Apples of the best varieties growing round the quarters, and still bearing traces of proper pruning and training. Age and neglect had, however, placed on them the finger of decay. The bark was cankered and the spurs massed so thickly together that fruit was out of the question. Here and there was a wide gap telling where a branch had died, and no thought given to fill its place. It needed not the knowledge of an expert to tell that the returns from the trees had been sufficient to pay the rent of the garden over and over again, but the fostering hand that tended them had gone, and the trees had fallen into decay. A wall ran along two sides of this particular garden and was clothed with ancient Pear trees. There is no reason to think that the cottage was ever occupied by anyone but an ordinary labourer, yet the trees had been properly trained on the orthodox horizontal principle. At the time of my visit the growth looked weakly, and what few fruits were noticeable were small and cracked—signs of poverty and decay, yet they will doubtless be allowed to remain till they eventually collapse altogether, and the wall most probably will stand useless.

By way of contrast I will cite another instance of a cottage and garden. The wall on one side of the house was clothed with a Morello Cherry, bearing a heavy crop of fine fruit, and over the front was an Apricot. A Coe's Golden Drop Plum had been accorded a place up the outer wall of the chimney, and to use the man's own words, "they ripened up there fine." The garden round the cottage was fairly large, and one portion was confined to vegetables, while the other was planted with bush Apple trees and Plums, with Gooseberry and Currant bushes between. Asked if they paid him, the man bent low and whispered, "I made £20 of 'em last year," and then went on to tell how he had first planted the wall trees, and in time finding them profitable had planted up the portion of the garden which hitherto had been of little use to him. These are but two instances, forcible by contrast, of the many that could be mentioned.

Landlords can do much to improve this last state of affairs. On one estate which possesses extensive cottage property, the owner some years ago provided his tenants with small trained trees to be grown on the walls. His only stipulation was that they must be properly trained and cultivated, and any occupier failing to do this had to give up his holding. An experienced man was appointed to pay periodical visits to see that these instructions were carried out and make a report. When encouraged in this manner, with only a few solitary exceptions, the cottagers took pride in their trees, which grew as they began to be profitable, with the result that the property is a credit alike to owner and occupier. Could not something more be done in this direction?

Gardeners can do something to make their subordinates better fruit growers. The head gardener by the influence he holds and the example he sets can often create an interest among those around him, and by doing so help them to help themselves. Let all who can hold out the hand of help and encouragement to those who would benefit by and appreciate such assistance.—H.

THE YOUNG GARDENERS' DOMAIN.

CULTURE OF THE GRAPE VINE.

(*Continued from page* 396.)

FOR succession the houses should be started at intervals of one month. Vines started into growth in early November should have their crop ripe early in April, or if hard forcing has been practised, in March. Vineries for late Grapes should be started early in March, as the Grapes require a longer time to become perfect. Less than six months should never be allowed. The grandest Grape we have, Muscat of Alexandria, is often found difficult to finish. The berries should be quite ripe in September, as it is of no use trying to finish them properly by the aid of fire heat alone.

In the earliest house, as the buds are pushing, raise the temperature to 50°, 55° by night, allowing 65° or 70° as the maximum in the daytime before admitting air. At this season ventilation must be very carefully done, or the young growths may be crippled. Close the house early, slightly syringing the canes twice daily, in the morning and at closing time, but if the weather be sunless do not damp too much, or mildew may be encouraged. With the advance of growth, and when the bunches show themselves, raise the temperature to 60°, 65° by night, and 70°, 75° by day. As the shoots approach the glass they should be gradually eased towards the wires by the aid of matting, and great care is needed to prevent damage to the brittle shoots. It is best to go over them every morning, easing a little each time until the growths are brought safely to the wires. Up to the time of flowering a moist, growing atmosphere should be kept up.

When the Vines are in flower the temperature should be 65°, 70° by night, and 75° by day, allowing about 5° more for Muscats. In distributing the pollen some gardeners say simply tapping the bunch is sufficient, but I find this will not answer in all localities. It is safer to go over each bunch at midday with a fine camel's-hair brush or rabbit's tail, as those treated in this fashion seldom fail to set well. Cannon Hall

Muscat and Muscat of Alexandria need especial care in this respect. All through the flowering period the atmosphere must be kept drier than usual.

As soon as flowering is over an increase of moisture must be allowed, and when it is perceived which berries are swelling thinning should commence. A sharp, clean pair of scissors is required, as if the stalks be torn instead of cut it is liable to cause early decay. This is especially the case in late hanging Grapes. Experience will teach the distance to leave between each berry. For instance, Black Hamburgh or Foster's Seedling do not requite so great a distance as Black Alicante or Gros Colman. In the case of Muscats little thinning is required, as there is generally so much waste from unfertilised berries. In thinning always commence at the bottom, and work upwards, and the stem must not be twisted in holding.

During the growing season the border must never be allowed to become dry. As each vinery is started the border must be examined, and if dry should have a sufficient supply to thoroughly soak the whole, while when the Vines are in full growth it is astonishing the quantity of water a Vine will take up. If the soil is light, water is required once a fortnight; if heavy, once in about every three weeks. The growth and bunches are greatly benefited by occasional waterings with soot water, and by the use of some well proved fertiliser. These should never be applied after the Grapes are fairly colouring, or they may cause the berries to be bitter. In applying water to Vine borders, it must always be several degrees warmer than the mean temperature of the house.—SEMPER.

POINSETTIA PULCHERRIMA.

FOR brightening the conservatory or plant stove, or for decorative purposes, during the dull winter months there are few plants to equal the Poinsettia. If the old plants are placed in a house with a genial heat about the beginning of April and given a good watering they soon start into growth. When the growths are about 3 inches in length they should be taken off the plants with a heel, and inserted singly in thumb pots which have been filled with a light, sandy compost. Place them in a propagating frame with a gentle bottom heat, keep them close and shaded, when they will soon form roots. When growth commences admit air for a few days to strengthen them, after which remove them to a shelf in a warm greenhouse. It is desirable to keep the plants as near the glass as possible, to insure stout, not weakly, growths.

After having rooted freely, transfer them to large 60-size pots in a compost of half loam and half leaf soil and an addition of sand. When they have filled the pots with roots move them into 6-inch pots. See that the pots are clean and well drained; a little soot sprinkled over the crocks is of great assistance in keeping out worms. Use the same compost with a free sprinkling of wood ashes. This provides a sound rooting medium, yet sweet and porous.

About the middle of July place them in a cool frame, ventilating freely, yet judiciously, during the day, and leaving a little air on at night to harden the wood. Weak liquid manure given twice a week, and a little soot water occasionally, will be found of great benefit to the plants at this stage. Syringe them with tepid water in the afternoon, as they delight in a moist atmosphere when growing.

About the end of September remove them into a house with a temperature of 65° by day and 60° at night, because if left out when the nights become cold they lose their foliage, which spoils the appearance of the plants.

Cuttings may be inserted till the middle of July, and by keeping the plants in small pots they prove attractive, and, for various decorative purposes, useful.

After the plants have passed their best, they should be arranged on a shelf in an intermediate house to ripen their wood, gradually withholding water from them. I have found that they break much better in the spring if left exposed to the light than when stored away under a stage or in some dark corner.

Red spider and scale are the chief pests of the Poinsettia; but if watering and syringing are carefully attended to, and a sufficiently moist atmosphere is maintained during their growing period, it is not often the plants are troubled much with these enemies.—J. V.

FRUIT FORCING.

Vines.—*Earliest Forced in Pots.*—Vines started now will afford Grapes fit for table in April or a little earlier with sharp forcing. For early work not any are better than Black Hamburgh and Foster's Seedling, or, for quality, White Frontignan and Madresfield Court. Stout well-ripened canes, with plump buds, and given a short rest, answer for early forcing. The Vines require a light, airy, efficiently heated structure, which may be a lean-to facing south or a three-quarter span-roof having the same aspect, or a span-roof with ends east and west. If the hot-water pipes are at the front of the lean-to and three-quarter span, also at the sides of the span-roof, the Vines may be stood upon them, placing tiles or slates on the pipes and standing the pots upon them. The tiles or slates become warmed and transmit the heat to the pots, which are more or less warmed at their base, and the roots are not prejudiced by the heat. The tiles or slates also throw off much of the water or liquid manure escaping from the pots, so that there is no risk of a surfeit of steam.

Pedestals of loose bricks should be formed for Vines in beds for the pots to stand upon, thus raising them to the required height and preventing sinking. Vines in pots and restricted thereto afford excellent fruit with judicious feeding. Oak or Beech leaves are the best for affording bottom heat. They supply a genial warmth and regular moisture in the early stages, and rich stimulating food when the demands of the Vines are greatest. The house must now be ready and the plants placed in position. The canes should be kept horizontally, or have the ends depressed, if necessary, to insure their breaking evenly from the base upwards. Damp the Vines and house two or three times a day, and maintain a temperature of 55°, on fine days 65°, the heat about the pots not exceeding 60° to 65°. Only afford water to render the soil evenly moist, as a wet medium retards root action, and in no wise contributes to a good break, but the reverse.

Early Forced Planted-out Vines.—When young and vigorous Vines have to be started for the first time, to afford ripe Grapes at the end of April or early in May, the house must be closed by the middle of the month, for they do not, as a rule, break so quickly as Vines that have been forced for a number of years. The older Vines that have previously been forced need not be started until the beginning of December. To produce a soft humid atmosphere and to economise fuel a good ridge of fermenting material may be placed upon the floor or inside border, and be turned at short intervals, additions of fresh being made as the heat declines. The temperature of the house should range about 50° at night, 55 by day, and 65° on bright days. The outside border must be protected from frost by a covering of leaves, with a little litter over them to prevent their blowing about. If spare lights are at command, by all means use them to throw off heavy rains and snow.

Houses Cleared of Grapes.—When the Vines are leafless and the Grapes cut attend to the pruning without delay, for nothing contributes more to health and a good break than thorough cleanliness and an early and complete period of rest. Vines in good condition, having stout short-jointed wood thoroughly ripened, may safely be pruned to a couple of buds. The latter, however, are not always sufficiently developed at the base of the annual growths to give as large bunches as desired, and in that case the laterals may be left a little longer, say one or two more eyes. It is necessary that a plump, round (not large and flat), well-developed bud on stout, hard, thoroughly ripe wood be selected for pruning to, as such usually produces a close, well-set, compact bunch. When the wood has not those characteristics the basal buds are often small, which arises from various causes—sometimes from overcropping, at others through overcrowding, frequently from excessive vigour, and oftentimes from weakness. The result is small bunches when hard and fast lines of pruning are practised. Wash the Vines with tepid soapy water, 3 or 4 ozs. of softsoap to a gallon of water, using a brush effectively, yet with care and judgment, so as to reach and dislodge any hibernating pests. If there have been infections of scale, thrips, or red spider, use one of the advertised insecticides. Remove the remains of the mulchings, also the surface material, down to the roots, especially near the collar, and supply a top-dressing of turfy loam chopped up moderately small, and to a barrowload (about 3 bushels) add a pint of bonemeal and a similar quantity of soot, with double the quantity of wood ashes, incorporating thoroughly. Where the houses must be used for plants they should be kept cool, not exceeding 40° to 45°, ventilating freely above that temperature.

Houses of Thin-skinned Grapes.—The soil and atmosphere having been saturated by rain, these have caused Grapes, particularly Black Hamburghs, which have been ripe since August, to damp considerably in spite of free ventilation and a genial warmth in the hot-water pipes. The Vines that ripened their crops in September are still in foliage, and will bear more moisture at the roots and in the atmosphere—indeed, moderate moisture in the atmosphere is necessary to prevent undue evaporation and the shrinking of the Grapes. A slight warmth in the hot-water pipes will be required almost constantly to maintain an equable temperature, but this must not be too high, or it will so dry the atmosphere as

to cause the Grapes to shrivel prematurely. A temperature of 40° to 45° at night and 50° by day will be sufficient, ventilating freely and early in bright weather, so as to prevent moisture being deposited on the berries. Outside borders should be covered with lights or tarpaulin to throw off heavy rains. Remove all fallen or matured leaves, practising every precaution against damp and mould.

Late Grapes.—These do not always finish well, and this usually arises from three primary causes—namely, starting the Vines too late, and not accelerating thorough growth during the spring and early summer months, so as to give the Grapes the full benefit of the summer sun to swell and ripen. Overcropping, too, not only prejudices the current crop, but militates considerably against the succeeding year's bearing of the Vines. A bad condition at the roots is, however, the most disastrous of all, for improper food is attended with many evils, and these hinder the perfection of the crop. If the defect is due to overcropping some relief may be afforded by cutting a portion of the crop at the earliest convenience; and though nothing will be gained by pushing the fire now, the temperature should be maintained at 60° to 65°, with 10° to 15° advance from sun heat, so as to secure the thorough ripening of the wood, admitting air freely when the weather is favourable, and leaving a little on constantly. Where the cause can be traced to imperfect drainage or bad borders no time should be lost after the wood becomes sufficiently ripened, or when the leaves give indications of falling, in getting out the old soil, rectifying the drainage, and relaying the roots in fresh compost.

Where the Vines are in proper condition the timely attention to fallen leaves in clearing away and looking over the bunches for decayed berries will keep matters straight. Air is the best preventive of mouldiness. A temperature of 45° to 50° suits the vinous Grapes, such as Gros Colman, and 50° to 55° the Muscats, as both improve considerably after apparently ripe.

THE KITCHEN GARDEN.

Globe Artichokes.—Owing to the extraordinary mildness of the autumn Globe Artichokes have not only continued productive unusually late, but the old stools are pushing up fresh sucker growths far more than desirable. Never perfectly hardy, the plants are peculiarly liable to suffer from the effects of an early severe frost this season. They must be protected then. Old flower stems should be cut down to within 1 foot of the ground, and all large leaves be similarly shortened. The protection may consist of either leaves, covered with strawy manure to keep them from blowing about, or ashes. If the precaution of weeding out worthless seedlings has not already been taken do it at once while yet they can be recognised.

Celery.—A dry autumn has been most favourable for the work of moulding up late Celery. Unless the soil is well banked up around the plants frost is liable to quickly ruin them. Not more than half of the tops of the leaves ought to protrude, and if the ridge is rounded off sharply and made smooth much rain and snow water will be thrown off. An outlet from the trenches ought to be made for this water, Celery keeping best when the subsoil is comparatively warm and dry. An effort should also be made to protect, as often as necessary, the exposed tops of leaves. If these are badly injured by frost, the decay which follows will inevitably gradually travel downwards and reach the hearts.

Beans and Peas.—In the caso of heavy slug-infested soils, sowing Beans and Peas in November is usually a waste of labour and seed. Under more favourable conditions seed may be sown of the early and hardy Early Longpod, Beck's Green Gem, and Mazagan Broad Beans; and any of the early round-seeded varieties of Peas about the middle of this month on a border sloping to the south. Dispose the rows as far apart as the known height of the varieties, sow rather thickly, and cover with about 2 inches of fine soil. If mice are troublesome, just damp the seeds and well roll them in powdered red lead prior to sowing. The young plants, from the time they are showing through the soil till next spring, will have to be well attended to, protecting from birds with galvanised wire netting covers or lines of thread, and from slugs by means of frequent dustings of soot and lime, applied when the dew is on the plants. As far as Peas are concerned, raising under glass and planting out in spring is the surest method of laying the foundation of an early if somewhat light crop of Peas; and Broad Beans also succeed well under similar treatment.

Mushrooms.—Beds formed in ordinary heated Mushroom houses and spawned early in November ought to produce good crops in January. It is a mistake to make very shallow beds, as these so soon become cold and dry. Let the droppings be thoroughly well prepared, and the bed or beds may then be formed 15 inches to 18 inches deep. They may be made to slope gently to the front, though there is no real necessity for this, and the manure should be put together solidly. Spawn directly the heat declines to about 80°, and if there is any likelihood of the heat rising again after spawning, or if more vapour is likely to collect about the spawn than is good for it, use large lumps. As a rule a single brick of spawn ought to be broken into about eight pieces. Insert these 8 inches apart each way, and any crumbs left should be strewn on the top, as a few early Mushrooms may result from these. If it may safely be done cover with 2 inches of good fine loam at once, but if this early enclosing of the heat is likely to lead to an injurious rise of the temperature, defer soiling over for about three days. A heavy covering of soft strawy litter should also be given directly this can be done with safety, wooden shutters sometimes taking the place of this.

Established Beds.—The best form of Mushroom houses are those heavily thatched, both on the roof and at the sides, and the next best those with ceiled-inside roof, double walls, and double-banked doors and windows. If a genial equable temperature of about 55° can be maintained, as in a warm cellar, and frequently in heavily thatched, well-darkened structures, without the aid of fire heat, these conditions are most favourable to the production of exceptionally heavy crops of succulent, richly flavoured Mushrooms. Where the houses resemble ordinary sheds in their structure, with perhaps mats hung over the windows and doors to exclude light and some cold air, the fluctuations of temperature are great, as well as injurious. If fire heat is the remedy apply this sparingly, and in all cases guard against high temperatures. Turn it off when the heat will stand at the figure named without the assistance of fire heat. The atmosphere not being made very dry by fire heat, daily syringings are not called for, and in any case avoid daily wetting the soil of the beds, as this is liable to saturate it, and to turn the tiny Mushrooms soft and brown. When water is needed give enough in a warm state to well moisten the bed at one or two waterings, and be content with that. Beds that have been producing for some time may well be assisted with liquid manure, diluted and warmed as for pot plants, or with water in every gallon of which 1 oz. of common salt has been dissolved.

THE BEE-KEEPER.

The Weather.

The past month has been remarkable for its even temperature and the number of fine days that have prevailed. Although the last week was extremely foggy, the sun shone brightly on several occasions, notably on Saturday, 30th ult., when the shade thermometer registered 60°, reminding one of May instead of the last days of October. There was less than an inch of rainfall on seven days, which is much below the average.

But how will this unseasonable weather affect the bees? In the first place it will cause the queens to continue laying longer than they would under ordinary circumstances, and if the weather should continue mild for a few weeks longer, the various colonies will doubtless be in a much better condition than they were last winter when the bees were confined to their hives for several weeks during the autumn owing to the inclement weather. It is advisable to bear in mind that when breeding is going on apace there will be a much greater consumption of stores than would otherwise be the case. If stocks have not been well provided with stores and a sudden spell of cold weather sets in, the brood will become chilled, and this will be the forerunner of much evil. Late feeding with thin syrup will have the same effect, the queen will commence laying, supplies are stopped, and the colony collapses.

If the bees from a strong stock have been observed carrying in pollen freely during the prevalence of fine weather lately, they should be examined with a view to ascertaining if they have sufficient stores. This may be done without disturbing the bees by simply lifting the quilt, and if two or three combs have sealed stores nearly their full length they will not require feeding. But if only a little is seen near the top of the frames, if not supplied with stores they will probably die of starvation.

It is now too late to feed with syrup, for although the bees would take it freely if given warm, they would not seal it over, and, therefore, candy is preferred at this season, which should be made according to the instructions given in previous notes. Bees take it freely, and, if well supplied, will come out strong and healthy the following spring.

Reduction of Frames in Hives.

Is it necessary to remove the outside combs from a hive if they are not covered with bees, and have no honey in them at this season? I do not recommend their removal from the hive, and now seldom practise it in my apiary, as, after experimenting with several hives, I came to the conclusion it was not worth the trouble.

Reducing the number of frames in a hive at this season is still recommended by some bee-keepers on the plea of warmness, as after the removal of the spare frames, those remaining are pushed close together to one end of the hive, and the division board placed close to them. The frames are then covered, and the intervening space between the division board and the side of the hives is also filled with some warm material.

A bag of chaff or cork dust answers the purpose admirably. It, however, involves much labour where colonies are numerous, as the spare combs have to be stored in a suitable place. These invariably keep better in the hive than anywhere else, and in practice I can see no advantage in removing them, as a hive should not have less than ten frames for stores and wintering.

If hives are large, and have space for fifteen or twenty standard frames, it would be a decided advantage to only allow the bees to have access to not more than twelve frames. The spare ones may then remain at the back of the division board, which can have bee space

left at the bottom. This will allow the bees to pass underneath, and it is surprising how they will clean all débris from the combs when confined to their hives, owing to the inclemency of the weather in early spring.

Two colonies of bees will winter well in a hive of this description if an entrance is made at opposite ends. They may then be placed in separate hives before they become strong enough to swarm the following spring. I prefer this plan to allowing both queens and bees to remain in a large hive with a super on the top, as when one colony swarms the bees from the other part of the hive will invariably go with them.

It is interesting to bee-keepers to try experiments on the above lines, as by removing the spare frames from some of the hives, and allowing them all to remain in the others, they will be enabled to see at a glance next spring which has wintered the best.

Colonies Strong in Autumn.

It is not always the stocks that are strongest in the autumn that will be the best in the spring, and in experimenting with a few or many combs in a hive, it will be necessary to do so for at least two winters before a decision can safely be arrived at. Where there are numerous stocks of bees kept there will always be a great difference between them the following spring. How is this to be accounted for? This is a difficult question to answer, but the fact remains.

In many instances that have come under my notice it has been those stocks that were extra strong in bees in the autumn that were the weakest the following spring. This, I believe, is often caused by the old bees dying late in the autumn. The colony may be headed by a young fertile queen introduced too late in the season to be of much use for increasing the number of bees.

A nucleus stock headed by a queen raised in the same hive as the former, and which goes into winter quarters with not one-twentieth part the number of bees, will probably be in a much better condition the following May. This clearly proves that it is the stocks that have the most young bees in the autumn that will be in the best condition the following spring.—An English Bee-keeper.

TO CORRESPONDENTS

All correspondence relating to editorial matters should, until further notice, be directed to "The Editor," **8, Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Old Apple Tree (*Cymro*).—The tree which is supposed to have been planted about 200 years ago, and of which you send a very good fruit, has in all probability been raised from a pip of the Catshead. It was customary in the olden time to raise Apple trees from seeds, and that is why there are in old orchards so many varieties which have never had other than local names. A few of the varieties are good, but the majority inferior. Dr. Hogg has described in the "Fruit Manual" the Catshead as "one of our oldest and best culinary Apples, in use from October till January; tree a vigorous grower, attaining the largest size, and though not an abundant bearer in the early period of its growth, it is much more productive as it becomes aged." Few other varieties of the same age as your tree could produce such fruit under similar conditions—namely, "growing close to a large Chestnut, and has had no manure applied for twelve years.' You must observe that we do not say it is the true Catshead, but a varietal form, and apparently a good one. The only sure way of your tenant securing trees of this particular variety will be by taking grafts from the original, and he will obtain fruit the sooner if he attach several to any healthy trees of inferior varieties that he can cut down for the purpose, otherwise graft on young Crab stocks.

Chrysanthemum Classification (*W. J. G.*).—You are no doubt aware that a new committee called the Classification Committee has made certain modifications in the N.C.S. catalogue, and particularly in the case of some disputed varieties supposed to be of the incurved type. As things stand at present Duchess of Fife is classed as an incurved, and Sir Trevor Lawrence as a Japanese incurved by this new Committee (see report in the N.C.S. schedule for 1897, pp. 26, 27); but M. Desblanc (Jap. inc.) and Chamechaude (inc.) remain in the Society's catalogue as indicated, and where it is stipulated that the N.C.S. Jubilee catalogue is the authority the two last named varieties must be shown as a Japanese incurved and incurved respectively. It is presumed that you mean M. Desblanc, for there are also a Madame Desblanc and a Yvonne Desblanc. To assist in the identification of the variety it may be mentioned that the proper M. Desblanc is of a deep reddish colour or vermilion, and a reverse of gold.

Banksia integrifolia (*Novice*).—This plant is frequently known as the Australian Honeysuckle, and is especially noteworthy as a free-growing and floriferous plant, which recommendations are not possessed by all its

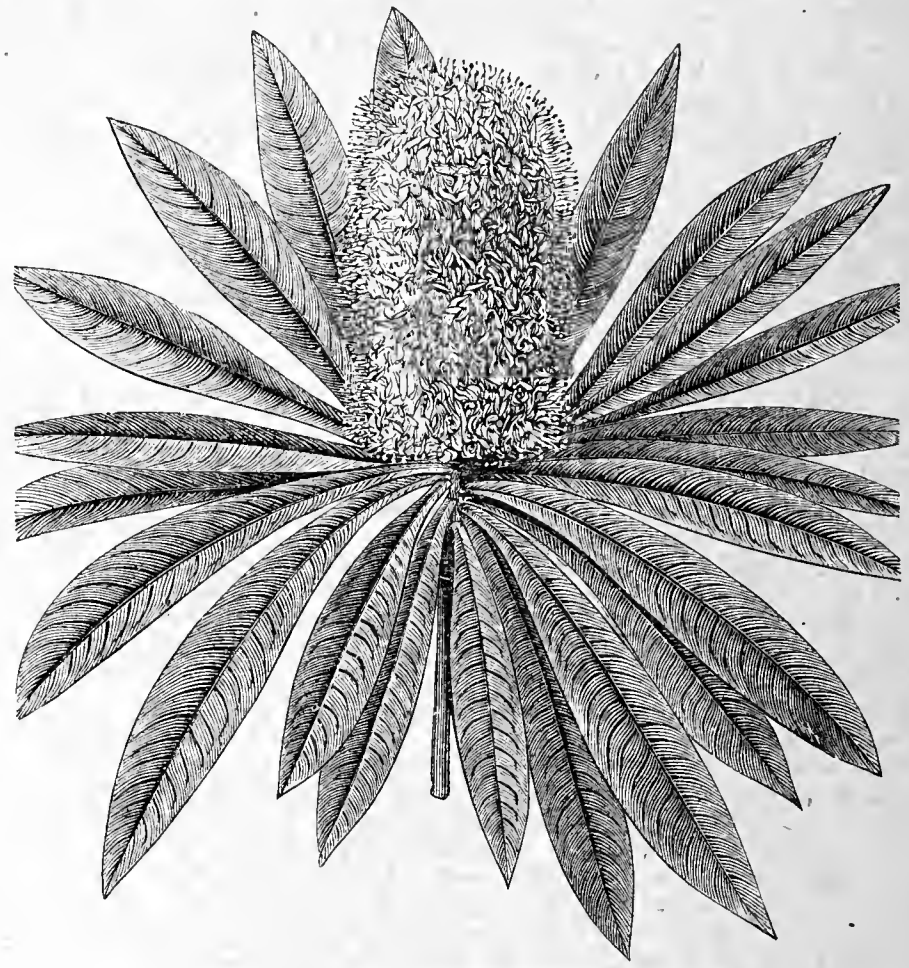

Fig. 70.—Banksia integrifolia (*reduced*).

allies. The popular name appears somewhat far-fetched, as are many other popular names; but it does not refer to the habit of the plant as might be supposed, but to the quantity of nectar secreted in the flowers. Banksia integrifolia (fig. 70) is a shrubby plant, usually of moderate size in cultivation, but attaining much greater dimensions in its native land, where some of its near relatives rise to a height of 50 feet. The flowers are yellowish in a cylindrical head at the end of the branches. The leaves are narrow and undivided, dark green, and firm in texture. The plant succeeds in light turfy loam and peat, and requires only the temperature of a greenhouse or conservatory, supplying water carefully when not in flower.

Grafting Seedling Orange Plants (*Dorset*).—Budding is the better practice, operating in August, and placing the worked plants under a hand-light. In the course of a month it will be observable if the buds have taken. They must then be untied, and the plants allowed to remain in the greenhouse all the winter. In the spring cut off the heads about 3 inches above the buds. Budding may also be done in the spring, or side grafting then performed; but it is often unsatisfactory. The mode is a modification of the whip, the stock being cut down to about 3 inches above where the scion is to be put on, and the graft (ripened wood of the preceding year, with a portion of two-year-old wood) having 3 inches of it left below the splicing for placing in a bottle containing rain water. This keeps it fresh until the stock and scion have "knit" together. Just before the trees from which the scions are taken start into growth is the proper time to graft; the stocks, being young, will be forwarder, and all the better on that account. Keep the ends of the attached grafts in water until the scions commence growing freely, and the junction is complete. In the autumn or late summer the part of the scion below the union can be cut off neatly, also the snag of the stock above the junction. Budded trees will require "snagging" in like manner.

Chrysanthemum Leaves Diseased (*Inquirer*).—The leaves are infested by the Spot fungus (Cylindrosporium chrysanthemi). The mycelium of the Spot fungus takes possession of the tissue of the leaf, which becomes brown, and ultimately black, withers and dries up. Finally outgrowths appear of an altogether different character—to wit, Botrytis chrysanthemi, and in the dead-leaf tissues or on them small black bodies are

formed, which tide the fungus over the winter or resting season of the host plant. You will thus see that early treatment is the only chance of successfully combating the enemy, which unfortunately often gets hold of the plants before being noticed. Dusting them early and occasionally on the under side of the leaves with anti-blight, fostite, or other advertised fungicides in powder containing sulphate of copper prevents the spreading to the parasite. Another precaution is plenty of air and light during the growing season, as well as after housing the plants, so as to harden the tissues and render them more disease resistant. The young leaves are very pale, or rather yellow, in colour, indicating deficiency of available iron in the soil, and the growth so relatively soft that the use of silicate manures could scarcely fail to harden the tissues and render them better able to contend with the fungus.

Neat Hedge Plant—Shrubs for Chalk (*E. B.*).—Austrian Briar Roses certainly flower the best when but little pruned. The closest Rose hedge is made by the old Scotch Rose, Rosa spinosissima, which produces small compact flowers abundantly. It is rather slow in growth. The Sweet Briar, Rosa rubiginosa, forms a good hedge and bears cutting well. If you want an evergreen, Box, Buxus sempervirens, does splendidly on the chalk. It can be cut into any form, and kept any width or height. Of shrubs, the following grow well on chalk soil:—Berberis aquifolium, B. Darwini, B. Nuberti, B. vulgaris and var. purpurea. Buddleia globosa (requires shelter); Calycanthus floridus, Ceanothus azureus (requires shelter or a wall); common and Portugal Laurels, Cercis siliquastrum, Rock Roses, Cistus species, require shelter; Cotoneaster microphylla, C. Simonsi, Deutzia crenata flore-pleno, Escallonia macrantha, in shelter; Euonymus japonicus vars., Garrya elliptica, Hypericum calycinum, Kerria japonica flore-pleno, Lavender, Leycesteria formosa, Ligustrum coriaceum, L. lucidum, Magnolia glauca, Philadelphus coronarius, P. Gordoniana, P. grandiflorus, Phyllyrea buxifolia, Pyrus japonica, Rhus Cotinus, R. typhina, Ribes aureum, R. album, R. sanguineum, Spartium junceum, Spiræa ariæfolia, S. callosa, S. bella, S. Lindleyana, S. japonica, Viburnum Opulus, V. Tinus, Weigela amabilis, and W. rosea.

Names of Fruits.—*Notice.*—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*A. W.*).—1, Marie Louise; 2, rotten; 3, Louise Bonne of Jersey; 4, Boston Russet; 5, specimen deformed, send better one. (*W. D.*).—1, Durondeau; 2, Beurré de Capiaumont; 3, Doyenné Boussoch; 4, Marie Louise d'Uccle; 5, Calville Blanche d'Hiver; 6, Melon Apple. (*R. P.*).—1, Josephine de Malines; 2, Beurré Hardy; 3, Bergamotte Bufo. (*C. F. B.*).—1, Old Nonpareil; 2, Scarlet Winter Pearmain; 3, King of the Pippins. (*H. & R.*).—7, Perhaps Alfriston; 8, Cox's Pomona; 10, Melon Apple; 11, Beauty of Kent; 19, Calville Blanche d'Hiver; 23, London Pippin. The others are probably local seedlings, the small ones worthless, the large promising. See rule as to number of fruits to send for naming.

Names of Plants.—We only undertake to name *species* of plants, not varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*F. R.*).—1, Berberis Darwini; 2, Jasminum nudiflorum; 3, Skimmia japonica. (*D. S. S.*).—1, Euonymus europæus; 2, Viburnum Lantana; 3, Justicia flavicoma.

EDITORIAL NOTICE.—It is particularly desired that all communications, parcels, catalogues, and newspapers intended for the EDITOR, be sent direct to 8, ROSE HILL ROAD, WANDSWORTH, S.W.

A GLANCE AT ISLINGTON.

AGAIN the Dairy Show is a thing of the past, and again it may be counted a success. The entries were beyond former years, and 184 cows were entered for the milking and butter tests. This appears to us to be the real heart of the exhibition, if one may so speak. The competition is so severe, and the tests are severe, too. We would like to see a few more fresh names on the exhibitors' list—a few more humble farmers, men whose daily bread depends so much on the milking value of their herds. We see the same names repeated, and we feel sure there are other breeders in the United Kingdom who would not be disgraced even at Islington. "Faint heart never won fair lady," and there is nothing like a bit of competition to find out both strong and weak points in one's own belongings. We might observe that the number of cows entered for these tests was in 1892 sixty-two, as against 184 in this year of Jubilee.

We think there might have been more than two Shorthorn bulls present with advantage, for after all we cannot expect good milking qualities in our cows and heifers when the sire comes of a beef rather than a dairy strain. The Jerseys were a strong class. Nothing succeeds like success; and they have done so grandly in all butter tests and dairy competitions. Wisely, too, the males were well represented. The Guernseys were uniformly good, and several winners during this present season were there. We wish we could see more Red Polls; they ought to be popular, for after their milking days they can render a good account to the butcher, which is more than may be said of their Island sisters. Why only four Ayrshires? Was it so far from home? There are plenty of good ones at home.

Much has been said of late as to the value of what we might term "pony cattle," Kerries and Dexters, but at present they do not appear to have achieved much popularity. At any rate, they are not the

stock of "masses," though some of the "classes" appear to have taken them up. They are pretty things, and to our mind look well, almost as well in a park as deer.

Goats have a class to themselves, and as their milk is so often highly commended for the delicate baby, it is well that they should be improved in their degree as well as cows. We should fancy, though, in these (coming) days of Pasteurised and humanised milk there would not be such a demand for that of the goat. From milk to cheese is an easy transition, and now Scotland actually dare compete with England in the making of Cheddars. What indeed is in a name? Nothing, it appears. Cheddar from Scotland! and no Stilton from Mr. Nuttall. Echo answers, Why? The Reading Institute, managed by Mr. Miles Benson, sent a good exhibit of Stilton, Cheddar, Cheshire, Wensleydale, Caerphilly, and several foreign varieties. Much butter! and beautifully displayed on white slabs on growing grass; tempting to the eye, tempting to the taste; all so good and so improved!

We are not quite sure that we do not prefer a slice off the lb. to an ornamental device, but we are old-fashioned and behind the times. The artists (or should we not rather say artistes?) are most skilful, and we wish their work could be preserved in something less perishable than butter. We made a remark last year, and we make it again with greater emphasis, Why should people still want teaching by example the excellence of skim milk bread? It speaks for itself, and we are sure that in many and many a farm house it is always to be found; indeed, we know bread that if it could speak could confess to unskimmed milk. What can be more nutritrious and yet so cheap? Cheap in fact, and cheap relatively.

One writer rather cavils at the admission of honey to a dairy show. Why, to our thinking, there could be no more suitable place. Bible and hymn-book both combine the two when a Land of Promise is mentioned. One without the other! The idea is incongruous.

Now we come to man with his many inventions—labour saving, health promoting. Is the day of the milk-cart over? No less than three makers showed tricycles adapted for the milk delivery trade—a horse and his keep saved. That is a step in the right direction. Then a cheap apparatus for sterilising milk in a small way. We have not all good keeping cellars or dairies, and milk is such a perishable article that we must hail any good method which prevents waste.

We mentioned lately the milk filtering in Swedish creameries, where the milk passes upwards through fine granite. We saw the residuum in the granite, and gave an anxious thought to our own methods of straining. A new milk filter is brought out where the milk passes upwards through swansdown linen (or calico?). This material is easily cleaned, easily renewed, effective, and very cheap. Improved churns and separators on every hand and at all prices.

Our principal nurserymen were there with collections of grasses, roots, and seeds; all the patent medicine makers and all the special food makers, and we really owe them a great debt of gratitude. Few of us can afford to dispense with a box of handy remedies, and all need at times supplemental cattle food.

We should not like to have had to judge in the butter making contests, but the judging is reduced to a science, and, if we mistake not, is done on the same lines as Chrysanthemum judging—viz., by points. The Judges are guided thus:—

Condition of butter in churn	10
Condition of butter on worker	10
Making up	20
Smartness and cleanliness	20
Colour of butter	5
Texture	20
Freedom from moisture	15
	100

And they cannot get very far wrong, but for all that 180 entries take a good deal of going through.

As is only right, the champion butter-making prize went to a lady, a member of a talented family, Miss Baynes. Last year she was third, her sister and brother, respectively, first and second. Butter making must run in that family. Miss Baynes looks young; she possibly has a future before her.

Well, we have only mentioned (and that very briefly) the leading features of the show. It is a grand object lesson, and worthy of all support. It has directly and indirectly put a stop to much adulteration, and while condemning the dishonest dealer by bringing his malpractices to light, supports and upholds the man who serves his customers with the best and purest articles possible.

Flax Growing.

The British farmer, to work prosperously, requires a good many strings to his bow. Whether one of the strings is to be Flax, is a question at present. A little book by Major Fraser* contains clear and lucid explanations of sowing, pulling, and preparing Flax for the market. The only question seems to be, Shall we find a market when we have done our part? Those interested in Flax culture should obtain a copy of this pamphlet.

WORK ON THE HOME FARM.

We have secured the last Potato, and never did we put a crop away in better condition or have a finer season for the work. As far as we know not one Potato has been touched by frost, which we think must be a record occurrence.

If farm horses could speak ours must have been heard congratulating each other on the fine autumn, for last year we were carting Potatoes off with the headland's axle deep in mud, whereas this year they have been as firm and dry as a high road.

Mangold must be taken up and stored now without further delay. The crop has increased quite 50 per cent. the last three weeks, and is now above the average. Farmers who hurriedly took up their Mangold in mid-October must have lost a very considerable weight by not waiting. Swedes and Turnips which came up at the proper season have increased enormously of late, and are quite an average crop. Sheep are all well on Turnips, and seem to be very healthy, cases of loss being rare. Lambs are better without too much forcing food until Christmas is turned, linseed cake and a bit of hay or Clover being the best foods to give with Turnips in the autumn.

Wheat will continue to be sown until December comes in, and this later sown often beats the earlier on weak soil, but it is very much more liable to damage by birds, especially larks. The best preventive is to use small seed, for this more quickly loses, or rather uses up, the store of starch it contains when sown, and it is that which tempts the lark to dig it up.

Large flocks of larks have lately arrived from abroad, and it is these foreign immigrants which do us the damage, home-bred birds not being sufficiently numerous. Some people dip torches in paraffin, and when lighted wave them about near the ground just before dark, and this is said to act very well in keeping the birds off during the night.

We hear further accounts of damage to stack roofs. It is surely penny wise and pound foolish to make haste to save the corn, and then not to take proper care of it when the goal has been reached.

REMARKS.

31st.—Foggy morning; sunny for two or three hours at midday; fair night.
1st.—Fog till 10 a.m.; sunny from 10.15 a.m. to sunset; overcast night.
2nd.—Cloudy early; bright sun from 11.15 a.m. to sunset; clear night.
3rd.—Fair day, with much bright sunshine.
4th.—Fair, but sunless
5th.—Fair, but sunless.
6th.—Fair early, occasional faint sun from 11 a.m. to 4 p.m.
Another dry week, temperature near the average.—G. J. Symons.

A FLOWERY NOVEMBER.

SELDOM does it happen that we have so many outdoor flowers at this season. Since last we wrote it has been a time of exceptional mildness and calm, and thus the life of the flowers has been preserved. We cannot speak dirge-like yet, though the time of mourning cannot be far off now. The skies are dull and grey, and it is only rarely that a faint smile of sunshine gilds the dying leaves and lights up the colours of the flowers. Yet though there is little sun the air is calm, and no heavy rains hasten the fall of the leaf and the dropping of the bright petal. The leaf falls, the petal decays, but the fall is slow and the decay—unwelcome ever—is a tardy one. Still buds open, though November's first week has gone, and the unexpanded bloom misses the touch of the sunlight. Still flowers remain in blow; still leaves are ruddy or golden with their dying hues.

It is the night of the gardener's time, but though night by our accounting it is to appearance only the time of the first of the gloaming. As we love the evening hours of summer when the Œnotheras open their cups to the coming of the twilight, so do we love to look at the flowers of the time. They are as the scant, silvery locks; the furrowed faces of the aged we care for; they are beautiful with the glory of the past, the memories of more joyous times. Can we pass on and leave these things unnoticed—their beauties unrecorded, and their cheering sanctifying influences hoarded within ourselves? Nay, even if the tale be badly told, the record blurred and imperfect, we must essay it, feeling the while that he who reads must read between the lines, and see there concealed that beauty—that pathetic beauty—of which words can give no satisfying measure.

As we look upon these Marigolds we see again the glories of the summer; yet, though they open not in full to the cold approaches of November sunshine, they have lost no part of their golden or orange colouring, no power to light up things around. There are Godetias yet with cups of purple, of blush, and of rose. No golden land is this where skies are bright and clear, yet still they give us their beauty of colour and of form.

The Virginian Creepers have nearly all lost

their leaves, and where only a week or so ago sheets of blood red covered the wall and clung to the trellis above, there is now only a network of grey branches. One Ampelopsis alone still keeps its leaves. This is A. Hoggi, a self-clinger, with large leaves, but these turn not crimson but yellow flushed with red. They are like some saffron sunsets we see. Close by Rose Madame Isaac Pereire, climbing up the trellis pillar, is about to yield its last petals to the all-powerful spirit of the year's departing time. Finer blooms we could hardly desire than those given in October, their colouring far more pleasing than that of summer's prime.

Overlooking the Lily pool there are still Tropæolums in bloom. Some of the older leaves were crippled by frost; but those undeveloped at the cold time have now expanded, and are fresh as in July, and the flowers themselves are as gay and bright as in the beginning of September. Near by are Sweet Peas still "winged for flight," and crown and tricolor Chrysanthemums, with Scabiouses and other annual flowers; while in the rock garden the little "Diamond Flower" of our cousins across the Atlantic, but known to botanists as Ionopsidium acaule, shines at the base of the stones. A wonderful posy can be gathered from the annuals alone.

There are also some late-planted Gladioli, and were it not that their spikes of gay blooms are still so effective in the garden they would have been cut before this to open in water in the house. Patches of Crocus longiflorus look bright on the rockwork terraces or peeping above a groundwork of greenery in the border. They are kept in countenance by some of their sisters, such as a few lingering flowers of Crocus speciosus and a few others, noteworthy among them being Crocus lævigatus, a pretty flower which opens to a comparatively small display of sunlight. There are yet a few of the double Meadow Saffrons spoken of before, and they please nearly everyone with their soft tinted rose or rosy purple or white blooms. A few single Colchicums appear from time to time as well, but their blooming time is soon over now.

In one of the borders a late plant of the pretty annual Poppy, Papaver umbrosum, is well nigh as bright in colouring as in the height of the Poppy time. Its scarlet black-based petals are, however, less fugacious now than in the heyday of summer, and stand long on the plant. Here and there, in out-of-the-way corners, the Welsh Poppy, Meconopsis cambrica, gives a few of its clear lemon-yellow flowers; and another Poppywort, Stylophorum diphyllum, has a bud ready to open, to give us a companion bit of colour. Flowers of Somnus we call them, but the God of Sleep has for once forgotten that it is time his plants were at rest for the year.

In a quiet corner Claytonia virginica makes a spreading carpet, with its fleshy green leaves and pale pink flowers. It is a "weed" here now, but one which is more than tolerated for its use as a groundwork for other plants, as well as for its own quiet beauty. The earlier Michaelmas Daisies have passed away, but the later Starworts are in beauty yet. Sprays of little starry blossoms like those of Aster cordifolius Diana, or larger flowers like those of Aster grandiflorus, await us, if we wish to adorn the house at the expense of the garden. Each spray or bloom we cut may well be, as Emerson says, "loaded with a thought" of Nature's gifts, to soothe us in the sad autumn days. Pretty, too, is a clump of Plumbago Larpentæ crowning a rockery, its blue flowers harmonising well with the bright tints of its leaves.

There linger other flowers still, posthumous children of the autumn's warmth. They flower in company with Chrysanthemums, one or two Christmas Roses, and the Primroses and other spring flowers which the mild time has coaxed prematurely into the light of day. These seem to look askance at the survivors of the summer's brave array. Hardy Fuchsias, Hydrangeas, Campanulas, Androsaces do not look fit company for the children of the spring.

Yet, after all, we love them. They all help us over the dull time, and tell us even better than our recollections alone of that time when the garden was, and will again be, full of the glory of blossom and leaf, bathed in the sunlight and redolent with the sweet odours of the flowers.—S. Arnott.

PRUNING VINES.

Pruning of all descriptions seems to have had a great fascination for gardeners from time immemorial, and to be a deft knifesman was, at one time, considered a great accomplishment for any gardener. There can be no doubt that many old gardeners were expert workmen in the matter of making clean short cuts, and in arranging the wood with mathematical precision over the surface of fruit trees and Vines. The great weakness of the system they pursued was that they held too closely to hard-and-fast rules under circumstances which differed greatly. We of the present day, on the other hand, go perhaps to the opposite extreme, and in many instances follow no particular system with such persistency as did those of old; but, often grasping certain principles which underlie the work, each man strikes out a course for himself, and it must, I think, be admitted that, on the whole, highly satisfactory results have been obtained under very different methods. Thus it will ever be as long as the brain is trained to guide the hands. Alter the conditions, and let the brain withhold its guiding power, it is then only a matter of time as to when disaster will come.

Vines have, perhaps, not suffered so much as fruit trees from a reckless use of the knife, because, if the roots are vigorous and plentiful, and the foliage kept free from insects, a fair share of success may be obtained under almost any system of pruning. Still, there are degrees of excellence, and all should strive to obtain the best results. Market gardeners who plant their Vines closely and root them out before they become very old, generally prune closely, and have every reason to be satisfied with the results. Private gardeners are somewhat differently situated, as their employers often do not care to destroy any Vines as long as there is the slightest prospect of bringing them into a satisfactory condition without resorting to radical measures, and we all know that Vines must be extremely old, and in a most deplorable condition, before they can be termed absolutely worn out, though of course it is often an open question whether or not replanting is the best course to pursue.

When dealing with old Vines which have become weak and debilitated, a surprising improvement may be made in one season by ignoring all hard-and-fast methods of pruning, and leaving plenty of young wood, so as to be able to have a number of young shoots to select from at disbudding time. The basal buds on the shoots which such Vines produce are often very poor, and to prune to them means a miserable crop, while on the other hand the shoots are simply shortened to the best bud to be found, no matter whether it is 2 inches or 2 feet from the base of the shoot, a fair crop may usually be secured. I do not say that any system of pruning will make up for deficient root action or the evils of an unsuitable border. These are matters which should also have proper attention. By following the plan above advocated at disbudding time the shoot carrying the most promising bunch can be retained, and the others, with the exception of one at the base of the shoot, be removed. This lower shoot should be encouraged to grow as strongly as possible by removing the buds, should any show, then the chances are that the following year the old shoot can be removed, and the basal shoot be relied upon to produce a bunch of fair size.

In dealing with Vines in a sound, healthy condition the character of the crop may be greatly varied by the method of pruning adopted, and before this is determined it must be distinctly understood that close pruning means comparatively small bunches, except in the case of young Vines. Therefore, when Grapes are grown for home use alone, and large bunches are not particularly prized, cut back to one or two eyes, and fairly good bunches will result, such as are extremely useful for keeping up a continuous supply. One great point in favour of medium-sized bunches is they are generally cut and used while in a perfectly fresh state, while larger bunches are not unfrequently dished up many times in succession till their appearance is not inviting.

Lady Downe's is not nearly so much grown as formerly, for although it is a splendid keeper, its tough skin seems to be against it, and if closely pruned it frequently produces too many small bunches. Gros Colman and Alicante, on the other hand, usually give good—and often large—bunches when close pruning is regularly practised. I have lately seen another remarkably fine late Grape, which must inevitably come to the front, and be largely grown. It is named Royal Leamington. Mr. Crump of Leamington has a house entirely filled with it, and the bunches on closely pruned Vines are all large and shapely, with good perfectly coloured berries.

Gros Guillaume does not continue satisfactory for long if close pruning and stopping are practised. Under that system of procedure the berries are frequently quite small, and the crop often scanty, whereas if long spur pruning is adopted, large bunches are produced annually, if the spurs are kept from 18 inches to 2 feet apart. In many instances in which Muscats are not satisfactory, I am convinced from past experience that they may be greatly improved by practising either the long rod or long spur system. There are many good cultivators whom I know do not agree with the plan, as they contend that by close pruning they kept their Vines in good condition for a

number of years; but as a counterblast to that I can point to others who have for years grown and still grow, some of the finest Muscats to be seen in this country by leaving plenty of long shoots at pruning time, and allowing shoots to ramble freely in summer. To those who are quite satisfied with size, finish, and freedom from shanking in their Muscats, I say, Keep to your present practice; and to those who are not satisfied, I have no hesitation in affirming that improvement may be quickly effected by pruning less closely, so as to have several shoots to select from.

An alternative plan in the case of old Vines is to run up young canes, and cut out the old ones. Gnarled old spurs are then done away with, and close pruning will often be satisfactory for a few years. This practice of training up young rods to rejuvenate old Vines is a good one if properly carried out, but I often notice instances where it is only partially practised, and it does not then seem to be satisfactory. Let me make my meaning clear on this point. We will suppose that a strong cane has been taken up from the base of an old Vine; this reaches the top of the rafter in one season, and two-thirds of it is cut away at pruning time, the rod is allowed to carry no fruit the following season, then in the autumn the old rod ought to be entirely removed, and the young one be depended upon entirely to produce the crop. Instead of doing this there is a tendency among many growers to keep the old rod lingering on for several years; but it does little good, because the young rod takes away the vitality from the old one. To put the matter plainly, as I see it, it stands thus: Each Vine must have an old rod, or a young one; the two together will not succeed when they draw their supply of sap from the same set of roots.

I think it is generally acknowledged that closely pruned Vines, as a rule, produce Grapes which colour with greater certainty than do those grown on Vines less closely pruned; but with continual close pruning the size of the bunches produced dwindles down to a low point. It must also be remembered that large bunches do not colour so well as small ones under whatever system of pruning they are produced; still, some cultivators manage to colour enormous bunches perfectly. This shows the highest degree of excellence, and is worth striving to attain.—H. D.

HARMFUL AND HARMLESS GARDEN MOTHS.—11.

Curious are some of Nature's diversities. We might have thought the November moth (Oporabia dilutata), which emerges at the same season as do several of the Hybernias, would have had on their pattern the female wingless, but she is equipped like her mate. This is one of the species that I have occasionally seen upon garden palings on a dull November day in the southern suburbs of London. The ample wings of grey, crossed by smoky waved lines, look appropriate to the season. But it also occurs throughout the British Islands. Its caterpillar is not abundant enough to be harmful, though we find it on a variety of trees in shrubberies about June, a stout-bodied creature, prettily marked with purple upon bluish green.

Some of our southern collectors of insects write to friends in the north to get them specimens of the mountain carpet (Larentia cœsiata) should they see any about midsummer by roadsides or on garden flowers, since it is common, not only in mountainous districts, but wherever the Bilberry or Whortleberry grows freely. The moth has nothing very particular about it, being grey, with a dark bar and brown lines. The caterpillar from which it is produced, though small, is singularly beautiful, showing how humble objects, almost unnoticed, are often adorned. It is found upon the Bilberry in April and May, resting on the stalk, head downwards during the day, and feeding after dusk. What is most remarkable in its appearance is a series of seven V-shaped markings along the middle of the back. Each side of the V is a rich brown, the centre of rosy hue; and at the point of each V a fawn stripe enters; outside these markings are short white lines on the olive-green general colour, the body being velvety. Having attained its full size the caterpillar makes a slight cocoon amongst the leaves.

Another moth in the same genus, L. pectinetaria, is an occasional visitant to gardens in which the fragrant Woodruff is allowed to form clumps, since the caterpillar can eat this plant, though its more frequent food is one or other of the common Bedstraws of our hedgerows. By day the moth sits with expanded wings on walls or palings, receiving the English name of the green carpet from the ground colour, which is a beautiful tint of green, not so apt to fade as the lighter hue of the emerald moths. Across the forewings is a band of black, edged by a delicate white line. The caterpillar has, like its relative just mentioned, some V-shaped markings of red upon a dingy brown, but it is not nearly as handsome. "One of the laziest caterpillars I ever knew," says an entomologist; "most of its time is passed lying sluggishly at the roots of the food plant, rousing up now and then to eat a little." Some pretty and rather small geometer moths allied to these are called the rivulets, because they have upon the wings an irregular line of pure white, which fancy has compared to the windings of a stream. Emmelesia affinitata has the dusky wings crossed by a double rivulet line, also near the margin a row of white spots. It flies during June, occurring chiefly in southern counties. Later on the caterpillar is found feeding on the seeds of some species of Lychnis or Campion, usually concealed from view; when full-fed it descends to spin a compact cocoon.

The various species of Honeysuckle are rather favourites with insects, and they attract the moths called Lobophoras into our gardens, since they furnish food to some of the caterpillars; others feed on Sallow, Privet, and even Ivy. They are somewhat notable moths, as, in several species, the male insect has a sort of lobe, or appendage, to the hind wings, and the caterpillars, small though they are, display some singularities in colour and markings, being also furnished with two curious points at the tail. Evidently the Latin name is explained by the lobes, which probably gave rise to the odd English one of "Seraphim," applied to a couple of the species, because they seem to possess six wings. Commonest is L. hexapterata, of pale grey, with smoky lines, and other marks which look like black arrowheads; the under wings are pure white, also the lobes. It is amongst the many that feed on Sallows and Willows while in the caterpillar stage, when it is of a delicate green, having yellow points at both head and tail. The two species that are bred upon the Honeysuckle are not abundant enough to disfigure the plant. The moths fly in April, braving the showers and frosts of that changeful month.

One of them, the barred tooth-striped (L. polycommata), though of moderate size, is a very handsome moth of varied colours; its companion species, the early tooth-striped (L. lobulata), is grey-and-black. In appearance, the caterpillars of the two nearly resemble each other; they are of some shade of green, marked with white, and have an odd habit, when reposing on a twig, of bending down the head so that it cannot be seen, being pressed against the front legs, which are crowded together. They are full-fed in June. The caterpillar of L. vivetata is many-coloured; it occurs upon Privet, Gueldres Rose, and Ivy, and is said even to be able to masticate the tough and prickly leaves of Holly.

Most of the geometrine moths, of which we have been examining some garden species, are not remarkable for loftiness or speed of flight, but there are exceptions, as in the little group of three that are called the highflyers. A gardener has no objection to see them pass over, though they are not parents of destructive caterpillars, but to the collector of insects it is annoying when one speeds along above at a height which is beyond the reach of his net. Still, all these moths are sometimes tempted to descend and taste the sweets of summer flowers. Indeed, as the caterpillar of the July highflyer often feeds amongst Heather the female moths must come down to deposit eggs, unless they drop them on the wing, which is unlikely. The other two species of the genus Hypsipetes have caterpillars which chiefly feed on Alder and Sallow, stout-bodied creatures, that hide by day, perhaps from fear of birds, and eat after sunset.

We have a largish group of moths, also geometers, which are known as the carpets, because the majority of them exhibit markings which were thought to resemble the patterns or designs of these household articles. Carpets nowadays are of such varied styles that it may be doubtful to some whether the moths thus named are particularly carpet-like; a few may be. The appearance of several species about gardens is appropriate sometimes, for in these we may also see carpet bedding. It is, moreover, the fact that few of the carpet moths do any perceptible harm to plants or trees. Probably the one we must give the pre-eminence to is the beautiful carpet (Melanthia albicillata), which Mr. Beauchamp says is almost without a rival for "pure colouring and delicacy of design," the ground colour being creamy white, upon which are brown blotches and lines. This insect occurs in many English counties and two or three Irish ones. Its caterpillar is also handsome, of a velvety deep green, marked with yellow and white. It has been taken upon the Raspberry in gardens, and has an odd way of swaying its head to and fro if annoyed, while it is held at an angle with the body. Now and then it eats the Bramble.

The blue-bordered carpet (Melanthia rubiginata) flies during July about orchards and gardens. The white wings display a bluish border, and a blotch of black. This pretty insect is bred from a caterpillar which feeds on the Damson, Bullace, and other varieties of Plum, in May or June, but not plentifully. It is long and slender, of various shades of green. A rather mischievous species bears the name of the garden carpet (M. fluctuata); there are two broods most seasons. The moth has rather dull colours of grey and brown. In the caterpillar we find livelier tints—red and white, with black and brown; it exhibits a series of what has been called arrowhead markings. We may detect it on Cabbages and other Brassicaceous plants; amongst garden flowers it attacks Arabis and Tropæolum. The spring brood is out during May, and a second batch of caterpillars in September. Primroses in gardens and woods supply food to the caterpillar of the silver-ground carpet, but it is seldom noticed, as it keeps near the earth in early spring. The moth is on the wing about midsummer.—Entomologist.

ROSES

Rose Seeds.

Will any raiser of Roses from seed kindly state the best method of treatment? I have tried sowing in heat, and in the open ground, but have not got many seeds to germinate. Is it better to sow them as soon as gathered, or to keep them until the spring? and if the latter plan is the better which is the best way to keep them? As I have a quantity of choice seed ripening I am anxious to know the best way of treating it.—W. H. Divers, *Belvoir Castle Gardens, Grantham.*

The Truth About Crimson Rambler.

As the original cultivator of the Rose on its introduction from Japan in the year 1878, I may say at once that the paragraph quoted by the Rev. Alan Cheales in your issue of 4th inst., page 429, is substantially correct. The Rose, along with a number of other plants, was purchased by Professor R. Smith for Mr. Jenner in the public gardens of Tokio. When it had been cultivated for a year or two in the gardens of Easter Duddingston Lodge, Mr. Jenner noticed its free-flowering character, and named it the Engincer, in honour of the Professor himself.

With regard to the name of the Rose, I may state that when the plants arrived at their destination each was encased in a curious, bowl-shaped pot, with a wooden label attached, and the native name of each plant inscribed thereon, but these names were never translated, otherwise we might now have had the Japanese name for this popular Rose. My experience of the flowering qualities of this Rose is that it does not do well on a wall, but much better in the open, as it seems to enjoy a full and free circulation of air.

Dr. Ramsay's remarks in an earlier issue of your paper as to this Rose having been in Mr. Jenner's garden "forty years ago" are not correct.—M. Chapman, *Torbrex Nursery, Stirling.*

Canker in Roses.

Several theories have been put forward from time to time as to the causes of and remedies for canker disease in Roses. I am convinced it is not soil alone, nor is it the stock Roses are worked on. We find it on Roses in widely different soils, on all of the many stocks, and even on plants growing on their own roots. It appears on roots and branches, under glass and in the open, on varieties of widely different growth and classes, and on the same when treated in varying forms as regards culture. For several years I have tried many ways of combatting this disease, and although in some few instances the plants certainly seem to have benefited, others so treated have not been improved in any respect.

As a rule canker is most troublesome among Maréchal Niel. It also attacks William Allen Richardson and other strong growers. It is found in the case of some Hybrid Perpetuals when worked on an uncongenial stock. Marie Verdier, Her Majesty, S. Reynolds Hole, and Captain Christy are examples of some which have a great objection to the Manetti in most soils; yet I have seen them doing well in more than one instance. These are only a few examples of its erratic and inexplicable attacks, and a few notes upon my efforts to combat the disease may be of interest.

It often happens that one plant out of many will develop canker with exceeding rapidity, and yet its near neighbours, under precisely similar conditions, are exempt. I have carefully lifted the attacked plant, and given that and the soil a thorough overhauling, without any result. Healthy plants on each side had no more or less swelling at the junction than the affected plant.

In one instance, several Maréchal Niels were side by side. An overflow drain from a cesspool ran from 3 to 4 feet deep in the soil. This was not made of the modern sanitary pipes, but the ordinary drain pipes used in agricultural draining. The roots of the Rose had penetrated the interstices and forced the pipes open, and the soil became heavily charged with a strong fertiliser. Many of the roots were quite dead, probably from undue saturation of so strong a liquid while dormant. The plant most affected developed canker very badly, but others escaped. A house of Maréchal Niels was forced hard, the plants being in pots and standing upon a turf bank. When we came to remove these they were found so strongly rooted through the drainage holes into the turf that it was decided to leave them, and a foot or so of more soil was placed around the pots, just covering the crown. The plants grew in a most luxuriant manner; there was promise of a grand crop, and buds were formed, when suddenly the whole of the plants' growth put on a most distressed look; leaves went brown or pale yellow, the buds fell, and not a dozen decent flowers were secured. We found the roots both above and below the drainage hole were one mass of canker, which, in this instance, was no doubt caused by constriction. The question is, Had we broken the pots and released the roots previously to adding more compost, would they have been attacked by canker?

A grand plant of William Allen Richardson has occupied a corner of a house since this variety was introduced; it is, in fact, our stock plant. Several years ago this developed canker very badly at the junction of the stock and Rose. I cut into this upon more than one occasion, rubbed fresh cow manure into it, added some light compost around the part, thinking it might perhaps take off on its own roots, as the first appearance of the disease looked much like a lump of callus formed above the soil. Now, although that plant still has a very large bunch of canker, it gives us a grand crop every spring and autumn. The soil is stiff and rather wet; the plant is upon the De la Grifferaie stock, and several hundreds of buds for working are taken from the plant every summer. In other cases, when W. A. Richardson has been attacked, I have known the plant die in a very short time.

It has been said canker is caused by undue interference with the balance of growth, and that cutting away growing shoots, or hard summer pruning, is a sure prelude to canker. I do not find it so, although, in several cases, plants so treated have been attacked during the same season. If it was a cause, how is it we find so many cases where Maréchal Niel—the Rose most affected by this disease—is annually treated upon the cutting down system, in order to get long rods for the following season's forcing, and yet do not find canker general?

Insects are given as a probable cause. That they aggravate the diseased part I fully believe. I have cut many scores of cankered protuberances open, and generally found a small insect in them, which, if not a species of the rhodites attacking our native Briars and causing rose galls, have a remarkably close resemblance in their larvæ stage. Insects are very fond of the sweet juices exuding from any injury to plants, and which, if undisturbed, would generally form healthy callus. I am inclined to the opinion that the constant irritation caused by the insects feeding upon these juices often tends to the more rapid development of canker.

We sometimes find a species of canker breaking out in little warty protuberances all over the branches of a Rose, and which in a short time so cripple the plant as to render it quite useless. Finally, I have proved that no form of canker is contagious in any way.—Practice.

ISLE OF WIGHT.

Macrocarpa, Ventnor.

Ventnor, one of the most picturesque and lovely places in the Garden Isle, contains many gardens where plants are grown exceedingly well, though it must be admitted that the climatic conditions are favourable to successful gardening. Whilst on a recent business visit I called at Macrocarpa, the residence of Miss Mitchell, and found that the horticultural department contained many things worthy of note. Mr. W. W. Sheath, the able gardener, who is ever energetic and pleasant, was busy getting his "Mums" into the conservatory, and he had a fine lot of plants with blooms fit for any exhibition. Amongst the most noteworthy I observed Matthew Hodgson, Edith Tabor, Mrs. Hume Long, C. H. Curtis, Eva Knowles, Phœbus, Madame Carnot, Colonel W. B. Smith, Pride of Madford, Mrs. C. Blick, Chas. Davis, Viviand Morel, and W. Holmes.

In the greenhouses he had a good display of Zonal "Geraniums' and Begonias. As to the latter I may say Mr. Sheath is not a grower of hundreds but of thousands. Several Cattleya labiata, Cypripedium Spicerianum, C. insigne, Odontoglossum Alexandræ, and Cattleya Loddigesi were in excellent health. A house of late Grapes looked remarkably well; large bunches with well coloured berries of Lady Downe's, Muscat of Alexandria, and Mrs. Pince. The cordon Apple and Pear trees looked healthy, and there were fine fruits of that highly appreciated Apple, Newton Wonder, still on the trees.

Outside were large specimen plants of Chrysanthemums in full bloom of such varieties as Ryecroft Glory, Source d'Or, and Mdlle. Elise Dordan; these with plants of Cosmos blooming profusely, and Dahlias still flowering, gave a charming effect, with the autumn leaves that bedecked the paths and beds. The photographic illustration (fig. 72, page 483) depicts a clump of Pampas Grass in the grounds of Macrocarpa.

Ventnor Show.

The Ventnor Chrysanthemum Society held its second annual exhibition in the Pavilion on November 9th and 10th. The exhibits were numerous, and of excellent quality. For cut blooms Mr. W. H. Jobling, gardener to Lady Harpur Crewe, secured premier honours in the open classes, and also the I.W. Horticultural Association's award of merit for an excellent bloom of Iserrette. Mr. F. Woods, Steephill Castle, took first in the class for groups, and also the I.W. Horticultural Improvement Association's certificate for cultural merit. Mr. W. Gee was first for specimen plants. Mr. W. W. Sheath first for both black and white Grapes. Mr. G. Witty was first for tray of vegetables, which contained some fine Peas of Boston Unrivalled and huge Sutton's Exhibition Sprouts. Mr. D. Day was first for Apples, and Mr. Sheath for Pears.

The other principal exhibitors were Messrs. H. Drover, J. Attrill, J. Silsbury, W. Taylor, J. Moseley, and W. Kingswell. Messrs. H. Drover & Son staged a collection of fruit, flowers and plants, not for competition. Messrs. J. Cheal & Sons also sent a collection of Apples not for competition. Much credit is due to the Secretary, Mr. W. Knight, and to the Manager, Mr. Jno. Gill, for the excellent arrangements and general management of the show.—S. H.

ORCHIDS

Cypripedium venustum Measuresianum.

Amongst the very numerous Cypripediums, the well-known venustum is highly appreciated. Every collection comprises the type and several variations from, some of which occasionally find their way to the Drill Hall. Amongst the most distinct of these varieties was one staged by Mr. H. J. Chapman, Camberwell, and named C. v. Measuresianum. When it was shown before the Orchid Committee it received an award of merit. The flowers were inclined to be small, but, as may be seen by the woodcut (fig. 71), the markings were very distinct. The dorsal sepal was white lined with green, while the petals and pouch were yellow barred with green. The foliage was pale green, blotched with a darker shade.

Notes on Cattleyas.

Seldom have these Orchids been so satisfactory at this time of year as they are this season, a fact accounted for in a measure by the brilliant weather recently experienced. But all through the season, as the different species of the labiata group have come into flower, they one and all have given a good account of themselves. Just now we have the grand old autumn flowering labiata, a plant that came to us a few years since almost as a novelty, yet with a character of nearly eighty years' standing; and well has it borne out the good opinion first formed of it, for it is of a magnificent constitution, very free and constant in flowering, and the blossoms present an almost endless variety.

All are good, especially when it is remembered that these gorgeous blossoms occur at a time that used to be noted for the dearth of flowers. To say it is easily cultivated hardly goes far enough. I have plants now in flower, and carrying about a dozen blooms on each, that were bought at about 2s. 6d. each, and have never been potted but once. And this reminds me of the fact that all these plants may with perfect safety be potted at any time of the year when it is apparent that a glut of young roots is about to be put forth from the rhizomes near the leading pseudo-bulb.

A little assistance in the way of top-dressing is very often of great benefit to many species just now, any that push roots in advance of swelling the bulbs, such as C. Mossiæ especially. It is true they are producing flower spikes, but there is no need to disturb the roots much unless they are in really bad order, and then they are better out of the pots than in them. The atmosphere of the house at this time of the year requires careful management; on the one hand to give sufficient stimulus to any late plants to finish their growth, on the other to prevent earlier ones starting out of season. Much can be done, of course, by the arrangement of the plants in the house, but even this will not do unless the atmospheric conditions are right.

The worst plants to start out of season are the varieties of C. Dowiana and C. gigas, but even C. Gaskelliana will do the same thing. This must, if possible, be prevented, as although the growths are sometimes strong and healthy, there is nothing to beat a true annual cycle of growth and rest as required naturally by the individual species. Of course, the times for this vary; for instance, C. Warneri, which is often described as the spring flowering labiata, may often be met with at this season just starting to grow from the base.

The best winter position for this plant, and for any of the last-named kind that have not kept in proper order, is one not more than a yard away from the roof-glass, where abundance of light reaches them from all sides. The beautiful C. Percivaliana is almost unrivalled in the beauty of the tints on the lip, lovely combinations of gold and deep crimson often occurring. This, too, delights in ample light—will not, in fact, thrive without it, and it is just as important for the finishing growths of C. Mossiæ, the most justly popular, perhaps, of all.

Coming to the upright-growing species, as represented just now by the quaintly coloured C. bicolor, a good clear light is of the utmost importance. The growths are finishing, and must be well consolidated, or any slight check during winter will be severely felt. Then badly ripened bulbs shrivel if allowed to get a little on the dry side, while those properly developed will stand drying for weeks with impunity. The many varieties of C. guttata, C. intermedia, C. Schofieldiana, and C. amethystoglossa are all alike in this particular. With regard to root moisture during the winter, it may be noted that the smaller, more seed-like, pseudo-bulbs will not, as a general rule, stand so much drying as the more obese, or club-shaped kind.

There is no better time than the present for an overhauling of the Cattleya house, cleaning every part of it thoroughly, and re-arranging the plants in their winter quarters. If possible, all the plants should be taken out of the house, but as this would be inconvenient in many cases, they should be shifted to one end and protected by a large piece of tiffany or light canvas while cleaning the opposite end. This will prevent the foliage being splashed from water and dirt. Begin with the roof, and wash this thoroughly inside and out, mopping down the glass, and scrubbing the woodwork with hot soapy water and soluble paraffin.

Sponge the glass inside, and then scrub down all lattice stages and walls, the stages dressed with gravel or spar, having this turned and placed back clean, dusting a little soot and lime about first. Having done the house, the plants should be all sponged, first dipping the heads in warm water and a solution of softsoap afterwards, sponging every leaf carefully. The rhizomes, too, must come in for careful

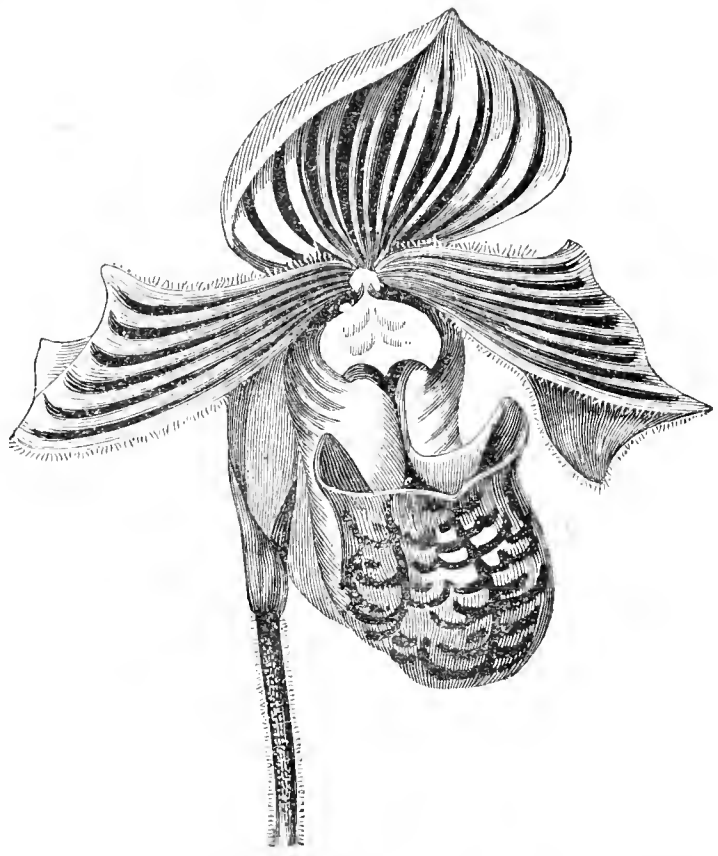

Fig. 71.—Cypripedium venustum Measuresianum.

attention, as the small white scab so prevalent among Cattleyas here finds congenial quarters. Wash the pots thoroughly, and before re-arranging renew any stakes or ties that may be defective.—H. R. R.

NOTES FROM IRELAND.

The Mildness of the Season.

The month of October ran its course, so far as weather was concerned, in a very satisfactory manner, and it is difficult to realise the fact that mid-November is now with us. On the seaboard of Dublin Dahlias still make a brave show, being there less affected by damp than further inland. A long border of these lately seen, consisting of some 200 plants, were, and in all probability are still, charming both in profusion and perfection of bloom. Fuchsias, and many a bright patch of Lobelia fulgens, are still in all their glory, whilst the last Rose of summer not only lingers with us, but is well represented by that gay, good, and generally satisfactory variety, Ulrich Brunner. On a sunny bank near the Phœnix Park, where a humble florist assiduously cultivates a little patch surrounding his thatched home, one sees in passing a delightful display of the German Scabious, varying in tint from white to rosy red. It should be a rare season for outdoor Chrysanthemums, but these are little in evidence. Vagaries among the fruit trees are common, both Apples and Pears putting forth occasional blooms. As for Strawberries, present appearances promise fruit for Christmas, blossom and a prospective crop swelling on many plants leading to that inference.

Although a wet and cheerless September gave us a few nipping nights ere it departed, the effects on tender plants were but partial, and recovery was rapid, the cottage homes still being bright with the gold and scarlet of Nasturtium blooms, set off by the vivid green foliage. But in no instance is the effect of this protracted mildness more noticeable than in the vegetable supply to the Dublin market. So much is this the case, that in one place where large breadths of the staple kinds are grown for it, the conclusion has been reluctantly arrived at that they do not pay for the labour of gathering and cartage, and a temporary cessation of the catering has been decided upon, excellent samples of autumn Broccoli and Veitch's Autumn Cauliflower returning at the rate of only 6d. per dozen, and Brussels Sprouts are realising relatively low prices.

Celery, too, in grand condition, and entailing a considerable outlay on labour in its production, yields the grower 1d. per stick. Yet one sees

openings in other directions. Onions, for instance, for which a good demand always obtains, are largely imported, although it is but fair to add that both soil and climate are not generally the best suited for their culture. One thing is worthy of remark—viz., those whose smartness results in having good breadths of an early Cabbage, such as Ellam's, in cutting condition during April, reap their reward in a brisk demand for it.

Potatoes are an exception to the low prices ruling in other commodities, and this in spite of many growers sending direct for sale instead of holding over; £4 per ton is the present price for average samples of Beauty of Bute and Sutton's Maincrop. There is no doubt that August and September were disastrous to the Potato crop of Ireland, and even here, where the worst effects were not felt, one is daily reminded that the indispensable esculent is decidedly inferior in quality. With cattle food still in abundance, it might be reasonably expected that glutted markets in this direction would not prevail However, many of the annual grazing tenancies expire at this period, probably accounting for much in this direction; and it is said, with what degree of accuracy I know not, that the engineers' strike is indirectly concerned in it. However that may be, this must be regarded as one of our principal exports.

One question has more than once been asked, How it is that the artisan in Liverpool (or other large English industrial centre) can procure the best we can produce in the way of beef, or catch in the way of fish, at a distinct advantage over his brother in Dublin? It is a question one would have to go beneath the surface of things for an answer, and it is not, perhaps, expedient to say more on which a little strong feeling exists. We are told upon the one hand that Ireland is purely an agricultural country, and on another that it is pre-eminently one of dairy production, which is, of course, but a phase of the former. As a gentleman once remarked, "If it is not this it is nothing." His Irish home is, I find, now supplied with cream in jars bearing the brand of the West Surrey Central Dairy. He, as a consumer, says it is cheaper and better than the native article, which, if not patriotic, is undoubtedly practical; a spirit which has not only emigrated to this side the Channel, but in all probability has come to stay.—K., *Dublin.*

HARDY AQUATICS.

THE cultivation of aquatic flowers is attended by many pleasures. In hot summer weather the very appearance of water is grateful. A small pool or aquarium well furnished with Water Lilies and other plants is a pleasant resort, and the gentle rippling of the water is cool and refreshing to the senses. In many gardens large or small lakes exist, the shallow waters of which afford ample space for a collection of aquatics; but in very small gardens the most that can be attempted is a small aquarium, unless a streamlet pass through, when a pool may be formed at some selected portion of its course, which the waters of the brook will furnish before passing on their way. Let us suppose, however, that no such streamlet exists, as it probably does not, and that it is desired to form a small aquarium. An excavation from 1 foot deep at the edges to 3 feet in the centre should be made. Inlet and outlet pipes should be provided to replenish the water or draw it off as may be required.

A stone basin is a good substitute for a clay-puddled aquarium, but by no means equal to it, for the plants derive nourishment from the clay, which they can never do from stone; besides, the stone basin is much more expensive than a puddled one. The basin may be formed of cement, which may be done by firmly ramming the bottom after it has been dug to the required width and depth. It cannot be rammed too hard, and then place a layer of lime-riddlings on the bottom and ram it as hard as the soil; on this spread with a trowel a layer of mortar an inch thick, formed of equal parts lime and finely sifted ashes—the dust that passes through the riddle. This should be allowed to dry, and if it has been well wrought and put on quickly it will not crack. On this again a coat of Roman cement is laid an inch thick, which is formed of cement one-half, plaster of Paris a quarter, lime finely sifted a quarter, with sufficient water to make it of the consistency of mortar. A cheaper way is to use equal parts of finely powdered lime and calcined marl; or Portland cement, with a little sand added, either of which will set as hard as a stone, and be impervious to water; but they should be laid on quickly, or they are apt to crack at the joinings. Soil 6 inches thick will be necessary at the bottom of stone or cemented basins for the aquatics to grow in. All ponds or lakes are formed in the manner before named, the only difference being in the size. A lake is simply nothing more than a basin on an extensive scale; but I will pass over the improvement of streams, lakes, and irregular pools of water for the present, and confine myself to the culture of aquatics.

Probably there is nothing so simple in the whole range of ornamental flower gardening as the cultivation of water plants, there being but two main points to attend to. These are providing a portion of soil for the roots to grow in, and planting or placing them at such a depth below the surface of the water as their size and habits require. Their peculiar natural habits should also be imitated. Those with floating leaves, as Nymphæas, Nuphars, and Villarsias, grow naturally in the deepest parts, while such plants as Caltha grow on the margin or in shallow water. The smaller kinds require to be but just within the water; whilst some do best when planted on the edge, but still with the roots in close proximity to water, of which Myosotis affords examples. Some, nay the greater part, of the taller-growing kinds require to be planted near the edge in shallow water, as, for instance, the upright-growing Grasses and Reeds.

In planting it is better to distribute them in groups than as single plants at regular distances. Even groups should not be regularly distributed, but disposed with irregularity in threes, or a dozen together, according to the extent of the water. They will thus look all the better. It will not look well to have all the tall-growing in one part, and the small in another; but the contrary. The smaller kinds will look better where the bank is broken by shrubs; and the taller kinds may be made to distinguish themselves between the shrubs on land and the water plants by placing them where the bank is unclothed. As a rule tall-growing kinds ought not to be planted where the bank is a dense mass of foliage, or the outline of the water will be destroyed; nor the smaller kinds where they cannot be seen and examined. Where, however, the bank projects and is clothed with trees or shrubs, advantage should be taken to plant a group of the taller kinds in as great a number and as much variety of foliage as may be consistent with the plants on land. The inlets should be planted with the lesser kinds, those that appear much above water being excluded, except one here and there to fix or attract the eye, or the smaller ones might remain unnoticed.

Plants with floating leaves as a rule ought to occupy the deepest parts of the water, and as they are much less numerous than those growing in shallow water, groups of one species where the water is extensive, or of one genus when it is small, should be planted in one place. Even then they should not occupy the whole of the mid-water, but with a broad channel between and distant from group to group they would appear as verdant floating islands, which, when arrayed in their summer dress, with their gorgeous white and golden flowers peeping from the watery surface, will be highly picturesque. If the plants be artistically disposed a lake will have much the appearance of an old-fashioned flower garden, the tall-growing aquatics in groups being the shrubs, the large species the single specimen shrubs, whilst the floating species will represent the gorgeous masses of one colour or beds, water taking the place of the lawn.

Where basins or small pools already exist that have no steps or terraces to accommodate plants which require to be placed at different depths, half-inch iron rods, with a loop at one end so as to hold a flower pot, bent so as to be the required depth below the surface of the water, and fixed firmly in the bank, will do much towards growing a greater variety of plants, and if the iron be galvanised the rods will last a long time. A goodly amount of soil, mud rather, being all we want for these plants, I have only to consider how it is to be given. For large pools it is best given at the bottom of the water, whilst for basins and small pools the plants had better be in pots, except such as have floating leaves, which must have at least 6 inches of soil to grow in. Nymphæas may even be grown in pots, but not so well as when planted out.

Stiff loam alone is suitable for all the floating species and tall-growing kinds; but the others require vegetable earth, peat, leaf mould, or bog soil one-fourth, strong loam half, and coarse gravel one-fourth; 6 inches is not too much for the taller species to grow in, but 3 inches will do for the smaller kinds. In assigning the plants their places in basins of water, regard should be had to effect, unless a collection be wished for, when, of course, effect is not the object aimed at; but the depth each species requires to be in the water must be borne in mind at the time of planting.

Aquatics are best planted in the spring, for then they have a good opportunity to establish themselves during summer. The best mode of planting is to fasten a ball of strong loam round their roots and drop them gently into the water at the desired place. Should the loam be of a friable nature, a large or small stone, in proportion to the size of the plant, must be fastened to the root in addition to the soil, or the plant will rise owing to the soil falling in the water. Those which require to be planted on the margin can easily be placed in the mud with the hand.

With regard to the plants that are to occupy the aquarium, it rests entirely with taste to say whether it shall be planted with those that have white or yellow flowers only, or with such as afford a variety of colour. It may be white with Nymphæa alba, or yellow with Nuphar lutea, or many colours by selecting from the list of aquatics to follow. In any way it should be planted in accordance with the laws of harmony and contrast. The white Water Lily is second to no aquatic for forming a good centre of white; but the plants in the beds around should have flowers of a different colour, so with yellow, and so on. If the basin be planted with one species only it is not necessary to form it into terraces; but it should be pretty nearly of a regular depth throughout, as much as circumstances will allow. Three feet is deep enough for either of the aforesaid Lilies, and 1 foot 6 inches quite shallow enough. Neither of them appear above water, but their leaves float on the surface, still having one of the florists' highest recommendations—"the flower is borne well up above the foliage." I certainly should plant but one species only, or, if many, such only as would attain their greatest beauty when the remainder of the design was arrayed in splendour.

But we have arranged for plants of different heights, and must find them. Well, here they are in flower garden order:—Centre, Nymphæa alba; Hydropeltis purpurea around it on the first step—the flowers are of a reddish purple colour—and Nuphar pumila at the outside or edge, which will be improved by having Myosotis (Forget-me-not) planted on the margin of the water all round. It is not necessary to adhere to this arrangement, for there is ample variety of habit and diversity of colour in aquatics, so that by having but one of a species a large number may be grown in a limited space. However, where anything like effect is desired, the basin had best be planted with Nymphæas in collection, Nuphars, Alismas, and others, for it is difficult to get aquatics to grow as even in height and outline as bedding plants. As far as regards fish

in small aquaria, a few gold fish are an embellishment, but fowls have no business in such a place.

Water plants are propagated by division of the roots and from seeds. Division is simply parting an old root, or taking off the offsets. Such species as emit roots from the stem or have stems floating beneath the water may be increased by inserting cuttings of the stems. An excellent plan for striking aquatic cuttings and raising from seed is to have a shallow stone basin, any size, about a foot deep, with a hole to let off the water, and a tap to fill it; the bottom to be covered with 3 inches thickness of stones and about 3 inches of soil—*i.e.*, peat and loam in equal parts laid on the stones; it is then filled with soft or rain water. In this trough cuttings of the creeping kinds are planted, and seeds of the floating species are dropped into it. In this they can remain until of sufficient size to plant in their final quarters, when the water can be let off, and a fresh planting take place. Cuttings are best inserted in March, and seeds sown as soon as they are ripe.

For the kinds growing on the margin, or what are, properly speaking, marsh plants, the trough will require to be filled with soil to within an inch or so of the brim, covering the surface with a thin layer of moss. Saturate with water and keep the whole well saturated afterwards. Offsets can be planted in March, putting them with their roots just beneath the moss, and seeds may be sown on the surface immediately after they are ripe. The seeds will vegetate more freely when the moss becomes decayed. When the plants are large enough to transplant they may be transferred to where they are to remain, moving them with a ball of earth adhering to the roots; for although placed in the water a ball of earth is of as much moment to them as in planting any other plant, success being more certain with a ball than without. For small basins the plants are handier in pots, especially the smaller kinds, potting them in the compost already mentioned like any other plant, and placing a stone on the surface of the mould to prevent the plant being displaced. The tender kinds are best in pots, for then they can be readily removed to shelter on the approach of severe weather.

Though we do not now propose to give lists of varieties of aquatic plants, we cannot refrain from seizing the opportunity to pay a tribute to the beauty of Marliac's hybrid Nymphæas. At several shows this season Mr. J. Hudson, Gunnersbury House, has staged collections of the flowers, and they are surprisingly beautiful. The colours are varied, and the size of the flowers excellent.—A.

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 9TH.

SCIENTIFIC COMMITTEE.—Present: Dr. M. T. Masters (in the chair); Mr. Michael, Rev. W. Wilks, Dr. Müller, Prof. Church, and Rev. G. Henslow (Hon. Sec.).

Cattleya labiata, Sport.—Dr. Masters observed that sports similar to those produced at the last meeting, in which two sepals were more or less resembling the labellum, had been sent to him from numerous localities this year. The species was introduced some fifty years ago, and subsequently lost; but it has been lately rediscovered in and introduced from Pernambuco.

Carnation Leaves with Horn-like Marginal Outgrowths.—Mr. Michael reported that no trace of acari could be seen, as suggested as a possible cause. Dr. Müller observed that a plant of Solanum jasminoides was covered all over with horn-like excrescences. Dr. Masters suggested that they were probably spongy outgrowths from the epidermis.

Stocks, &c., Attacked by Beetles.—Mr. Michael observed that Stocks, Virginia Stocks, and Nasturtiums in his garden were attacked and utterly spoilt in a fortnight by thousands of beetles eating the flowers of the two former plants, but the leaves as well of the last-named. They do not entirely kill the plants, which renew both leaves and flowers after the beetles have disappeared. A partial remedy was found in shaking the plants over a basin of hot water. It appears to be Phyllotreta atra, one of the numerous "flea beetles." Miss Ormerod, to whom they were sent, suggests "trying a mixture of equal parts of fresh gas lime and quicklime, with a much smaller proportion of soot, and about half as much sulphur as of soot. These should be powdered up together very finely, well mixed, and dusted on to the foliage *when the dew* is on it, morning or evening. Just a sprinkling is enough. It usually acts well if applied as above, so as to adhere to the beetles and foliage." She was under the impression, however, "that lime similarly applied would do equally well."

Ivy Attacked by Dodder.—Mr. Chas. Herrin of Dropmore sent specimens of Ivy badly attacked by a *Cuscuta*. He remarks, "This parasite has established itself on the west wall of our church, destroying the Ivy with which it is covered. It has been thoroughly destroyed, Ivy and all, once, a few years ago; but now that the Ivy has begun to grow nicely again, half covering the wall, it has again appeared, and is destroying it." As the seeds must germinate in the ground, or perhaps in the chinks in the wall as well, the aim must be to kill them before germinating. If the ground by the wall receive a good dressing of slaked lime, such might prove effective.

Cox's Orange Apple Striped.—Mr. G. Swailes of Beverley sent an Apple, mostly red, but striped with green on one side, the latter colour being on the most exposed side. The cause was unknown. Dr. Masters suggested the possibility of accidental crossing having been the cause, for Darwin had described similar results in an Orange pollinated by a Lemon ("An. and Pl. under Dom." I., p. 399). Mr. Wilks mentioned that a Beurré d'Amanlis Pear in his garden had thrown out a green striped sport, also a bough bearing golden foliage.

Gall on Jessamine.—Mr. Henslow exhibited a large globular gall which he had taken from the stem of this plant. As no fungus was present, it was sent to Mr. MacLachlan for examination.

Composition of Potatoes.—Prof. Church gave some account of the late recent researches of MM. Coudon and Bussard on the distribution of the constituents in Potatoes. They found that a slice of a Potato revealed three zones; the external one beneath the epidermis contained 73 per cent. of water, the central holding about 80 to 84 per cent.; that the central part contained the greater amount of nitrogen, the exterior the greater quantity of starch. This accounted for the "bursting" in a floury Potato, which is relatively more free from albuminoid matters. The cause of the interior portion being more consistent is that the starch cells though bursting are held together by the curdling of the albuminoid matters during cooking. The same peculiarities appear in the thirty-four varieties examined. The intermediate zone was also of an intermediate character with regard to its structure and cell contents. It was to be regretted that the authors did not distinguish between the true albuminoids and the amides in estimating their per-centage of nitrogenous matter. As a rule the former amount to 1·3 in Potatoes, but they had estimated them from the total nitrogen as from 1·8 to 2·5. Dr. Masters remarked that these observations corresponded with the stem-structure of the Potato, which would have the cortex as a starch reservoir as it is in trees, while the deeper layers would correspond with the phloem or proteid-holding sieve tubes.

Notes & Gleanings

EVENTS OF THE WEEK.—On Tuesday next the Committees of the Royal Horticultural Society will meet at the Drill Hall, Westminster. It is hoped the display will be much superior to the last one. For other fixtures, readers will do well to consult the list of shows on page 479.

—— WEATHER IN LONDON.—From Wednesday last until Sunday night the weather was wonderfully mild for the early part of November Overcoats were discarded by many persons, and one might easily have thought it the month of May but for the falling leaves. Flowers that are usually over long before this are blooming profusely in the London gardens. During the early hours of Monday morning rain fell heavily, but the day was dry, and a cold wind blew for some hours. Tuesday was milder, rain falling in the evening and through the night. At the time of going to press on Wednesday it was drizzling slightly.

—— WEATHER IN THE NORTH.—The first two weeks of November brought weather dull and foggy generally, with an occasional drizzly shower, and a rare gleam of sunshine. During the night of the 13th a great deal of rain fell, but Saturday was fine. Sleety showers occurred throughout Sunday; on Monday morning the higher hills were whitened with snow, and 5° frost were registered. Tuesday morning was dull, with cold N. wind, and 90° frost during the night.—B. D., *S. Perthshire.*

—— EUPHORBIA CYPARISSIAS.—This European plant deserves a few words of praise because of its autumn colouring. Were it not for its inveterate habit of straying beyond its bounds it would be more appreciated even in summer because of its elegant-looking habit alone. The greenish yellow flowers are scarcely bright enough; but at times they look pleasing even though the green tinge detracts from their effect It is in autumn, however, that the Cypress Spurge looks its brightest when it assumes a colouring of saffron and gold. A nice plant on the top of a rockery here has been much admired since it began to colour in the beginning of October.—S. ARNOTT.

—— HORTICULTURAL CLUB.—The usual monthly dinner and conversazione took place at the Club Rooms, Hotel Windsor, on Tuesday last, and notwithstanding the counter attractions of the Chrysanthemums, there was a good attendance of the members. The chair was taken by the Rev. W. Wilks, and there were present Messrs. Shea, Selfe Leonard, Chas. E. Pearson, Alfred Pearson, George Bunyard, James H. Veitch, Geo. Nicholson, G. Massee, and the Secretary. The subject for discussion was Lilies and their diseases, which was introduced by Mr. Massee, President of the Mycological Society, who gave a most interesting and scientific description of the disease which has attacked two at least of the families of Lilies which we receive from Japan—Auratum and Speciosum—and of the experiments which have been carried out at Kew for the purpose of ascertaining the best way of fighting the disease. A cordial vote of thanks was accorded to Mr. Massee for his most interesting address.

—— Royal Horticultural Society.—The next Fruit and Floral meeting of the Royal Horticultural Society will be held on Tuesday, November 23rd, in the Drill Hall, James Street, Westminster, one to four. At three o'clock a lecture on "Horticultural Exhibitions and Schedules" will be given by Mr. John Wright, V.M.H.

—— Shirley Gardeners' Association.—The monthly meeting was held at the Parish Room, Shirley, on Monday, the 15th inst. There was a very good attendance, Mr. B. Ladhams, F.R.H.S., occupying the chair. Mr. F. Shrivell, F.L.S., Tonbridge, gave a lecture on "Chemical Manures for the Garden," and detailed the results of four years' experiments conducted by himself and Dr. Bernard Dyer.

—— Apple Trees in Bloom in Mid-November.—The unprecedented mildness of the weather has had a remarkable effect in the West of England. Strawberry plants are in many places in full bloom, and in the neighbourhood of Trowbridge, not far from the far-famed "White Horse," and under the shelter of the Wiltshire Downs, a farmer has an Apple tree which for some time past has been covered with blooms, and the fruit is now setting for a second time this year.

—— Hessle Gardeners' Society.—A meeting of the above Society was held on Tuesday, November 9th, Mr. Geo. Picker in the chair. Mr. Lyons read a very interesting paper on "The Gardener's Refuse Fire *versus* The Compost Heap." The essayist pointed out the disadvantages that are caused by the burning of garden refuse, and described the advantages gained by allowing it to remain in heaps to decompose. He also described the best mode of rendering such unsightly heaps attractive. The animated discussion that followed the essay showed that a great number of members did not hold the same views as the essayist. Owing to a Chrysanthemum show being held in the vicinity there was only a moderate attendance. A hearty vote of thanks was given to the essayist and Chairman at the termination of the meeting.—G. W. G.

—— "Indian Gardening."—On September the 15th the first issue of this gardening paper was published at Calcutta, and the six numbers received to date are now before us. The paper and type used are both of good average quality, and a perusal of the several articles, with their selection, prove much care in the editorial department. All topics relative to gardening are dealt with in a sound practical manner, and it is probable that the paper will receive a considerable amount of support. "Indian Gardening" is issued weekly. Agricultural notes and articles have also a goodly amount of space devoted to them, and will enhance the interest and widen the popularity of the journal. An advance may be seen between the first and sixth number, which augurs well for the future. We trust the promoters and managers of "Indian Gardening" will meet with unqualified success.

—— Grapes for Maidstone.—In view of the fearful calamity which has overtaken our county town, I am endeavouring to arrange for a supply of Grapes for the sufferers. Nearly 2,000 cases of typhoid have been recorded, and the distress is terrible. The struggle towards convalescence after attacks of this fever is always a long and weary one. Solid food cannot be given, no matter how keen the pangs of hunger may be. The Mayor tells me that Grapes are needed, and anyone having some to spare, if only a bunch or two, would be performing a good act by sending them. Boxes sent to the Mayor, marked "Maidstone Grape Fund," will be diverted to the proper quarter, and both railways, S.E.R. and L.C.D.R., deliver such gifts free. I would gladly send printed labels to anyone on receipt of a postcard. I may add that kind promises of assistance have already been made by several well-known horticulturists.—W. P. Wright, *Willesborough, Ashford, Kent*.

—— The Remarkably Mild Weather.—Seldom has there been such warm weather immediately preceding the end of the first half of November as there has been for the last few weeks. The natural consequence is seen in the wealth of flowers to be seen in suburban gardens. The display of Chrysanthemums in the garden of the cottage behind the post-office on Wimbledon Common was a great point of attraction to pedestrians a day or two ago; and it is notable that the "Daily Mail" on Monday printed from a gardening correspondent at Wimbledon—probably the owner of the garden in question—the following list of plants which he says are at the present time blooming in his garden:—

Myrtle	Antirrhinums	Marguerite Carnations
Fuchsias	Chrysanthemums	Everlasting Flowers
Nasturtiums	Scarlet Geranium	Auriculas
Polyanthus	Violets	Pansies
Roses	Wallflowers	Red Daisies
Mignonette	Michaelmas Daisies	Nicotiana affinis
Marigolds	Lobelias	Calliopsis Drummondi, and
Primroses	Marguerite Daisies	Vincas.

—— Gardening Appointments.—Mr. J. Dare, after ten years' service at Stancliffe, has been appointed head gardener to W. Hoare, Esq., at Iden Manor, Staplehurst. Mr. A. E. Drewett, until recently gardener at Wakehurst Place, Hayward's Heath, has been appointed head gardener to A. B. Foster, Esq., Canwell Hall, Tamworth, Staffs.

—— Violas in November.—"A Viola Lover" writes:—"At the Tamworth Show, on the 10th inst., Mr. W. Sydenham exhibited a table of Violas, which conveyed the impression that we were nearer June than November. Many beautiful new and some older varieties were seen in the best of condition. When we consider the Viola starts blooming in April and May, and continues to do so until November, we surely can claim for it a position second to none amongst hardy flowers."

—— Apples for Export.—In the Taunton district Apples have been very plentiful this year, and large quantities have been sold for exporting to Normandy. Agents purchase the crop, by the tree or by the orchard, gather, and of course pack the fruit, the bulk of it being sent by boat from Bridgwater, Burnham, and other small towns on the coast. What prices have been obtained I do not know, but, as the farmers seem quite satisfied, I should say the Apple crop, in this district at any rate, has been profitable this year.—J. E.

—— Birmingham Gardeners' Association.—At a recent meeting of this Society (Mr. Spinks in the chair) a very interesting and comprehensive paper was given by Mr. W. Gardiner on the Pæony. The essayist advocated the merits of the numerous varieties of herbaceous and tree varieties (Moutan), both as garden flowers and for cutting purposes, including also their comparatively simple requirements in a cultural point of view. Stress was laid upon the beauty and delicious fragrance possessed by many of the varieties. An interesting and instructive discussion followed.

—— Roofing Felts.—The uses to which felt may be put in the garden are extremely numerous, indeed they are so valuable as to warrant a supply being always on hand. By the aid of felt a shed may be made waterproof and the temperature raised several degrees. But it is of no use procuring felts unless those of good quality are chosen, and amongst the best are those marked with the Red Hand. From many sources we have heard excellent testimonials as to the excellence of the material bearing this trade mark, and those procuring some for any purpose will do well to order this, when they may be sure of a trustworthy article. It can be supplied by all ironmongers, who have also pamphlets containing interesting notes on the uses of felts.

—— Export of Ginseng.—From a recent number of the "Pharmaceutical Journal" it appears that in November, 1895, an ordinance was promulgated in Corea legalising the export of Ginseng. For centuries red Ginseng has been sent to Pekin by the overland embassy, the trade being a royal monopoly from which the King of Corea derived the principal portion of his revenue, the export by sea being prohibited. The annual crop is limited in quantity to about 15,000 catties, upon which an excise duty of 10 dols. a catty is charged under the new regulations, to which is added an import duty of 5 per cent. ad valorem, levied on its arrival at a treaty port in China. Under the new law the King is compensated for his loss of the Ginseng monopoly by an equivalent addition to the privy purse.

—— Open Spaces.—At the monthly meeting of the Metropolitan Public Gardens Association, 83, Lancaster Gate, W., the Earl of Meath (Chairman) presiding, a communication was read from the City Parochial Foundation, consenting to the allocation of their open space grant of £1000 to the cost of laying out Bethnal Green Parish churchyard, and to the provision of a drinking fountain therein, in accordance with the proposal of the Association made some time previously, and it was resolved to seek permission to erect a tablet in the ground, with a suitable inscription, as a record. It was also agreed to offer trees for planting in thoroughfares at Kensington, Calvert Avenue, Shoreditch and Hoxton Market, and to grant seats for South Grove, Camberwell, and De Beauvoir Square. The Chairman reported the opening of a playground in Benbow Street, Deptford, secured and laid out by the Greenwich Board of Works, and provided with ample gymnastic apparatus by the Association. Letters were read respecting the proposed acquisition for the public of Churchyard Bottom Wood, N., Pymmes Park, Edmonton, N. a part of Golder's Hill Estate, N.W., a site at Bromley, Kent, a burial-ground at Barking, E., Camberwell Churchyard, a cleared area in Islington, and a plot of land in Ratcliff. It was also decided to see whether any steps could be taken, and, if so, what the cost would be, to improve the churchyards of St. Nicholas and St. Paul's, Deptford, in order to render them more available as public gardens than at present.—("Garden.")

Chrysanthemum Shows.

As is usual at this time of the year we have received numerous ntimations of Chrysanthemum shows which are to be held during the coming season. Spaee, however, can only be found for mentioning those that have been advertised in our columns. If any have been omitted we shall be glad to add them to the following list. We append the names and addresses of the various Secretaries.

Nov. 17th and 18th.—South Shields.—B. Cowan, Harton, South Shields.
„ 17th and 18th.—Hull.—E. Harland and J. Dixon, Manor Street, Hull.
„ 17th and 18th.—Bristol.—E. G. Cooper, Mervyn Road, Bishopston, Bristol.
„ 17th and 18th.—Rugby.—W. Bryant, 8, Barby Road, Rugby.
„ 17th, 18th, and 19th.—York.—J. Lazenby, 13, Feasegate, York.
„ 18th and 19th.—Bury St. Edmunds.—G. A. Manning, "Bury Post," Abbeygate Street, Bury St. Edmunds.
„ 19th and 20th.—Bolton.—J. Hicks, Markland Hill Lane, Heaton, Bolton.
„ 25th and 26th.—Leamington Spa.—L. L. Lawrence, 76, Parade, Leamington.

National Chrysanthemum Society.

On Monday last the Floral Committee of this Society held a meeting at the Royal Aquarium, Westminster, Mr. T. Bevan occupying the chair. There was an excellent show of novelties, some good incurved varieties being staged. First-class certificates were awarded as follows:—

Master H. Tucker.—Large incurved Japanese, with broad stiff florets; deepest crimson, reverse chestnut bronze. Shown by Mr. H. Shoesmith of Woking.

Georgiana Pitcher.—Massive incurved Japanese, with broad, long, incurving and curling petals of good substance; soft yellow. From Mr. W. Wells of Earlswood.

Mdlle. Lucie Faure.—Immense incurved, with long and pointed florets, building up a flower resembling Chas. H. Curtis; creamy white. From Mr. W. J. Godfrey of Exmouth.

Ernest Cannell.—Very large incurved, of deep build, neatly incurved, florets somewhat pointed; colour buff yellow. Exhibited by Mr. R. Leadbetter, Elmstead Grange, Chislehurst.

Mrs. Geo. Carpenter.—Pretty rosy lilac Japanese, with white centre florets, fairly long, twisting and curling. Shown by Mr. Geo. Carpenter, West Hill, Byfleet.

Madame Laurence Zédé.—Large, massive incurved Japanese, with long, broad, incurved, and curving petals, slightly twisted; colour rosy lilac, white centre. From Mr. W. Wells.

Earlswood Beauty.—Large single, of good form, with long florets of good width, and neatly grooved; creamy white, yellow disc. From Mr. W. Wells.

Some other noteworthy examples received commendations. the best being Matthew Hodgson, Lady Northcote, Phillip Mann, Mrs. W. C. Egan, and Madame Ferlat. The Committee expressed the wish to see again the following:—Mabel Miller and Archie Ray. A small silver medal was awarded to Mr. W. Wells for a collection of cut flowers, and a commendation to Mr. P. Waterer for his improved name ticket-holder, for fixing in front of show boards.

Chrysanthemum nipponicum.

Although hardy, this comparatively new Japanese species of Chrysanthemum is likely, when better known, to be extensively grown as a greenhouse decorative plant. The inflorescences are after the manner of those of C. fruteseens, but quite distinct, as is the whole plant, from that species. It can be had from 1 to 2 feet in height, with a sturdy, bushy habit. The leaves are spathulate, 2½ to 3 inches long, dark green and glossy, and the margins deeply toothed on the upper half. The flowers are terminal and erect on stout stalks from every growth. They are 3 inches across, the ray florets white, with a large disc of yellow florets. It should be grown in a similar manner to ordinary decorative Chrysanthemums.

Cuttings may be inserted any time up to the end of March. They take from three to five weeks to root if given a little heat. After they are well rooted they should be potted into 5-inch pots, and when established the points should be pinched out. A further shift should be given into 7-inch pots about the end of May, ordinary Chrysanthemum soil being used. At this potting they should be stood outside. The last stopping should be given by the end of June. No staking is necessary, as the growths are all sturdy enough to support themselves. About the end of August they should be placed in a frame and allowed to come on slowly, when they will flower during October and November.—W. D.

Aquarium Show.

It has been pointed out to us that in our report of this exhibition we referred to an exhibit from Mr. Wells, Earlsfield. Of course, it should have read Earlswood, and we regret the error. We also omitted to refer to the handsome stand of horticultural sundries exhibited by Messrs. Wood & Sons, Ltd., Wood Green.

County Challenge Chrysanthemum Competitions.

I venture to return again to my old proposal ere the Chrysanthemum fever of the season expires, in favour of the establishment of county challenge competitions, because I believe these would arouse interest, especially with gentlemen, that seems, in relation to the Chrysanthemum, to be dormant. So far competition seems to be too much amongst the gardeners. A county competition would serve to put gentlemen as well as their gardeners on their mettle, and arouse interest of the most desirable kind. These interests the mere local competitions fail to excite.

Were there in each county a splendid challenge vase to be won yearly, and for the year only, how many employers but would be too proud to see such a trophy on their side boards. To prevent the vase getting into the same hands too often I would render the winner of one year ineligible to compete the next. The class should be for forty-eight blooms, sixteen to be incurved. That would be indeed the front row. Such a competition should be supplemented by six money prizes, the first being £8, and the entrance fee should be 10s. The competition should be peripatetic—that is, in various towns in the county, so that each principal society might have the benefit of the competition in turn. The local society should find one-half the prize money, and the challenge vase committee should collect the rest. Beyond this, we might in time see a grand national competition by counties in London annually, with collections of, say, 100 blooms, thus furnishing a really magnificent show.

In my own county of Surrey we have such growers as Mease, Salter, Higgs, Paddon, McLeod, Hunt, Baker, Jinks, King, and many others; and what a grand competition could thus be furnished for a county challenge vase, would all these fine growers but agree to take part in it.—A. D.

At Ipswich.

In the years that have gone by Ipswich has, perhaps, been renowned more for the Roses that are so splendidly grown in the neighbourhood thereof than for its Chrysanthemums. However, such a state of affairs could not hold good in these days, for the Chrysanthemum is grown everywhere in greater or lesser numbers. In this ancient East Anglian town and its environs there are now many devotees of the Eastern flower, and of them all none is more widely known than Mr. R. C. Notcutt of the Broughton Road Nurseries. He is not an old grower any more than he is a cultivator of several thousands of plants to produce a richly varied display, but the introduction of the lovely Edith Tabor placed him at once in the very van of growers throughout the country. It was hailed with delight, and remains still one of the most popular varieties in cultivation, for it is in all respects excellent.

If we cannot justifiably place him amongst those who cultivate Chrysanthemums on the largest scale, the quality of the blooms he exhibits at least warrant his inclusion amongst those who grow for quality in contradistinction to others whose object is apparently size at any cost The rage—and it can be called nothing else—for mere size is extremely regretable, for with its attainment are lost that grace and elegance for which Japanese varieties are so much appreciated. A reversion in favour of refinement must come sooner or later, and it is pleasant to see several of the trade growers, including Mr. Notcutt, endeavouring to divert the popular fancy into that, its rightful channel. Let us hope that the near future will see the exclusion of those immense ungainly flowers from the stands at our exhibitions, and the sooner it comes the better for the cult.

Returning to our original subject, we will proceed at once to the Broughton Road Nursery at Ipswich. The establishment is not a very large one, comprising only a few houses, which are, as a rule, light and well built, and almost all of which contain Mums. There are some that do not, being stocked with Ferns, Asparagus, Primulas, and other plants grown for decoration purposes, in which phase of gardening the firm has a wide circle of clients. The largest house—a broad span-roofed one—is devoted entirely to Chrysanthemums, the plants standing in a large central bed, the whole of which is readily inspected from the path that runs round it. There is not quite so much crowding here as is frequently the case when Chrysanthemums in pots are being staged, and if the system cause a stem or a pot to be seen, it at any rate permits of all the plants and flowers being seen with perfect ease.

In the preliminary glance round a sharp watch was kept for new varieties, in order to ascertain if the collection were up to date in this respect. We were not long in being assured that this was decidedly the case, for the major portion of the novelties were noted as being in flower. Then, too, mildew on the foliage and damping of the florets were sought, but vainly, for there was an absence of both. What we did observe were the capital leaves produced by the medium sized solid wood. Larger growths have often been seen, but none better ripened than this, and experience has proved that the strong wood is not always the best ripened, and cannot be relied upon to produce flowers of the finest quality. On these points we were soon satisfied, and then the flowers themselves were submitted to scrutiny to ascertain which were of the best in respect of colour, refinement, and freshness.

Foremost amongst the few varieties it is purposed to mention must be placed Edith Tabor, than which nothing more beautiful need be wished. The superb flowers are still unrivalled in their particular style,

despite the several newer ones now grown. That charming sport from Viviand Morel named Lady Hanham was observed in splendid form, the colour being particularly good. Madame Carnot and its yellow sister are largely grown, and of course are very conspicuous, and the same may be said of the old Edwin Molyneux Notwithstanding the fact that it has been in cultivation very many years, this is still one of the most popular varieties, while of its colour it is quite unapproachable. Two of the most beautiful yellows are Oceana and Phœbus, in each of which the colour has developed wonderfully at Ipswich. The incurved Jap Robert Powell at Broughton Road, as at many other places, has done remarkably well, and should become a great favourite.

The number of white Japanese that are possessed of more than average merit is very large, and it is difficult for one to make a selection, as some might prefer an incurved flower, while others would choose a reflexed. Madame Carnot has already been noted, and we may add to it Western King, Simplicity, Mrs. H. Weeks, Lady Byron, Madame Gustave Henry, Mrs. J. Lewis, Ponderosum, and Snowdon, each perfect in its way. Then there were such others as Modesto, Royal Standard, Hairy Wonder, A. H. Wood, Australie, Mrs. C. Orchard, Lady Ridgway, N.C.S. Jubilee, with scores of others of which no mention can be made. These must be taken as representative of the extent of the collection of Japanese varieties, and it is needless to say the section comprises the bulk of the entire collection here as at most other places nowadays.—D. R.

CHRYSANTHEMUMS IN THE NORTH.

Hyrst House, Batley.

Mr. Hurford, gardener to R. J. Critchley, Esq., has this year 350 plants in grand foliage, producing well finished and highly coloured blooms. The best of the new varieties are Mutual Friend, E. Silsbury, Lady Byron, Simplicity, Primrose League, E. Tabor, Eva Knowles, Madame Carnot, Col. T. C. Bourne, Robert Owen, Duchess of Wellington, and Phœbus

The Woodlands, Batley.

For many years Mr. J. Davis, gardener to Geo. Sheard, Esq., has held the premier position for groups at the Batley Chrysanthemum Show. On these occasions the distinctive features of Mr. Davis' arrangements are high quality of the blooms, combined with effective arrangement and finish. The plants are chiefly cultivated for this purpose, but a few incurved were also very promising. The best of the newer varieties in Japanese were M. Gustave Henry, Modesto, Mutual Friend, Simplicity, M. Demay-Taillandier, Australian Gold, Edith Tabor, Mrs. J. Lewis, Oceana, Miss Rita Schroeter, and Phœbus.

South Westmoreland.

Until last season Chrysanthemum growers in this district had received little or no recognition from the horticultural press, when, through the courtesy of Mr. W. J. Ireland, gardener to J. Wakefield, Esq., Sedgwick House, Kendal, a detailed report of the several collections appeared in the *Journal of Horticulture*. This season nothing short of an inspection would satisfy the several growers, and with this object in view Mr. Ireland met me at the Oxenholme Station to pilot me through the district. As showing the comparative mildness of the climate "Geraniums," Heliotrope, and other tender bedding plants are still blooming freely. This cannot be a bad district for Chrysanthemums was the conclusion arrived at, and it was subsequently verified by the grand flowers seen.

Sedgwick House.

Here, and all through the district, the plants are grown on the stopping system to time buds for the first crown, the autumn climate being too moist to get good results from buds secured after August. The condition of the plants in reference to the degree of ripeness, as judged by the degree of the hardness of the wood or to the contrary as a test, was an interesting study. The Japanese varieties are chiefly grown hereabouts; but the wood was far from being in a condition of ripeness which many cultivators insist upon as necessary for high-class flowers. Yet the blooms produced by Mr. Ireland would give points to many at shows with high reputations. Mr. Ireland's collection contains all the best older varieties; but it is also rich in newer ones which, without an exception, have been so well timed as to give the most satisfactory results. Mrs. H. Weeks up to now, in many places in the North, has achieved the reputation of being a bad doer; but here we find several grand flowers. Mrs. G. W. Palmer was conspicuous, as were Western King, Mrs. W. H. Lees, Pride of Exmouth, Mrs. Hume Long, Gold Dust, M. Demay-Taillandier, Miss Goschen, Mrs. Gover, Olive Oclee, Ponderosum, Lady Byron, Mrs. Briscoe-Ironside, Lady Ridgway, Oceana, Col. T. C. Bourne, Mrs. E. G. Hubbuck, Edith Tabor, W. H. Godfrey, and Madame Carnot.

Brettargh Holt.

Under the charge of Mr. McQuaker, gardener to Chas. Walker, Esq., we found a large collection of well-developed blooms. The most noticeable were Lily Love, Duchess of Wellington, Van den Heede, Thérèse Rey, Madame Carnot, W. W. Coles (very grand), Chas. Davis, Interocean, Hairy Wonder, Col. Chase, M. Panckoucke, Eva Knowles, and Madame M. Ricoud.

Levens Hall.

This, the seat of Capt. Bagot, M.P., has a reputation to antiquaries for its old oak furniture, carvings, tapestry, and ancient armour. The gardens are noted for the extent and variety of specimens of topiary work, and it seemed as if the only thing modern about this unique place is the Chrysanthemums, and here even there are no large blooms in accord with modern ideas. We found, however, two houses full of profusely flowered bush plants exceedingly creditable to the courteous gardener, Mr. W. Gibson, and equally useful for either indoor or outdoor decoration.

Eversley, Milnthorpe,

The residence of P. Argles, Esq., is within view of the famed fells of Whitbarrow, the home of the lovely Primula farinosa. To suit the tastes and requirements of the ruling powers Mr. Cookson, the gardener here, confines his efforts to the production of smaller blooms for cut flower and decorative purposes, but these are of the best quality, giving evidence of both care and skill in their production.

Dalham Towers.

This is the seat of M. Broomley Wilson, Esq., where Mr. Sarples ably presides over the extensive garden establishment. The magnificent display of Chrysanthemums, numbering over 300 plants, and filling a large early vinery, testifies to Mr. Sarples' skill as a cultivator. We noted fine examples of Ethel Addison, Australian Gold, Exmouth Yellow, Phœbus, Madame Carnot, Mrs. Hume Long, The Queen, Mrs. E. G. Hill, Colonel Chase, Miss Goschen, Pride of Exmouth, Rose Wynne, L'Isere, Philadelphia, Hairy Wonder, and Mons Chenon de Leché.

Elleray, Windermere.

As the places included in the next day's programme laid further apart, we were early on the road to beat up Mr. Henderson, gardener to A. H. Heywood, Esq. The sloping banks of Windermere are noted for fine examples of Coniferæ, and we found them in their highly developed beauty. Here again the Chrysanthemums were a rich treat, remarkable for high colour and fine proportions. Some of the specimens will find their way to the great tournament at Edinburgh, and are quite good enough to uphold Mr. Henderson's reputation as an exhibitor. The following were grand:—Mons. Chenon de Leché, Beauty of Teignmouth, Phœbus, C. Davis, Mons. Panckoucke, Rose Wynne, Niveus, Western King, Mutual Friend, Ad. Chatin, Australian Gold, Modesto, Mons. Gruyer, Simplicity, Emily Silsbury, Edith Tabor, Miss Rita Schroeter, and Owen Thomas.

Cleve House, Windermere.

Mr. T. Winskill, gardener to J. R. Sladen, Esq., has arranged in the conservatory a beautiful display, so that every bloom comes directly into view. Amongst them are many flowers which would grace an exhibition stand, and some of the finest were Mons. Gruyer, Sunstone, Simplicity, Duchess of Wellington, J. Seward, Duchess of Fife, C. H. Curtis, Madame Carnot, and International.

Dalton Hall, Burton.

Mr. Moorhouse has for upwards of twenty-five years held the position of head gardener to E. G. Hornby, Esq., at this fine place, and is looked up to by the gardeners in the district as being the oldest Chrysanthemum grower, and still one of the best. A large collection is grown, and a few well selected novelties tried each year. Duchess of York, Deuil de Jules Ferry, Mutual Friend, Australian Gold, Noces d'Or, Mrs. Hume Long, John Seward, Madame Carnot, Oceana, Olive Oclee, Lady Ridgway, Graphic, Mrs. H. Lees, Miss Rita Schroeter, and Modesto, were all worthy of note, besides a host of the older varieties.

Thornleigh Burton.

This is the residence of R. Boardman, Esq., who with his gardener, Mr. C. Ellwood, are enthusiasts in Orchid culture. At the same time Chrysanthemums are considered of importance, and are well represented. Some excellent blooms of the following were in evidence—Sunflower, Queen of England, C. H. Curtis, Niveus, Thérèse Rey, Lady Saunders, Edith Tabor, Anna Hartshorn, G. C. Schwabe, Mons. Panckoucke, Phœbus, and Louise.

As darkness now intervened, and I was due in Liverpool next morning, several places where good collections are cultivated were of necessity left unvisited. I should like to add that it is somewhat surprising that amongst so many excellent cultivators, and as results prove, where climatic influences are favourable for high development, no attempt has been yet made to establish a Chrysanthemum show in Westmoreland. The town of Kendal would be a good rallying point for such a venture, which, if carried out, would provide a new sensation, and a great treat to the district.—Yorkshire Grower.

SHOWS.

GUILDFORD.—November 9th and 10th.

Although held in the old county town of Surrey this show is not a large one; but it certainly shows first-rate quality, and that is important. A much larger hall is needed to enable the show to be fully displayed, as at present it is divided. That want Guildford Borough should meet.

There was only one exhibitor in the larger group class, and a capital one, though the plants were rather too thickly set. Foliage plants are here admitted, and with excellent effect. The exhibitor was Mr. H. Cook, gardener to the Rev. F. Poynder, Stokes Hill, Guildford. With one-third more space allotted, this group would have been a very effective one. In the smaller group class of Chrysanthemums only the first prize was taken by Messrs. Hart & Sons, nurserymen, Guildford, solidly built; Mr. Harris, gardener to Miss Thrupp, Merrow Grange, coming second; and Mr. A. Jenner, gardener to Mrs. Simpson, Guildford, was third. Table plants were numerous and good, the best six coming from

Mr. Seabrook, gardener to R. N. Stearns, Esq., Woking, Mr. Harrison being second.

The leading class in the cut bloom section was for twenty-four Japanese, and here was keen competition, Mr. H. Paddon, gardener to Colonel Ricardo, Bramley Park, taking first place with a superb lot of blooms, having of whites Simplicity, Madame Carnot, Miss Elsie Teichmann, Mrs. J. Lewis, Pride of Exmouth, Mrs. Wecks, and L'Isere; yellows—Phœbus, the champion blooms 8 inches deep; Oceana, Edith Tabor, A. H. Wood, and Australian Gold. Other colours were found in Madame Rozain, Australie, Viviand Morel, Mons. Chenon de Leché, Lady Ridgway, Lady Hanham, Dorothy Seward, President Borel, and others. Mr. C. Baker, gardener to W. Webb, Esq., Ewhurst, was second, having also very fine blooms, including Modesto, Viscountess Hambledon, Mons. Chenon de Leché, Graphic, Pride of Madford, Madame Carnot, with others. Mr. R. Turvey, gardener to Sir Richard Webster, M.P., Cranleigh, was third.

Mr. Paddon was again first with twelve Japs, having splendid blooms; Mr. Fageant, gardener to F. Wellesley, Esq., Woking, following close with capital flowers; and Mr. Baker was a good third. In the class for twelve incurved Japanese Mr. Paddon was the only competitor, having very fine Australian Gold, H. Jacotot fils, Wilfrid Marshall, Boule d'Or, Mrs. Weeks, Pride of Madford, Modesto, Australie, Madame Gustave Henry, and Joseph Brooks.

Mr. H. Barrow, gardener to Mrs. Hugorin, Bramley, was first with six Japanese, having superb blooms. With six of one variety Mr. Paddon was well first with a fine Phœbus, Mr. Turvey coming second with the same variety, and Mr. Hange, gardener to W. Major, Esq., had fine Madame Carnots.

In the class for twenty-four incurved Mr. Paddon had the field to himself, showing fine samples of C. B. Whitnall, Mrs. R. C. Kingston, C. H. Curtis, W. Tunnington, V. Tomlin, J. Agate, Robt. Cannell, Globe d'Or, and Mrs. S. Coleman. In the class for twelve blooms the same exhibitor was again first with capital flowers of great excellence, Mr. C. Baker following very close; Mr. T. Osman of Ottershaw Park coming third. In his stand C. H. Curtis was the premier bloom.

Mr. Barrow took first prize for six blooms in this section also. With six of one variety Mr. Paddon again came first with good Mrs. Heale, beating C. H. Curtis, blooms of which from Mr. Heffell, Sheire, were second, Major Bonnaffon coming third. It is very inconvenient that both Curtis and Bonnaffon should be so much alike. They should not be admitted into one stand.

Mr. Paddon still had not done winning, for he was placed first with twelve splendid Anemones, including Sir W. Raleigh, Queen Elizabeth, Mdlle. Cabrol, Minnie Chate, Delamere, and Gladys Spalding. With twelve blooms of not less than six varieties of Japanese Mr. A. A. Wheeler, Bramley, was first. There was a keen competition for twelve blooms, set up in sixes, in pairs of vases, the heaviest and fine flowers coming from Mr. Martin, gardener to Col. Tredcroft; but how the Judges made this award when the blooms were set up in flower-pots papered round it is hard to understand. On the second day the blooms had largely toppled over. Mr. J. Jones, gardener to T. Lucas, Esq., Send, was second, set up in proper vases, and on the second day these would have been placed first easily.

LEEDS.—November 9th and 10th.

Held under the management of the Leeds Paxton Society. Upwards of sixty classes, including groups, stove and greenhouse plants, table plants, and cut blooms, were keenly contested, and well filled with exhibits of a very high order of merit.

Six long tables across the Hall were filled with cut blooms, making an imposing display. The Right Hon. the Earl of Harrington, Elvaston Castle (Mr. Goodacre, gardener), was awarded the first prize for eighteen incurved, exhibiting very neat blooms of C. H. Curtis, Queen of England, Mrs. S. Coleman, Duchess of Fife, Golden Empress, Violet Tomlin, J. Doughty, Princess of Wales, Mons. R. Bahuant, Lord Alcester, Miss M. A. Haggas, Mrs. H. Flight, Leonard Payne, Globe d'Or, and J. Agate. Mrs. A. Wilson, Tranby Croft (gardener, Mr. Leadbetter), was placed second, showing good blooms of C. H. Curtis, J. Agate, and Mrs. R. C. Kingston. Mr. G. B. Cockburn, Lingdale Lodge, Birkenhead (gardener, Mr. Burden), was third. The class for twenty-four Japanese was an exceptionally strong one, the first prize falling to Mr. R. A. Bowring, The Heath, Cardiff (gardener, Mr. Joy), who showed Simplicity, John Seward, Viviand Morel, C. Davis, Duke of York, Phœbus, Australian Gold, Pride of Exmouth, Miss Elsie Teichmann, H. J. Hubbuck, Mrs. H. Kloss, Edith Tabor, Chenon de Leché, Mr. E. Tate, Mrs. G. W. Palmer, General Roberts, Etoile de Lyon, and Madame Carnot. Mr. Leadbetter was second; and Mr. J. W. Backhouse, Beverley, third.

Mr. Leadbetter secured first honours for twelve incurved with Alfred Salter, Queen of England, C. H. Curtis, Ma Perfection, J. Lambert, Empress of India, Baron Hirsch, Mr. J. Murray, and J. Agate. The local classes for cut blooms were greatly in advance of any previous show, and reflected high credit on the exhibitors. Mrs. Bowering, Allerton Hall, Gledhow (gardener, Mr. W. Moore), was placed first for a fine stand of twelve incurved, showing neat examples of J. Agate, Mrs. R. C. Kingston, C. H. Curtis, Duchess of Fife, Golden Empress, Empress of India, Perle Dauphinoise, Brookleigh Gem, J. Doughty, Robt. Petfield, and Madame Darier. Sir Jas. Kitson, Bart. Gledhow Hall (Mr. Grix, gardener), was second; and Mrs. Tetley, Foxhill, Weetwood (gardener, Mr. Eastwood), third. Mr. W. Moore again secured first prize for twelve Japanese, with good examples of Viviand Morel, Ed. Tabor, Lady Ridgway, C. Davis, Thos. Wilkins, Niveus, G. C. Schwabe, Pride of Madford, Australian Gold, Mons. Chenon de Leché, Mons. Panckoucke, Madame M. Ricoud; Mr. Grix second; Mr. Eastwood third. For cut blooms, open to members of the Leeds Paxton Society only, Mr. Moore secured first for a stand of twelve Chrysanthemums; Mr. Pratt Clark, Rodley, second; and Mr. Eastwood third.

Baskets of Chrysanthemums were most tastefully and effectively arranged. Mr. A. J. Hall, Harrogate, was first; and Messrs. Walker Bros., florists, Covered Market, Leeds, second. Messrs. Hall, Walker, Portway, and Backhouse secured prizes for Chrysanthemum bouquets, bridal bouquets, ladies' sprays, cut flowers, in the order named, with fine examples in each class.

Groups of Chrysanthemums were closely contested. Mr. Moore secured premier honours with an exceedingly neat and effective arrangement, relieved with light Palms and Grasses, and margined with Maidenhair Ferns; all pots and stakes were kept out of sight, and the plants effectively graded in height and contour. The second prize was awarded to Mr. Mason, whose arrangement was rather lighter yet very effectively arranged, and no doubt lost weight in the competition by reason of a less finished margin. Mr. Eastwood was placed third; and Mrs. Taylor, Buckingham House, Headingley (gardener, Mr. Leech), fourth.

LIVERPOOL.—November 9th and 10th.

Having described the leading class of cut blooms in last week's issue, which was won by Mr. Geo. Burden, gardener to G. B. Cockburn, Esq., Oxton, the next in importance was for eighteen incurved, this being secured by Mr. P. Greene, gardener to Thos. Gee, Esq., Allerton, with a nice even stand, the best blooms being C. H. Curtis, Mr. J. Kearn, Violet Tomlin, Robert Petfield, Queen of England, Violet Foster, and Globe d Or. Mr. Haynes, gardener to Mrs. Nicholson, Oswaldcroft, Wavertree, was an excellent second. For twelve incurved, Mr. J. Bracegirdle, gardener to W. H. Watts, Esq., Elm Hall, Wavertree, won with a splendid stand, C. H. Curtis, J. Agate, and Queen of England being capital. Mr. J. Williams, gardener to C. J. Proctor, Esq., Boscobel, won for six, the maiden class being taken by Mr. E. Foulkes, gardener to G. E. Marsden, Esq.

The Japenese section was well filled, Mr. Haynes having a handsome stand, comprising Chas. Davis, Australie, Mutual Friend, R. Dean, John Seward, Simplicity, and Lady Ridgway as the best. Mr. J. Davies, gardener to E. Ellis, Esq., Dee View, Heswall, was a close follower. Mr. J. Young, gardener to the Cheshire Lines Committee, Otterspool, was deservedly first for twelve Japanese, specially good being M. Chenon de Leché, Pride of Madford, and Dorothy Seward. Mr. J. George, gardener to Mrs. Ihler, Huyton, had bright, fresh-coloured flowers for six.

Staked and trained plants were a great improvement, Mr. T. Gowen, gardener to J. A. Bartlett, Esq., Mossley Hill, winning for four trained large flowering, one pyramid, and six untrained. Mr. J. Rose, gardener to J. G. Kitchen, Esq., Fernwood, Huyton, for three trained Pompons and one, all excellent. Mr. W. Wilson, gardener to H. Cunningham, Esq., Gateacre, won with one large flowering, also taking seconds in several other classes; and Mr. J. Harrison, gardener to Mrs. W. G. Bateson, Allerton, won with one stand, and also with a grand group of Chrysanthemums, bright and effective. Mr. Bracegirdle following was also excellent. The latter was second to Mr. Gowen for a group of Chrysanthemums and foliage plants, both exhibitors deserving much credit. A class for twelve Japanese, distinct, in 5-inch pots, one bloom on a plant, plants not to be propagated before the first week in June, was won by Mr. Wharton, gardener to J. Findlay, Esq., who also won with Pompons, the classes for Anemones and Reflexed being taken by Mr. G. Eaton, gardener to W. H. Shirley, Esq., Allerton, and Mr. W. Wilson.

Orchids made a fine display, were well flowered, but lacking somewhat in variety. Mr. E. R. Finch, gardener to J. Smith, Esq., Newstead, Wavertree, took the prizes for three and one, Mr. Bracegirdle following, both having handsome sets. The Jno. Cowan & Co., Ltd., prize for two cool house Orchids was won by Mr. Randall, gardener to A. L. Jones, Esq. Undoubtedly one of the prettiest features in the show was the class for a group of flowering and foliage plants, arranged for effect in baskets 3 feet 6 inches in diameter. The winner was Mr. Taylor, gardener to E. Pryor, Esq., Aigburth, with an arrangement which may in one word be described as a masterpiece, the others being most effective. For a vase of Chrysanthemum blooms, arranged for effect, Mr. Holford, gardener to C. Maciver, Esq., won; Mr. Haigh, gardener to W. H. Tate, Esq., Woolton, taking it for a basket arranged for effect.

The Grapes were of superb quality. Mr. Elsworthy, gardener to W. L. and R. F. Gladstone, Court Hey, Broadgreen, won for a collection of six dishes of fruit and two bunches Black Alicante, all well finished. Mr. Ferguson's Barbarossa and the two handsome Gros Colman in the prize four staged for Mrs. H. Bright, Knotty Ash, will be remembered. Messrs. Eaton and Garnett had good quality in classes for white Grapes. The principal prizewinners for Pears were Mr. Bible, gardener to Lord Trevor, and Mr. Hannagan, gardener to Thos. Comber, Esq., Chester, whilst nearly every open class for Apples was taken by that good cultivator, Mr. J. Davies, gardener to W. E. King-King, Esq., Bodenham Manor, with fruit superior in every way to American samples. Other prizewinners in local classes were Messrs. Leadbetter, J. Williams, W. Mackarell, and J. Lee.

Certificates of merit were unanimously granted to Messrs. R. P. Ker and Sons, Aigburth Nursery, for a greatly admired bank of Cyclamens in variety, a splendid feature in the show; to Messrs. Dobbie & Sons, Rothesay, for a charming collection of cut Chrysanthemums containing many fine new varieties, the blooms being of excellent quality; for a fine stand of new Giant Violets staged by Messrs. J. House & Son, Westbury, Bristol; to Mr. Winkworth, gardener to R. Brocklebank, Esq., Haughton Hall, Tarporley, Cheshire, for Black Hamburgh Grapes

taken from a Vine growing on a south wall. They were fairly large, well coloured, and flavour excellent. The same award was granted to Mr. Taylor for a splendidly bloomed plant of Viviand Morel. The silver and silver-gilt Ryecroft medals, for which the Committee are kindly indebted to Mr. H. J. Jones of Lewisham, were won by Mr. Bracegirdle and Mr. Young.

BIRMINGHAM.—November 9th, 10th, and 11th.

The thirty-seventh annual exhibition of Chrysanthemums, fruits, and vegetables of the Birmingham Society was held in Bingley Hall, under most auspicious circumstances, and proved to be the best yet held by the Society. To such an extent have the later shows increased in popularity and dimensions that the Committee has at last been compelled to seek for some other place with more accommodation than the comparatively spacious Town Hall could afford, resulting in the selection of Bingley Hall, and on the ground floor of which a bird's eye view from the surrounding gallery was obtained of the whole of the exhibition. With further characteristic enterprise the Committee commendably signalised the record reign of the Queen by increasing the number and value of the prizes, and which was further augmented by generous supporters giving various handsome cups. The total value of the prizes offered is £500, or about £200 more than on any previous occasion. It may be remarked that the whole of the vast Hall was illuminated for the occasion by the "New Intensified Gaslight" Company, and, but for which great acquisition the comparatively feeble light afforded by the old system would have proved disastrous. We are informed that upwards of 32,000 people visited the show.

To the visitors in general undoubtedly the most attractive feature in the show was the splendid and large display of "floral arrangements," occupying spaces not exceeding 20 feet by 5 feet, and Messrs. Perkins and Sons, Coventry, added lustre to their reputation by securing the coveted first prize—viz., the City of Birmingham Victorian Jubilee silver cup, value £25, for a grand display of bouquets, baskets, wreaths, and crosses. Mr. John Crook, Birmingham, carried off a silver cup, value £17 10s., as second prize, with an excellent arrangement. The third prize silver cup, value £10, was awarded to Messrs. Jones & Sons, Shrewsbury, for also a very good, though somewhat heavier arrangement; and the fourth prize silver cup, value £6, fell to Messrs. John Pope & Sons, Birmingham.

A new feature was that in the shape of a class for "collections of British grown fruit," to occupy a space not exceeding 50 square feet. There were three competitors, and the first prize, the Gardeners of Birmingham Victorian Diamond Jubilee silver cup, was taken by Mr. J. H. Goodacre, Elvaston Castle Gardens, for a fine assortment of Grapes, Pines, Oranges, Melons, Apples, and Pears, the greater variety of sorts of fruit having proved the chief factor. The second prize, a silver cup, value £10, was worthily won by Messrs. G. Bunyard & Co., Maidstone, with a grand collection of Apples and Pears, the former especially being in most cases very fine and richly coloured. The third prize exhibit was that of Mr. J. Colwell, Sidmouth, Devon.

The groups of Chrysanthemums arranged for effect in circular form in a space 16 feet in diameter, Ferns and foliage plants admissible, and of which there were seven exhibits arranged in a line, with plenty of space between and around them, proved to be a source of much interest and attraction. They were chiefly pyramidal in shape, and surmounted with specimen Palms. The first prize of £10 and the Society's Victorian Diamond Jubilee gold medal fell to Mr. Thomas, gardener to J. Whitefield, Esq., Moseley. The finely developed blooms and substantial foliage, supplemented with elegant Crotons and Palms judiciously intermixed, was much admired. The second position was accorded to Mr. G. Menzies, gardener to Richard Cadbury, Esq., Moseley, the prize being £7 and the Society's silver medal. The third prize of £5 and the Society's bronze medal was secured by Mr. W. H. Westbury, gardener to Charles Showell, Esq., Edgbaston. The fourth prize went to Mr. Oliver Brasier, gardener to Lady Martineau, Edgbaston.

There was also a keen contest in the class for groups occupying oval spaces, 10 feet by 7 feet, one exhibitor having inadvertently chosen a circular space. The first prize and a silver challenge cup, given by Mr. R. Sydenham, were won by Mr. Lewis Fewkes, gardener to T. Clayton, Esq., Castle Bromwich, with a highly creditable group. The second prize and the Society's silver medal were awarded to Mr. W. Torevall, gardener to Mrs. Scarf, King's Heath. The third prize fell to Mr. C. Batchelor, gardener to Mrs. Armfield, Edgbaston; and the fourth to Mr. E. J. Musten, gardener to A. F. Bird. Esq., Moseley. Specimen plants of Chrysanthemums were hardly up to the usual form seen at the Society's shows. Mr. Oliver Brasier, however, in the class for nine large flowering (Japanese excluded) was awarded the first prize for very good examples. The second position was assigned to Mr. J. Maldrem, gardener to George Cadbury, Esq., Northfield; and the third to Mr. J. V. Macdonald. The remaining seven smaller classes for Chrysanthemums in pots were well represented by Messrs. Brasier, A. Cryer, J. Maldrem, Macdonald, and W. Otway.

Cut blooms were one of the leading features, and the various classes were keenly contested. For twenty-four incurved, distinct, the first prize and the Society's V.D.J. gold medal fell to Mr. J. H. Goodacre, Elvaston Castle, for superb examples of the leading varieties, his best blooms being such as C. H. Curtis, Lord Alcester, Miss V. Tomlin, Mrs. S. Colman, Prince of Wales, Miss M. A. Haggas, D. B. Crane, and Madame Darier. The second prize was awarded to Mr. C. Crookes, gardener to Lady Hindlip, Droitwich. His examples of J. Agate, Major Bonnaffon, C. H. Curtis, Jeanne d'Arc, and Lord Alcester were especially good. The third prize went to Mr. J. Copson, gardener to Mrs. P. Phipps, Northampton; whilst the fourth and fifth prizes fell to Mr. W. Mease, gardener to A. Tate, Esq., Leatherhead, and Mr. R. Jones, gardener to C. A. Smith-Ryland, Esq., Warwick, respectively. For eighteen blooms of incurved, distinct, Mr. C. Crookes; Mr. J. Parker, gardener to W. Roberts, Esq., Stourbridge; and Mr. J. Gould, gardener to J. Entwistle, Esq., were the winners in the order named. For twelve incurved, distinct, the first prize fell to Mr. C. Crookes, the second to Mr. F. G. Foster, Havant, and the third to Mr. J. Copson, all having very good examples.

The Japanese section was very strongly represented, both in numbers and quality; and the premier honours fell to Mr. W. Gleeson, a new exhibitor here, from Stanmore, for a splendid collection of twenty-four blooms, distinct. His example of Simplicity attracted much attention, his other best blooms being Phœbus, Mons. Chenon de Leché, Edith Tabor, Viscountess Hambledon, Oceana, Mrs. H. Payne, and Duke of York. The second prize was secured by Mr. W. Mease, whose best blooms were Mrs. J. Lewis, Madame Carnot, E. Molyneux, Phœbus, Australian Gold, Mrs. C. Blick, Madame G. Henri, and yellow sport from Madame Carnot. The third prize fell to Mr. C. Crookes, and the fourth to Mr. C. Bellis, gardener to Sir E. H. Boughton, Ludlow. The fifth and the sixth prizes went to Mr. W. Pearce, gardener to S. Loder, Esq., Wecdon, and Mr. J. Copson.

For eighteen blooms, distinct, the first prize was well won by Mr. R. Jones, the second by Mr. F. G. Foster, and the third by Mr. H. Liney, gardener to W. M. Lowe, Esq., Wellesbourne. For twelve Mr. R. Jones was the only exhibitor, and was awarded the first prize with a fine exhibit. The competition in several other cut bloom classes was keen. Primulas and Cyclamens with hand bouquets were excellent in all respects.

Fruit was a prominent feature and deserving of special record. Grapes were strongly in evidence, and our sympathy was extended to the several non-successful exhibitors of meritorious productions. Amongst the prize-winners were Messrs. S. Bremmell, gardener to H. H. F. Hayhurst, Esq.; J. H. Goodacre; J. Jones, gardener to Mrs. Need, Malvern; T. J. Nelson, gardener to A. Barnes, Esq., Chesterfield; J. Jones; A. Chandler, gardener to A. James, Esq., Rugby; W. Harman, gardener to the Earl of Denbigh, Lutterworth; J. Lambert, gardener to the Earl of Powis, Powis Castle; and H. Russell, Worcester. Apples were exceedingly fine and numerous, while Pears were finely represented. Vegetables proved to be a fine class, and the competition very strong.

Messrs. Cutbush & Son, Highgate, exhibited (not for competition) a fine group of Begonia Gloire de Lorraine. A gold medal was awarded to Mr. W. J. Empson, gardener to Mrs. Wingfield, Ampthill, Beds, for a remarkable display of fruits and vegetables (not for competition). An exceedingly fine and interesting collection of Cacti was exhibited by Mr. F. A. Walton, The Friary, Handsworth, Birmingham.

YEOVIL.—November 10th.

This Society still retains its popularity among both exhibitors and sightseers, and another very successful exhibition was held in the Town Hall and Corn Exchange. Mr. E. H. Oakley is the Honorary Secretary, and performs his duties to the satisfaction of all concerned.

There were fewer large groups of Chrysanthemums than usual, but the quality and arrangement of those shown left little to be desired. For one of the largest size Mr. A. Crossman, gardener to J. Brutton, Esq., was well first, his front rows of miniature plants giving a good finish to the group. Mr. W. Rendle, gardener to H. S. Bennett, Esq., was a creditable second, but had evidently reserved his strength for the smaller group class, where he was a good first. Bush plants were better than usual. Mr. G. Gillingham, gardener to Miss Phelps, was first; Mr. G. Gilham, gardener to W. J. Davis, Esq., second; Mr. F. Biss, gardener to Jabez Bradford, Esq., third, and Mr. A. Crossman fourth.

All the cut bloom classes were well filled, and a fine display was made. For thirty-six blooms of Japanese varieties the first prize was £5, and six growers competed. Mr. A. Robinson, gardener to J. S. Dunn, Esq., Castle Carey, was placed first, his collection comprising grand blooms of Mutual Friend, Reine d'Angleterre, Primrose League, Australie, Silver King, J. Seward, Graphic, Duke of York, Mons. Panckoucke, Madame Rozain, Dorothy Seward, International, Phœbus, Good Gracious, Rose Wynne, Lily Love, G. Schwabe, Thérèse Rey, and Mons. Chenon de Leché. Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Langport, was a very close second, his most noteworthy blooms being Simplicity, Graphic, Souvenir de Petite Amie, Chenon de Leché, Mutual Friend, Bellem, Australie, Mons. Gruyer, E. J. Whittle, and Florence Davis. Mr. A. J. Allsopp, gardener to Viscount Portman, took the third for a good array of fresh well coloured blooms, the fourth prize going to Mr. J. Horner, gardener to A. D. Paull, Esq., Chard.

With eighteen Japanese varieties Mr. J. Lloyd was first, Mr. A. Robertson followed, while the third prize went to Mr. F. W. Pitman, gardener to F. G. Lemon, Esq., Castle Carey, all staging superior blooms of the best varieties. For twelve varieties Mr. T. J. Stone, gardener to Colonel Berkley, was first, his stand including excellent blooms of Viviand Morel, C. Davis, Edith Tabor, T. Wilkins, and Etoile de Lyon. Mr. A. Crossman was second, and Mr. H. S. Bennett third. Some of the best blooms in the show were to be seen in the classes for six blooms of one colour. Mr. A. Robertson was first for a yellow variety, showing Phœbus; and also for a white variety, with Mdlle. Thérèse Rey. In the any other class Mr. Pitman won the first prize with Mons. Chenon de Leché, the competition in each instance being keen. Liberal prizes were offered for single specimen blooms. Mr. A. Crossman was first in both the open and local classes with grand blooms of Pride of Yeovil, a nearly white refined sport from Viviand Morel, which has been repeatedly shown

successfully in previous years. Incurved varieties were not largely represented. Mr. J. Lloyd was the most successful exhibitor of these.

Fruit and vegetables were numerous and good, while trade exhibits were extensive and of marked excellence. The collection of Apples shown by Messrs. R. Veitch & Son, Exeter, was particularly good, finer fruit rarely being seen. Messrs. J. Scott & Co. also made an admirable display of fruit and Roses; and Messrs. Jarman & Co., Chard, had a representative collection of Apples and vegetables.

BOURNEMOUTH.—November 10th and 11th.

This very fashionable and popular seaside resort held its eleventh annual exhibition on the above dates at the Hotel Mont Dore Winter Gardens. The result was a splendid success. The groups were very artistically arranged, and most imposing. The cut flowers were numerous, and of high quality. The classes for decorated tables of cut Chrysanthemums, epergnes, bouquets, baskets, and the various others gave a pleasing variety, and added considerably to the interest of the exhibition. Fruits, especially Grapes, and also the vegetables, were of very high quality; and a most remarkable exhibit in this line at this time of the year was sixteen pots of Strawberries in full fruit, bearing a fine crop of large ripe fruit, reminding one of April or May, instead of November. These were exhibited, not for competition, by Mr. Woodford, gardener to Mrs. Trevor Goff, Everton Grange, and the varieties were Noble and Royal Sovereign.

The leading prize for cut blooms was for thirty-six Japanese, not more than two of any one variety, and here her Majesty the Queen, Osborne, Isle of Wight (gardener, Mr. G. Nobbs), scored a popular victory with a fine stand of fresh bright flowers of good substance, consisting of the following varieties:—Edith Tabor (2), fine; Hairy Wonder (2), very fine; Chas. Davis (2), Phœbus (2), Etoile de Lyon (2), James Bidencope, Viviand Morel (2), Simplicity, L'Isere (2), Mrs. C. Blick, Mrs. C. H. Payne, Reine d'Angleterre (2), Madame Carnot, M. Chenon de Leché (2), fine; Amiral Avellan, Mrs. E. W. Clarke, Mrs. W. H. Lees, Australie (2), very large; Silver King, Mdlle. Thérèse Rey, Mrs. H. T. Drewett, Baron A. Rothschild, Mons. Panckoucke, Occana, fine; Graphic, and W. T. Newett. Mr. Thos. Wilkins, gardener to Lady Theodora Guest, Blandford, was second with an excellent lot of blooms; and Mr. D. Brown, gardener to Mrs. Atkyns Wood, Kinton House, Christchurch, third. So good were the exhibits in this class that extra prizes were awarded to Mr. Woodford, gardener to Mrs. Trevor Goff; and Mr. T. Boote, gardener to Mrs. F. Ricardo.

In the class for twelve Japanese Mr. Thomas Wilkins was to the front with fine Mrs. Hermann Kloss, Pride of Exmouth, Yellow Madame Carnot, Beauty of Exmouth, Eva Knowles, Mutual Friend, Modesto, Viviand Morel, Duke of York, Mrs. R. Jones, International, and Etoile de Lyon; Mr. Woodford, second; Mr. G. Nobbs, third. Two extra prizes were also awarded in this class. The premier Japanese bloom in the exhibition was found in a stand in this class, exhibited by Mr. H. J. Harvey, gardener to A. R. Sheriden, Esq., Hampton Court, Dorset, a very fine Australian Gold, which received the prize. For six Japs, any one variety, Mr. Harvey was first with Madame Carnot; Mr. W. J. Grace, gardener to W. R. Neave, Esq., Fordingbridge, second, with Phœbus; and Mr. Nobbs third, with Mdlle. Marie Hoste. For six Japs in a vase Mr. J. K. Ingram, Parkstone, was first with fine Australian Gold; Mr. A. H. Newell, gardener to W. Petch, Esq., second, with Thos. Wilkins; third, Mr. L. J. Newell, gardener to W. H. Dove, Esq., Branksome Tower Hotel, with Madame Carnot.

There were some very highly finished stands of incurved exhibited. In the class for twelve, distinct, Mr. Woodford was well to the front with Violet Tomlin, Lucy Kendall, Princess of Wales, Queen of England, Golden Queen, Prince Alfred, and others. Second, Mr. T. Boote. Third, Mr. T. Wilkins. For six of any one incurved Mr. W. J. Grace was well first with deep and highly coloured flowers of Mrs. R. C. Kingston, one of which, an extra deep flower, was awarded the prize for the premier incurved bloom in the exhibition. Second, Mr. Gallop, gardener to H. M. Middleton, Esq., Dorchester, with Chas. Curtis. Third, Mr. Harvey, with Ma Perfection. The various classes devoted to amateurs and the local divisions were exceedingly well filled, and the exhibits were very meritorious.

In the class for a group of Chrysanthemums and foliage plants, arranged in a space of 100 square feet, Messrs. G. Watts & Sons, Bournemouth, put up a tasteful arrangement; second, Mr. H. Haskins, Branksome, for a very pretty exhibit. The N.C.S. certificate of merit and the Society's medal was awarded to this first prize group.

The competition for a 50 feet group of Chrysanthemums, for which a silver challenge cup is offered, was well contested by three very even exhibits, Mr. Newell, gardener to W. H. Dove, Esq., Branksome Tower Hotel, winning by very superior and fresh flowers, well blended and arranged. The second and third gave some difficulty. It was quality versus effect, and as the two Judges were divided, two others that were officiating were asked, and as they were also divided, it was decided to give them an equal second, so close were they considered to be. Mr. C. W. Barrett, gardener to G. J. Fenwick, Esq., Bournemouth, had the brightest and dwarfest arrangement. The smaller groups of 40 feet helped very materially towards the exhibition, one side of the Hall being devoted to them. The first prize, silver medal and money prize, was won by Mr. G. Shave, gardener to W. W. Moore, Esq., Bournemouth; second, Mr. W. F. Machin; third, Rev. H. Burrows; fourth, Mr. W. Hoare.

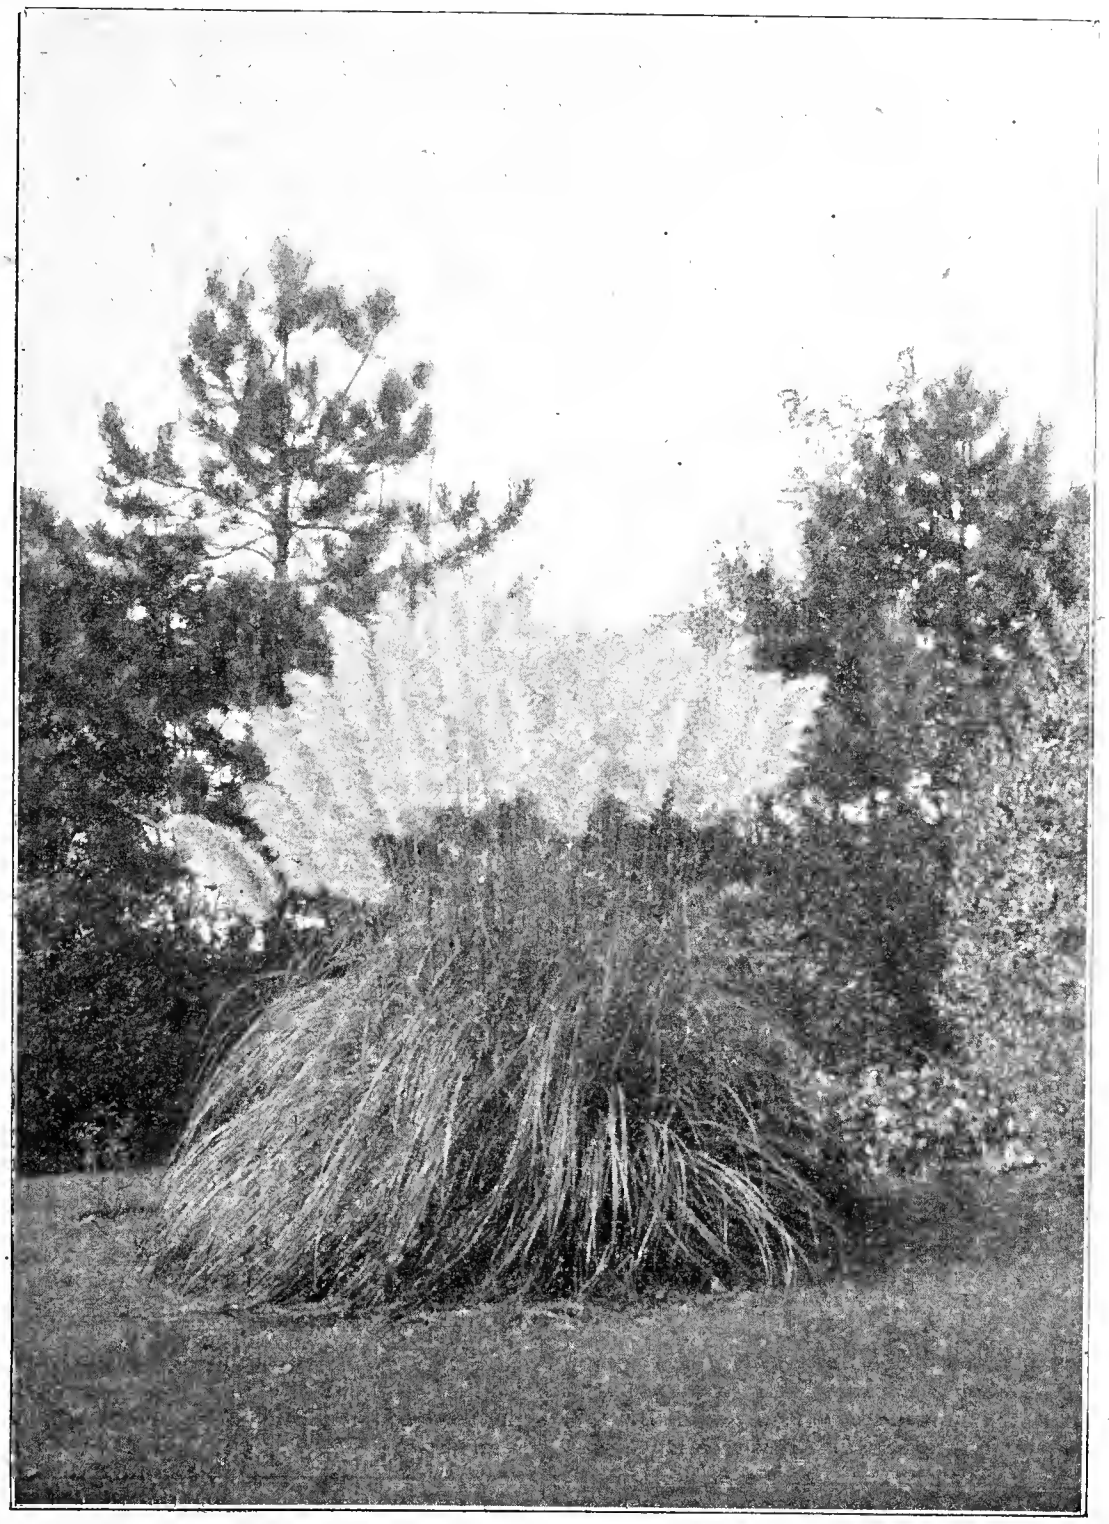

Fig. 72.—Pampas Grass in Macrocarpa, Ventnor. (*See page* 474.)

The exhibits in the specimen plant classes were mostly bush specimens and cut-backs, W. H. Lincoln, Chas. Davis, Florence Davis, and Viviand Morel being the best varieties; and Mr. G. Eldridge, Mr. Chas. Barrett, Mr. W. H. Dove, and Mr. C. W. Barrett winning the chief prizes. Worthy of mention were the tables of cut blooms on stems with foliage on a space 5 feet by 4 feet, to illustrate the decorative value of the Chrysanthemum. Mr. W. W. Moore was first with fine blooms, arranged with light Palms; Mr. G. J. Fenwick second; Mr. W. H. Dove third. For a similar sized table, showing the different sections of Chrysanthemums, Mr. W. W. Moore was again first; Mr. J. S. Sellon second; Mr. Chas. Barrett third.

BROMLEY.—November 10th and 11th.

The sixteenth annual show of the Bromley District Chrysanthemum Society was held in the Grand Hall, Bromley, and was the best show the Society has held, both in the number of exhibits and the quality of the blooms.

The chief interest was in the cup class for twenty-four Japanese, distinct, and twenty-four incurved, not less than eighteen varieties nor more than two of one variety. Six competitors entered, Mr. Harvey, gardener to R. B. Martin, Esq., Chislehurst, being placed first with a very heavy stand, composed of the following:—Japs: Prefet Robert, Mrs. C. Blick, Madame M. Ricoud, Phœbus, M. Chenon de Leché, Miss D. Shea, good; C. Davis, V. Morel, W. Fyfe, Madame Carnot, La Colosse Grenobloise, Australie, Mutual Friend, Mons. G. Biron, International, Mons. Gruyer, The Graphic, M. Demay-Taillandier, Lady Hanham, Etoile de Lyon, Elsie Teichmann, and G. C. Schwabe. Incurved: C. Curtis, Queen of England (2), Mrs. Coleman, Lord Alcester, W. Tunnington, Mrs. Heale, Mrs. R. C. Kingston, Golden Empress (2), Mrs. J. Eadie, good colour; Duchess of Fife, J. Doughty (2), Mrs. J. Kearn, Major Bonnaffon, J. Lambert, Miss Haggas, Empress of India, Princess of Wales, Bonnie Dundee, Mrs. R. King, Jeanne d'Arc, and R Cannell; Mr. C. Payne, gardener to C. J. Whittington, Esq., last year's winner, being second; Mr. R. Leadbetter, gardener to A. G. Hubbuck, Esq., Chislehurst, third, and Mr. E. Dove, gardener to C. B. Fry, Esq., Bickley Hall, fourth.

For twelve Japs and twelve incurved, distinct, Mr. J. Lyne, gardener to H. F. Tiarks, Esq., Chislehurst, was first with the following Japs:—Mons. G. Henry, M. Panckoucke, Mrs. H. T. Drewett, Mr. G. Warren, Mrs. C. Blick, M. Hodgson, Mrs. H. Weeks, Duke of York, Miss E. Teichmann, Phœbus, M. Carnot, V. Morel. Incurved: Mrs. R. C. Kingston, J. Lambert, Mrs. Coleman, Duchess of Fife, Major Bonnaffon, J. d'Arc, C. Curtis, J. Agate, Violet Tomlin, Mr. J. Kearn, M. Desblanc, Princess of Wales. Mr. H. Redden, gardener to G. W. Bird, Esq., West Wickham, was second. For twenty-four Japs, distinct, Mr. C. Blick, gardener to Martin R. Smith, Esq., Hayes, was first with a very even stand. Mr. J. Blackburn, gardener to J. Scott, jun., Esq., Elmstead, Chislehurst, was second; and Mr. E. Mills, gardener to F. Lloyd, Esq., Coombe House, Croydon, third. For six Japs, six incurved, and six reflexed, Mr. W. Thomas, gardener to J. Greig, Esq., Chislehurst, was first, being closely run by Mr. Lyne, second; and Mr. W. Pascoe, gardener to Capt. Torrens, Hayes, third.

For twelve incurved, distinct, there were ten competitors. Mr. Prebble, gardener to M. Hodgson, Esq., Shirley, took first with C. Curtis, Baron Hirsch, D. B. Crane, J. d'Arc, Miss Haggas, Brookleigh Gem, W. Tunnington, Violet Tomlin, Bonnie Dundee, Duchess of Fife, Globe d'Or, Lord Alcester. Mr. Lyne was second, and Mr. Harvey third. For six incurved there was again keen competition. Mr. Harvey was first; Mr. G. B. Lees, gardener to R. de Quincy, Esq., Oakwood, Chislehurst, was second, and Mr. Mills third.

For twelve Japs, distinct, the stands were all very close in point of merit, Mr. Mills eventually taking first place. The blooms were Madame Carnot, C. Davis, Phœbus, G. Warren, Prefet Robert, Swanley Giant, Australie, Hairy Wonder, M. Chenon de Leché, M. Panckoucke, V. Morel, and Louise, a massive bloom; Mr. Blick was second, and Mr. Pascoe third. For six Japs, distinct, Mr. Blick was first; Mr. Budworth, gardener to F. G. Powell, Esq., Swanley, second; and Mr. Mills third. For six Anemones Mr. E. Stone, gardener to C. D. Clark, Esq., Hayes Lane, was first with Lady Margaret, M. Panckoucke, Junon Descartes, Queen Elizabeth, and John Bunyan; Mr. Lyne second, and Mr. Pascoe third. For twelve Pompons, Mr. Pascoe was first, and Mr. Dyer, gardener to T. Peacock, Esq., Croydon, second, there being only two competitors.

For six incurved, one variety, Mr. Harvey was first with Queen of England, very even, well-finished blooms; Mr. Payne second with Princess of Wales; Mr. Lyne third with C. Curtis; Mr. Brister an extra with the same variety. For six Japs, one variety, Mr. Redder was first with Madame Carnot, grand deep blooms; Mr. Blick second with Phœbus; Mr. C. Jordan, gardener to H. Hoskier, Esq., Hayes, third with Madame Carnot.

For a group of Chrysanthemums, arranged for effect, three groups were put up; each one was worthy of a first prize, the individual blooms in each were well grown, and fit to show on a board. Mr. Brister, gardener to F. Charlesworth, Esq., Bickley, was first; Mr. E. Dove was second; and Mr. Lyne third.

The plant, fruit, and vegetable classes, as well as the amateur and cottagers' sections, were well filled, as were also the classes for table decorations. The Bromley Society is to be congratulated, this being the best show held under its auspices; that the efforts of the Committee and Secretary were appreciated by the public was amply proved by the crowded hall on both evenings. A record was established for admission.

DONCASTER.—November 10th and 11th.

The annual show of this Society was held in the Corn Exchange, when the beauties of the interior of the building were further enhanced by the array of groups of Chrysanthemums. The premier Japanese bloom in the show was staged by J. D. Ellis, Esq., Worksop (gardener, Mr. J. Alderman), a grand bloom, Mons. Chenon de Leché. The same gentleman was first for twelve Japanese. Second, R. S. Schofield, Esq., Sand Hill, Howden (gardener, Mr. Brown). Third, the Countess Rosse, Wormersley Park (gardener, Mr. A. Brookes).

For twelve incurved varieties (not less than nine distinct) Mr. Alderman was again first, including two grand Duchess of Fife; Identity, Jeanne d'Arc, and Queen of England being also good; second, the Countess Rosse; third, Mr. Keywood, gardener to W. H. B. Wrightson, Esq. For twelve Japanese varieties (not less than eight distinct) Mr. Alderman was again to the fore with grand Edith Tabor, Australie, Mrs. E. G. Hill, and Western King; second, Countess of Rosse; third, C. H. Simpson, Esq., Moor Top House, Ackworth (gardener, Mr. T. Kitchell).

The following were open to the district only. For six distinct Anemone flowered Mr. D. Cheetham, gardener to Mrs. E. Crawshaw, Warmsworth, was first, and Mr. Keywood second. For six incurved, dissimilar, Mr. Butcher, gardener to W. Chadwick, Esq., outdistanced Mr. West, gardener to Sir W. Cooke, Bart. W. Chadwick, Esq., managed to get the first award for twelve incurved varieties, nine dissimilar, though he was well followed by Mr. West; third, Mr. Keywood. For six Japanese, incurved, C. W. Blagden, Esq., of Hill House, Doncaster, secured the first award; second, Sir William Cooke; third, Mrs. E. Crawshaw. In the class for twelve Japanese blooms, nine dissimilar, W. B. Wrightson, Esq., C. W. Blagden, Esq., and Sir Wm. Cooke were awarded the prizes in order given.

For groups of Chrysanthemums there were three competitors:—First, Mr. Butcher; second, Mr. Keywood; third, Mr. Wenman. Mr. Hill, gardener to Mr. Morris at Beechfield, was well first for his miscellaneous group. The show was well attended.

FROME.—November 11th.

This exhibition of Chrysanthemums and fruit was a considerable advance on either of its predecessors, and, all things considered, it is doubtful if a more generally attractive display has been made in the south-western counties this season.

Two magnificent circular banks of plants were arranged, not for competition, by Mr. J. Trollope, gardener to the Marquis of Bath, Longleat, and Mr. Young, gardener to the Earl of Cork, Marston House, Frome, and round the sides of the large Market Hall in which the show was held were no less than eight other groups competing for prizes. In the nurserymen's class for groups the Frome Flower and Fruit Co. was easily first, the second prize going to Messrs. J. Cray & Son, Frome. Gentlemen's gardeners only were allowed to compete in another class for groups, and in this instance Mr. A. Curry, gardener to C. Baily, Esq., was well first, his arrangement of superior Chrysanthemums and other plants meeting with unstinted praise. Mr. W. Cutter, gardener to Mrs. Le Gros, also had a good group, and was second, the third prize going to Mr. Burston, gardener to Mrs. Graham, for an arrangement very slightly inferior to that preferred to it. Mr. Curry; Mr. Carpenter, gardener to A. R. Baily, Esq.; Mr. Phillips, gardener to Mrs. Baily, and the Frome Flower and Fruit Co. were the most successful competitors in the various other plant classes.

A silver cup, value £5, was offered as the first prize for the best twenty-four cut blooms of Japanese Chrysanthemums, and this attracted entries from six of the leading West of England growers. To Mr. Robinson, gardener to Lord Ludlow, Westbury, was awarded the cup, for among others grand blooms of Madame Carnot, G. J. Warren, Primrose League, A. H. Wood, Sunstone, Silver King, Chenon de Leché, Viviand Morel, C. Davis, M. Hoste, Mrs. J. Lewis, Hairy Wonder, and Edith Tabor. Mr. A. Robertson, gardener to J. S. Donne, Esq., Castle Carey, was a good second, and Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., a close third.

For twelve blooms the Somerset Fruit Co. was first, Mr. A. Carpenter second, and the Frome Flower and Fruit Co. third. The best stand of twelve incurved blooms was shown by Mr. J. Lloyd; Messrs. Robinson, Carpenter, and the Somerset Fruit Co. also gaining prizes with incurved varieties. Baskets of autumn foliage and berries, bouquets, and table decorations were excellent.

LINCOLN.—November 11th.

An extremely beautiful show of Chrysanthemums, plants, and fruit, held under the auspices of the Chrysanthemum Society, was opened in the Drill Hall, Lincoln, on the above date, by Mrs. C. H. Seely. It may be that there have been larger and more extensive shows in previous years, but for variety and interest there has perhaps been none to excel the present one. The cut blooms especially were extraordinary, both in regard to size and richness of colour, a circumstance for which the fine weather of the present month is responsible, the sunshine of October being very favourable for the development of the blooms. The best incurved bloom in the show was a handsome specimen of Charles Curtis, shown by Mr. N. C. Cockburn; and the best Japanese one of the variety known as Pride of Madford, shown by Mr. C. E. Marfleet. No little interest, says the "Lincolnshire Echo," was taken in a chaste ivory white bloom named Mrs. Charles Hilton Seely, and there were several of the hirsute type introduced from America a few years ago. The show of groups was not a particularly large one, though the square one arranged by Mr. Illman, the only one in its class, contained some very choice plants, and was arranged with extreme taste. A new feature were the drawing-room groups, with a mirror as a background, and this attracted very strong competition; a very artistic group, shown by Mr. N. C. Cockburn, taking first honours. There was a very fine display of fruit.

The chief open class in the cut bloom section was for twenty-four incurved, in not less than twelve varieties. The first position was taken by Mr. A. Wipf, gardener to N. C. Cockburn, Esq., Hartsholme Hall, Lincoln, who exhibited a handsome stand. The varieties comprised J. Agate, C. H. Curtis, Mrs. R. Kingston, Golden Queen, Duchess of Fife, Madame Darier, Mrs. Heale, Queen of England, Prince Alfred, Lord Wolseley, Princess of Wales, Violet Tomlin, Empress of India, Mrs. Coleman, Lucy Kendall, Miss M. A. Haggas, and Brookleigh Gem. The second prize was taken by Mr. F. Thornton, gardener to C. E. Marfleet, Esq., Boothby Hall.

For twenty-four Japanese, distinct, the competition was keen, and some superb blooms were staged. The first prize was deservedly taken by Mr. F. Thornton, who was followed by Mr. A. Wipf and S. Kelsey, Esq. The premier stand contained charming examples of Australian Gold, Reine d'Angleterre, Phœbus, Pride of Madford, Lady Byron, Viviand Morel, Eva Knowles, Mrs. C. Harman Payne, Van den Hcede, Madame M. Ricoud, Australie, Thos. Wilkins, Modesto, Dorothy Seward, Charles Davis, Etoile de Lyon, Edith Tabor, Eda Prass, Commandant Blusset, Mons. Chenon de Leché, Louise, Miss Rita Schroeter, and Lady Dorothy.

In some of the other classes the prizes were awarded as follows :—Twelve blooms, incurved, distinct.—First, Mr. N. C. Cockburn ; second, Mr. G. Bainbridge. Twelve blooms, Japanese, distinct First, Mr. N. C. Cockburn. Twelve blooms, reflexed, not less than nine varieties.—First, Mr. N. C. Cockburn. Twelve Anemones, distinct.—First, Mr. N. C. Cockburn. Twelve Pompons, distinct.—First, Mr. N. C. Cockburn ; second, Mr. C. E. Marfleet. Single Chrysanthemums, twelve bunches, in not less than six varieties.—First, Mr. N. C. Cockburn ; second, Mr. C. E. Marfleet ; third, Mr. A. Shuttleworth. Six blooms, incurved, distinct.—Third, Mr. W. Cooper. Six blooms, Japanese, distinct.—First, Mr. A. Shuttleworth ; second, Mr. F. Mottershall ; third, Mr. W. Cooper. Six blooms, Japanese, one variety.—First, Mr. N. C. Cockburn. Six blooms, incurved, one variety.—First, Mr. N. C. Cockburn ; second, Mr. G. Bainbridge. Six blooms, hairy variety.—Second, Mr. N. C. Cockburn. Hand bouquet, composed of Chrysanthemums only and any kind of foliage.—First, Mr. J. Illman ; second, Mr. A. Shuttleworth ; third, Miss Foster. Dessert table.—First, Mrs. Illman ; second, Miss Foster. Group of Chrysanthemums and other plants, arranged for effect in a square.—First, Mr. J. Illman. Group of Chrysanthemums and green foliage plants, arranged for effect in a semicircle.—First, Mr. N. C. Cockburn ; second, Mr. J. Illman. Twelve cut back Chrysanthemums, distinct.—First, Mr. N. C. Cockburn ; second, Mr. A. Shuttleworth. Table of bouquets, wreaths, sprays, buttonholes, illustrating decorative value of Chrysanthemums.—First, Mrs. Illman. Drawing-room, mirror, or panel group of Chrysanthemums, with foliage plants, arranged for effect.—First, Mr. N. C. Cockburn ; second, Mr. J. Illman ; third, Mr. A. Shuttleworth.

WESTON-SUPER-MARE.—November 11th.

The Chrysanthemum shows held at Weston-super-Mare have hitherto been noted for the number and excellence of the specimen plants on view, but on the occasion under notice there was a great falling off in this department. Only Messrs. W. Brooks & Son competed in the five classes provided for trained plants, and these well-known growers took a first prize in four instances. With untrained plants there was fairly good competition. The successful exhibitors were Messrs. Pope, gardener to T. Mullins, Esq. ; F. Williams, gardener to Reginald Cox, Esq. ; and W. Summerhayes, gardener to H. Pethick, Esq.

Groups of Chrysanthemums, occupying a space of 50 square feet, showed a great improvement on anything of the kind attempted in previous years. There were six competitors. Mr. J. Brooks, gardener to W. M Appleton, Esq., was well first, his arrangement of perfectly flowered plants being most effective. Mr. W. Summerhayes was a creditable second, Mr. F. Williams a close third, and an extra prize was awarded to Mr. S. M. Jones, gardener to Miss Baker.

Cut blooms proved a great attraction to the visitors who thronged the Victoria Hall, where these shows are held. Every class was well filled, and the competition was extremely close. For twenty-four incurved varieties, Mr. J. Bishop, gardener to H. E. Murray Anderson, Esq., Taunton, was first, his blooms of Miss Haggas, Violet Tomlin, Brookleigh Gem, Globe d'Or, Queen of England, C. H. Curtis, R. Petfield, Lady Dorothy, John Lambert, Princess of Wales, and Major Bonnaffon being remarkably good. Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Langport, was second, and Mr. W. Strugnell, gardener to W. H. Long, Esq., M.P., Trowbridge, third. For twelve incurved, Dr. J. H. Sharpe, Huntspill, was easily first, his stand containing superior blooms of Harold Wells, R. C. Kingston, Princess of Wales, and C. H. Curtis. The veteran quarryman, Mr. J. Baylis, Winterbourne, was second, in his stand a bloom of C. H. Curtis was singled out as being the premier bloom of incurved variety in the show. Mr. Sutton, gardener to W. A. Todd, Esq., Stoke Bishop, was first for six varieties.

There were five competitors with twenty-four Japanese varieties, only a very few points dividing them. The first prize was awarded to Mr. J. Lloyd, whose best blooms were of Phœbus, Madame Ricoud, Rose Wynne, Duke of York, J. Seward, Etoile de Lyon, Mons. C. H. Payne, General Roberts, Khama, Edith Tabor, Souvenir de Petite Amie, International, Madame Calvat, and Mons. Gruyer. Mr. G. Drake, Cardiff, was second, and Mr. G. Horner, gardener to A. D. Paull, Esq., Taunton, was a good third. The competition with twelve varieties was equally keen. Mr. W. Strugnell was first, having fine, fresh blooms of Mons. J. Allemand, Modesto, Australian Gold, Helen Owen, Mutual Friend, Rev. G. S. Scott, and Golden Gate. Mr. G. Sutton was second, and Mr. W. H. Payne, gardener to Charles Wells, Esq., Stoke Bishop, third. The first prize for six varieties went to Mr. J. Marshall, gardener to J. Dole, Esq., Redlands, Bristol, for exceptionally fine blooms of Madame Carnot, Viviand Morel, Edith Tabor, Australie, W. H. Lees, and Colonel Smith.

MONMOUTH.—November 11th and 12th.

After a lapse of six years this show has been revived, and the success which has attended its resuscitation points only too clearly to the fact that such an exhibition is a necessity in an horticultural district such as surrounds Monmouth, and that a possible mistake had been made in allowing it to remain in abeyance so long. In the early spring a strong Committee was formed, with Lord Llangattock as President, and Mr. F. C. Williams as Hon. Sec., to draw up a schedule and make other necessary orgauising arrangements for an exhibition in the autumn, and how well the Committee has achieved its object is only too obvious by the excellent horticultural show which has been held in the Rolls Hall on Wednesday and Thursday. The schedule comprised no less than 106 classes, embracing competitions for Chrysanthemums, pot plants, and cut blooms, for professional gardeners and amateurs, pot plants of various flowering and decorative varieties, cut flowers, fruit and vegetables for both professionals and cottage garden holders, and for these no less than 500 entries were received. The exhibits were systematically arranged in various parts of the hall. The centre portion was occupied by an immense combination table for the cut blooms, plants, decorative exhibits, whilst around the room were arranged the groups. The fruit was with advantage exhibited in the proscenium, and the vegetables and a few of the flowers were located in the corridor and on the stage, the cottage exhibits, as formerly, being quartered in the gallery.

To adequately describe in detail the exhibits is obviously too great a task to attempt in this notice, and we must content ourselves with merely a general survey. On the whole the show is a distinct improvement as regards the quality of the exhibits, and although some of the group classes were necessarily curtailed from want of space, the quantity had not appreciably decreased. Commencing with the open classes of the Chrysanthemum groups (60 feet), there were three entries. Mr. G. Phillips, the gardener at Wyastone Leys, was easy first with a magnificent collection attractively grouped. Mr. C. M. Crompton-Roberts obtained second place.

In most of the classes of the cut blooms there was keen competition. In the twenty-four incurved specimens Mr. John Lockyer took first honours, his collection including splendid specimens of C. H. Curtis, Lord Alcester, Madame Darier, and Duchess of Fife. Mr. Henry Pitt's best blooms in his second prize collection were C. H. Curtis and Empress of India, whilst in Mr. G. Phillips' stand a fine Globe d'Or stood out prominently. The twelve incurved brought six competitors forward, and the blooms were equally good. Mr. A. Knowles of Newent took first, and we noticed on his board splendid specimens of R. Cannell, C. H. Curtis, and Duchess of Fife. Mr. Bayford of Glewstone Court took second, in which a fine Globe d'Or figured conspicuously. Mr. Louis Gueret of Chepstow came third with a collection including a C. B. Whitnall, Lord Wolseley, and Hero of Stoke Newington.

The Japanese were remarkably fine classes. In the twenty-four varieties seven competed. Mr. John Lockyer, gardener to Mr. J. C. Hanbury, Pontypool Park, took first, and also secured the gold medal offered by With's Chemical Manure Company. His collection included specimens of Mutual Friend, Amiral Avellan, Dorothy Shea, and Duke of York. The second was taken by Mr. A. W. G. Wright of Linton, in whose collection were Madame Carnot, Oceana, and a beautiful white Simplicity. Mr. Gueret also secured third position here, and his chief blooms were Wilfred Marshall, Mutual Friend, and Madame Carnot. The twelve varieties also had seven competitors. Mr. Bayford had a splendid assortment. Captain Hoopgood of Ross was a close second. In the reflexed and Anemones no entries were received. In the baskets of Chrysanthemums two entries were catalogued. Mr. Hill securing first with a nicely arranged assortment, the second of Mr. W. Luton, Hilston Park, being too closely packed to make an effective display.

Considerable additional attractiveness was bestowed on the show by the magnificent non-competitive exhibits. First and foremost was the splendid collection of flowering and foliage plants sent by the President, and arranged by his gardener, Mr. T. Coomber. A background was provided by Chrysanthemums, Palms, and Dracænas, then came a line of white Eucharis amazonica, whilst in the foreground were Cattleyas, dwarf Chrysanthemums, Cypripediums, and Pandanus Veitchi, the whole edged with Maidenhair Fern. Mr. E. Watkins had a pretty group arranged on the stage steps, which included Palms, Heaths, Bouvardias, and foliage plants, also a very artistically made wreath. Messrs. Pillinger & Co. had a collection of Chrysanthemums, foliage plants, Heaths, Palms, and Ferns, located in the vestibule. The exhibition of fruit by Mr. John Basham, F.R.H.S., Bassaleg, near Newport, was exceptionally fine, and included a number of dwarf Apple trees in pot bearing fruit.—("Monmouthshire Beacon.")

WINCHESTER.—November 11th and 12th.

One of the most compact and meritorious autumn exhibitions of Chrysanthemums and other produce seen in the provinces is that held by the Horticultural Society of this ancient city. The Guildhall is the site chosen, and a capital one it is, being commodious, light, and easily accessible. Mr. Chaloner Shenton is a hardworking methodical Hon. Secretary, ably assisted by a practical Committee, of which Mr. F. W. Flight is Chairman. In such hands all the details of a really fine show were carried out without any hitch.

Cut blooms were extensively shown, and demand a premier notice. The most important class was that for forty-eight, half incurved, the remainder Japanese. Along with the challenge cup offered as the leading prize the sum of £7 was given. Four competed, making a good display. Mr. W. G. Adams, 89, Clarendon Road, Southsea, secured the premier position with perhaps the finest stand of incurved blooms seen this year, for with two exceptions every bloom was as near perfection as is possible to have them. The varieties were—Duchess of Fife (2), Golden Queen of England (2), Lord Alcester (2), W. Tunnington, Ma

Perfection, Mrs. R. C. Kingston, Charles Curtis, Alfred Salter, Major Bonnaffon (2), J. Agate, Miss D. Foster (2), Empress of India (2), Mr. J. Kearn, Lord Rosebery, Mrs. S. Coleman, C. B. Whitnall, Queen of England, and George Haigh. The Japanese were of medium size, bright, and well staged—Phœbus (2), International, Australian Gold, Madame Carnot, Pride of Madford, Charles Davis (2), J. Seward, Australie (2), James Bidencope, Viscountess Hambledon, Mons. R. Dean (2), G. J. Warren, General Roberts, Mutual Friend, Edith Tabor, Chenon de Leché (2), Modesto, Viviand Morel, and Thos. Wilkins. Mr. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, was a good second; and Mr. J. Agate, Havant, third.

In the class for twenty-four Japanese the competition was keen. The premier award was made in favour of Mr. J. Bowerman, gardener to C. Hoare, Esq., Hackwood Park, Basingstoke, for a remarkably good collection. The varieties were Mrs. J. Lewis, Australie, Madame Carnot, Thos. Wilkins, Duke of York, Phœbus, Mrs. W. H. Lees, Edith Tabor, Chenon de Leché, Viviand Morel (fine), G. C. Schwabe, Oceana, C. Davis, Mrs. H. Weeks, J. Seward, Mons. R. Dean, Mrs. Carpenter, Mons. Gruyer, and Miss Elsie Teichmann. Mr. R. West, gardener to H. J. Wigram, Esq., Northlands, Salisbury, second; and Messrs. Elcombe & Sons, Romsey, third.

Mr. Adams was again successful in the class for twelve incurved, distinct, and also for half a dozen in two varieties, with blooms similar to those in the leading class; Mr. Neville, a creditable second in both classes. Mr. G. Best, gardener to F. D. Leyland, Esq., The Vine, Basingstoke, secured the leading award for twelve Japanese, staging worthy examples, the best being Viviand Morel, Mrs. Weeks, Edith Tabor, and International; Mr. West a close second. A most interesting class was that for twelve Japanese, white, in four varieties. No less than nine competed, making an imposing display. Mr. Neville was decidedly in front of his opponents with a most meritorious exhibit of Madame Carnot, Mrs. C. Blick, Niveus, and M. Gustave Henry, all of the finest quality; Mr. G. Street, gardener to the Rev. Dr. Fearon, The College, Winchester, second; Mr. J. Agate, third. A similar class was provided for yellow flowered varieties, which made an equally imposing display. Mr. Bowerman was distinctly the premier exhibitor, staging full, solid blooms of Thos. Wilkins, Wilfred Marshall, Edith Tabor, and Amiral Avellan. Mr. H. Clark, gardener to P. Mortimer, Esq., Ashe Park, Overton, second; Mr. Best third.

For twelve blooms, any colour except those previously mentioned, also four varieties, Mr. G. Best just succeeded in securing the leading award with M. Demay-Taillandier, J. Bidencope, Eva Knowles, and International. Mr. Bowerman was a close second; Mr. West third.

Groups of Chrysanthemums made an imposing display, so well were they represented. Mr. G. Street easily secured the coveted award with really splendid plants arranged lightly so that each bloom could be distinctly seen. Mr. G. Newman, gardener to Captain R. G. Gaussen, Twyford Lodge, Winchester, second; Mr. R. Stone, gardener to the Ven. Archdeacon Haigh, The Close, Winchester, third. Chrysanthemums grown for conservatory decoration were magnificently represented, so dwarf were they, at the same time carrying such grandly developed blooms. Mr. G. Adams, gardener to Colonel F. A. Dickens, Blackbridge, Winchester, was first with plants averaging 3 feet high, perfect in every way. Especially good were Mrs. Dr. Ward, Mons. Panckoucke, Niveus, M. C. Molin, and Elsie Teichmann. Mr. H. Gigg, gardener to Rev. R. M. Moorson, Holyrood, Winchester, was second. Mr. F. J. Croot, gardener to B. B. Colson, Esq., Sunny Bank, Winchester, third.

Specimen trained plants were best staged by Mr. Holloway, gardener to Mr. A. Brown, Hill Farm Dairy, Southampton, in the class for six. The best single specimen was one of Golden Christine, from Mr. A. E. Taylor, 3, Hillside Terrace, Winchester. Mr. G. Adams secured premier honour for a single plant carrying the largest number and best quality blooms with a charming plant of Madame Ad. Chatin.

Groups of miscellaneous plants arranged for effect made an imposing display. Fruit and vegetables were well represented. Table decoration, epergnes, and ladies' sprays were an interesting feature of the show. In the first-named class Miss Nellie Owen, Basingstoke, was distinctly ahead with a light arrangement. Mrs. E. Carr second. Miss Elsie Wadmore, Brook House, Basingstoke, third. Mrs. E. Carr secured the leading award in the classes for a stand of flowers, foliage, and grasses, ladies' sprays, and buttonhole bouquets. Miss Louisa Wills, Southampton, had the most tastefully arranged stand of flowers (Orchids excluded), a pleasing combination.

Mr. Neville staged a magnificent collection of cut Roses ("not for competition"). Mr. Molyneux, gardener to W. H. Myers, Esq., M.P., had five dozen blooms incurved and Japanese of leading varieties, all of first quality, as well as two dozen bunches single and Pompon flowered varieties, making in all an interesting exhibit. Mr. E. Hillier, Winchester, had several dozen dishes of Apples of the leading varieties.

STRATFORD.—November 11th, 12th, and 13th.

This was a charming show, held in the Town Hall, Stratford. The Hall, though very large, was crowded with exhibits. The groups, which were very numerous, were keenly contested, and the cut bloom section was well filled. The Society boasts having the largest amateur membership of any Chrysanthemum Society in the kingdom.

For a circular group of Chrysanthemums, arranged with foliage plants, Mr. R. Kenyon, gardener to A. F. Hills, Esq., Woodford, proved the victor in a keen competition; the blooms were exceedingly fine, and the foliage and general arrangement good. Mr. J. Emberson, Grove Road Nursery, Walthamstow, second with a good group, which lacked finish; Mr. P. Burnard, gardener to E. Rider Cook, Esq., Woodford, third.

In the class for twenty-four Japanese blooms, distinct, Mr. R. Kenyon was easily ahead with a very fine stand; the best blooms were Australie, Matthew Hodgson, Mons. Panckoucke, C. Davis, Mons. Chenon de Leché, Mrs. H. Kloss, Edith Tabor, Modesto, and Mrs. J. Lewis. Mr. C. Tullet, gardener to G. Alexander, Esq., Brentwood, second with a good display. Mr. J. W. Simmons, Wanstead, third with weaker flowers. For twenty-four incurved blooms, Mr. T. Tullet was just a few points in front of the second prizewinner. The best blooms in Mr. Tullet's stand were Mrs. R. C. Kingston, Chas. H. Curtis, Prince Alfred, Madame Darier, and Princess of Wales. Mr. J. W. Simmons had well finished blooms, but a trifle weaker.

Mr. G. Whitehead, gardener to S. Nicholls, Esq., Walthamstow, was deservedly awarded first prize for three trained plants with Col. W. B. Smith, W. Seward, and Madame Carnot. Mr. T. Smith, Leytonstone, was awarded premier honours for a group of Chrysanthemums with a capital arrangement of well-grown plants. Mr. W. J. Smith, Plaistow, secured second place with a taller group. Mr. J. Tyler, East Ham, third with a very fresh and bright exhibit. Mr. T. Smith was again first for a group of yellow and white Chrysanthemums, having very fine examples of Madame Carnot, Simplicity, Edith Tabor, and Modesto. Mr. J. Smith, Plaistow, second.

For twenty-four Japanese, distinct, Mr. T. Smith was again successful; his best blooms were Mons. Chenon de Leché, Lady Hanham, M. Gruyer, Silver King, Niveus, Viviand Morel, and Chas. Davis. Mr. G. Raddon second, with a very nice even exhibit. Mr. A. J. Brightwell, Forest Gate, third. For twelve incurved varieties Mr. G. Raddon, Forest Gate, was well ahead with good blooms of Mrs. R. C. Kingston, Jeanne d'Arc, Bonnie Dundee, and Mrs. J. Gardiner. Mr. T. Smith second, showing good Chas. H. Curtis, Empress of India, and Queen of England. Mr. J. Smith third.

The miscellaneous exhibits were very numerous, and included collections of Apples and Pears from the Dukes of Norfolk and Westminster; collections of Chrysanthemums from Messrs. W. Wells, Redhill; R. C. Notcutt, Ipswich; J. B. Riding, Chingford; and J. Spink, Walthamstow.

WINDSOR.—November 12th.

The annual autumn exhibition was held in the Albert Institute, and was a decided improvement upon any of its predecessors. So numerous were the exhibits that the new hall, recently added to the Institute, had to be utilised. This increase in the number of entries is encouraging to the Executive. If the public would but increase likewise in their patronage, a really successful Society would be assured. The Hon. Secretary, Mr. Herbert Finch, works hard to keep the Society progressing. Dr. Wyborn, the esteemed Chairman of Committee, along with Mr. C. Sainty, Vice-Chairman, work hard to obtain success.

Cut blooms were really well shown in the many classes provided for them. The leading one was that for eighteen Japanese and the same number of incurved, distinct. Mr. G. Sturt, Round Oak, Englefield Green, secured the leading award by the superior quality of his blooms in both sections. The incurved were of medium size, and fairly well finished. The varieties were C. Curtis, Lord Alcester, Mrs. J. Gardner, Mrs. R. C. Kingston, Mrs. Coleman, R. Petfield, Golden Empress, Lucy Kendall, Miss M. A. Haggas, Golden Queen of England, Alfred Lyne, Hero of Stoke Newington, W. Tunnington, Jeanne d'Arc, Barbara, Duchess of Fife, Princess of Wales, and Major Bonnaffon. The Japanese were large, bright, and well staged. The Japanese were M. Gruyer, E. Tabor, Viviand Morel, Simplicity, M. D. Taillandier, Rose Wynne, Etoile de Lyon, Mutual Friend, M. C. Molin, Phœbus, Prefet Robert, Madame Ad. Chatin, Silver King, Niveus, G. C. Schwabe, Madame Carnot, Miss D. Shea, and Mdlle. Thérèse Rey. Mr. G. Lane, gardener to Miss A. G. Ridge, Ascot, second.

In the class for twelve incurved and twelve Japanese a silver challenge cup goes with the first prize award, in addition to a money prize. Mr. Sturt secured the verdict by the superiority of the Japanese blooms, which were of huge size and well coloured. The varieties were Graphic, Edith Tabor, Viviand Morel, Phœbus, Miss D. Shea, Mrs. C. Blick, M. Gruyer, Mutual Friend, Duke of York, Simplicity, Oceana, and Mdlle. Thérèse Rey. Duchess of Fife, Major Bonnaffon, Empress of India, Mrs. R. C. Kingston, C. H. Curtis, and Princess of Wales were the most prominent in the incurved section; Mr. Lane, second, with fine Japanese, smaller incurved; Mr. F. Heereman, gardener to Lady Isabella Keane, third.

Mr. F. J. Paul, gardener to Mrs. Bowring, won premier place for twelve incurved, with neat if not large blooms; Mr. J. Williams, gardener to F. Ricardo, Esq., second, with smaller specimens. Mr. Sturt staged massive blooms of C. H. Curtis in the class for six, any one variety, incurved, and secured the leading award.

Twelve Japanese, distinct, was a strong class, Mr. J. Williams winning with creditable examples. Mr. Paul followed closely; Mr. Cole, gardener to Mrs. E. B. Foster, a good third. Anemone flowered varieties made a pleasing display, so well were they represented. Mr. Cole just beat Mr. E. Wicks, gardener to Hon. Lady Murray, for premier place with blooms having slightly better centres, for which this section is mainly cultivated; Mr. J. Williams, third. For six Japanese, any one variety, Mr. Lane won with fine examples of Australie. Mr. T. Wright, gardener to G. W. Marsden, Esq., followed with Good Gracious in first-class condition; Mr. Sturt, third. The best reflexed varieties were staged by Mr. W. Neate, gardener to Miss Thackeray; Mr. Sturt coming next. Cut blooms

in the amateurs' division were well staged by Mr. S. Bannister and Mr. J. T. Young, the prizes going in the order here given.

Chrysanthemums are here most effectively displayed in baskets or vases associated with other foliage, and a grand display is usually produced. Her Grace the Dowager Duchess of Sutherland offers special prizes for twelve blooms so arranged with stems not less than 12 inches long. Upon this occasion the premier award went to Mr. J. Wood, gardener to Lord Boston, for a really effective basket of meritorious blooms; Mr. Hayes, gardener to Mrs. Langworthy, second, Mr. Sturt third.

A class was set apart for ladies—a basket or vase suitable for table decoration, filled with blooms and other natural foliage—which brought ten competitors. Mrs. Young secured the leading award with a charming arrangement of bronze and yellow blooms; Mrs. Finch second, with admirable taste, the blooms lacking quality somewhat.

Five charming groups of Chrysanthemums in pots were arranged around the large hall, making an imposing display. Mr. W. Cole was an easy first prizewinner with plants well grown, carrying grand blooms lightly disposed; Mr. Bunee, gardener to Winkley Smith, Esq., second; Mr. James Wood third. Other plants, fruit and vegetables, were creditable to all concerned.

ECCLES AND PATRICROFT.—November 12th and 13th.

A charming and bright show was held on the above dates in the Drill Hall, Patricroft, and it is certain that in the quality of cut blooms nothing has been seen like them at any of their previous shows, and the large crowds that visited it must have been struck by such a lovely display, which is no doubt brought about through the courtesy and kindness shown to all exhibitors alike by the Chairman and Secretary, Messrs. Larmuth and Huber.

The chief open class was for twelve incurved and twelve Japanese, with silver cup and handsome money prize, the cup to be won three times. Last year's winner was Mr. Kirkman, gardener to G. Stanning, Esq., Leyland, who had the cup wrested from him this year by Mr. C. Osborne, gardener to H. Tate, jun., Esq., Allerton Beeches, with a remarkably fine stand, the incurved being neat, whilst the Japs were well coloured. The varieties were Graphic, R. Dean, Edith Tabor, Australie, Mrs. Palmer, Madame Gustave Henry, G. C. Schwabe, Lady Ridgway, Pride of Exmouth, Mons. Chenon de Leché, Phœbus, Duke of York, J. Agate, Queen of England, C. H. Curtis, W. Tunnington, Lord Alcester, Empress of India, Dorothy Foster, Duchess of Fife, Miss Haggas, Robert Petfield, J. Kearn, and Golden Empress. The finest Japanese ever seen in the neighbourhood of Liverpool and Manchester were found in the second prize stand, staged by John Davies, jun., Esq., Carnarvon; Australie, Charles Davis, Mons. Chenon de Leché, Duke of York, Bellem, and Edith Tabor being conspicuous. A grand bloom of Chas. Curtis gained the above named gentleman the N.C.S. certificate for best incurved bloom in the show. Mr. Kirkman was a good third.

The miscellaneous class for twenty-four was won by Mr. Carling, gardener to Mrs. Cope, Woolton, who also won for six Japs and six incurved and six Anemones. Mr. Davies was successful with twelve incurved, Mr. Osborne second; and for twelve Japanese Messrs. Kirkman and Davies were awarded the positions. Names are not given owing to pressure of space. In the classes for twelve incurved, twelve Japs, and six of each, Mr. Whittle, gardener to R. G. Allan, Esq., Allerton, simply swept all before him, gaining in the former class the silver medal. Messrs. Harker, Jackson and E. Pollitt were also successful in these classes.

The plants were very well grown and generally in good condition, more especially that put up by Mr. Mulloy, gardener to Thos. Harker, Esq., J.P., who won also for six and one. Mr. Powell won with six singles and three Pompons. Mr. Montford won one of the silver challenge cups for twelve cut blooms, the other being taken by Mr. E. J. Chambers for the same number, the challenge gold medal being taken by Mr. Huber, and the N.C.S. medal by Mr. Mulloy. It is impossible to give all winners, but Messrs. J. Atherton (who also won a silver medal), Huber, Chambers, Smethurst, and Woolans were in great form. Messrs. Dickson and Robinson and Dickson, Brown, & Tait were represented by very good stands of miscellaneous plants.

SHEFFIELD.—November 12th and 13th.

This show was held in the Corn Exchange, and proved to be a thorough success. The open class for cut blooms was a very good one, bringing together a large number of high class blooms, generally fresh and bright in colour.

In the class for twenty-four incurved the Dowager Lady Hindlip, Droitwich (gardener, Mr. Crooks), was deservedly awarded first honours for a grand even stand containing C. H. Curtis (2), Lord Alcester, W. Tunnington, grand; J. Agate (2), Mrs. D. Foote, John Lambert, Golden Empress Major Bonnaffon (2), Jeanne d'Arc, Queen of England, Princess of Wales, Mrs. Healc, Lady Dorothy, Brookleigh Gem, Mrs. Colman, Bonnie Dundee, Miss M. A. Haggas, and Violet Tomlin. The Earl of Harrington, Elvaston Castle (gardener, Mr. Goodacre), was placed second, showing fine blooms of Duchess of Fife, F. W. Flight, Miss S. Colman, and Madame Darier. J. D. Ellis, Esq., Worksop (gardener, Mr. Alderman), was third. Lord Trevor, Brinkinault, Chirk (gardener, Mr. F. Bible), fourth.

For twenty-four Japanese, Mr. Crooks again won with fine deep flowers, perfect in finish, of Chas. Davis, Mrs. W. H. Lees, Australie, M. Panckoucke, Viviand Morel, Mrs. Seward, Duke of York, Madame Carnot, Eva Knowles, Ed. Tabor, Simplicity, Australian Gold, Phœbus, Thos. Wilkins, Mons. Chenon de Leché. Mr. F. Bible showed a good stand for second prize; his best blooms were Australian Gold, Mrs. H. Lewis, Pride of Madford, Mons. Chenon de Leché, and Mutual Friend. Mr. Alderman was third. Mr. Henry Cooke, Woodhouse, was fourth. Mr. F. Bible was first for twelve incurved, and Mr. Goodacre second. Mr. Crooks secured first prize for a fine stand of twelve Japs, showing Australie, Mrs. Seward, Duke of York, Primrose League, Phœbus, Pride of Madford, Mdlle. Thérèse Rey, Edith Tabor, Chenon de Leché, Simplicity, Vicomte Roger de Chezelles, Mrs. H. Lees. Mr. Bible was second, and Mr. H. Cook third.

For six incurved blooms, Mr. Broomhead secured first with a fine stand of J. Agate, Major Bonnaffon, C. H. Curtis, Mrs. R. C. Kingston (exceedingly fine), Hero of Stoke Newington, and Miss M. A. Haggas. Mr. Crooks was second, and Mr. Bible third. For six Japanese Mr. Broomhead was first, Mr. Crooks second, and Mr. Bible third. Six large Anemones.—Miss Walker, Osgathorpe, was first, Mr. H. Cook second. Six reflexed.—Mr. C. Scott, gardener to J. Coley, Esq., Sharrow House, first; Mr. H. Cook second.

Chrysanthemum groups, interspersed with foliage plants. The prizes were keenly contested, the first prize being awarded to Mr. H. Willford for a good arrangement, with the surface nicely undulated, and altogether well treated; Mr. E. Austin, gardener to L. Brith, Esq., Chesterfield, was a close second; Mr. T. Morton, gardener to J. Gregory Lowood, Esq., third; Mr. Butcher, Chesterfield, fourth. A new feature, worthy of being generally followed, was introduced in decorated fire-grates, mantels, and mirrors. These coming between the Chrysanthemum groups were a great relief, and proved effective. Mr. Willford secured first prize with a tasteful arrangement, showing considerable artistic taste; the second prize by Mr. Scott, and the third by Mr. W. Wildgoose, lacked quality in individual plants for the purpose required. In the 60 square feet groups, Mr. B. Glossop was first, Mr. Wildgoose second, Mr. Lydd third, Mrs. Butcher fourth.

In the district cut bloom class the exhibits were highly creditable. Mr. G. C. Scott, Sharrow, was first for twelve incurved; Mr. Alderman second; Miss Wake third. For twelve Japanese Mr. Alderman was first, including in his stand fine blooms of Australian Gold, Oceana, Ed. Tabor, and Australie. Mr. G. C. Scott was second, and Mr. Broomhead third. In the smaller classes Miss Wake, Messrs. Scott, Alderman, Stables, and Wenman, gardener to Viscount Halifax, shared the honours.

Bunches of stove and greenhouse flowers, bouquets, buttonholes, with Primulas, table plants, and British Ferns were, as is customary at Sheffield, splendidly shown. Exhibits not for competition proved valuable additions to show. A large basket of Chrysanthemums, arranged by Mrs. W. A. Milner, commanded special attention and admiration for taste in the arrangement, combined with the high quality of the blooms. The exhibits by Messrs. Crossland, Handsworth, M. Seagrave, and Martindale were all fine, comprising healthy specimens in large numbers of stove and greenhouse plants, wreaths, and crosses in perfect taste. Messrs. Dobbie & Co., Rothesay, displayed a stand of Chrysanthemum blooms, which included some grand novelties, such as Secretaire Fierens, President Nonin, Lady Oporto Tait, Lady Isabel, Lady Hanham, and Mrs. Maling Grant, with two fine decorative varieties—viz., Golden Elsie and Barbara Forbes. Mr. W. Wells, Earlswood Nurseries, Redhill, staged a large collection of novelties, especially noticeable being Werther, Surpasse Amiral, Madame Firlat, and Madame Ed. Roger, a curious shade of green, and altogether a great novelty. Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, obtained first-class certificates for Mrs. G. W. Palmer, a sport from Mrs. H. Payne, and Mdlle. Laurence Zédé, a massive twisted incurved Japanese of a clear lilac colour.

BRADFORD.—November 12th and 13th.

The eleventh show of the above Society proved to be the best of any previously held. The open classes were well filled, and the local growers in the cut bloom and the group sections far surpassed any previous efforts.

In the class for twenty-four Japs, Mr. Midgley, gardener to H. Mason, Esq., Bankfield, Bingley, was first, showing grand blooms of Madame Carnot (2), Viviand Morel (2), Madame G. Henry (2), Phœbus (2), Mons. Chenon de Leché (2), Modesto, Van den Heede (2), Etoile de Lyon, Mrs. J. Lewis, Mrs. H. Payne, Baron A. D. Rothschild, Australie, Mdlle. M. Hoste, J. Seward, Pride of Exmouth, Edith Tabor, International, and Simplicity. Second, Mr. G. Haigh, gardener to H. Tate, Esq., Woolton, Liverpool, whose stand included fine blooms of Australie, Thos. Wilkins, Graphic, and Australian Gold. Third, Mr. G. Burden, gardener to C. B. Cookburn, Esq., Birkenhead.

For twenty-four incurved Mr. Bardon was first with Duchess of Fife, C. H. Curtis (2), J. Agate (2), John Lambert (2), Empress of India (2), W. Tunnington, Major Bonnaffon, Ma Perfection, Mrs. R. C. Kingston, Violet Tomlin, Perle Dauphinoise, and Golden Empress. Mr. Haigh was second, and Mr. P. Blair third. For twelve Japanese Mr. Midgley was first, showing Madame Carnot, International, Australie, Mrs. J. Lewis, Van den Heede, Mons. Gruyer, Mons. Panckoucke, Mrs. H. Payne, General Roberts, Ernest Cannell, Eva Knowles, Mutual Friend. Second, G. Haigh. Third, G. Bardon. For twelve incurved Mr. Bardon was first with J. Lambert, J. Agate, Empress of India, C. H. Curtis, Major Bonnaffon, Violet Tomlin, Perle Dauphinoise, Mrs. R. C. Kingston, John Salter, Mrs. S. Coleman, Lucy Kendall, and Miss M. A. Haggas. Second, Mr. G. Haigh. Third, Mr. P. Blair. Six Anemones, first, Mr G. Haigh; second, Mr. J. Brook, Heaton.

Six Japanese, one variety, Mr. A. Barber, gardener to J. Omerod, Esq. was first with grand blooms of E. Molyneux; second, Mr. Moorby

gardener to Mrs. Knowles, Shipley; third, Mr. J. Brooke, Heaton. Japanese, any one variety, white or yellow, Mr. Barber first with grand blooms of Mons. Panekoucke; Mr. Thomas, gardener to the Marquis of Ripon, Studley Royal, second; and Mr. J. Brooke third.

In the class for a group of Chrysanthemums in a space of 80 feet, Mr. W. Wardman, gardener to W. Gilson. Esq., Thornbury, was first; Mr. Shearman, Undercliffe Cemetery, second; and Mr. G. Todd, Ripley Villa, Bradford, third. For a group of miscellaneous plants, Mr. J. M. Moore, Cragg Royal, Rawdon, was first; Mr. E. Smailes, gardener to J. E. Goodall, Esq., Pudsey, second; and Mr. T. Bell, gardener to H. Maude, Esq., Baildon, was third. In the local classes for plants and cut blooms, Messrs. Howland, Clark, Thornton, Spearman, Marston, Moorby, Greenfield, Todd, Bell, and Moore were the chief prizetakers.

BATLEY.—NOVEMBER 13TH.

THE tenth show under the management of the Batley Paxton Society was held in the large Drill Hall. Owing to the prevalence of fog for a fortnight previous to the show a slight falling in the number and quality of the local exhibits was noticeable.

The open class for cut blooms was at least equal to previous years. Mr. Goodacre, gardener to the Earl of Harrington, won the very handsome silver challenge cup, value 21 guineas, for thirty-six, eighteen incurved and eighteen Japs. The incurved stand carried Globe d'Or, Violet Foster, C. H. Curtis, John Doughty, Miss Dorothy Foster, Duchess of Fife, John Lambert, Major Bonnaffon, Lord Alcester, Robert Petfield, Mons. Westhouse, Mrs. Coleman, Princess of Wales, Leonard Payne, Miss M. A. Haggas, Jeanne d'Arc, Miss S. Coleman. The Japanese were Phœbus, Eva Knowles, Simplicity, Mrs. H. Payne, Yellow Madame Carnot, Milano, Niveus, Duke of York, Australian Gold, Chenon de Leehé, Viviand Morel, Edith Tabor, Rose Wynne, C. Davis, Mutual Friend, with duplicates. Mr. Leadbetter, gardener to A. Wilson, Esq., Tranby Croft, was a good second.

Mr. Leadbetter was first for twelve incurved, staging Violet Tomlin, Golden Empress, Princess of Wales, C. H. Curtis, Mrs. R. C. Kingston, Major Bonnaffon, Lucy Kendall, J. Lambert, Ma Perfection, Alf. Salter, Lord Alcester, Queen of England. The same exhibitor was also first for twelve Japs, and Mr. T. Gill, gardener to H. Omerod, Esq., Boothroyd, Brighouse, second. In the local cut bloom class Mr. J. Thornton showed a very fine stand of eighteen flowers, securing first prize; Mr. J. Davis, gardener to G. Sheard, Esq., The Woodlands, Batley, being second. In the smaller classes Messrs. Harford, Thornton, Davies, and Messrs. B. W. Crossley & Son secured the chief prizes.

Groups of Chrysanthemums at Batley are always keenly contested and well arranged. Mr. J. Davis won the first prize, arranged with telling effect; Messrs. B. W. Crossley & Son second, Mr. H. Jackson third. In the local cottagers' class for Chrysanthemum groups, a keen competition resulted in Mr. J. Earnshaw being placed first, Mr. J. Allerton second, Mr. G. Beaumont third.

MANCHESTER.—NOVEMBER 16TH AND 17TH.

MR. WEATHERS, the courteous Curator of the Botanical Gardens, is to be congratulated on the excellent show brought together. The Manchester schedule comprises many large classes, the chief of which was for thirty-six incurved. Here that excellent grower Mr. West, gardener to E. Behrens, Esq., Bettisfield Park, Whitchurch, was a capital first with heavy, well-coloured flowers of Chas. Curtis (2), Ma Perfection (2), Lord Rosebery (2), Alfred Salter (2), R. Petfield (2), Major Bonnaffon (2), Golden Empress (2), Mrs. Heale, Princess of Wales, Miss Haggas, W. Carpenter, Lord Alcester (2), Brookleigh Gem, Globe d'Or (2), Mons. Bahuant, C. B. Whitnall, Baron Hirseh, Jno. Lambert, Queen of England, Jno. Doughty, Duchess of Fife (2), Jno. Fulford, and Empress of India. Mr. J. H. Goodacre, Elvaston Castle, Derby, was a good second; Mr. Geo. Haigh, gardener to W. H. Tate, Esq., Highfield, Woolton, a close third; and Mr. R. Pinnington, gardener to Mrs. Banner, Blacklow House, Roby, fourth.

For twenty-four Japanese, distinct, Mr. West again scored with grand flowers of Chas. Davis, Thos. Wilkins, Stanstead White, Australie, V. Morel, Primrose League, Jno. Seward, Graphic, Simplicity, Miss Dorothy Shea, Phœbus, G. C. Schwabe, Mdlle. M. A. de Galbert, Edith Tabor, Reine d'Angleterre, Pride of Madford, Georges Biron, A. H. Wood, Hairy Wonder, Viscountess Hambledon, Mons. Marius Ricoud, Mons. Chenon de Leehé, Madame Ad. Chatin, and Amiral Avellan. The second prize went to Mr. R. McKellar, gardener to Jas. Watts, Esq., Abney Hall, Cheadle. Mr. J. Kirkman, gardener to J. Stanning, Esq., Leyland, was a close third with bright flowers; and Mr. A. R. Thorp, Mere House, Newton-le-Willows, fourth. For thirty-six, miscellaneous, Mr. Vaughan, gardener to T. Brocklebank, Esq., Woolton, won with a bright stand. Mr. R. Pinnington was a capital second. The same exhibitor also won for a very heavy stand of twelve incurved, and Mr. Goodacre second.

Staked plants in pots, always a grand feature at Manchester, were more beautiful than usual, and a finer nine plants have probably never been seen than those staged by Mr. Bradburn, gardener to J. H. Gaddum, Esq., Adrien House, Didsbury. Little less meritorious were those staged by Mr. Mulloy, gardener to Thos. Harker, Esq., Brook House, Fallowfield, for second. Mr. Bradburn was again up to the high standard for six Japanese in pots. Mr. Mulloy again following. For six Pompons the latter won with fine plants; Mr. D. Livesey, gardener to Mr. Earl, Kersal, being second.

The trade, as usual, contributed handsomely to the success of the show. Messrs. W. Clibran & Son, Altrineham, staging a collection of choice cut Chrysanthemums in all the newest varieties, the singles being particularly effective. The strain of Celosia exhibited was one of the most brilliant we have seen. We never remember having seen Mr. Cypher stage a finer collection of Orchids. To enumerate all the many good things exhibited, and which gained first-class certificates and awards of merit, would take up much space, and so we must content ourselves by classing it well worthy of the gold medal awarded. Messrs. Lewis & Co., Southgate, and Hugh Low & Co., although not represented so largely, had quality on their side, and they, too, received their meed of praise and certificates at the hands of the Judges. Messrs. Dickson and Robinson, and Dickson, Brown & Tait, arranged two most attractive groups of Cyclamens and Ferns at the entrance to the Hall, for which an award of merit was deservedly granted. Mr. W. Boond, Lymm, Cheshire, staged six dozen excellent cut blooms, and Mr. W. Owen, Hartford, some fine forms of Cypripedium insigne. Mr. Weathers had a large bank of Cotton Plants grown in pots, and carrying a great abundance of pods in various stages, some being fully developed, with pods burst and the cotton showing. Messrs. Edwards & Sons, Sherwood, had a fine selection of their Edwardian ware.

BRIEF NOTES ON ALPINE FLOWERS.

(*Continued from page* 371.)

ANDROSACE CHAMÆJASME.

THIS charming little Androsace is, according to the Kew authorities, only a variety of A. villosa, and but for its cumbrousness for garden purposes, the name of A. villosa var. Chamæjasme should be used in speaking of it. It is, like others of the plants of the genus to which it belongs, one of the choicest of alpine flowers, repaying well a little care and attention. The plant is formed of little silvery rosettes, which increase by underground shoots from the base, so that where a suitable rooting medium and a good position can be afforded it is by no means a plant likely to be lost.

The flowers, though individually small, are more effective through being produced in umbels. They are blush on first opening, but ultimately change to a deep pink. The eye is yellow, changing to crimson. The height of A. Chamæjasme varies according to the soil in which it is grown and the amount of moisture it receives at the root, but it may be taken as from 2 to 4 inches. It is a plant which no lover of alpines should be without, although there is no scarcity of flower in the rock garden at its flowering time in June. It was introduced from Austria about 130 years ago, but is far from plentiful in gardens. A deep and well drained rich loam is the soil generally recommended, but I believe it will be found better to give it one of rather lighter nature. In my garden it does well on the southern slope of a rockery built in terraces, and planted in sandy peat with gravel, and a little lime intermixed.

A similar compost is, I observe, recommended by a Continental grower of great experience. When I first grew A. Chamæjasme I thought it advisable to cover it with glass during winter to throw off rain; but this precaution is not, I find, absolutely necessary. The "Rock Jasmine" is the pleasing popular name given to this Androsace in one of our gardening books.

DIANTHUS ATRORUBENS.

The alpine Pinks are general favourites, and the one now under notice usually attracts the attention of garden visitors, although far inferior to many of the genus in beauty or neatness of habit. The foliage is neat enough, and the habit, before flowering, is quite what one could wish. The defect of the plant lies, however, in the length of the flower stem, which is too great in proportion to the size of the flowers produced at its summit. These flowers are borne in what are called aggregated heads. They are small and sessile, and look too closely jammed together. The deep red colour of the blooms is what appears to cause visitors to notice this alpine Pink, although there are others of almost similar colour of greater beauty. The stem is about a foot long. Dianthus atrorubens does not rank very high in my estimation, but is "starred" in the "Dictionary of Gardening" as a desirable garden plant. It is a native of the South and East of Europe, and was introduced in 1802. It is increased by seeds or cuttings.

EPILOBIUM DODONÆI.

Dodoens' Willow Herb is more suited for the rougher parts of the rock garden, especially at the base of rockwork, where it may receive a good supply of moisture. A native of Piedmont and Dauphiny, it is perfectly hardy in our climate, and not at all difficult to grow, either in the flower border or rock garden. It has been in cultivation in Great Britain for about 100 years, but is not much grown. It grows about 1 foot high, and has very narrow lance-shaped leaves and deep rose-coloured terminal flowers. E. Dodonæi is not fastidious as to soil, but a light well drained one, with plenty of moisture passing through it, will suit it. It may also be planted on the edge of a pool or bog garden. It is increased by division or seed. It is synonymous with E. Fleischeri and E. Halleri.

SAXIFRAGA UMBROSA VARIEGATA.

With the few lines that remain a brief mention may be made of this pretty variety of the common London Pride or None-so-Pretty. It is a counterpart so far as regards flower of that well-known plant, and its attractions consist in the beautifully marked green and white leaves. These are very prettily variegated, and most people admire them very much. The plant shows a tendency to revert to the typical green-leaved variety, and it will be found desirable to thin-out the green plants, or they will choke out the less vigorous variegated individuals. S. umbrosa variegata is not very plentiful, and I have no knowledge of its first introduction.—ALPINUS.

LONDON TREES AND FLOWERS.

The Fall of the Leaf.

"Dead leaves wisper!" So ran a legend whieh, some years ago, was found chalked in rude letters on a London wall. The inscription, whether written as faet or allegory, is the true eomment on that mysterious undertone whieh, during late Oetober, the breeze sings nightly through the winnowed trees. Autumn hears it, and foreseeing the end, blaneh es a little through her crimson patehes. Worn out with husbandry, the earth listens and grows, almost impereeptibly, more still. And London, robbed of her green ornament, puts on a coat of grey and turns—shivering—to faee November.

Onee a year, at least, Londoners wake to the faet that their city is a port, and a near neighbour of the sea. The discovery is made when a North Sea fog drifts over the Essex marshes and, deseending on the Clty, shuts out the day. It is said that a "London particular" does no harm to a healthy man, but its effeet on vegetable life is disastrous. The mixture of acids contained in the vapour kills off most leaves in a few hours; and the breeze which, before the visitation, swept through the foliage with no effect, now reaps a faded harvest with every breath. Strictly speaking, London has no autumn, though the other seasons are each so clearly marked. Spring comes early, and very green. The Elms and Limes in the City, the Lilae and the Almond in suburban gardens, are out and blooming long before their eountry cousins are astir. In summer, spring renews itself most wonderfully in the Planes which, with the Ash and the Acacia, are greenest and fullest at the end of June. But autumn—golden autumn—hardly exists in town. The leaves die suddenly, as if a pestilence had touched them, while eountry hedgerows are still aflame. This year deeay set in unusually early. The Limes were, as usual, the first to go. The Lime is a craven in this respeet, and strikes his colours at the first hint of the approach of frost. Two trees in Gray's Inn gardens were shedding their leaves quite early in September. By Miehaelmas the Ash and Elm were in full retreat. Only the Planes and the Lombardy Poplars withstood the onslaught of their adversary, Winter, and now—in the first week of November—the former still makes a fight of it against night frost and morning fog.

The giant trees in Berkeley Square—undoubtedly the finest group of Planes in London—are still well covered, though the broad leaves are tipped with red and yellow, and the fruit buttons hang brown and withered from their stems. Indeed, if "Leafy London" is ever to deserve the name Leigh Hunt bestowed on her, it will be by the help of the Planes. The Elms are dying out. This year, even in the parks, the leaves grew rusty as early as July, and the light yellow eolour—an early autumn dress—never appeared at all. There can be little satisfaction for tree lovers in the poor searred trunk in Fountain Court, Temple, which seems to moek the queenly beauty of the country Elm. The Chestnuts also are in the same condition. There are not half a dozen left outside the parks, while the Willows and Sumaehs (both of which are planted about London squares) are a distressing sight for anyone who recalls their size and freshness when they grow in country air. It is the thought of these starvelings, and others like them, that causes one to wateh with grave anxiety the health of that doyen among London trees—the Wood Street Plane. It is sad to see the old giant show some symptoms of decay. Rumour says that it was planted immediately after the Great Fire. It looks as if two centuries of drought and smoke had begun to tell their tale. This season some of the branches at the top did not bud. Many of the leaves, too, faded before the summer's end, and, worse than all, the old tree no longer sheds and renews its bark with the vigour of a few years ago. May Time deal gently with the veteran, for probably no tree of such a size and majesty will ever bloom again in a London street!

It is plain that London in autumn is a borrower of other nations for her natural ornament. Her finest trees are Persian, and her flowers are Japanese. For, except the Violets, there is nothing in the streets but the Chrysanthemum. Even for City buttonholes it is the only wear. The long-petalled Japanese variety was almost the only blossom to be seen in Fleet Street when these researches were made. Covent Garden, in the early morning, told the same story. The flower market brimmed over with Chrysanthemums of many eolours. "We are selling blooms at a penny," said a salesman (without enthusiasm), "whieh two years ago would have fetched sixpence apiece. Millions pour in here every week." The flower market revealed a wonderful sight. It was a mass of riotous colouring and patchwork hues. Here was a foam of white petals; next a great bank where red lay mixed with yellow, and purple mingled with pale pink. There was a sea of palest lilac, splashed with a deeper mauve. At one end stood a great cluster of plants, whose petals were golden bronze, with a fleck of scarlet at the heart. It was as if autumn had touehed a liliputian woodland with a finger of flame. Other flowers one notieed afterwards—Violets, Lilies, Roses, aud many more. But the blaze of the Chrysanthemums eelipsed these English posies, for a time. One other beautiful foreigner was found—a branch of White Lilac from Southern Franee. "White Lilac," said its exhibitor, "always spells winter. We shall have no new English flowers until the Snowdrops and Croeuses come in."

Surely winter comes with a good graee, wearing White Lilac next the Holly's green and red. And Snowdrop and Crocus are names with which to conjure from the fog's blaek mist some faint yet fragrant vision of another spring.—("Daily Telegraph.")

THE YOUNG GARDENERS' DOMAIN.

Clerodendron Balfourianum.

This stove plant is worth a plaee in any collection on aecount of its great beauty and free-flowering properties. It is one of those few plants which possess sueh a strong contrast of eolour, the flower itself being pure white, while the stigma and stamens are bright red. The flowers, which are small, are borne in elusters, and when trained balloon fashion, the effeet is grand. Another good quality is the plants last a very long time in bloom.

Like Allamandas, they require a period of rest. To this end water must be gradually withheld, and the plants afforded the lightest place in the stove to insure the wood being properly matured. By the first week in November the plants may be removed to an intermediate house, with sufficient water to prevent the soil in the pots beeoming dust dry. In early spring remove the plants again into the stove, repotting any that may require it, using a eompost of loam, peat, cow manure, and sand, with ample drainage. Give abundance of water during the growing season, with an oeeasional dose of weak liquid manure.

If it is intended to increase the stock, euttings should be taken as soon as procurable, and when placed in small pots in sandy soil in the propagating pit they will soon root, and with the ordinary eare bestowed upon stove plants, will make niee plants suitable for plaeing into 8-inch pots the following spring. With attention to details, handsome and valuable speeimens ean be formed in a few years. I find the best method of training young plants the first year is on perpendicular wires at one end of the stove. This variety requires little or no pruning.—Youngster.

Winter-flowering Tree Carnations.

There are few plants so useful at this time of the year as Carnations. Their comparatively easy culture and free-flowering habit ought to insure their more extensive cultivation, especially by those who cannot have houses devoted to the Malmaison varieties. I believe they are more serviceable for decorative purposes, and may be used for the conservatory, to whieh they add a charming effect. A model tree Carnation is a plant from 2 to 3 feet in height, bushy, with numerous side growths springing from the main stem, vigorous in habit and profuse in bloom.

Cuttings for early winter flowering should be inserted in small 60-pots, about the middle of November or early in Deeember. Seleet side growths with a heel of the old wood, place five around the edges, plunge them in a brisk bottom heat of about 70° to 75°, and keep the plants close for a time, but do not allow them to droop if possible. A suitable compost for cuttings is good yellow sandy loam, leaf soil, and sand in equal parts; and eare must be taken that the base of the eutting rests firmly on the bottom of the hole. The soil should be in a somewhat moist eondition, to preclude the necessity of watering for a considerable time. Each day earefully wipe all moisture from the top of the glass to prevent drip, removing decayed leaves as soon as discovered. Immediately root action has commenced admit air freely.

Those inserted in November ought to be ready for potting singly early in January, when other cuttings should be inserted. When the plants are established remove to a temperature of about 50° by night, and 5° higher in the day, with air to prevent the plants becoming drawn. The grower will have to keep a sharp look out for green fly, which will quiekly ruin the young plants, but the pest is easily exterminated by the XL fumigator or insectieide. Keep a watehful eye on the young plants, and do not allow them to become root-bound, or they will experience a check when repotted. By February the earliest plants ought to be ready for repotting, using 5 and 6-inch pots aecording to the size of the plants. A further stoek of euttings should be inserted some time in Mareh and treated as previously advised.

The main object of the grower ought to be to have his plants growing steadily, and to keep them as sturdy as possible. Careful attention must always be paid to watering, which is certainly one seeret of suceess. Abundance of air should be given on all favourable occasions. When the warm weather sets in the plants will do well in cold frames. For the final potting use a eompost of three parts yellow fibrous loam, one peat, about the same of sheep manure rubbed fine, with one quarter mortar rubbish, wood ashes, and a sprinkling of bones (half-ineh), and eharcoal. The syringe may be used twice daily in favourable weather, which will keep green fly and thrips at bay.

If the plants are free from parasites it will be a pleasure to wateh the development of the leaves, and their colour will be a rich glaucous green. By the end of May the lights may be removed in the daytime, and in June they may be left off altogether for a time if the season is dry. As the pots get full of roots give an oeeasional watering of clear soot water and liquid manure, with a top-dressing of Clay's fertiliser about once a fortnight.

All late plants should be in their flowering pots by August. The flower buds must be neatly staked, and when this is done the plants may be put inside to develop their flowers. Abundance of air should at all times be admitted. In order to get flowers of good quality disbudding will have to be practised. During the winter months pay eareful attention to watering, and see that none is watered unless well on the dry side, using rain water if possible.—J. F. D., *Yorks.*

HARDY FRUIT GARDEN.

Planting Fruit Trees.—The weather has been suitable for preparing soils of varying character, the absence of heavy rains insuring the moving and breaking up of the soil being carried on under clean conditions. Heavy and retentive soils are always better when they can be prepared under good circumstances, the roots of newly planted trees taking freely to ground that is fairly pulverised, moist, and warm.

Should the positions intended for fruit trees still be unprepared, it is desirable that the work of preparation be commenced forthwith. When the soil is very light and dry there need be no hesitation in trenching it to the depth of 2½ feet. Keep the best soil on the top, however, but well break up the subsoil. Should the latter be very unsuitable for the entry of roots it might in special instances be removed to the depth of a foot, substituting better material. The average depth of good soil necessary for the roots of fruit trees is 2 feet. Wherever this depth can be commanded there will be no necessity to remove any subsoil, but see that it is sufficiently open to admit of free drainage.

Good, substantial soil needs no manuring at the time of planting. The best enriching material is good loam, which may be added freely to soils below an average quality. Pulverised clay is good for light and very sandy soils, and will increase their retentive power. Wood ashes well worked into the surface soil render it friable and suitable for the emission of rootlets, so that newly planted trees may become readily established.

Selection of Trees.—Whether trees are personally selected by the cultivator or left to the discretion of the nurseryman is a matter of convenience. Hardy, vigorous trees or bushes of medium strength are the best for all purposes. They should possess a good proportion of fibrous roots, which ought to be carefully preserved in lifting and kept from the drying influences of the air by careful packing.

Distances to Plant.—Planting too thickly, whether on walls, fences, borders, or open plots, is decidedly disadvantageous to the welfare of the trees, besides a waste of material and a cause of unnecessary trouble in planting. Fruit trees should be planted with regard to their ultimate development. If they are planted so closely that when approaching to a good bearing condition the branches grow into one another considerable harm accrues which can never be properly rectified. Apricots, Peaches, Nectarines, Plums, and Cherries on walls, trained fan shaped, may be 15 feet apart. Apples and Pears, horizontally trained, 18 feet apart; fan shaped, 15 feet. Pyramid Pears on Pear stocks, 16 feet apart. If root-pruned, 10 feet apart. Pears on Quince stocks, not root-pruned, 6 feet apart. Cordon Pears and Apples on walls or fences, 18 inches to 2 feet apart. Standard trees ought to be 25 to 30 feet apart, bush trees of Apples and Pears 10 feet apart, Gooseberry and Currant bushes, 6 feet apart.

Details of Planting.—It is important to throw out the soil for the reception of the roots, so as to form wide, but shallow holes. Previous to inserting the trees in position any broken and bruised ends of the roots ought to be pruned smoothly, making a short, upward, slanting cut. Shorten long, rambling roots to a reasonable length for them to be laid out straight. Form the soil at the base of the holes into a convex mound, and on the top place the trees, which must not be planted deeper than formerly. The earth marks on the stems will determine this. Some fine, light material, consisting of friable soil and wood ashes, should be at hand for placing among the roots. Spread out the roots in layers to their full extent, securing them in position by scattering the fine soil over them from the stem outwards. Treat each layer of roots the same way, the uppermost layer being 3 or 4 inches from the surface when finished. The soil about the roots should be made as firmly as possible, but avoid heavily treading with the feet. This may so strain the roots that they will be broken or injured.

Watering.—The best possible way of washing the soil among the roots is to give a thorough watering after planting with a rosed can. The water will carry the particles of soil among the finer roots, and all air spaces will thereby be filled up, leaving the soil sufficiently firm for the roots to grasp readily.

Staking Trees.—In some cases it is more convenient to insert the stakes before planting. All trees, however, which require support, ought to have it as soon as planted. If rocked to and fro by the wind great pressure is placed on the roots which have obtained no hold on the soil. Soft material should be placed round the stems, securing them to the stakes with copper wire.

Mulching.—Shortly after planting, the ground above the roots may be lightly mulched with short half-decayed manure. It will assist in conserving heat in the soil and in preventing the entry of frost.

FRUIT FORCING.

Peaches and Nectarines.—*Earliest Forced House.*—The trees must be started to ripen the fruit in May, when the varieties consist of Hale's Early, Stirling Castle, Crimson Galande, Dymond or Grosse Mignonne, Royal George and Bellegarde Peaches, with Lord Napier, Rivers' Orange, Stanwick Elruge, Humboldt, and Dryden Nectarines. The very early varieties—Alexander or Waterloo, Early Beatrice, Early Louise, and Condor Peaches, with Cardinal, Advance, and Early Rivers Nectarines—need not be started until the new year. If the lights have been off, the inside border will have been thoroughly moistened down to the drainage. Weakly trees will be benefited by an application of liquid manure. Fire heat need only be employed at night to exclude frost, and by day to insure a temperature of 50°. Commence ventilating at 50°, and close the house at that temperature, ventilating fully without lowering the heat below 50° in the daytime. Syringe the trees in the morning and early afternoon of fine days until the buds begin to show colour; but then (and on dull days prior thereto) discontinue the syringing, yet maintain a suitable moisture in the atmosphere by damping the paths, borders, and other available surfaces on bright mornings and fine afternoons, admitting a little air constantly at the top of the house. Aim at bringing the trees on gradually to secure well developed blossom.

Houses Started at the New Year.—Trees started early in the year for affording fruit at the end of May or early in June must now be kept as cool as possible. Pruning will have been attended to, which is a light affair where proper attention has been given to disbudding, retaining growth only essential for extension and next year's bearing, and cutting out after the fruit is gathered the useless wood. The trees, however, must be examined to remove wood not required, and that have been overlooked during growth. Brown scale is sometimes troublesome, and must be destroyed. Secure the trees to the trellis, allowing plenty of space in the ties for the swelling of the branches. Remove any loose inert soil from the surface of the border, supplying fresh material not more than a couple of inches thick on the roots. Quickly acting fertilisers should not be applied until the crop has set, a dressing then being given, and at intervals of a month or six weeks afterwards up to the fruit changing for ripening. Mulching also with short manure should be deferred until the trees are somewhat in growth. Houses with fixed roof-lights should be kept as cool as possible, ventilating to the fullest extent except when severe frost prevails.

Houses for Starting in February.—The trees started early in February ripen the fruit late in June or early in July, and will now require similar treatment to that advised for those in the house to be started at the new year. The roof-lights are much better removed, but it is a common practice to use houses of this kind for plants requiring protection from frost, especially Chrysanthemums. It is not a good procedure, for the Peach trees are deprived of the rest essential to success, and it often excites the trees prematurely, being then followed by a check, as is usually caused when the Chrysanthemums are over by throwing the house open, inducing the buds to fall. It is also a bad system to leave houses and trees unattended after the leaves fall until the absolute necessity arises for starting the trees. The trees are never handled so safely as when the wood contains least sap, which is as soon as the leaves have fallen, and the delay is taken advantage of by red spider, thrips, and other insect pests to find safe retreats. The house, therefore, should be thoroughly cleansed, the trees pruned, readjusted to the trellis, and every needful operation performed, so that a start can be made with confidence when the proper time arrives.

Houses Started in March.—The trees in these structures, and closed early in March, will ripen their fruit in July if brought forward by artificial heat; but where warmth is given when the trees are in blossom, and to secure the safety of the young fruit from frost, the fruit will not ripen until August or September if kept cool. The house may be a Peach case or glass-covered wall, with sufficient hot-water piping to exclude frost; afford a genial warmth when the trees are in blossom, accelerating the ripening as may be necessary, and ripening the wood in cool districts. The trees are now leafless where they have been subjected to artificial heat to ripen the fruit in August, and should undergo the operations advised for those in the early house. The roof-lights should be removed, the hot-water pipes emptied, leaving the lights off until the blossoms show colour, unless it is desired to start the trees before. If the lights are fixed, the ventilators should be thrown open to the fullest extent, except when frost prevails.

Late Houses.—Make no attempt to remove the leaves until they part readily from the trees by shaking the trellis, but cut out all the wood that has borne fruit and all superfluous growths. Do not allow the soil to become very dry, but if necessary give water to moisten down to the drainage. Keep the house cool by free ventilation, clearing away the leaves as they fall. Trees that grow too luxuriantly should be root-pruned and lifted whilst the leaves are upon them, but the wood being unripe they must not be lifted until the leaves have for the most part fallen, or the unripe wood will shrivel and die. If the wood does not ripen well turn the heat on by day with moderate ventilation, and turn it off in the afternoon so as to have the pipes cool before night, and then open all the ventilators, unless frost prevails, when ventilate according to circumstances, for the sudden collapse of the foliage is detrimental to the trees' health. When the wood does not ripen up to the points of the shoots a trench may be taken out at some distance from the stem and the roots be cut, which will check the tendency to growth and induce ripening. After remaining open ten days to a fortnight the trenches may be closed, making the soil firm and giving a good watering.

Wall Cases or Unheated Houses.—In some localities Peaches and Nectarines do not succeed against walls, and they are covered with glass, under which the trees afford more satisfactory crops. The walls should have south aspects in the northern parts of the kingdom; in the south late Peaches and Nectarines ripen well in September and October in structures facing west. They are not, however, always satisfactory. Sometimes the border is at fault and the trees make late growth, not ripening the wood well. Where that occurs the trees should be lifted and the roots laid in fresh compost nearer the surface. If the drainage is not good it

must be rectified, and the soil being unsuitable it should be removed wholly or in part, supplying or adding fresh. The border need not be wider than 4½ feet in the first instance for young trees, and all are accommodated in a border 1 foot wider than the extent of the roots, adding to it as these extend. A narrow border is superior to a wide one, only due regard is had to watering and feeding, with judicious mulching. If new trees are to be put in select those just coming into bearing—say, two or three years trained to walls, and lifted in the year previous to moving. Carefully lifted and planted they will bear fruit the first season, and not being overcropped will not be materially hindered in extension. Introducing new trees and the lifting and replanting of Peaches and Nectarines should be effected as soon as the trees are leafless or nearly so, as upon early removal depends success in the following year. By a judicious selection of varieties fruit of first-class quality may be had in a Peach case from the early part of July until early in October. Peaches: Alexander, Hale's Early, Dagmar, Crimson Galande, Stirling Castle or Royal George, Goshawk, Alexandra Noblesse, Dymond or Grosse Mignonne, Belle Beauce, Goshawk, Barrington, Bellegarde, Princess of Wales, Gladstone, Sea Eagle, Late Admirable, and Golden Eagle. Nectarines: Advance, Early Rivers, Lord Napier, Stanwick Elruge, Rivers' White, Humboldt, Dryden, Pineapple, and Victoria.

THE BEE-KEEPER.

Making Mead.

A CORRESPONDENT lately desired information for making mead from combs obtained from straw skeps. There are some bee-keepers in this district who have kept bees on the old-fashioned system for many years, and who are noted for the good quality of the mead they have made annually, and from one of them I got particulars of how he had made it for close on fifty years. These I give for the benefit of other readers.

The usual plan of treating the combs to obtain the honey from them after their removal from the skep is to place them in a fine sieve in front of a fire; the majority of the cappings having been removed, the honey will readily drain into the vessel placed underneath for that purpose. Although the combs may be constantly stirred and turned over, it will be impossible to remove all the honey from the combs, and when in this condition they are in prime order for making mead. It is advisable to have all the combs ready at one time, and as soon as the honey is drained from them preparations should be made for our purpose. The recipe is as follows:—

Take the combs from three or more skeps, and after the honey has been drained off place them in a tub, add 3 gallons of cold water, which should be constantly stirred. If the combs are not well broken up it may be done by hand, and may remain in this condition for several days until all the honey has left the combs. If time is an object warm water may be used, but not too hot, otherwise the wax will be melted. Allow the combs to soak for half an hour, and after stirring them well for a few minutes pour the liquor off, and add more warm water to the combs, which in half an hour will have extracted all the honey from them. Strain the débris through a cheese cloth, which may be preserved for making wax.

It will now be necessary to find out if the liquor is of sufficient strength. To test it, drop in a new laid egg. If it sink to the bottom it will be too weak to make mead of the first quality. Honey must then be added in sufficient quantity until the egg floats. The liquor, however, must be of sufficient warmth to melt the honey, otherwise it will not have the desired effect. Boil slowly for an hour, and during the process add ¼ oz. each of cloves, mace, and stick cinnamon; any other flavouring may be added according to taste.

When it has cooled sufficiently, strain through a cheese cloth, and add half pint of brewers' yeast, allowing it to ferment for two or three days, and skim occasionally. It should then be placed in a cask, and the bung left out for a fortnight until fermentation has ceased. The cask may then be corked up tightly and the mead be bottled any time within a year, when the cask may be required for the same purpose again.

It is not necessary, as some people imagine, to add spirits of any kind, as mead made on the above lines has come under my notice that has kept in prime condition for several years; in fact, if properly made, it will improve with age.—AN ENGLISH BEE-KEEPER.

GARDENERS' CHARITABLE AND PROVIDENT INSTITUTIONS.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—*Secretary*, Mr. G. J. Ingram, 50, Parliament Street, London, W.C.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—*Secretary*, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

ROYAL GARDENERS' ORPHAN FUND.—*Secretary*, Mr. A. F. Barron, **The Royal Gardeners' Orphan Fund, Chiswick, W.**

TO CORRESPONDENTS

All correspondence relating to editorial matters should, until further notice, be directed to "THE EDITOR," **8, Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Chrysanthemum Mutual Friend (*Mum*).—This variety is recognised by all competent authorities as a white, and could not therefore be staged in such a class as you specify. If your blooms of Australie are closely incurved, deep, and symmetrical they must be very good, and should find a place in almost any stand of Japanese.

Strawberry Jam (*Poppy*).—We have an excellent supply, made as follows:—To each pound of Strawberries allow half a pound of sugar. Procure firm scarlet Strawberries (ours are Vicomtesse Hericart de Thury), strip off the stalks, and put the fruit in a preserving pan over a moderate fire; boil for twenty minutes, stirring constantly. Remove from the fire and add the sugar, granulated being the best; place over the fire, and boil quickly for another twenty minutes. Put into pots, and tie down while hot. Most of the fruits have retained their natural shape, and the flavour is all that can be desired. We are obliged by your letter, which shall have our best attention.

Chemical Manures for Vines (*Vex*).—The following mixture is what you have in mind as having been recommended in our columns. Pure vitriolised raw bones three parts or lbs., muriate of potash two parts, one part each of sulphate of lime and sulphate of ammonia, with half a part of sulphate of magnesia, applied at the rate of about 4 ozs. to the square yard. Splendid crops of Grapes have also been supported by 2 ozs. of mineral superphosphate, with 1 oz. each of muriate of potash and muriate of ammonia per square yard three times during the season. An important point is to have abundance of fibrous roots for appropriating the food supplied, or it can do little good.

Plants for Letters on Dog's Grave (*Magda*).—We have seen some very pretty work done in both Crocuses and Snowdrops, also Scilla sibirica. These are only good in the spring. Another pretty letter-work arrangement was in double Primroses, a second in Gentiana verna, and a third Phlox verna. The prettiest of all was Arenaria purpurascens, and Saxifraga Camposi. All these have to be planted. In annuals the dwarfest of all is Ionopsidium acaule. Virginian Stock, Silene pendula compacta var. alba are also neat in growth, but do not last long. Only low and not spreading plants are suitable for lettering. The most long-lasting lettering is dwarf Dutch Box kept neatly clipped.

Loam and Manure for Vines (*Cross*).—Heavy top-dressings of loam and manure are not good. The most important point is to get roots and then feed. Of course, roots cannot be had without medium to grow in, and that is one great reason for the usual annual top-dressing of turfy loam. In no case, however, should the thickness be more than 3 inches, and not that unless the old loose surface soil is removed so as to get roots in the fresh material. It is better to use a moderate amount of manure with the turf, one-third being a maximum of sweetened stable manure freed of the straw, or as much as may be effected by shaking out the litter. It is easy to add sweet manure from time to time during growth, and by that means supply nourishment without burying the roots deeply or giving more than they are likely to occupy. In addition to the loam and manure, you may now supply (on the top of the top-dressing) a mixture of five parts steamed bonemeal and three parts double sulphate of potash and magnesia, with two parts sulphate of lime, well mixed together, using ¼ to ½ lb. per square yard, working in moderately into the top-dressing. There is nothing in the mixture to "run away," and with the phosphate, potash, and magnesia thus supplied nitrogenous matter of a quickly acting nature can be given in the spring or early summer; but too much nitrogen does not answer for the Grapes you name—Gros Colman and Black Alicante; they do better with steady supplies of slowly decaying matter, or what this gives—ammonia passing into nitrite and nitrate in about right amount if given as advised.

R.H.S. Fruit Committee and Medals (*Critic*). — Referring to an exhibit of fruit at one of the meetings you say "The Fruit Committee is a stingy body at times, and a few heaps of Onions and Turnips would have got a bigger medal." Our interpretation of the apparent anomaly is this, and the pithy comment thereon is that, in your opinion, "Onion and Turnip" medals (though that is, perhaps, not a happy way of putting it) are voted too freely. We have certainly heard it said that if some medal hunters could have their way there would soon be no medals left, as the species would become extinct.

Daisy Roots on a Lawn (*Daisy*).—There are two ways of destroying the Daisies without serious disfigurement:—1, Extracting the roots or plants by what is known as a Daisy fork or grubber—a short-handled implement with a forked end and priser on the back for uprooting the plants. This does excellent work during moist weather. The holes are filled, after clearing off the grubbed up plants, with rich soil, which encourages the growth of the grass. 2, Dress the lawn with "lawn sand," sold by nurserymen, applying it according to the instructions. This causes the lawn to become rather brown for a time, but the effects soon pass off, and the grass grows all the better with considerably fewer Daisies.

Hollies Casting Their Leaves (*R. S.*).—Some thirty-six years ago we had a similar experience of Hollies casting their leaves to an extent rendering them almost completely leafless. This we attributed to the prevalence of fog during the latter part of October and early in November, with the sulphurous smoke and vapour from some factory chimneys. The prickly-leaved species and varieties suffered the most, and the smooth-leaved the least. In the country we also once experienced a similar downfall of Holly leaves in the autumn, this also after a period of foggy weather. The trees became so bare as to necessitate cutting back, which proved a decided advantage both as regards form and subsequent growth and foliage. These are the only two instances in our experience of Hollies casting their leaves in the manner you describe. We can offer no suggestion as to prevention.

Apple Trees in a Dell (*W. W.*).—We have been compelled to grow hardy fruits in a garden in land liable to be flooded by water two or three times during the winter. Apples did very well, Keswick Codlin supplying fruit for use during August and September into October. Golden Noble seldom failed, continuing the supply from October to Christmas, when Northern Greening followed, and with it Bramley's Seedling, one of the very best Apples for damp situations. For eating, Devonshire Quarrenden, King of the Pippins, Blenheim Pippin, and Golden Russet proved the best, supplying fruit from September till March. Black Currants were grown in the spaces between the Apple trees in the garden and gave bountiful crops. Land that is water-logged for two or three months is most inimical to fruits. Temporary flooding does no harm; it is the stagnation and souring of the land that does the mischief to the roots.

Collapse of Cucumber Plants (*S. W. G.*).—The leaves were coated almost all over with soil, possibly owing to movement in passing through the post; but from whatever cause the occurrence is a serious drawback in examining them, the grit making sad work of microscopic apparatus. The mould on the leaves is Aspergillus glaucus, the conidial condition of Eurotium herbariorum, the fruits being, also the sclerotia, present in great abundance. The fungus, however, has no connection, only as a consequence of decay, with the collapse of the plants. This has been caused by the root-stem eelworm, Tylenchus obtusus, which swarmed in the destroyed tissues. There was also present a white worm, Enchytræus Buckholzi, which attacks the roots and stems of Clovers, Vegetable Marrows, and other plants outdoors; and we have found it in the same parts of Cucumbers, Melons, Bamboos, and many other plants indoors. We regard it, however, only as a semi-parasite, and very easily killed. For instance, it only lived a few seconds in water containing a little silico-fluoride of ammonia, while the eelworms were not killed for several minutes, yet there is no question of its destroying the pests—root-stem eelworm. The only thing to be done is to clear out the plants and soil, commencing afresh with clean plants and compost. This, however, will only result in the same disaster unless the precaution be taken to disinfect the soil before using, for unquestionably the pest (eelworm) is introduced in it. Treating the soil with boiling water thoroughly destroys them, only reach every part. The old soil should be scalded, so as to kill the pests therein, for they lead a free life as well as parasitic one, living on decaying organic vegetable matter, and even in water containing organic substances.

Ascertaining the Height of Trees (*Junior*). — Though the measuring of trees is not understood so widely as it ought to be, it is, as a matter of fact, very easy to learn. An excellent and thoroughly reliable system is that adopted by Mr. A. Harding, Orton Hall, Peterborough. This capable gardener devised the contrivance shown in fig. 73, by which the heights of any trees may be accurately determined. The tree measurer on the right of the figure consists of a staff 6 feet long pointed for pressing into the ground. To the centre of the staff a piece of half-inch board 12 inches wide and exactly square is affixed with screws. The diagonal cross lath is 3 feet long and perfectly straight. It may be fixed or moveable; if the latter, a small batten being screwed on the board for it to rest on when in use. The plumb line is indispensable, as no correct measurement could be had without it. The plumb-bob may be about the size of a small Walnut, the string passing through its centre, then knotted to make all secure. In measuring the tree the staff is placed at a distance from it so that with the plumb exactly perpendicular, the cross lath points to the top of the tree, the person taking the "sight" resting on one knee or reclining to bring the eye to the bottom of the lath. The lath is then drawn to the ground, where the end rests at C in the figure, or if the lath is fixed a string will answer the purpose of extending the sight line to the ground. From this point C to the centre of the trunk, not the face of it nearest the point, but the middle, will represent the actual height of the tree; or to put the matter concisely, the horizontal line, A C is equal to the vertical A B; and if the tree were blown or cut down its top would follow the course shown by the curved line and rest at C. If a tree has several leaders, as Pinus excelsa and some others often have, the sight should be taken of the most central one, or nearest in perpendicular with the roof of the tree, not a side branch that may happen to be a little taller, as the base line would then not give the true height of the specimen. On level ground it is easy to perceive that altitudes of a number of trees can be quickly ascertained. When the ground is irregular provision must be made for having the line level from the root of the tree, or A in the figure to C. The central board, it may be repeated, must be a true square, the perfectly straight sighting lath

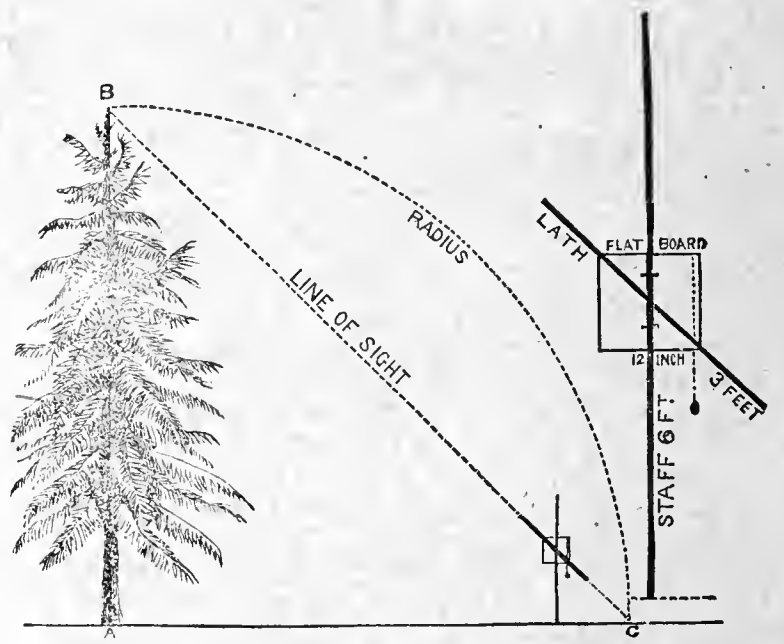

FIG. 73.

resting across it exactly from corner to corner, as the least deviation will lead to error, and the weight must hang positively plumb, as not otherwise can the measurement be accurate. Any handy man can make an appliance of this kind.

Names of Fruits. — *Notice.* — We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*H. H.*).—Your specimen was quite rotten. (*A. McC.*).—1, Golden Winter Pearmain; 2, Court of Wick; 3, Winter Quoining. (*D. C. F.*).—1, Golden Reinette; 2, Hollandbury; 3, Dutch Codlin; 4, Minchull Crab. (*M. E. B.*).—1, Winter Nelis; 2, Doyenné du Comice; 3, Nouveau Poiteau; 4, Beurré Superfin; 5, Beurré Capiaumont; 6, Durondeau. (*G. A. Y.*).—1, Alfriston; 2, Cox's Orange Pippin; 3, Blenheim Pippin; 4, unknown, worthless; 5, Ribston Pippin. (*J. D.*).—1, Court Pendu Plat; 2, Cox's Orange Pippin. (*W. T.*).—1, not recognised; 2, Ecklinville Seedling; 3, Hollandbury; 4, Winter Hawthornden.

Names of Plants.—We only undertake to name *species* of plants, not varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*C. W. P.*).—1, Euonymus europæus; 2, Diplacus glutinosus; 3, Panicum variegatum. (*K. J.*).—1, Nertera depressa; 2, dead; 3, a form of Adiantum cuneatum; 4, A. gracillimum; 5, Asplenium bulbiferum. (*L. G.*).—1, Maranta zebrina; 2, Kentia Belmoreana; 3, K. Canterburyana; 4, specimen insufficient, send when in flower.

EDITORIAL NOTICE.—It is particularly desired that all communications, parcels, catalogues, and newspapers intended for the EDITOR, be sent direct to 8, ROSE HILL ROAD, WANDSWORTH, S.W.

WORKING AT HIGH PRESSURE.

This does not include an eight-hours day—high pressure does not admit of this. At any rate, garden or farm cannot afford it; they are always at high pressure. There is always work enough to occupy all hands, and work that calls imperatively for the doing. If the actual crops do not need attention (and we find we are never long off the land), there is extensive work at our door with the live stock of all sorts, in which the farm abounds, or ought to abound. The preparation of the different foods, the feeding hours, the cleansing of boxes and sheds, is work that demands constant and careful attention. Nothing slipshod here, if you please. Regularity and punctuality must be ever to the fore.

Here we find the difference that constitutes first or second-class farming. An extra man costs money, but an extra man often insures much more than his wage by the care and assiduity exercised towards those animals under his charge. Mind, we always are keeping a sharp look out on the labour bill, yet still, at the same time, we know that one man cannot do the work of two, and it is the falsest economy to have yards full of badly fed, badly bedded cattle. It is the same on the land. Good farming is ever exacting. The land is ready to do its share, and it repays the worker for thorough cultivation. We fancy we do things fairly well in England—that is, we fancy we get a fair return for our labour, but just now, after reading an account of a Mr. Hallock and his farm (78 acres) in the State of New York, we begin to think we have much yet to learn. True, the circumstances are different, soil different, but we suppose that he, too, like us, is subject to great variations of climatic influences. We speak of our year as one of changing seasons, and truly it is so, for in no two years are any two given seasons alike. Nothing is more certain than the uncertainty of our weather. All this adds to our difficulty, and our summer seasons are generally but short.

We have not the advantage, too (or at least only a few of us), of being so near such a market as New York, and the American, as a rule, is a greater consumer of fruit and vegetables than the average Englishman. Apparently Mr. Hallock is his own carrier—that is, by means of water—so that must reduce the freight bill considerably. We have water carriage here, but most of our canals are only adapted for the slow-going barge or keel. We do not utilise steam power except on our rivers. We trust mainly to railways, and they generally contrive to make their own terms, which are very advantageous to themselves.

We confess we are a good deal puzzled to know where market gardening ends and farming begins. The produce of this States farm savours so of market gardening, of course on a large scale. We rather wish we could see some particulars of English market gardens —*i.e.*, their size and so forth. Most market gardens have a certain amount of glass. This farm appears to have none, or at least no mention is made of it, and we presume the climate is such that the Cucumbers and Squashes grown need no protection against the weather.

The produce of this farm runs something like this:—Potatoes, 4500 bushels, early; Potatoes, 1800 bushels, late; early Cabbages, 4260 barrels*; corn cobs (Green Maize), 1000 bushels; Strawberries, 9000 quarts; Onions, 8350 bushels. Of these 2300 bushels were grown from sets. Then there is other produce not distinctly specified, or with no note of quantity, such as Carrots, Cucumbers, Squashes, hay, Onion seed, and Carrot seed. The ground never lies idle here. The early Potato crop, which was dug the first week in July, yielded 300 bushels per acre. The ground was at once planted with Cucumbers, Carrots, Squashes, or Maize, the head or cob of which is eaten green as a vegetable.

Mr. Hallock finds it pays to set new Potato seed; he, like us, finds the varieties so soon deteriorate, and he grows what used to be a favourite here, Early Rose. We have improved upon that. We believe some of our good "earlies" are of American birth. To lose no time the Potatoes are well sprouted before being set. The Onion crop seems to be most prolific. We ask, Can it be there is no Onion maggot in New York State? The Onions are placed in lines 14 inches apart, and between the rows we find Carrot; the Onions are lifted first, and then the Carrot has the ground to itself. Carrots are sown as late as July; well, that may do in New York State, but we fear it would not answer here. Here, again, all Carrot seed is sprouted before being drilled, which it is through a special contrivance which prevents the breaking off of the sprouts.

Cabbages fluctuate; we should fancy a season too cold for tenderer vegetables would help to raise the value of the Cabbage. It is said that if the English working man can get plenty of (coarse) greens, he prefers fat, rough mutton, as the grease of the mutton and the "greenery" form a diet that his soul loves. There is no doubt of it that few dishes are more delicious to the unspoiled palate than a bit of bacon boiled in the pot with Cabbage or Spinach.

Mr. Hallock does not forget to feed his land, as it so well feeds him. Not forgetting the home manure, he will purchase as much as 1000 two-horse cartloads of stable manure. Now we are not quite sure about this stable manure. Sometimes the term "stable" is

* We are not told weight of these.

applied to cow houses. We had a feeling that horse manure proper was *not* of the highest value; we are quite ready to be corrected on this point, but we think we are right. Added to this doubtful manure is something really good—viz., 70 tons of ground fish manure and complete fertiliser. What must be the smell of this 70 tons in the aggregate we leave our readers to imagine. We trust it is speedily ploughed in.

No wonder with all this tillage early Potatoes yield 11 tons per acre. It is stupendous. We could not afford to do so much tillage here except in very rare cases; the carriage would kill everything, let alone the original price of the fertiliser. The hands, too, call for a word of acknowledgment. No stinted labour here; that is, if the men are up to anything at all. In the busy season forty men are kept in constant employment. They are fed and lodged on the premises, and this in itself must entail a good deal of thought, let alone work. There is another point where Mr. Hallock is much in advance of his neighbours. When an article is out of season it is usually dear, so Mr. Hallock contrives by means of cold storage to keep certain articles till the ordinary market is clear of them. Then he comes in and reaps the reward of his forethought.

In reading this account for the first time we were somewhat puzzled by the expression "Onion sets." Have we solved the difficulty when we suggest Eschalots?* In no other way, we think, could Onions be grown from sets; at least, there is no method known to us, and we are perfectly sure that a man of Mr. Hallock's acumen will grow pickling Onions of some sort, and certainly Eschalots are most prolific and easily managed.

WORK ON THE HOME FARM.

Weather conditions are still dry and free from frost. We have had a little drizzling rain, but not enough to stop thrashing or interfere with any farm work; indeed, Wheat has gone into a much drier seed bed in November than it did in mid-October. The plant is now growing so fast that there may be danger of its getting too forward. There are many complaints of dry wells and springs, and of difficulty as to water supply for cattle in the yards. To-day a neighbour has been carting water a mile and a half for threshing purposes.

We are delivering Potatoes from the pie, and find much more disease than appeared when they were covered up. There are many complaints of such being the case, and especially does this apply to Reading Giants, which are seriously affected. Much alarm is thus being caused, and we fear many Potatoes will be forced on the market in order to get rid of diseased tubers at a good price. The effect, however, will be to temporarily ruin the market, and growers would be much wiser to turn the Potatoes over, picking out all tainted ones, and carefully pie them down again; and whilst writing on this subject, we must strongly advise growers to sell their Potatoes at home to the highest bidder, not to send them to be sold on commission. There never was a better opportunity of striking a blow at the commission trade, which has done very serious harm in all markets. Hedges and ditches call for attention when there are hands to spare. It is a good plan to get on with this kind of work, for little or nothing can be done during a frost period, and we may have a severe one in store. A mild autumn usually precedes a severe winter.

Basic slag should be ploughed in any time between now and Christmas; it will be much more available for either grain or roots if sown now than sown in spring or summer with the crop.

WEBB & SONS' ROOT COMPETITION.

THIS competition covers nearly the whole of Great Britain, and is restricted to crops grown from Webbs' seeds, and with the aid of the firm's special manures. The judges were Mr. E. Doolittle, High Habberley, Kidderminster; Mr. H. Sankey, Fulfin, Lichfield; Mr. J. R. Butler, Churchill, Kidderminster, and the following is a list of their awards:—

Five acres of Webbs' Swede, open to the counties of Salop, Stafford, Montgomery, Warwick, and Leicester.—First prize, £15 15s., Mr. S. Timmis, Charnes Old Hall, Eccleshall, 50 tons 18 cwt. per acre. Second prize, £10 10s., Mr. W. Humphreys, Evenall, Oswestry, 41 tons 2 cwt. per acre. Third prize, £5 5s., Mr. R. Preece, Cressage House, Shrewsbury, 40 tons 1 cwt. per acre. Three acres of Webbs' Mangold.—Prize, £5 5s., Mr. Roger Gittens, Alberbury, Shrewsbury, 52 tons 6 cwt. per acre.

Five acres of Webbs' Swede, open to the counties of Hereford, Monmouth, Brecon, Glamorgan, Radnor, and Pembroke.—First prize, £15 15s., Mr. R. Thomas, Rowston, Pembroke, 41 tons 16 cwt. per acre. Second prize, £5 5s., Mr. J. Thomas, Tile House, Boverton, Cowbridge, 39 tons 12 cwt. per acre. Three acres of Webbs' Mangold.—Prize, £5 5s., S. H. Wood, Esq., Norden Farm, Leominster, 53 tons 18 cwt. per acre.

Five acres of Webbs' Swede, open to the counties of Oxon, Bucks, Berks, Wilts, Hants, Surrey, Worcester, and Gloucester.—First prize, £15 15s., Mr. W. M. Harvey, Allington Manor, Bishopstoke, 38 tons per acre. Second prize, £5 5s., Mr. L. Pullin, Severn House Farm, Berkeley, 37 tons 2 cwt. per acre. Three acres of Webbs' Mangold.—Prize £5 5s., Mr. G. Dodge, Cannon Court Farm, Fetcham, Leatherhead, 54 tons per acre.

Five acres of Webbs' Swede, open to the county of York.—First prize, £10 10s., Mr. W. Scorer, Givendale Grange, Borobridge, 40 tons 3 cwt. per acre. Second prize, £5 5s., Mr. T. Bradshaw, Amotherby, Malton, 34 tons 13 cwt. per acre.

Five acres of Webbs' Swede, open to the counties of Bedford, Cambridge, Cornwall, Cumberland, Cheshire, Devon, Derby, Dorset, Durham, Essex, Hertford, Huntingdon, Kent, Lancaster, Lincoln, Middlesex, Norfolk, Nottingham, Northampton, Northumberland, Rutland, Somerset, Suffolk, Sussex, Westmoreland, Carmarthen, Carnarvon, Cardigan, Denbigh, Flint, and Merioneth.—First prize, £15 15s., Mr. J. Hayton, Beck Farm, Wigton, 56 tons 8 cwt. per acre. Second prize, £5 5s., Mr. E. H. Jones, Penarth, Four Crosses, Chwilog, R.S.O., 40 tons 3 cwt. per acre.

Five acres of Webbs' Swede, open to the counties of Roxburgh, Haddington, and Berwick.—Prize, £10 10s., Mr. W. Gemmill, Greendykes, Macmerry, 24 tons 11 cwt. per acre. Five acres of Webbs' Swede, open to the county of Perth.—First prize, £10 10s., Messrs. J. & D. Morton, North Muirton, Perth, 33 tons 1 cwt. per acre. Second prize, £5 5s., Sir R. D. Moncrieff, Bart., Bridge-of-Earn, 31 tons 10 cwt. per acre. Five acres of Webbs' Swede, open to the counties of Forfar, Fife, and Kinross.—Prize, £10 10s., Mr. Geo. Reid, Ladywell, Kirriemuir, 25 tons 11 cwt. per acre.

Five acres of Webbs' Swede, open to the counties of Aberdeen, Banff, Kincardine, and Elgin.—Prize, £10 10s., Colonel Leith Hay, C.B., Kennethmont, 23 tons 10 cwt. per acre. Five acres of Webbs' Swede, open to the counties of Stirling, Dumbarton, and Clackmannan.—Prize, £5 5s., Colonel Murray, Polnaise Castle, Stirling, 25 tons 10 cwt. per acre. Five acres of Webbs' Swede, open to the county of Ayr.—Prize, £10 10s., Mr. John Allan, Holmston, Ayr, 37 tons per acre.

[* No. If Onion bulbs the size of hazel nuts are obtained by late sowing—the end of May or early in June—taken up in October, stored, and planted in March, they will develop into large bulbs, at least those will that do not produce flower stems, and the larger the bulbs are when planted the more likely is bolting to follow. Try the plan.]

THIS YEAR'S WORLD'S WHEAT CROP.—Mr. Broomhall, F.S., Corn Trade statistician, has issued his annual statement, showing the world's Wheat crop raised this autumn. The total production in Europe, reckoning the British crop at practically the same quantity as the last, is 140 million quarters, compared with 185 millions in the previous year, which was the average crop. Compared with the so-called famine year of 1891, the deficiency amounts to 10 million quarters. North and South America he reckons as having produced 93 million quarters, of which the state raised 74, compared with 59 last year. The total production of the Americans in 1891 was 101 millions. Asia, Africa, and Australia are reckoned as having produced somewhat in excess of the preceding year, but fully 11 millions less than in 1891. The world's total production is given at 278 million quarters, compared with 298 millions in 1896, 309 millions in 1895, 320 millions in 1894, 314 millions in 1893, 305 millions in 1892, and 308 millions in 1891.

REMARKS.

7th.—Sun through slight fog in morning; dull after noon.
8th.—Dull and foggy throughout, with frequent rain.
9th.—Dull and damp, with more or less fog almost throughout.
10th.—Fair early, with occasional spots of rain; a little sun after 11 a.m.; overcast evening.
11th.—More or less fog almost throughout.
12th.—Fair, with a gleam of sun about 10.40 a.m., but occasional spots of rain.
13th.—Fair day, but slight rain between 8 and 9 a.m.; clear evening, halo at midnight.
Temperature not remarkable, rain still small.—G. J. SYMONS.

Journal of Horticulture.

THURSDAY, NOVEMBER 25, 1897.

ONIONS AND SUCCESSIVE CROPS.

THOSE who are desirous of making a little money out of the land might advantageously think seriously of Onions. I have noticed that not only in our neighbouring town, but also others, foreign Onions find their way into shops where "home-grown" bulbs are never offered for sale. I am told that buyers prefer the Spanish Onion on account of its mild flavour, but this I think might be overcome by growing varieties of the Excelsior type, treating them similarly to those grown for exhibition.

By way of experiment I sowed a packet of Ailsa Craig thinly in boxes in the middle of February, standing them in the vinery. The seedlings were planted out at the end of April in two rows 26 yards long, 1 foot apart in the rows, and 6 inches from plant to plant. When taken up they weighed 184 lbs., and were disposed of at once for 5s. per cwt. We have no difficulty with our Onion crops. The seeds are sown thinly in drills 1 foot apart, when the ground is in good working order from the end of February to the end of March. Previously it has been trenched 2 feet deep, or to the hard subsoil, which is broken up with a fork or pick, and a layer of manure is thrown into the bottom of the trench. Burnt earth and lime are well worked into the surface, and a good dusting of basic slag is given before the ground is raked over ready for the drills. No thinning is done except as required for cooking. We sprinkle soot between the rows when the plants are growing freely, and again when they can conveniently be got between without materially disturbing the tops.

This year our crop is not so good as usual, and we did not expect it would be, as the land had not been trenched for two years, and then only a moderate amount of manure both in quantity and quality was worked in. We had the two rows next to those that were planted out of the boxes weighed and found 164 lbs., but an unusual quantity had been pulled from the unthinned rows during the season. We usually grow a ton over our requirements, and these are disposed of wholesale in our local market for £6. The variety we grow is Sutton's A1. We sow 13s. worth of seed.

About the middle of September the bulbs are lifted and laid in a shed, and the ground is then raked over and planted at once with spring Cabbage. Seed of Ellam's Early is sown thinly in an open place about the middle of August, the young plants being placed direct from the seed bed, 1 foot apart each way. A little soil is drawn up to stems in October to steady them, and in the spring the ground is sprinkled with soot, and liquid manure run between the rows. We commence cutting about the middle of April, and these are sold wholesale at 8d. a dozen.

From the middle to the end of June the Cabbage are cleared off, and Celery trenches are thrown out, 2 feet wide and 12 inches deep, a space of 4 feet being left between the rows for earthing. By this time the Mushroom beds are exhausted, when a good dressing of this manure is wheeled and dug-in. The trenches are then thoroughly soaked with clear water, and the following day with manure water; and when the soil has dried a little the plants are put out two rows in a trench 9 inches by a foot. They are well watered after planting, and for several evenings are damped over with a coarse rose watering pot. Earthing-up is done at two or three times, commencing at the middle of September. We grow Sulham's Prize Pink, of which the seeds are sown from the end of March to the middle of April. The seedlings are pricked out on a temporary hotbed, and from which a crop of Lettuce has been cut. The price we get is from 1s. 6d. to 2s. per dozen sticks. To this must be added a crop of Lettuce, that is taken from the spaces between the rows, and sold for 6d. per dozen. Before sowing the Lettuce seed, drills are drawn and soaked with liquid manure.

I have stated what we are in the habit of doing, because we think people in their own neighbourhood should supply the local market instead of sending to other towns and other lands for what is required. We have little encouragement to grow for market, and the only unpleasantness is in having too much for our requirements. It has been for some years the custom to sell a little, allowing 10 per cent. commission. I find £10 useful for my own pocket, and, besides, believe it is the duty of those who have anything to do with land to get as much out of it as possible. What land by a few years' judicious working can be made to produce but too few have any conception.—S. B. O.

HINTS ON JUDGING GROUPS AND PLANTS.

Much has been written about the methods practised in judging cut blooms. Little, however, has been said with regard to the adjudicating of plants, either singly or collectively. There are many persons who do not grow Chrysanthemums for the purpose of exhibiting them in a cut state, yet do much toward the embellishment of an exhibition by contributing plants in some form or other. Such growers, then, are entitled to as much consideration as those who compete in the cut bloom section. I do not say that plant growers do not have their products thoroughly and well estimated, but there exists some confusion as to the manner in which the relative merit of individual exhibits are pronounced.

Chrysanthemums in groups occupy at many exhibitions a strong feature, indeed they add as much, if not more, to the general beauty of a show, than all the cut blooms. As in judging the latter there is a want of unanimity amongst exhibitors and visitors as to the position in which certain exhibits are placed. Judges have to consider the wording of the schedule, where they learn the requirements of the committee as to the points of excellence that a certain group should contain. At one show where I assisted in judging, my colleagues and myself incurred the displeasure of certain members of the committee for awarding the first prize in a group class contrary to their wishes, but quite in accordance with the specification laid down in the schedule. Briefly, the wording was thus: "Group of Chrysanthemums and green foliage plants arranged for effect." The plants in the first prize exhibit were arranged in an undulated manner, without the slightest sign of crowding; every bloom could be distinctly seen, the plants being nicely interspersed with Palms, the whole presenting a pleasing appearance. We had no hesitation in placing this group first. The second prize exhibit was a sloping bank-like arrangement, not lightly arranged, but the individual quality of the blooms was superior to those in the first prize group. At six o'clock I was told that we had made a mistake; it was quality, pure and simple, in the Chrysanthemum blooms that they intended to encourage. Here was an instance, then, of wrongly wording the class in the schedule.

As a rule the prizes are offered for a "group of Chrysanthemums, quality and general effect to be the leading features." In nine cases out of ten the idea is to encourage quality of bloom and a sensible method of disposing without recourse to the "packing" method of arrangement. It is not possible to lay down a hard-and-fast rule of the points of excellence to be found or required in groups of Chrysanthemums as compared in judging cut blooms. So many points go to render one particular group better than its neighbour. Every judge of my acquaintance prefers dwarf plants to tall ones, but at times a 4-foot plant will have superior blooms to that 1 foot less. The dwarf one may not have good foliage, or the plants may be huddled together so as to render each variety almost unrecognisable. This particular dwarf plant has but one point of excellence, whereas the taller has others also.

Groups of Chrysanthemums alone must be judged upon combination principles. First the plants should be dwarf, well clothed with foliage, especially the front row. Each should carry large fully developed blooms of good colour and be quite fresh. Above all they must not be so crowded together as to lose individuality. The situation the group occupies must be considered a little, but a smooth, flat, sloping form of arrangement is objectionable. A little variation in the manner of disposing of the plants is well, and it is surprising how a few good blooms elevated above their neighbours enhance the appearance of a group. The greater the variety of form the blooms contain the more distinctly is it a representative group of Chrysanthemums. In no case, however, should this latter point be allowed to carry weight if the individual blooms are not of good quality, but simply placed there to include all sections. What we want to see is excellence of bloom, not mediocrity.

Some exhibitors so arrange their plants that the front row, although dwarf, stand upon pots 8 or 10 inches high, simply with the idea of preserving the sloping face consequent upon the plants being too tall at the back. Such instances as this need condemnation. The front row of plants should in all cases stand on the floor. If the regulations allow of the pots being hidden by foliage plants or other device, all well and good, but a clean one containing a plant clothed with healthy leaves down to the soil cannot be very objectionable. Some groups are a mere forest of white stakes, so plentifully is this method of supporting the plants and blooms persisted in. This is a most objectionable practice, and one that should receive the most pronounced condemnation. The reasonable exhibitor who supports his plants with stakes of an invisible colour, and his blooms by the aid of thin wire, should surely reap some advantage.

I have dealt rather lengthily with Chrysanthemums in groups only, and I will now make a few remarks about what I will term the combination group classes—viz., the inclusion of foliage and other flowering plants; to show the Chrysanthemum in its utilitarian point of view when combined with other decorative plants. Committees of Chrysanthemum societies have, almost without exception, recognised the fact that a combination of Chrysanthemums and other plants creates a more pleasing and valuable effect than do Chrysanthemums alone. The visitor wearies of such a glare of colour year after year; and besides, combination groups have a greater educational value.

Perhaps the most effective groups are those where the addition to Chrysanthemums is confined wholly to foliage plants. It is somewhat difficult to obtain the right kind of flowering plants to associate harmoniously with the Chrysanthemums in possession. Not so, however, with foliage plants, as Palms, Crotons, Eulalias, and Bamboos lend themselves so effectively to the relief of the highly coloured Chrysanthemum blossoms. The point of first consideration is the individual quality of the latter; in this case the Japanese varieties are the most effective. Not only should the plants be dwarf, but thoroughly well clothed with healthy leaves, and displayed in such a manner that the plant itself, irrespective of the blooms, is a feature of the group. Crotons grown on single stems, not more than a yard high, with drooping distinctly coloured leaves, are unsurpassed for this form of decoration, and such should have due weight accorded them by the judges. In a group of this kind pots ought not to be visible, as so many opportunities present themselves of hiding them. The rule must be strictly enforced that all plants are growing in pots and not merely limbs cut off and inserted in pots for the time being. An exhibitor who does this secures an undue advantage over his opponent who cultivates his plants successfully. The better the quality of the moss employed for covering the pots the greater the advantage an exhibitor would obtain.

A summary of points, then, in judging combination groups would be quality of individual portions of the material employed, and lightness in arrangement with harmony of colouring. For instance, the base of a mound from which a highly coloured Croton Warreni rises, should not be composed of Cullingfordi Chrysanthemums, or again, Eulalia japonica marginata must not rise above a group of Elsie or Elaine Chrysanthemums.

In judging plants there are fewer points to observe. The schedule of prizes generally stipulates for a given number—say, six or nine. The point to determine is the plants which have the best blooms, accompanied with a due share of leaves. There are two classes of specimen trained plants. Some cultivators grow the plants to a large size—say, 5 feet in diameter, with 200 blooms or more upon each plant, and such plants as these may, from a training point of view, be meritorious examples; but they are not useful in a decorative sense, as they occupy so much space. Plants that are limited in size to, say, 3 feet in diameter, each carrying from thirty to fifty blooms of high-class merit, are much more desirable than those grown for size alone. Those having a large number of blooms, but of small size, cannot compete with those of less dimensions, but carrying finer blooms and good foliage. Of course, bush plants ought to be well clothed with leaves and be freely flowered. The quantity of blossom produced, along with perfect foliage, is the main point of consideration. —E. Molyneux.

BROAD VIEWS OF GARDENING.

How beautiful at all seasons are those demesnes where the spirit of gardening has been permitted to roam untrammelled through their length and breadth! Possibly it is only given to the higher and keener criticism, forming its judgment by analysis, to appreciate the true value of that taste, energy, and forethought which provides unqualified and unlimited gratification to the cultivated eye. The development of natural beauty is an art, and at comparatively small expense some of the happiest and most pleasing effects have been obtained.

I have lately visited a noble family, on whose estate so much quiet work is being done, that it seems strange so little is done in others offering as fine a field, and possibly even greater facilities for it. With the happy example in my mind it is easy to state a case illustrative of the question. We have here an example of the British gardener in the higher ranks of his calling, who has certainly ample to do, to think of, and to think for, in the general economy of garden management, the plots of his garden being measured by acres, the walks by miles, and the glass by thousands of feet; who, nevertheless, is steadily, in some instances perhaps stealthily, insinuating the higher doctrine of picturesque gardening beyond his immediate sphere.

In more than one quiet corner of the garden is to be found unobtrusive preparation of various plants destined to ornament some particular place or create particular features as opportunity occurs. On sunny bank or in shady nook bold patches of appropriate plants, as are perfectly in keeping with their surroundings, give to them additional interest and charm, and if one were unaware of the quiet work always in progress the superficial conclusion might be arrived at that here Nature was bountiful in her gifts and happy in her methods of distribution. Who could not enjoy that mossy dell in which hundreds of Osmunda regalis are luxuriating *au naturel?* Yet is there just the possibility remaining that the ministering hand which transferred them from a distinct part of the estate to their present happy home would not be recognised? Then, again, in a ravine, where damp rocks on the shady side are clothed far up with the burnished fronds of the common Hartstongue, what secret is there in a sense so natural? That this was not a part and parcel of the local flora is obvious to those who can bring past observation in context with the present, and what secret there is is vested in a visit when a newspaperful of fertile fronds was gathered at the right time, brought home, and lightly dried, to be afterwards as lightly shaken over the face of the moist rocks.

Near at hand is an old Ash tree springing into twin stems some 20 feet up, and cradled in the fork is a flourishing plant of the common Polypody, with rhizomes creeping slowly but surely up the limbs on either side. This is one of those little freaks that Nature delights in, and who shall gainsay her methods of adornment? There are, however, so many felicitous expositions continually cropping up in but a brief tour of inspection through this particular estate, that he who would not on the whole be gratified by the good work done is indeed hard to please. It is only on returning to the garden that the missing link 'twixt Nature and Art is discoverable in the large provision of Virginian Creepers, whose crimson flecked streamers depend from many an old tree trunk through the woods on an autumn day. There is no training of our hands to such things. It is the magic spell woven by the spirit of Nature around the disciples of gardening, whose lives are softened and even beautified by it.

In another patriarchal demesne where some few instances occur of certain plants being naturalised by the acre, one would like to trace through silent generations the connection between cause and effect. Just without the boundary wall is an ancient graveyard, and there the curious-minded may discover among the quaintly worded memorial stones one massive prostrate slab placed by a certain earl 150 years ago to the memory of his head gardener for faithful service to him and his father before him. I like to link, rightly or wrongly, this grand old gardener with those picturesque sheets of Omphalodes verna, covering an acre at least, and other things which, in a similar manner, adorn the banks and braes around this ancestral home; and it is pleasant to see and to know that in this severely practical age the mantle has descended upon men who, as gardeners, find time, and ways, and means to open out or contribute fresh fields of delight in the unlimited possibilities of picturesque gardening.—The Squire.

INTELLIGENCE IN PLANTS.

(*Continued from page* 429.)

The spreading Dogbane is also a fly-catcher. It has five traps inside it, all capable of catching and holding flies, and for no purpose, so far as can be ascertained. The innocent-looking little "Sundew," Drosera rotundifolia, however, captures flies on business principles. The leaf is fitted with long and short hairs, and round the base of these is a sticky secretion in which the unhappy fly or ant is detained till the short hairs can bend inwards towards it and hold it till the long hairs can do the same. Then to make sure the leaf folds itself back till the point of it touches the stem, and after a time opens out, showing the dry skeleton of its victim, and with the usual innocent look asks for more. Why do the five pollen-bearing stamens of Saxifrage Parnassia palustris bend back over the stigma of its own flower so as to cover it and prevent its fertilisation? and why do not the whole five ripen together as usual, instead of one by one? The method prevents self-fertilisation in a very clever and pretty way. If all five were ripe at once it could not be prevented. The pods of the Broom, Vetch, and Bird's-foot Trefoil cease to grow and begin to dry at a certain point, and their contents do not, and when the crisis arrives the pods burst and send the seeds out pell-mell. Each half of the pod twists itself into a sort of ringlet. The Dog Violet has three boat-shaped valves, each with two rows of seed, and on a hot day the valves dry and crowd the seeds so that the least touch explodes the lot, and they shoot up into the air. The capsules of the Mesembryanthemum, and that of the Veronica, only discharge their cargoes of seed in wet weather.

The capsule of the Dead Nettle, as if to show a new idea, divides itself into four compartments. In the Prunella these small prisons and the seeds inside stay on the calyx or outside wrapping of the flowers till the sepals, opening up with the rain, push them overboard. The Cranesbill has five seeds each in its shell, and these when ready all split at the same moment, and take a flying leap of some feet. The Erodium seed, wrapped in a modified leaf called a carpel, springs away from its parent, and has in some way possessed itself of a long thread-like filament, which curls into a sort of vegetable corkscrew. When it begins to rain this corkscrew commences to straighten itself out until it gets the loose end of the corkscrew against something firm, and thus in straightening itself out forces the seed down towards or into the soil; then it dries, winds itself up into a spiral again, and by the next shower comes has found some other firm object against which to place its free end, and down goes the seed a bit further. Several of the seeds of the Anemone and Clematis tribe and the Feather Grass (Stipa pennata) screw themselves into the ground in this way. The grains of the Barren Oat and other Grasses have these corkscrew arrangements, and in damp weather a heap of them will begin moving off hither and thither, as if alive.

The Common Wood Sorrel has an elastic outer coat, which when touched fires the seed off quite a distance. So does the Hairy Cress and the "Touch-me-not." The Anastatica hierochuntica has an entirely different method. It does not cast its seed off to seek its own living, but just takes it about till it finds a proper place for it. It then dries into a ball, keeping the seed in the centre, steps down from its pedestal and lets itself be blown about the desert till it finds a moist place, when it opens out and lets the seed go. An Australian Grass and a Brazilian Club Moss have similar habits. So has the Bupthalmum maritimum. Mesembryanthemum trifolium of the Cape, when closed up, might be mistaken for a coat button, but put into water it suddenly bursts into something like a star-fish with a dozen rays. Then we have the Sand Box Tree, the fruit of which, like a flat large Orange, is divided into a dozen lobes or more, each containing a seed. When ready these lobes go off like a gun and send the seed out an immense distance, and to make fully sure that the seed cannot be retained the pod or lobe divides into two. But Nature has ten thousand ways of achieving her ends, and makes use of all sorts of media.

The seeds of the Mangrove germinate on the tree, and drop with ready-made roots into the swamp below. Here let us think a bit. The Mangrove tree grows in a deep horrible swamp, and if the seeds dropped in the usual way they would sink too deeply and be smothered, or be liable to frequent disturbance, but dropping with a ready-made root, and already germinating, there is something to keep them afloat and prevent their entire submersion. When we take into consideration the further fact that plants change their habit with changing

habitat, there seems to be something very, very like reason and intelligence at work.

Of the Nicaraguan Acacia every thorn is tenanted by ants, and if the plant is shaken they swarm out and attack the aggressor, and so protect the tree from browsing animals, and more especially from the leaf-cutting ants, which are otherwise terribly destructive. The plant secretes honey for its guests, and fruit-like bodies grown on the leaflets and the whole contents of the spines are evidently meant for their support. These ants are not known to exist anywhere else, and whenever Mr. Bell sowed the seeds of this Acacia where none of its friendly ants existed the seedlings were promptly devoured by the leaf-cutting ants.

The Harebell and the Daisy seem to have nothing in common, or at least very little; yet it is evident that they mark the opposite extremes of one and the same series. A common ancestor for both is evident. "These transition forms," says Oswald, "Harebell, Rampion, Sheep's-bit, Hemp, Agrimony, and Daisy have deviated, each more or less, from the direct line by reason of adaptation to climate and surroundings, as well as to the severe competition to secure a place in Nature." How, without conscious intelligence, are we to explain these gradual adaptations?—(*Paper read by* Mr. W. PICKARD *at a meeting of the Sheffield Chrysanthemum Society.*)

(To be concluded.)

COLOURED BARK FOR WINTER EFFECT.

DURING winter, when deciduous trees and shrubs are destitute of leaves, it is interesting to notice the great variation of colour produced by the young stems of various genera and species. In some cases the bark is so highly coloured as to make it worth while to grow groups of those things on purpose for the winter effect.

It is also interesting to notice the difference in the colour of the stems of different species of one genus. In the genus Rubus, for instance, we have a wide variation of colour. In Salix the same thing occurs, and in some species a wide difference occurs also in the varieties. In other genera one colour appears to prevail in the whole of the species, differing only in shade. The genera which are most productive of coloured stemmed species are Rosa, Rubus, Cornus, Salix, Acer, Spiræa, Philadelphus, Betula, Berberis, and Tamarix, with odd species from other genera.

Among species of Roses, some of the best coloured are R. carolina, R. lucida, R. nutkana, R. ferruginea, R. pomifera, R. acicularis, and R. blanda with red stems, R. rugosa with light-coloured bark thickly covered with brown spines, and R. alpina with red stems thinly coated with purplish bloom, the latter being the most conspicuous of all.

Many of the species of Rubus, such as R. villosus, R. corylifolius, and R. laciniatus, have red stems, but more conspicuous are those which have their stems coated more or less thickly with white bloom. The best of these are cæsius, lasiostylis, biflorus, leucodermis, neglectus, and racemosus. Cæsius has red stems coated with grey bloom, the bloom not being too thick to hide the red beneath. Lasiostylis is a Chinese species, resembling in habit our common Raspberry. The stems are thickly covered with white bloom and short purple spines. Biflorus is, perhaps, the most conspicuous of the whole group. It is a temperate Himalayan plant of vigorous habit. The stems are so thickly coated with white bloom that people often imagine that they have been painted. It is, without doubt, one of the most remarkable of our coloured stemmed shrubs. Next to this the most striking is neglectus. In this case the stems are bright red, and thinly covered with white bloom, with occasional thicker patches of bloom which, in some lights, has a violet tinge. Leucodermis has red stems thickly coated with bloom. Added to these there are deliciosus, spectabilis, and odoratus with light brown stems, and phæniculasius with green and red stems thickly covered with reddish brown hairs, and a few strong spines of the same colour.

Of Salix we have the red, yellow, and purple barked forms of S. vitellina, the yellow stems of lucida, daphnoides with the young shoots coated with white bloom, and fragilis var. basfordiana, a tree of considerable size, with the young growths red and yellow.

The genus Cornus adds considerably to our list, as some of the very best coloured stemmed plants belong to this family. The most conspicuous are alba and its varieties, Baileyi, Nuttalli, amomum, sanguinea, and stolonifera with red stems, and alternifolia with dark purple stems; also a yellow stemmed variety stolonifera.

Several Acers have ornamental stems, the most noticeable being Ginnala, which has the old wood brown and the young red, japonicum and varieties, and palmatum with stems varying in the different varieties from grey to dark red, and argutum with bright red stems.

In Spiræa and Philadelphus the stems of most of the species are bright brown, the colour being more marked throughout the latter than the former genus. Of Spiræas the brightest are S. salicifolia, canescens, japonica var. glabrata, bracteata, media, arguta, and Menziesi. Several of the Berberis have red or brown bark, the most noticeable species being virescens with red, and integerrima with dark brown stems.

Among other genera which have one or more species with bright-coloured bark there is Tamarix, with very dark purple, almost black stems. Ribes, with the species sanguineum, with reddish-brown stems; aureum, with brown; alpinum, with grey stems; and speciosum, with the young wood light and the old wood dark. Neillia opulifolia var. lutea has bright brown bark, as also has Stephanandra flexuosa and Nevinsia alabamensis. Added to these we have the bright green of Kerria japonica, and the numerous species of Cytisus and Genista; also the greenish-brown young wood of Staphylea trifolia, and the red stems of several of the species of Ceanothus. Although not exactly beautiful, the winged stems of Euonymus alatus are interesting. The stems are four cornered, the angles being formed of cork, which extends along the whole of the growth.

Among trees we have the bright brown of Taxodium distichum, the silvery trunks of Beech, and the golden bark of Fraxinus excelsior var. aurea, together with a great variation among the species of Birch. Of the latter the common Birch, Betula alba, is well known, its white trunk and dark pendulous branches being very conspicuous among other trees. Besides this there are papyrifera and ulmifolia var. costata, both with white bark; Ermanni, with the old bark dark brown, which during winter peels off, leaving the young bark beneath white; and lutea and nigra, with dark brown bark. The manner in which large strips of the outer bark of nigra peel off is very interesting. A plant of this should be found in all collections.

Many more plants could be mentioned which are more or less useful and interesting from a gardener's point of view, but these will be sufficient to show what a wide variation of colour exists in the bark of hardy trees and shrubs. The colour is always best in well-grown first year's wood, so it is necessary to aim at good wood each year if an effect is wanted. In large gardens or parks a few masses of these coloured stemmed plants will be found an acceptable addition, especially as some will grow where really good flowering shrubs would be a failure. By the side of a pond or lake, or on a marshy piece of land, the varieties of Salix vitellina would be at home. (It may be mentioned, in passing, that to obtain the best colour from these the wood should be cut hard back each spring, so that long young shoots are made.)

In drier places masses of Cornus would look well, particularly if planted thinly and the ground beneath carpeted with Winter Aconites, Snowdrops, Chionodoxas, or kindred plants. The white Rubus looks well when grown near masses of evergreen shrubs. Masses of Cornus sanguinea, species of Roses, and Spiræas might be made in parks and plantations, where, besides being bright in winter, they would be useful as cover for birds. Most of the plants mentioned are of the easiest cultivation. Many grow well in inferior soil, but it is better to give a little good soil to last the plants for the first year or two; after they have once become well established they will take care of themselves.—W. D.

CULTIVATION OF PERENNIALS.

PERENNIALS are becoming very fashionable, and deservedly so, as they are better suited to our climate and give a greater display for a longer period than many of our tender bedding-out plants that require housing nearly eight months in the twelve. What is more beautiful in the autumn months than a carefully selected border of perennials, planted in large patches, coming into flower just as the tender bedding-out plants are almost past their best?

Many of the tall-growing sorts are suitable for room or table decoration, as they can be cut with a good length of stem; in fact some are quite as suitable for that purpose as many of our "stove" or "greenhouse" flowers, and when arranged with taste the effect is all that can be desired.

Perennials require good cultivation, as they soon exhaust the soil of nourishment; and on that account we make a practice of lifting all plants every third year, and give the border a good manuring, putting in plenty of leaf mould and wood ashes along with the manure.

Although perennials can be planted almost any period in the winter and spring months, I consider November the best time to lift and re-arrange them, provided the weather prove suitable for the operation, as the plants will then make fresh roots and establish themselves before the shortest day. Our soil being rather light and of a sandy nature here, I make a practice of putting the manure next to the subsoil, thereby inducing the roots downwards, so that should the summer be very hot and dry, they are then able to withstand the drought with impunity.

Perennials require as much attention in their culture as any other plants if good results are expected, and when well arranged, according to height, in a long border they are very effective indeed.

Calceolarias give a poor return for the labour bestowed on them, especially in a very dry season, as we have discarded them altogether and found an excellent substitute in Viola Ardwell Gem. This Viola is very sweet scented, the colour very pleasing to the eye, being of a bright lemon, and is greatly admired by all classes. I have not seen any Viola that can surpass it in constitution, and for standing the drought. It also flowers longer than any I know of, throwing the flowers well above the foliage.

Before ending this note on perennials I may here remark that if successful results are anticipated the plants must be lifted regularly as advised above, or they will soon overgrow themselves, and then look very unsightly; instead of throwing up good spikes of flower they will degenerate. On the other hand, if done as recommended, they will give satisfaction to employer and employed alike. Such has been my experience in different localities. I think there is a great future for herbaceous perennials, as they make a grand display when carefully selected, surpassing our tender bedding-out plants, and are also more useful for cutting and decorative purposes. There is an endless variety of perennials, and tastes differ so much, that I defer giving a list of any specially.—W. K. PETTIGREW, *Hewell Grange Gardens.*

ORCHIDS

Cattleya Fabia.

At this season of the year, when every show is almost wholly taken up by Chrysanthemums, it is pleasant to turn to the Orchids in search of change. This is not the time of year when Orchids are seen in their best dress, but the Royal Horticultural Society rarely fails to secure a few choice specimens at its Drill Hall exhibitions. On November 9th there were several charming plants shown, and amongst the most prominent was Cattleya Fabia, staged by Mr. J. Smith, Orchid grower to the Right Hon. Joseph Chamberlain, Highbury, Birmingham. It is a hybrid resulting from a cross between C. labiata and C. aurea. The sepals and petals are rich rose and the lip is velvety crimson, paling slightly towards the margins. A flower is depicted in the woodcut (fig. 74), from which an idea of the handsome form of the flower may easily be had. The Orchid Committee awarded a first-class certificate to C. Fabia.

Dendrobium bigibbum.

When seen in good cultural condition there are few more beautiful or brighter Dendrobiums than this North Australian species. Not only are the individual blossoms very fine and richly tinted, but they are produced in considerable number upon the spikes, the latter occurring both on the apex of the new pseudo-bulbs, and also from the sides of the older ones. It grows from a foot to 18 inches in height, the blossoms being about 2 inches across, of a rich deep magenta in the type, the lip being a deep purple shade in front. The variety superbum is larger and brighter in colour, while album or candidum has the sepals and petals pure white, the lip having a deep purple blotch on either side.

Like most of the Australian kinds, D. bigibbum requires rather different treatment from that of the deciduous and the ordinary evergreen kinds. As often as not the growth commences just at the worst time of the year—that is, in autumn. In summer it is easy enough to keep up a warm and moist temperature, combined with a brisk and buoyant atmosphere, but as the season goes on and the sun gets lower it becomes increasingly difficult to do so. But the plants must be kept gently moving when once they have started; if they can be kept dormant until the spring by all means keep them so, but do not force them to rest by withholding moisture when it is apparent that the plants are becoming active.

I have had good results by placing the plants in a house with Phalænopsis or other East Indian kinds of Orchid, but in many places nowadays a separate compartment is kept for these Australian kinds; anyway, what they need is a nice genial growing temperature, with not sufficient moisture on the one hand to cause a weak spindly growth, or too little, which brings insect pests in galore and checks the growth. It is imperative that every ray of light obtainable reach the plant, and for this reason they should be suspended as near the glass as possible.

Keep up this nursing treatment until the new year is getting advanced, when with the increasing light much less care is necessary. They may then be grouped with the Wardianum, crassinode, and similar kinds, and will thrive admirably together. A strict resting season is not required—in fact, would be harmful; but it is easily seen when growth is at its lowest ebb, and at this time a little reduction should be made in the water supply, and an airy, comparatively dry atmosphere is advisable. While the plants are in flower too much moisture is not to be advised, for the blooms, though of good texture and lasting quality, are easily damaged by damping. They may not be actually wetted from the syringe, but the moisture gathers upon them, more especially at night, and when the sun shines on them in the morning the mischief is done.

The flowers over and growth on the wane, it becomes necessary to give new compost either in the form of top-dressing, or a new pot or basket. Personally I have not much faith in top-dressing this class of Orchid. Their roots are small, and they run near the surface, and it is almost impossible to remove old material or to dibble in the new without disturbing some at least of these. Then many beginners in Orchid culture, instead of mixing crocks and charcoal with the peat and moss for top-dressing, use the latter by itself, and gradually thicken the compost until it holds far too much moisture.

In such cases it would be safer to leave the plants alone for another year, and then repot, turning the plants carefully out of the old material and removing all old decayed compost and dead roots. This species may be planted in pots, in pans for suspending, or in wood baskets according to the fancy or convenience of the individual grower, only be careful not to place too much compost about the roots, and owing to their dislike of this, I prefer the small pans for suspending. These may be filled two-thirds of their depth with clean crocks, about an inch of compost being ample for any except very large specimens. Cover the crocks with a layer of rough sphagnum, and place the plants so that the leading pseudo-bulbs just rest on the top of the compost, the latter being neatly trimmed off to a cone-shaped mound.

Fig. 74.—Cattleya Fabia.

For compost use equal parts of the best fibrous peat and moss, the latter being used in a fresh and living state. Add small crocks and charcoal in plenty, either beforehand or when placing the compost. This must be firmly placed, as the roots, though disliking anything sour or close, are partial to a firm and fairly solid medium. There are not many insects that trouble well-grown Dendrobiums, but should red spider or thrips put in an appearance at any stage of growth, they should be at once removed by sponging or the vapourising fumigator. D. bigibbum, as noted above, is a North Australian species, and although it has been in cultivation since 1824, it appears to have been lost to sight for a long time, and was subsequently rediscovered by Dr. Thomson in 1855.—H. R. R.

ROSES

Mildness of November.

At the Bristol Chrysanthemum Show, on the 17th and 18th, three silver cups (as special prizes) were offered by Mr. W. Kemp, Bristol, for the best stand of twelve Tea-scented Roses, not less than six varieties. For these prizes seven stands were staged, the first prize awarded to that veteran amateur, Mr. Thos. Hobbs, with a clean, fresh, and beautiful stand, consisting of Niphetos (2), Maman Cochet, Madame Willermoz (2), The Bride, Caroline Testout, Madame Lambard, Catherine Mermet, Marie Van Houtte, and Corinna, cut from his Rose ground (except Niphetos), one of the highest points in Gloucestershire.—Exhibitor.

Rose Crimson Rambler.

Mr. Chapman's interesting letter on page 474 will be very welcome to those of your readers who are curious as to the introduction of this popular Rose to Europe. As a connecting link between the early days spoken of by Mr. Chapman, when it bore the name of "The Engineer," and the present time, we may say that it was exhibited at the Edinburgh Rose Show in 1887 under the name of Paniculata. Through the kindness of friends in Scotland we obtained buds of it, and we had it growing in our nursery here under the name of Paniculata for some time before it was exhibited and sold under the name of Crimson Rambler.—Wm. Paul and Son, *Waltham Cross.*

The Propagation of Roses from Seeds.

In the issue of November 18th Mr. W. H. Divers asks for information on the above subject. At Kew many species of Roses are raised from seeds yearly, and on the whole germinate fairly well. At various times different methods have been tried, of which the following is considered the best.

When home grown seeds are sown, they are sown thinly as soon as gathered. Well-drained pots or pans (according to the quantity required) are filled with a mixture of two parts loam, one part leaf soil, and one part sand. They are covered to the depth of a quarter of an inch with fine soil, and the receptacles are plunged outside in a bed of ashes for the winter. About the beginning of March they are taken into a slightly heated house, stood on a warm bed of fibre, and kept shaded night and day. During the spring some germinate.

Seeds which are received from abroad during the autumn are treated in the same manner, but seeds which arrive in spring are placed straight in the house. Any seeds which have not germinated by the beginning of September are picked out of the soil and resown. They are afterwards stood outside and left until the following spring, then almost all germinate. They are put outside so that the winter weather shall act on the hard shells of the seeds. They are taken inside in March for various reasons. The extra warmth makes them germinate quicker; they can be kept during spring and summer in a more equal state of moisture, and the tiny plants when they first appear are not so likely to be eaten off by slugs as when outside.

Occasionally seeds germinate in a month from the time of sowing; more often, though, they are from six to twelve months, and often two years, so that it is not wise to throw away any as worthless under two years from the time of sowing.—W. D., *Kew.*

ROYAL HORTICULTURAL SOCIETY.

DRILL HALL.—November 23rd.

The exhibition in the Drill Hall on Tuesday was a very good one, the display of Chrysanthemums being particularly interesting. Orchids and Onions were well shown. Unfortunately there was a heavy fog the whole of the day, which rendered it impossible for the colours to be properly seen.

Fruit Committee.—Present: P. Crowley, Esq. (in the chair); with Messrs. J. Cheal, A. F. Barron, A. H. Pearson, P. C. M. Veitch, A. Dean, W. Bates, G. T. Miles, C. Herrin, G. Reynolds, F. Q. Lane, J. Smith, G. Norman, J. Willard, and R. Fife.

Messrs. T. Rivers & Son, Sawbridgeworth, exhibited six baskets of Apples, comprising splendid examples of Ribston Pippin, Bijou, Buckingham, King of Tompkin's County, Peasgood's Nonesuch, and Cox's Orange Pippin, with Grapes Gradiska and Directeur Tisserand (silver Banksian medal). Mr. Bayford, gardener to C. Lee Campbell, Esq., Glewston Court, Ross, exhibited thirty-two dishes of Apples of distinct varieties. The specimens were clean, and so far as could be seen, splendidly coloured. Perhaps the most prominent were Lane's Prince Albert, Tyler's Kernel, Dumelow's Seedling, Maltster, Cox's Pomona, Queen Caroline, Golden Noble, King of the Pippins, Bess Pool, Peasgood's Nonesuch, Bramley's Seedling, Alfriston, Bismarck, Warner's King, and Emperor Alexander (silver Banksian medal).

Mr. E. Beckett, gardener to Lord Aldenham, Aldenham House, Elstree, sent seven heaps of magnificent Onions. The varieties were Barnet Hero, Sutton's A1, Cocoa Nut, Ailsa Craig, Anglo-Spanish, Green's Prizetaker, and Cranston's Excelsior (silver Banksian medal).

Prizes for Flavour.—Mr. G. Woodward secured the premier prize in the Apple class with Cockle's Pippin in fine condition, and was followed by Mr. Bayford with Cox's Orange Pippin. In the Pear class the first prize went to Mr. J. Crook with Winter Nelis, and the third to Mr. G. Woodward for Nouvelle Fulvie.

Floral Committee.—Present: W. Marshall, Esq. (in the chair); with Messrs. C. T. Druery, H. B. May, R. Dean, G. Stevens, J. Hudson, T. Peed, R. B. Lowe, H. J. Cutbush, J. D. Pawle, J. Walker, C. E. Shea, C. Blick, H. Turner, R. M. Hogg, and C. Jeffries.

Mr. F. Cubberley, gardener to J. W. Temple, Esq., Leyswood, Groombridge, staged a grand group of Begonia Gloire de Lorraine. The plants were in 48 and 32 pots, and were simply a mass of flowers. The value of this plant for winter flowering was never better exemplified than by this exhibit (silver-gilt Banksian medal). Messrs. Cripps & Son, Tunbridge Wells, arranged a group of Poinsettia pulcherrima, margined with dwarf Palms. The plants were dwarf, and carrying finely coloured bracts of good size (silver Banksian medal). Messrs. J. Veitch & Sons, Ltd., Chelsea, sent a few plants of the beautiful hybrid Begonia Mrs. Heal, of which the colour could not be properly seen in the bad light.

Messrs. H. Low & Co., Upper Clapton, sent a number of plants of Carnation Winter Scarlet, a free-flowering fragrant variety. From the same source also came small plants of Begonia Gloire de Lorraine. Messrs. W. Cutbush & Son, Highgate, staged a collection of Pernettya mucronata. The plants were fruiting splendidly, but the various colours could not possibly be properly seen (silver Banksian medal). Mr. W. J. Godfrey, Exmouth, sent some charming Carnations, together with Chrysanthemums F. F. Domoto, Mrs. Maling Grant, Lady Northcote, and Mrs. Peabody.

Mr. W. L. Calcutt, Stoke Newington, exhibited a table of vases of Chrysanthemums, with other flowers and foliage (silver Flora medal). Mr. A. H. Rickwood, gardener to the Dowager Lady Freake, Fulwell Park, Twickenham, staged a number of Chrysanthemums in variety, mostly grown for decorative purposes, as cut blooms (silver Banksian medal). Mr. R. Owen, Maidenhead, arranged five boxes of Chrysanthemum blooms, amongst which several of the leading varieties were noticed, as well as a new incurved named Mrs. W. C. Egan (bronze Banksian medal). Messrs. Vilmorin, Andrieux, & Co., Paris, sent a few plants of Primula obconica.

Mr. W. Wells, Earlswood Nurseries, Redhill, was represented by a large collection of Chrysanthemums, comprising single, Pompon, and decorative varieties, as well as many excellent large Japanese blooms. These were of very fine form, with only here and there any suspicion of coarseness. Prominent amongst the many were Julia Scaramanga, G. J. Warren, Mdlle Laurence Zédé, Georgina Pitcher, Madame Carnot, Ma Perfection, C. W. Richardson, Gertrude Salter, Mrs. F. A. Bevan, Mons. Panckoucke, Snowdon, Madame Ferlat, Sunstone, Australie, Western King, Julian Hilpert, Graphic, and Madame X. Rey Jouvin (silver-gilt Banksian medal).

Undoubtedly the most conspicuous exhibit in the show was the table of Chrysanthemums arranged by Mr. H. J. Jones, Ryecroft Nursery, Lewisham. Besides the cut blooms shown in boxes in the orthodox manner, there were singles and small flowered varieties shown on long stems, and some large vases containing about a dozen blooms each. These latter were very imposing, and produced an excellent effect. Interspersed amongst the flowers were Palms and Ferns. Very conspicuous were Edith Tabor, Miss E. Addison, Western King, Mons. Desblanc, Duchess of Fife, Graphic, Yellow Madame Carnot, Mrs. R. Jones, Australie, A. H. Wood, Master H. Tucker, W. Wright, Mdlle. Thérèse Rey, Ma Perfection, Ernest Cannell, The Egyptian, Madame Ferlat, Bonnie Dundee, Kahma, Nyanza, and Hairy Wonder (silver-gilt Flora medal).

Orchid Committee.—Present: H. J. Veitch, Esq. (in the chair); with Messrs. J. O'Brien, De B. Crawshay, H. Ballantine, F. Sanders, H. M. Pollett, A. H. Smee, W. H. Young, H. J. Chapman, E. Hill, and S. Courtauld.

Messrs. H. Low & Co. were represented in the Orchid section by a small collection, comprising Cattleya labiata in variety, C. Bowringeana lilacina, Vanda cœrulea, Oncidium Forbesi, with Cypripediums Leeanum superbum, L. giganteum, L. compactum, Sallieri Hyeanum, enfieldense and œnanthum superbum (silver Flora medal). Messrs. Sander & Co., St. Albans, staged a number of Orchids of good quality, and in fair variety. The fog unfortunately marred the effect very considerably. We noticed Cypripediums Leeanum villosum, L. superbum, L. excellens, L. giganteum, and L. delicatum, Phaius Ashworthianus, Calanthes Bella and Florence, Dendrobiums Johnsoniæ, and Habernaria carnea, besides several others (silver Banksian medal).

The little group of Orchids effectively arranged by Messrs. J. Veitch and Sons, Ltd., was exceedingly interesting. The bulk of the group was taken up by Cypripediums, of which there were Aeson, Leonidas, Actæus, Sallieri, Leeanum, Prospero, Euryades, Roberti, Io grande, Pheres, Œone, Chamberlainianum, Tityus, Niobe, and œnanthum superbum. In addition to these, we observed Lælio-Cattleya Pallas, L.-C. Decia, L.-C. Tiresias, L.-C. Semiramis, L.-C. Statteriana, Cattleya Mantini, Zygopetalum Mackayi, and Oncidium Forbesi (silver Flora medal). Mr. J. Smith, Orchid grower to the Right Hon. Joseph Chamberlain, Highbury, Birmingham, staged Cattleya Miss Williams and Lælio-Cattleyas Ophelia, Clive, Gottoiana, corbeillense, and albanense (silver Banksian medal). Mr. H. Ballantine, gardener to Baron Schröder, The Dell, Egham, sent Odontoglossum Dayanum.

Certificates and Awards of Merit.

Apple Lady Falmouth (G. Chambers).—A small dessert Apple resembling Court Pendu Plat. The fruit is somewhat flattened, and has an open eye set in a broad, shapely basin. The stalk is short and deeply

inserted in a russety cavity. The crimson colour spreads over almost the whole surface (award of merit).

Begonia Julius (J. Veitch & Sons).—Another hybrid resulting from a cross between B. socotrana and a tuberous-rooted variety. The profusely borne flowers are double and of a salmon pink colour. The plant is about 12 inches high (award of merit).

Cypripedium Beckmani (L. Linden).—The large dorsal sepal is bright green with large brown blotches. The petals are very broad and of a shining chocolate hue, the pouch being a lighter shade of the same colour (award of merit).

Cattleya Empress Frederic var. Leonata (J. Veitch & Sons).—This is a grand flower. The broad sepals and narrow petals are rich rose. The lip has a velvety crimson central blotch and rose hued margins. The side lobes are yellow veined with crimson (award of merit).

Cattleya labiata White Queen (J. Barker).—Save for a suspicion of yellow on the lip this is a pure white form (award of merit).

Chrysanthemum Georgina Pitcher (W. Wells). — A grandly shaped incurved Japanese, with very broad florets. The colour is pale yellow (award of merit).

Chrysanthemum Julia Scaramanga (W. Wells).—Raised by Mr. Silsbury. This is a long floretted Japanese that builds up a fine flower. The colour is deep terra cotta (award of merit).

Chrysanthemum Mary Molyneux (N. Molyneux).—An immense incurved Japanese with twisted lower florets. The colour is pale pink with a silvery reverse (award of merit).

Chrysanthemum Mrs. H. Folkes (H. Folkes).—Another addition to the many white Chrysanthemums. The flower as shown was somewhat flat (award of merit).

Chrysanthemum Mrs. F. A. Bevan (W. Wells).—A fine reflexed Japanese of a clear pink shade (award of merit).

Grape Directeur Tisserand (T. Rivers & Son).—A black late Grape of much promise. The skin is thick, and the flesh is very sweet and juicy (award of merit).

Lælia Olivia (J. Veitch & Sons).—A lovely hybrid, resulting from a cross between L. xanthina and L. crispa. The sepals and petals are pure yellow, and the charming lip is yellow with purplish crimson veins, and a blotch of a similar shade in the centre. The margin pales off slightly (award of merit).

Odontoglossom Dayanum (H. Ballantine).—The narrow sepals, petals, and lip of this Orchid have a ground colour of green. The numerous spots are brown, of which colour there is a large blotch on the lip (award of merit).

GRAPES AT BYFLEET, SURREY.

I COULD but remember with some amused feeling the little burst of anger made evident so recently over a R.H.S. medal award to a few bunches of Grapes, when visiting Mr. G. Bury's vineries at Byfleet, and seeing the splendid crop he has, and the excellent samples he has also; and this fine result obtained from a sheer bed of sand, and from Vines that have been—not three years, but ten years planting, having during that time borne huge crops. The houses are two, 336 feet long, spans of 25 feet wide, and they are planted in equal portions of Black Hamburgh and Muscat of Alexandria in one, and Black Alicante and Gros Colman in the other. It was when looking at these latter, noting the handsome bunches and their grand berries, so well coloured and finished, that I was reminded specially of the little outbreak referred to.

It is just possible that at the January meeting, when Grapes are getting scarcer, Mr. Bury may send up some samples of his Grapes for the Committee to judge of the fruit products of a deep bed of sand. Inside the houses this much resembles walking in a sandpit, it is so deep and loose. Probably there is not a grower of Grapes in the kingdom but, asked for an opinion as to the merits of the soil here for Grape culture, would have condemned it. If so, certainly a look through these long vineries now would alter that opinion, for the crop has been again this season so great a one, that it is really marvellous how the Vines can, year after year, go on producing them.

Mr. Bury, like the general run of market growers, is a very modest, unassuming man, and makes no fuss over his crop. The loss of a thousand medals or prizes would not disturb his equanimity. No one knows better than he that he has had a first-rate Grape crop, and if prices now do not rule very high, at least he, in common with other growers, strives to make up that deficiency by heavy crops. Generally these market men go on year after year producing fully double the weight that private gardeners get, and they have fine samples and quality also.

The Vines in both houses are planted on each side at about 4 feet apart, and on each of the four sides there are eighty-four, or a total of 336. The rods reach to an average length of 11 feet, and as there are many supernumerary or additional rods to Vines, the actual number is about 400, which multiplied by eleven, gives a total length of 4400 feet run of rod, and taking a further average of twelve bunches to a rod, a very low estimate, that would give for the season some 4800, and doubtless double that quantity in pounds. Of course these vineries are only small ones amidst the vast area of glass devoted to Grape culture in this country, but they serve to show how immense the produce must annually be over the entire area.

Gardeners may often do well to visit one of these market places and note the process of culture. Mr. Bury feeds chiefly with superphosphate, sulphate of potash, and gypsum, occasionally flooding the inside border with water. Probably we should hear of fewer Grape failures were more sand employed in forming Vine borders.—A. D.

Notes & Gleanings

EVENTS OF THE WEEK.—We may now consider ourselves at the end of the Chrysanthemum season, for there are only a few late shows to be held. Horticulturists will doubtless welcome the little rest that follows the season of the autumn queen. So far as we are aware there are no events of particular interest fixed for the forthcoming week within the metropolitan area.

—— WEATHER IN LONDON.—Since our last impression went to the machines we have had some beautiful weather, the sun shining brilliantly on several days. Almost every morning and evening has been more or less foggy, Sunday evening and Monday morning being very dense and unpleasant. It was almost dark throughout Tuesday, and the same conditions prevailed on Wednesday.

—— VICTORIA MEDALLISTS OF HONOUR.—With the issue of the *Gardeners' Magazine*, dated November 20th, was presented a large plate, comprising portraits of the sixty medallists. We congratulate our contemporary on the admirable manner in which it has carried out what must have been a tedious and extremely difficult operation.

—— THE POSTAL AUTHORITIES SCORE.—In the way of curious addresses this probably deserves a place :—

Dobies Seedsman and
Florist
Scotland
i know no other
Address kindly
find them.

The communication came from Nuneaton, and was successfully delivered in Rothesay without delay.

—— ORIGIN OF CAMPANULA ISOPHYLLA ALBA.—Mr. L. Castle, in his notes on the Cambridge Botanic Garden, in your issue of November 4th, refers to this plant in connection with my name, and since practically nothing about it is known it may be useful if I place on record the origin of so very popular a plant. In the year 1870 I took charge of the herbaceous department at Kew, and soon after raised this as a chance seedling from the type. The type itself was then new, having been introduced to Kew by Mr. J. T. Moggridge, and the white variation was obviously at once choice and good for distribution. For this purpose, therefore, I got up a stock, and by about 1872 or 1873 it was in the hands of the leading nurserymen who were interested in herbaceous plants. Personally there is a good deal of interest in having been instrumental in preserving so useful a variation, and there is also a great deal of interest in the fact that so popular a plant originated at Kew.—R. IRWIN LYNCH.

—— NATIONAL AMATEUR GARDENERS' ASSOCIATION (LIVERPOOL BRANCH).—On Thursday evening a large attendance of members met at the monthly meeting held in the Common Hall, Hackins Hey, Liverpool, the President (Isaac C. Glover, Esq.) in the chair. The exhibits consisted of Chrysanthemums, the quality of which was decidedly improved in every way. For twelve cut blooms Japanese Messrs. Cangley and Geo. Chappell, jun., were so close as to warrant the first and second prizes being divided. The blooms were fresh and well coloured. Mr. Baddeley was awarded third prize. Mr. Ardran was given first prize for six very pretty Japs. Mr. A. Cooper took second for six incurved, Mr. Hoskyn full points for a charming basket, and Mr. Robins for a hand bouquet in yellow-and-white. Other flowers were put up for points, the exhibits altogether being very much admired, and the interest taken by all present being sufficient guarantee of much good work in the near future. The paper of the evening was by Mr. Cliffe, head gardener to H. Lawson, Esq., of Blundellsands. Mr. Cliffe is well qualified to speak on the culture of Chrysanthemums, having at the late show at Blundellsands carried off both the silver cups for his exhibit of this popular flower. His remarks were listened to with great attention, and a large number of questions as to pinching and bud-taking were put to the lecturer. The paper was generally pronounced to be one of the most practical and useful of those read before the branch. A very cordial vote of thanks terminated the proceedings.

—— Indian Appointment.—We learn from the "Aberdeen Journal" that Mr. James Simpson, lately of the Royal Horticultural Gardens, Chiswick, London, and formerly residing at Cults, Aberdeen, has received from Mr. Thomas M'Meekin, Falkland Park, South Norwood Hill, London, an appointment on his Tea estates in Assam, India. Mr. Simpson entered the service of Messrs. James Cocker and Sons, nurserymen, Aberdeen, as an apprentice, and during his apprenticeship he (in 1893) received the Royal Horticultural Society's certificate for examination in horticulture. Thereafter, in April, 1894, he went to the Society's gardens at Chiswick, going through the various departments, where he had ample opportunity for study, of which he took full advantage. He was for over two years Hon. Secretary and Treasurer of the Chiswick Gardeners' Mutual Improvement Association, and held the South Kensington science and art certificates in mathematics, drawing, and botany. Mr. Simpson left for Assam by the British India Steam Navigation Company's ss. "Manora" on Friday last.

—— Mr. W. W. Astor's Round Table.—The section of a Californian Redwood tree, with which Mr. W. W. Astor wins his wager, has been safely brought to Cliveden. The wager was the result of some statements made by Mr. Astor at a dinner party, concerning the size of the Californian Redwoods, the owner of Cliveden staking a considerable sum on his ability to produce a cross-section of one of the trees capable of accommodating forty guests when used as a dinner table. The section shipped from San Francisco, is 2 feet in thickness, with an average diameter of 15 feet 6 inches, and a maximum diameter of 16 feet 6 inches. Considerable difficulty was experienced in bringing the slab of timber by road from London to Cliveden, sixteen horses being employed to draw the trolley on which it was placed. At Cliveden it was taken down the grass drive, and owing to the splintering of the planks beneath the wheels the latter frequently sunk deep into the turf.

—— Prunus Pseudo-Cerasus.—The "Garden and Forest" says: "Of the exotic trees recently introduced into American gardens one of the most promising is the Japanese Prunus Pseudo-Cerasus, which has for several years proved hardy in the Arnold Arboretum, where it is growing rapidly and has not yet been attacked by insects or fungal diseases. Forms of this tree or of some allied species with double flowers are now rather common garden plants in the United States and Europe, but these are less hardy and of much slower growth than the wild type, which appears to be rare in American collections. It is the largest tree of the Rose family in Japan, and, next to the Apricot, more cultivated for its flowers by the Japanese than any other tree. In the forests of Yezo, where it is very common and sometimes 80 feet high, with a trunk 3 feet in diameter, it resembles in the appearance of the bark and in habit the wild type of Prunus Cerasus, the Cherry tree of our gardens. In autumn it is particularly beautiful, as the leaves turn deep scarlet and light up the forest before the Maples assume their brightest colours.

—— Royal Meteorological Society.—The opening meeting of the session was held on Wednesday evening at the Institute of Civil Engineers, Mr. E. Mawley, F.R.H.S., President, in the chair. Mr. R. H. Curtis gave the results of a comparison between the sunshine records obtained simultaneously from a Campbell-Stokes burning recorder and from a Jordan photographic recorder. These simultaneous observations were carried out by Mr. E. T. Dowson at Geldeston, near Beccles, and extended over a period of twelve months. The records were sent to Mr. Curtis for tabulation, who gave the results of his examination in this paper. After describing the methods adopted for the measurement of the records, Mr. Curtis drew the following conclusions from the figures:—(1) In the case of the Campbell-Stokes instrument, the records are capable of being measured with a very fair degree of accuracy. (2) The records of the Jordan instrument afford room for much greater difference of opinion as to what ought to be tabulated, and consequently measurements of the Jordan curves are open to considerably more doubt than are measurements of the Campbell-Stokes curves. (3) When the whole of the photographic trace which can be distinctly seen, but including portions of it which are decidedly faint, has been carefully measured, the amount will approximate sufficiently to that of the Campbell-Stokes instrument to allow of records obtained from both forms of instruments being compared *inter se*. From an examination of the records at other stations, it appears that on some occasions the instruments have begun to record within thirteen minutes after sunrise, and has continued up to ten minutes before sunset. Mr. Curtis concluded his paper by calling attention to various defects in the adjustment and working of the instruments, and pointed out how these might be overcome. After the paper had been read, an interesting discussion ensued as to the merits of the respective sunshine recorders.

—— The Naming of Plants—When naming a plant in honour of some great man liberties are frequently taken in the orthography, and very often the person chosen is more honoured in the name than by anything special that he did to deserve it. The celebrated French botanist, Baillon, had the naming of a plant, from the island of Juan Fernandez, that had never before been named or described. From that island he had naturally the story of Robinson Crusoe in mind, and he thought, to honour Crusoe's man Friday, he would give this plant his name; but he did not call it Fridaya, but translated it into the French name for Friday—that is to say, the sixth day of the week, *Vendredi*, and the plant became described in the books as *Vendredia*. No one would ever suspect from this name that it was intended to honour Robinson Crusoe's sole companion on the desolate island.—("Meehan's Monthly.")

—— Lachenalias as Basket Plants.—Lachenalias, when grown as basket plants for hanging in the greenhouse or conservatory, thrive wonderfully well, and are worthy of more extended cultivation, as they are seen to much better advantage than when grown in pots. The baskets should be prepared at any time from July to September, well lining them with live moss and then filling with a good compost, which should consist of equal parts of loam, leaf soil, and well-decomposed manure, with sand added. The bulbs must be dibbled in the moss at equal distances apart, this operation being performed annually. Abundance of water is necessary after the plants commence to grow. This can best be supplied by immersing the baskets in a bucket or other vessel, care being taken to gradually withhold the supply as the foliage shows signs of decay, after which they should be stored in a cool dry place until time to rebasket them again. At no time should the Lachenalias be subjected to a high temperature, for they will not bear it. I have found L. pendula the most useful and attractive variety to grow for this purpose.—H. T. M.

A RARE NOVEMBER.

Walking through a garden on the 14th of November, with the thermometer standing at 55° in the shade, I was struck with the beauty of the flowers in the beds and borders. True, it was in a favoured district, not far from the south coast, but even there in November one does not expect to find Henry Jacoby Pelagoniums in full bloom. Yet so it was, and plants that had been denuded of their young flowering parts in September in order to make cuttings, had broken out into fresh growth, followed by a wealth of blossom, such as is often looked for in vain during the whole of a wet cold summer. There were also tall specimens of Fuchsias; white and yellow Marguerites were blooming as freely as in summer, while the air was fragrant with the breath of Mignonette and Violets.

And Roses, too; has there ever been such a time for late blooms? Enthusiasts have this year enjoyed a double season. Maréchal Niels and Gloire de Dijons are carrying a profusion of superb flowers—not half-opened, scentless specimens, such as we are apt to picture the last blooms of summer, but fully expanded perfect flowers, that would have borne fair comparison with the ideal Rose of June. Nor were these all, for on dwarf plants were noticed Catherine Mermet, Hon. Edith Gifford, and others, as well as rich red blooms of Hybrid Perpetuals. All these, we must remember, in the middle of November, when under ordinary circumstances we have long since bidden adieu to the queen of flowers.

Rarely have we seen such a wealth of Dahlias and Chrysanthemums as this season. They are autumn flowers, and as such we expect them; but how often there comes that early biting frost, that turns the brilliancy of the former into a blackened mass, and cuts too short the existence of the latter by nipping the buds before they have had an opportunity of opening. Our Indian summer has this year suited them exactly.

Gardeners generally, and particularly those who have much autumn decorative work, will appreciate the late outdoor flowers, as it is needless to say what a difference it makes when severe early frost cuts off the outdoor blooms early, and nothing remains but those under glass. Gardeners feel the loss in such cases severely, as there is not much to fill up the breach before the forced flowers come along. This season, however, there has been no such trouble, as the garden even now is supplying ample outdoor flowers to meet the requirements of most, and here again we feel another benefit derived from the Indian summer of 1897.

Is there no voice also from the kitchen garden telling of double seasons and crops extraordinary? Only the other day I saw a superb dish of Peas gathered and in preparation for the dinner table. The variety was Sutton's Late Queen; and on another row of the old and justly popular Ne Plus Ultra were hanging excellent well-filled pods ready for gathering. Scarlet Runners and French Beans have recently been gathered from late sowings.

Just another remark, and this time—ripened wood. Surely all fruit wood must be thoroughly matured this season, and many are looking forward to a good fruit year in 1898. If the wood were all we might hope with confidence, as it is brown and hard with buds and spurs, plump and showing well; but there is the blossoming time to come, when the flowers have to run the gauntlet of frost and cold wind. However, that is for the future, and my notes have only to do with the present. Never have we had a finer autumn, and the prospects in gardens, orchards, and farms are more than usually cheering at this late period of the year.—G. H. H.

CHRYSANTHEMUMS

Chrysanthemum George Foster.

The season of 1897 has seen the introduction of many splendid new varieties, more especially in the Japanese section. Almost the whole of these have had brief descriptive notes in these pages from time to time, and amongst them was a variety named George Foster. As being of more than ordinary merit we now give an illustration (fig. 75, page 507) of this, reproduced from a photograph kindly sent by Mr. W. J. Godfrey, who is the raiser of the variety. As may be seen, it is a grandly built incurved Japanese with broad very substantial florets of a rich yellow colour. Taking all things into consideration it is more than probable that George Foster will become a valuable Japanese for exhibition purposes. We understand the plant is an excellent grower, and the flowers come good from any bud.

N.C.S. Floral Committee.

A meeting of the Floral Committee of this Society was held on Monday last at the Royal Aquarium, Mr. T. Bevan presiding. First-class certificates were awarded as under :—

J. Chamberlain.—A large spreading flower with long broad florets, curling and incurving at the tips; colour bright crimson with old gold reverse. Shown by Mr. H. Weeks.

Madame Ferlat.—A very large incurved; massive and globular in build, with medium sized florets; white. From Mr. W. Wells.

Julia Scaramanga.—A large, closely built Japanese with long narrow curling florets, twisting and intermingling; colour pale rosy bronze. Also from Mr. Wells.

From M. Anatole Cordonnier of Bailleul, France, came some fairly well-grown blooms, one of which, called Don de la Madone, a white Japanese, was commended. The Committee wished to see again M. A. E. Feaver, a bronzy yellow-and-crimson incurved. A vote of thanks was awarded to Mr. C. Gibson for six blooms of white incurved Japanese called Mustapha. Other good novelties of promise were Madame J. Chauré, M. J. J. Glessner, Lucien Rôiny, and Surpasse Amiral.

N.C.S. General Committee.

The General Committee of this Society held a meeting at Anderton's Hotel, Fleet Street, on Monday evening last, when the chair was occupied by Mr. T. W. Sanders. Minutes and correspondence took up some little time, and then a discussion upon the light in the west gallery of the Aquarium on the occasion of the last show, which was generally considered to be bad. A model of the Society's new small gold medal was submitted for approval. It was proposed and carried that the Classification Committee be again called together towards the end of the present or beginning of next year to take into consideration several new varieties of doubtful types. Mr. Higgs was elected on this Committee in the place of Mr. Owen, deceased.

The dates of the General Committee and Floral Committee meetings for next season were then decided upon, and are as follows :—General Committee—August 29th, September 26th, October 24th, November 28th, December 19th, 1898; and January 16th, 1899. Floral Committee—September 6th and 26th, October 11th, 24th, 31st, November 14th, 21st, 28th, December 6th and 12th. There was a good deal of discussion upon other subjects, mostly connected with the shows, and of a formal nature.

The National Chrysanthemum Society.

Seeing that the exhibitions of this great Society have for some time ranked amongst the finest and most representative in the kingdom, and seeing, further, what wonderful success have attended upon the great exhibitions of Chrysanthemums held at Birmingham, Hull, Edinburgh, Belfast, and in other large provincial towns—shows held entirely on the responsibility of the local societies, and in buildings for the time their own, and apart from all objectionable surroundings, I venture to suggest that what can be done with such splendid results elsewhere, may be carried out with equal success in London. Why should visitors to the N.C.S. show, who want to see and enjoy the Chrysanthemum, be debarred that capacity for enjoyment in London which other towns furnish?

There is no exhibition, and such a grand exhibition too, that suffers so in being cut up and distributed all over the place, the grand exhibits being stuck here and there to suit the requirements of the Aquarium manager, as does the one of the National Chrysanthemum Society. Out of the many thousands of persons who crowd the place on the show days two-thirds at least are attracted there to see the show. Is it not time that the executive resolved to break away from the thraldom which makes the Society the slave of the Aquarium authorities? In no other place in the kingdom is this state of things existing. I am sure there are thousands of the patrons of Chrysanthemum kept away because they do not like the place, and thousands who go there would prefer to see the show anywhere else. I hope the executive will face this matter boldly.—A. D.

Robert Owen.

This fine Chrysanthemum is not so often seen at shows as it ought to be. Perhaps some growers think it too near the incurved class for Japanese. I have here six plants in 8-inch pots—each carrying three blooms—one of which I send as a specimen. Some experience a difficulty in growing it, but I am glad to say it comes good here every year without any special treatment. The bloom sent is 4½ inches deep, and 17 inches in circumference.—A. J. Long, *Wyfold Court, Oxon.*

[The specimen was a good one, and showed that Mr. Long's treatment was appreciated.]

Staging Chrysanthemums at Exhibitions.

As each season goes by there is always some new feature of beauty to note in the Chrysanthemum world. It may be that a colour Nature has so long denied comes upon us in full glory in the shape of a "sport" or seedling; or perhaps some bold and artistic grower hits upon a novel idea for arranging his plants to form an effective group. Such departures both gardeners and the public in general hail as a welcome change.

In regard to cut blooms in the big classes, we still adhere to the style which has been so long in vogue, although at many shows classes are provided for blooms staged with long stems and arranged among plants or other foliage, as well as for blooms shown in large vases. These are welcome departures from the beaten track which make a distinct feature and invariably command much admiration. At present, however, there is not the slightest sign that the long practised style of staging will be superseded, because of the great difficulty experienced in packing securely for travelling blooms on long stems. As the size of blooms continues to increase, this difficulty is not likely to be diminished in the future. Should any society, therefore, be bold enough to offer all its prizes in the cut bloom section for flowers on long stems it would have to depend on local growers for exhibits. This would not be likely to lead to any great advance in culture, as there is nothing like open competition to raise the standard of excellence at shows in general.

Seeing that the old and well tried method of staging is likely to continue, every effort ought to be made by exhibitors to render that system as effective as possible. One would naturally suppose that in their own interests they would do this; but strange as it may appear, there are many exhibitors whose stands of blooms show a great lack of taste and judgment in their arrangement. It is not the men new to the work that are the greatest offenders in this respect, as I am acquainted with several old exhibitors who grow grand flowers, and often win at important shows, yet they do not seem to have acquired the "knack" (perhaps they have not the inclination) of displaying their blooms to the best advantage. One may find them staging grand deep Japanese blooms in such a way that the tops of the flowers in each row are almost level with each other, or, at the most, the slope from back to front is not more pronounced than the slope of the stands on which they are shown.

On the other hand, some seem to think that the back row cannot well be placed too high, and aim at forming as sharp an angle as possible. I have an idea that matters might be considerably improved if societies stated in their schedules the height at which the back row of blooms should be arranged, measuring, of course, from the tops of the flowers. In order to prevent disqualification through any slight mistakes exhibitors might make in their measurements, margin of an inch could be allowed. Under an arrangement of the above description uniformity in the appearance of the various exhibits would be obtained at shows where the opposite state of affairs has long prevailed. Judges, too, would find their work slightly simplified, as when flowers are competing stands are fixed at greatly different elevations it is difficult for the eye to catch their relative depth.

The arrangement of colours is also a matter which might with advantage have more attention paid to it than it often receives. The light coloured blooms ought to be so placed as to give the whole stand a well balanced appearance. It is not often that we find such glaring errors made as that of placing two blooms side by side whose colours absolutely clash; but a trained eye in colour blending knows that something more than the mere avoidance of glaring errors is necessary to secure the most finished effect.

When we turn to the classes provided for incurved blooms, the absence of very rough examples is perhaps more noticeable than formerly, but for this the dressers can scarcely be given credit. It is rather because many of the new varieties grow into good form with little artificial aid. To dress blooms thoroughly well a long time is required, and I fancy the percentage of those who take that necessary amount of trouble is less than it was ten or fifteen years ago. There is not generally so much difference between the heights at which various exhibitors set up their incurved blooms as may be observed in the Japanese classes, although I have seen some stands set up far too high to produce the best effect. On the other hand, it is no unusual occurrence to note stands of good blooms which are not set up at all. This season, at an important show, I saw a flagrant error of this description for which the exhibitor apparently paid dearly, as I could—after examining the blooms closely—see no other reason why he failed to obtain a much-coveted prize. In this instance some of the back row blooms were even lower than those in the second one, and the whole exhibit failed entirely in showing the high quality of the blooms until a close inspection had been made. Such unfortunate affairs are, no doubt, exceedingly annoying to the victims, but the judges must, in the case of close competition, give due weight to good staging, and after a grower has worked hard for a whole year to grow fine blooms, he must be singularly deficient in shrewdness if he does not find out and practise the way to stage them to the best advantage.

Sometimes this loose staging is perhaps caused by the narrow margin of time the exhibitor allows himself for staging, but even this can be remedied, as it is far better to reach the scene of conflict the night previous to the show, and have an early start next morning, than to leave home by the first morning train on the show day, and have a "rush" to be ready for the judges.—OLD EXHIBITOR.

CHRYSANTHEMUMS FOR GENERAL PURPOSES.

THE adaptation of the Chrysanthemum for all classes of growers renders their cultivation extremely popular and interesting. Varieties are now so numerous that it is not difficult to find what are best adapted to cultivate under the conditions and convenience obtaining. The Japanese section supplies the bulk of the best varieties. There may be had medium sized and large blooms in plenty of every shade of colour common to Chrysanthemums in general. Many good varieties are found in the reflexed section, which only, as a rule, produce medium sized flowers. Among the Japanese there are varieties with gracefully drooping flowers, others with florets short and stiff, and some with incurving petals, which do so in such a regular manner that we are almost inclined to class them at first sight as abnormally large examples of the true incurved section.

However, this illusion is soon dispelled; for on examination it may be noticed that the florets are longer, broader, and less closely arranged. The size of the flower, too, attains beyond the dimensions of the majority of the true incurved forms. For perfection in the latter, large size as well as quality may not be absolutely essential in every case. When quality, regularity in form, freshness, and good colour are present in blooms of fair size, the lack of extraordinary size is not so conspicuous, nor is it essential, except for the exhibition board. Depth is regarded as of more importance than diameter. For general purposes Mrs. G. Rundle, G. Glenny, and Mrs. Dixon occupy high positions as perfect flowers, but being usually small in size they are not frequently included with varieties of the same class for exhibition. In some instances special classes are arranged for these varieties forming interesting exhibits. I have seen in former years houses of these varieties alone proving attractive and profitable to their owners.

Some incurved varieties may be had in flower very early: for instance, Mons. R. Bahuaut and Baron Hirsch. A few more useful varieties in this class are Jardin des Plantes, a rich golden yellow; Empress of India, white; Madame Darier, nankeen yellow, striped purple; D. B. Crane, bronzy buff and red; Golden Queen, canary yellow; J. Agate, white; Lord Alcester, pale primrose; Nil Desperandum, orange red; Pink Venus; Princess of Wales, pearly white; Refulgens, purple maroon; Sir Titus, silvery rose; Violet Tomlin, purple violet.

Coming now to the Japanese section, I can recommend a selection which includes a number of the older varieties, as well as those of more recent introduction. Nearly everyone, exhibitors and ordinary growers, including beginners in Chrysanthemum cultivation, grows Viviand Morel. As a rule it is a clean, healthy, free-growing variety, with smooth foliage and a dwarf habit of growth, producing the best coloured flowers on second crown or terminal buds. The colour is a blush mauve, the petals long and drooping. If buds are taken on early crowns the flowers are much lighter in colour and not so effective. Similar in growth and habit, time of blooming, but different in colour, is Chas. Davis. It is a sport from V. Morel, and is of a rosy bronze. Like its parent, the colour is better on the second crown or terminal buds. The habit of plant, colour and shape of foliage is similar to V. Morel. There has recently appeared another sport from V. Morel named Lady Hanham, of a golden rosy cerise colour, originating in Yorkshire. It is an attractive variety.

Mr. H. Broomhead is a medium grower, producing flowers of a clear nankeen yellow. Source d'Or does not rank as a show flower, but is one of the leading decorative and market varieties in its particular colour, orange shaded gold. When well grown and not disbudded some excellent sprays of bloom may be secured on long stems. Mdlle. Lacroix, a pure white variety with drooping petals, is still most useful, though it has long been in cultivation, but as a show flower is now superseded by larger. It is wonderfully free-blooming and dwarf in habit of growth. The blooms last well. Mrs. Cox is of a dark amaranth colour. Good blooms of this variety are very effective in a group or mixed collection of flowers, whether the blooms are of medium or large size.

Miss Watson, a Japanese reflexed of a pale or canary yellow, is very free. It does well as a cut-back plant, and the blooms last so well that tinges of pink colour appear on the petals. Pelican is a late December blooming variety of a creamy white. Its colour and late development render it extremely useful. Wm. Seward, a rich and attractive crimson, is one of the best of the dark varieties, and a few plants, having three or four flowers each, effectively brighten up a group. H. Shoesmith may be had very dwarf by cutting low down in May, and the flowers produced will be medium in size, light, and graceful, the colour being a light buff. Good white varieties are always welcome, so even a small collection may well include Princess May. It is of robust habit.

Niveus is a remarkably good pure white variety, either for exhibition or cutting. Plants may be grown dwarf or allowed to grow naturally, as it is not a tall variety. Margot is an excellent decorative variety, either grown as single blooms or when only slightly disbudded. The colour is rosy chamois. W. H. Lincoln holds tenaciously its prominent position as a late yellow. This variety gives good blooms from almost any bud, but to obtain them of large size the number must be limited. Ryecroft Glory is a mid-October variety, doing well without disbudding. The plant is of dwarf bushy growth and the flowers a bright yellow. It is indispensable for an early display. John Shrimpton occupies a foremost place among the dark varieties. The colour is a rich crimson scarlet, and blooms which do not attain to a large size are attractive and useful.

Madame Octavie Mirbeau produces fine, large, and shapely flowers on dwarf stems, the colour being white and rose with a faint edge of amaranth. In a well-grown flower the petals are gracefully drooping. Mdlle. Thérèse Rey is an excellent white with a cream centre, fairly dwarf and easy to grow. Julian Hilpert is one of the newer Japanese varieties. The colour is deep primrose and blooms are rather late, but of an immense size. It is one of the strongest growers, and will attain to the height of 6 feet even when cut down in May. The petals are long and spreading, and as the flower opens there is quite a distinct green hue visible among the young florets. The first bud which appears after cutting down should be taken.

Golden Gate is dwarf in habit, and produces large spreading yellow flowers the latter part of November, and is a decided acquisition both for decoration and cutting. Silver King produces the best flowers allowed to grow naturally and taking second crown buds. The colour of the blooms is rosy mauve. They are slow in developing, but remain in a fresh condition a considerable time. Beauty of Exmouth ranks as a very useful white variety of dwarf habit, which we can hardly afford to exclude. Madame Chas. Molin is another pure white; good blooms are obtainable on second crowns and terminals. Etoile de Lyon may be grown naturally, and allowed to form terminal buds, which give the latest but best coloured flowers. On crown buds the blooms are lighter in colour, and usually larger. Cut-down plants also give good flowers on the crowns. The plants are vigorous growers, producing clean, healthy dark coloured foliage. One of the oldest twisted-petalled varieties is Gloriosum, colour pale yellow.

Col. Chase, a pale blush and yellow variety, has exceptionally neat and gracefully drooping flowers, the colours of which are very pleasing and chaste. It is a variety admirably adapted for formal training, good specimens being this year exhibited at the Aquarium and other shows. Though good yellows among the Japanese are now plentiful, Sir E. T. Smith is worthy of mention, the shade of yellow being a rich golden, the petals broad and flat, tips incurved; a tall and rather slender grower, coming in useful as a late bloomer. Rose Wynne, a delicate blush approaching to a pure white. This is excellent as a large flowering variety for a mixed collection, good flowers being produced from any bud. The petals are regularly arranged, long, and incurving to the centre, which gives the flower a most compact appearance. It is a fine representative of the Japanese incurved section. Lord Brooke also belongs to the last named class, and has good incurved characteristics; the petals are broad and stiff, the colour a bright bronze yellow, shaded red.

Mdlle. Marie Hoste, a dwarf grower, gives attractive flowers of a creamy white, very faintly flushed with claret. Cecil Wray is a gem among yellows; the colour is so deep and bright. The habit of the plant is dwarf, but the growths are rather slender compared with many other varieties. Souvenir de Petite Amie represents one of the best dwarf bushy varieties. Flowers are pure white, and may be grown to a large size with special culture to that end, but the prettiest and best formed flowers are to be had on those of medium size. High culture builds up high deep flowers without adding much to the length of the petals. Thos. Wilkins is an excellent bronze, or deep chrome yellow; succeeds well without extraordinary culture, rendering it well adapted for a mixed collection. Chas. Blick comes rather late, but it has attractive rich yellow blooms, the petals curling and incurving.

Dwarf primrose coloured varieties are rather scarce, but Lady E. Saunders fills up a gap in that respect, and produces excellent blooms. Madame Ad. Chatin is a superb white, the flowers produced being lovely, large, and excellently formed. This variety may be grown dwarf by rooting cuttings secured from the tops of plants after they have made the first break in May or June. Pot into 6-inch pots and secure one flower to each plant.

Elsie, a sulphur white reflexed variety, formerly was much grown for decoration. Though the flowers were small, they nevertheless were useful and attractive. A sport from this variety has now been obtained similar in size, but of a yellow colour. Sprays of this are exceedingly useful for various purposes, and I would recommend its inclusion as a decided acquisition to the decorative class.

Chrysanthemums which bloom in December are specially welcome. Tuxedo is a beautiful addition. The flowers, though not large, are of a nice form and rich colour, a deep orange. Plants grow tall, and the best flowers appear on terminal buds. E. G. Hill may be had, too, at this time. The flowers are orange yellow, shaded red, not large but rich and pleasing. —E. D. S.

SHOWS.

GRASSENDALE AND AIGBURTH.—NOVEMBER 13TH.

THIS increasingly popular show, one of the best in the Liverpool neighbourhood, was held in the Parish Room on the above date, and proved to be even more interesting than on former occasions.

The topic amongst growers has been the destination of the handsome challenge cup, valued at 20 guineas, which was last year presented by Alfred L. Jones, Esq., for twelve incurved and twelve Japanese, the cup to be won two years in succession. Last year's winner was Mr. J. Heaton, gardener to R. P. Houston, Esq., M.P.; but this year the valuable trophy was taken by Mr. Whittle, gardener to R. G. Allen, Esq., Aigburth, who had a splendid stand. Mr. Heaton was a fine second, and was not at all disgraced.

The latter took the prizes in the three other leading classes, also taking many prizes in the miscellaneous classes, other winners in this section, all of which were of exceptional merit, being Messrs. Randall, gardener to A. L. Jones, Esq.; F. Keightley, gardener to Mrs. Duncan; Leadbeater, gardener to W. J. Davey, Esq.; Kelly, gardener to R. Singlehurst, Esq.; and E. Taylor, gardener to E. Pryor, Esq. The latter won with a fine group of plants and a charming basket, 3 feet 6 inches in diameter, arranged for effect.

Grapes were excellent, as was also hardy fruit. Messrs. Jones, gardener to T. H. Bingham, Esq.; Leadbetter; Dickenson, gardener to H. A. Saunderson, Esq.; Taylor; and Maiden, gardener to W. H. Taylor, Esq. Other fine plants, not for competition, were sent by Mr. J. Harrison, gardener to Mrs. Bateson, and Mr. Randall. The chief officials, Messrs. Evans, Fawkes, and Madeley, with a competent Committee, worked assiduously to make the show a success.

BELFAST.—NOVEMBER 16TH AND 17TH.

THE Ulster Horticultural Society has every reason to plume itself on the successful autumn exhibition which was opened on Tuesday in St. George's Markets by the Lady Mayoress. It undoubtedly marks a big stride ahead of anything hitherto accomplished by this progressive and enterprising organisation. The presence of a number of leading cross-Channel Chrysanthemum culturists imparted to the show a truly national aspect, and, while there may naturally enough have been some heart-burning amongst Irish exhibitors on the score of some of the heavy prizes being carried off by the friendly "stranger," the Society gave proof of a comprehensive and liberal enterprise in throwing wide open the doors of competition. This is a policy which is bound to substantially increase both the popularity and the prosperity of the exhibition as the years roll by. It will also tell beneficially upon horticulture on this side the Channel, and already results of an encouraging character are to be noted in this direction.

With the entries increased by about eighty, and a notable improvement in many of the sections, this year's exhibition stands pre-eminently higher in the scale of merit than any of its predecessors. Encouraged in a considerable degree by the favourable anticipations of a record display, the members of Committee eclipsed themselves in their efforts to make it, so far at least as they were concerned, worthy of Jubilee year, and visitors to the show premises had not far to seek for practical and prominent evidence of the success attained. A Victoria Jubilee championship of £100 and three medals, presented by the Lady Mayoress and ladies of Ulster, was one of the most interesting features of the exhibition, and brought out a really magnificent exhibition of Chrysanthemum blooms. In this competition the Judges awarded the first prize of £40 and a gold medal to Mr. F. A. Bevan, Trent Park, New Barnet, whose collection of blooms was an object of general admiration. Mr. Alfred Tate, of Surrey, was second, and the Hon. W. F. D. Smith, M.P., Henley-on-Thames, third; Captain G. Nicholson, Glenmore, Drogheda, fourth; Lord Ashbrook, Durrow, fifth; the Countess of Pembroke, sixth; and Mr. J. H. Torrens, J.P., Edenmore, Whiteabbey, seventh. Mr. Bevan also took first prize in the cut-flower section with a handsome exhibit of twenty-four incurved. Messrs. Alexander Dickson & Sons had about two hundred specimens of fruit in baskets and on plates, embracing all the leading varieties of Apples and Pears, both for cooking and dessert. These eminent nurserymen also showed a number of ingenious devices and designs, such as an anchor, a cross, a star, and crescent, in addition to bouquets, and a tasteful arrangement of wreaths, a lyre and harps, ladies' sprays, buttonholes, and a collection of Hyacinths, Tuberoses, Violets, and some very choice flowers, Asparagus, and Crotons. Mr. Hugh Dickson, Belmont, showed 150 dishes of Apples, all home-grown, decorated with Oranges and berries.

Passing reference may be made to a table of cones and autumn-berried plants exhibited by Mr. D. Crombie, gardener to Lord Powerscourt, which were all grown in Powerscourt demesne. William Robertson, Esq., J.P., Strandtown, was given a first prize for a magnificent group of decorative Chrysanthemums; the Countess of Pembroke got a similar award for a fine collection of yellow Japanese blooms, as did also C. H. Brown, Esq., Helen's Bay, for twelve Japanese blooms of distinct varieties. Other leading exhibitors of blooms were Messrs. David Ingammells, Covent Garden, London; W. Clibran & Sons, Manchester; and H. Cannell & Sons, Kent. Mr. John Forbes, Hawick, exhibited his new Perpetual Carnation. Mr. Robert Jameson, Park Avenue Nurseries, Sandymount, had some very pretty shower bouquets, and A. D. Lemon, Esq., J.P., Strandtown, was represented by four pots of Japanese and incurved Chrysanthemums. The exhibition of fruit and vegetables was distinctly superior in all sections.

The staging of the plants and flowers, and indeed everything connected with the arrangement of the various sections of the show, could hardly have been improved upon. Every possible advantage was taken of the space available, while the decorative side of the exhibition was by no means overlooked. On the contrary, the taste and skill displayed in this connection were worthy of all praise, and showed clearly that those who carried out the work were both earnest and capable. We append the names of the prizewinners in a few of the chief Chrysanthemum classes.

For a group of Chrysanthemums, twenty pots.—First, Wm. Robertson, Esq., J.P., Netherleigh (gardener, Mr. P. M'Haffie). Second, R. Tennant, Esq., J.P., Rushpark (gardener, Mr. J. M'Ilveen). Groups of Chrysanthemums, twelve pots.—First, A. D. Lemon, Esq., J.P., Edgecumbe (gardener, Mr. H. Kirkpatrick). Second, J. D. Barbour, Esq., D.L., Conway, Dunmurry (gardener, Mr. R. Draper). Third, J. Lepper, Esq., Fairacre (gardener, Mr. T M'Donald). Groups of Chrysanthemums.—First, William Robertson, Esq., J.P., Netherleigh (gardener, Mr. P. M'Haffie). Second, J. Lepper, Esq. (gardener, Mr. T. M'Donald). Third, A. D. Lemon, Esq., J.P., Edgecumbe (gardener, Mr. H. Kirkpatrick). Six pots Chrysanthemums, three incurved and three Japanese.—Wm. Robertson, Esq., J.P., Netherleigh (gardener, Mr. H. Kirkpatrick). Four pots Chrysanthemums, two Japanese and two incurved.—First, A. D. Lemon, Esq., J.P., Edgecumbe (gardener, Mr. H. Kirkpatrick). Second, J. Lepper, Esq. Four pots Chrysanthemums, Japanese and incurved excluded.—First, W. Robertson, Esq., J.P. (gardener, Mr. P. M'Haffie). Second, J. Lepper, Esq. (gardener, Mr. T. M'Donald). Best specimen Chrysanthemum, incurved.—First, A. D. Lemon, Esq., J.P., Edgecumbe (gardener, Mr. H. Kirkpatrick). Second, W. Robertson, Esq., J.P. (gardener, Mr. P. M'Haffie). Best specimen Chrysanthemum, Japanese.—First, A. D. Lemon, Esq., J.P., Edgecumbe (gardener, Mr. H. Kirkpatrick). Second, Wm. Robertson, Esq., J.P. (gardener, Mr. P. M'Haffie). Groups of stove and greenhouse plants.—First, R. Tennent, Esq., J.P., Rushpark (gardener, Mr. J. M'Ilveen). Second, J. Lepper, Esq. (gardener, Mr. T. M'Donald).

In the cut bloom section for twenty-four Japanese, distinct varieties.—First, Lady Emily H. Bury, Charleville Forest, Tullamore (gardener, Mr. R. M'Kenna). Second, Colonel the Honourable C. F. Crichton, Mullaboden, Ballymore (gardener, Mr. W. G. Michison). Third, W. Robertson, Esq., J.P., Netherleigh (gardener, Mr. P. M'Haffie). Twelve Japanese, distinct varieties.—G. H. Brown, Esq., Fordevra, Helen's Bay (gardener, Mr. James Reid). Six Japanese, distinct varieties.—G. H. Brown, Esq. (gardener, Mr. James Reid). Twelve Japanese, white, two varieties.—First, Countess of Pembroke, Mount Merrion, Booterstown (gardener, Mr. H. Crawford). Second, Lady E. Bury, Charleville Forest (gardener, Mr. R. M'Kenna). Third, John M'Stay, Esq., Moyaro, Hannahstown (gardener, Mr. James Little). Twelve Japanese, yellow, two varieties.—First, Countess of Pembroke (gardener, Mr. H. Crawford). Second, John Torrens, Esq., Rostulla, Whiteabbey (gardener, Mr. William Hodgins). Third, Marquis of Downshire, Hillsborough Castle (gardener, Mr. Thomas Bradshaw). Twelve Japanese, any other colours, two varieties.—First, William Robertson, Esq., J.P., Strandtown (gardener, Mr. P. M'Haffie). Second, Countess of Pembroke (gardener, Mr. H. Crawford). Third, T. H. Torrens, Esq., Edenmore, Whiteabbey (gardener, Mr. James Robinson). Twenty-four incurved, eighteen varieties.—First, F. A. Bevan, Esq., Trent Park, New Barnet (gardener, Mr. W. H. Lees). Second, Alfred Tate, Esq., Downside, Leatherhead, Surrey (gardener, Mr. W. Mease). Third, T. H. Torrens, Esq., Edenmore (gardener, Mr. James Robinson). Twelve incurved, distinct varieties.—First, John Torrens, Esq., Rostulla (gardener, Mr. W. Hodgins). Second, Lady Emily H. Bury, Tullamore (gardener, Mr. R. M'Kenna). Six incurved, white, one variety.—John M'Stay, Esq., Hannahstown (gardener, Mr. Jas. Lyttle). Second, Lord Ashbrooke, The Castle, Durrow (gardener, Mr. James M'Kellar). Third, T. H. Torrens, Esq. (gardener, Mr. J. H. Robinson). Six incurved, yellow, one variety.—First, Lord Ashbrook, Durrow Castle (gardener, Mr. James M'Kellar). Second, William Robertson, Esq., J.P. (gardener, Mr. P. M'Haffie). Third, Countess of Pembroke, Booterstown (gardener, Mr. H. Crawford). Six incurved, any other colour, one variety.—First, T. H. Torrens, Esq. (gardener, Mr. J. H. Robinson). Second, John Torrens, Esq. (gardener, Mr. William Hodgins). Third, Lord Ashbrook, Durrow Castle (gardener, Mr. James M'Kellar). Twelve Anemone-flowered, six varieties.—First, John Torrens, Esq. (gardener, Mr. Wm. Hodgins). Second, Lady Emily H. Bury, Tullamore (gardener, Mr. R. M'Kenna). Third, T. H. Torrens, Esq., Edenmore (gardener, Mr. J. H. Robinson). Thirty-six blooms, twelve varieties, shown in glasses.—W. Robertson, Esq., J.P., Netherleigh (gardener, Mr. P. M'Haffie). Best incurved bloom.—F. A. Bevan, Esq., New Barnet (gardener, Mr. W. H. Lees). Best Japanese bloom.—Hon. W. F. D. Smith, M.P., Henley-on-Thames (gardener, Mr. H. Perkins).

Basket of Chrysanthemum blooms, artistic arrangement.—First, John S. Smallman, Esq., Shamrock Lodge, Dalkey (gardener, Mr. W. Whelan). Second, J. D. Barbour, Esq., Conway House, Dunmurry (gardener, Mr. R. Draper). Third, A. D. Lemon, Esq., J.P., Edgecumbe, Strandtown (gardener, Mr. H. Kirkpatrick).

Forty-eight Japanese blooms, thirty-six varieties.—First, F. A. Bevan, Esq., Trent Park, New Barnet (gardener, Mr. W. H. Lees). Second, Alfred Tate, Esq., Downside, Leatherhead, Surrey (gardener, Mr. Wm. Mease). Third, Hon. W. F. D. Smith, M.P., Greenlands, Henley-on-Thames (gardener, Mr. H. Perkins). Fourth, Captain G. Nicholson, Glenmore, Drogheda (gardener, Mr. Peter Brock). Fifth, Lord Ashbrook, The Castle, Durrow (gardener, Mr. James M'Kellar). Sixth, Countess of Pembroke, Mount Merrion, Booterstown (gardener, Mr. H. Crawford). Seventh, T. H. Torrens, Esq., J.P., Edenmore, Whiteabbey (gardener, Mr. James H. Robinson).—("The Northern Whig.")

CHIPPENHAM.—November 17th.

This, the first Chrysanthemum show held at Chippenham, was a complete success. It clashed with Bristol and another Wiltshire exhibition, otherwise many more flowers and fruit would have been staged, in which case the Committee, with their excellent Honorary Secretaries, Messrs. L. H. Marshall and G. A. H. White, would have had more exhibits than they would been able to find good room for.

Groups of Chrysanthemums were fairly numerous, and in some instances considerably above mediocrity. In the open class Mr. Passmore, gardener to E. H. Clutterbuck, Esq., was well first, the second prize going to Mr. G. Humphries (of Dahlia fame), Kington Langley. L. H. Marshall, Esq., Mayor of Chippenham, was easily first with a smaller group, and also had a first prize for a collection of twelve admirably flowered untrained plants. For a group of miscellaneous plants Mr. G. Humphries was first, and Mr. Huff second. Various other plant classes were provided, and these were well filled.

In the open class for twenty-four cut blooms of Japanese Chrysanthemums, the Bromham Fruit Company, near Calne, was a good first, their stands containing grand fresh blooms of Madame Carnot, M. M. Ricoud, W. H. Lees, Mons. Meg, Mrs. H. Chiesman, Madame C. Capitant, Golden Gate, Herman Kloss, Australian Gold, Phœbus, Mutual Friend, Madame C. Molin, Mons. Chenon de Leché, Western King, and Julia Scaramanga. Mr. F. Perry, gardener to Captain Spicer, Spye Park, Chippenham, was second, Mdlle. M. A. Galbert and Mutual Friend being among his best. For eighteen incurved varieties Mr. Perry was first with good blooms of C. H. Curtis, Lucy Kendall, J. Agate, M. Bonnaffon, and other popular varieties.

The best twelve varieties were shown by the Bromham Fruit Co., Mr. F. Perry taking the second prize. In the local class for twelve Japanese varieties the Bromham Fruit Co. again took the lead, with Mr. Perry second. The first named had fine blooms of Silver King, Mutual Friend, E. Foregate, Madame Carnot, and Golden Gate. Mr. W. Spink, gardener to T. Harris, Esq., Calne, was well first for six varieties, showing good blooms of T. Wilkins, C. Davis, Viviand Morel, E. J. Whittle, and G. C. Schwabe. L. H. Marshall, Esq., was second, and an extra prize was awarded Mr. Passmore. The class for six blooms of any one variety proved very attractive. L. H. Marshall, Esq., was first with Good Graeious, and Mr. Perry a close second with Phœbus. Amateurs also acquitted themselves admirably, Mr. G. A. White taking a good lead among these.

Fruit and vegetables were plentiful, and good in point of quality. In these classes Messrs. F. Perry; Pitts, gardener to Sir A. W. Neeld, Bart.; Passmore, and the Bromham Fruit Co., were the most successful. A fine non-competitive group of Chrysanthemums and other plants was arranged by Mr. Welch, gardener to Sir J. Dixon-Poynder, Bart., M.P., Corsham, and another equally attractive group was lent by Messrs. G. Cooling and Sons, Bath.

CHISLEHURST.—November 17th.

What can be accomplished in organising and carrying out a Chrysanthemum show at a short notice by a body of men determined to do their best for the cause of charity was exemplified on Wednesday last by the members of the Chislehurst Gardeners' Association. Less than three weeks since it was suggested that the members should have a show amongst themselves and make a small charge for admission, the proceeds to go to the Gardeners' Orphan Fund. The idea was taken up by the members, who one and all determined to do their best to make it a success; the gardeners were, however, powerless without the consent of employers, but in every case when asked, permission to exhibit produce was freely given, and the result obtained was beyond the most sanguine expectations. St. Mary's Hall, West Chislehurst, was placed at the disposal of the Association by the Rev. H. L. Russell.

Groups of Chrysanthemums and miscellaneous plants, cut blooms of Mums, fruit, and vegetables, with plants for table decoration, were pressed into service, and made a very fine display when arranged by the Staging Committee. As the show was non-competitive, no classes were specified, but one gentleman very generously offered three prizes for a collection of vegetables, six varieties, to be competed for by allotment holders, and no less than nine exhibitors staged produce that would have done credit to shows of greater pretensions.

In cut blooms Mr. Lyne, gardener to H. F. Tiarks, Esq., Foxbury, staged twenty-four Japanese and twenty-four incurved, as also did Mr. W. Harvey, gardener to R. B. Martin, Esq.; Mr. R. Leadbetter, gardener to A. G. Hubbuck, Esq.; and Mr. G. B. Lees, gardener to R. de Quincey, Esq.; whilst Mr. J. Blackburn, gardener to J. Scott, jun., Esq., staged thirty-six Japanese. The whole of the blooms in these exhibits were fine, and secured much admiration from the visitors. Cut blooms were also contributed by Mr. W. Hopgood, gardener to Mrs. Parr; Mr. Evans, and Mr. Green.

Mr. Wood, gardener to H. James, Esq., arranged a capital group of Chrysanthemums, as also did Messrs. Pinyon & Son, Chislehurst; while groups of miscellaneous plants were staged by Mr. Lyne, Mr. Last, gardener to R. Foster, Esq.; Mr. Hatto, gardener to J. Dun, Esq.; and Mr. Grevatt, gardener to J. Stoneham, Esq. Fruit was staged by Mr. Boniface, gardener to J. T. Firbank, Esq., twenty-four dishes of Apples and Pears; Mr. Lyne, eight dishes of Apples and two bunches of Grapes; Mr. Filkins, gardener to R. B. Berens, Esq., twenty-five dishes of Apples and Pears; Mr. Last, twelve dishes; and Mr. Lawson, six dishes. Table plants were contributed by Mr. Lyne and Mr. Lees. Mr. J. Heard, gardener to Mrs. Redpath, staged a good collection of Cyclamens, well grown and flowered, as was to be expected from so good a grower of this useful winter flowering plant. Mr. Gutteridge, gardener to Canon Allen, staged three baskets of very fine Mushrooms, and Mr. Woodger exhibited a floral bell formed of Chrysanthemum blooms, and having the initials of the Association on it. This was suspended in a conspicuous place, and was humourously dubbed the belle of the show.

The show was well patronised during the afternoon and evening—in fact, one might say it was crowded, which was very satisfactory, and it is to be hoped that a good balance will be left over after paying the few expenses incurred. During the evening the Rev. H. L. Russell presented the prizes to the successful allotment holders, and in doing so said that thanks were due to the members of the Gardeners' Association for the very great pleasure they had afforded them.

READING.—November 17th.

The annual exhibition of the above Society was held in the Town Hall on the above date. The entries were much more numerous than in former years, and consequently the competition was keener. The chief feature was the groups, but these were arranged in too stiff and formal a style. The cut bloom classes were well filled, and some excellent stands were staged. A word of praise is due to the Secretary, Mr. W. L. Walker, for the able manner in which the several details of the show were carried out.

For a circular group, 10 feet in diameter, there were four competitors, each of whom staged in a very creditable manner. The premier prize was taken by Mr. Perkins, gardener to the Hon. W. F. D. Smith, M.P., Greenlands, Henley, with a splendid arrangement. Amongst the conspicuous varieties were Mrs. H. Weeks, Chas. H. Curtis, Viviand Morel, Etoile de Lyon, Madame Carnot, and Chas. Davis. The second prize group consisted chiefly of bush plants, and was shown by Mr. T. Turton, gardener to the executors of John Hargreaves, Esq., Maiden Erlegh, Reading. Mr. R. Bassil, gardener to D. H. Evans, Esq., Pangbourne, was third.

In the class for a group of Chrysanthemums in pots, not disbudded, to occupy a space of 6 feet by 4 feet, there were three exhibitors, one of whom was disqualified. Mr. M. Booker, gardener to W. Berkley, Esq., Reading, was a decided first, followed by Mr. Chamberlain, gardener to F. M. Lonergan, Esq., Cressingham. For three trained specimens, distinct, Mr. Booker was again first with well grown plants of Phœbus, Viviand Morel, and Souvenir de Petite Amie. Mr. Wilson, gardener to Mrs. Garland, Lower Redlands, was second; and Mr. Mayne, gardener to Miss Wallis, Bath Road, Reading, third.

Undoubtedly, the most charming and interesting class in the whole show was that for a group of cut Chrysanthemum blooms arranged with Ferns and small foliage plants, to occupy a space of 4 feet by 3 feet, to illustrate the decorative value of the Chrysanthemum. Seven exhibitors competed, and the first prize stand was of great beauty, the flowers and plants being arranged with the most excellent taste. This was from Mrs. Walker. Mr. F. Bright, gardener to J. P. B. Karslake, Esq., Whitenights, Reading, was second with a heavier arrangement; and Mr. Chamberlain a very good third.

The cut bloom section comprised many classes, in several of which the competition was very close. Some of the blooms were of high quality, though others staged were decidedly past their best. The principal class for incurved was for twenty-four distinct varieties, and Mr. Higgs, gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, was awarded the first prize. His best blooms were Duchess of Fife, C. B. Whitnall, George Haigh, Princess of Wales, Robert Cannell, Bonnie Dundee, Brookleigh Gem, Empress of India, and Mrs. C. Colcman. The second position was taken by Mr. Paddon, gardener to Col. H. Ricardo, Bramley Park, Guildford, who had good blooms of Mr. R. King, Mrs. R. C. Kingston, W. Tunnington, C. B. Whitnall, Violet Tomlin, Major Bonnaffon, and Duchess of Fife. Mr. Neville, gardener to F. Flight, Esq., Twyford, was a good third.

In the class for twenty four Japanese, distinct, seven fine stands were staged, and the competition was very keen. Mr. Higgs again proved successful with a superb stand, comprised of Madame Carnot, Australie, Hairy Wonder, Mdlle. Thérèse Rey, Bellem, Viviand Morel, Mons. Chenon de Leché, Oceana, Madame Gustave Henri, Phœbus, Etoile de Lyon, Charles Davis, and others. Mr. Paddon was an exceedingly close second; he had fine blooms of Australian Gold, Etoile de Lyon, Phœbus, W. H. Lees, Mrs. C. Blick, and Mons. Panckoucke. Third, Mr. A. Maxim, gardener to Col. H. Walpole, Heckfield. For twelve Japanese, distinct, Mr. Cole, gardener to Sir Geo. Russell, Bart., M.P., Swallowfield Park, was an easy first, his best blooms being Phœbus, Niveus, Mrs. W. H. Lees, Charles Davis, and Mrs. J. Lewis. Mr. Galt, gardener to Chas. E. Keyser, Esq., Aldermaston Court, was a good second; and Mr. Fagents, gardener to F. Wellesley, Esq., Woking, third.

Mr. Maxim took the lead in the class for twelve incurved with a good stand, which included Bonnie Dundee, Lucy Kendall, Duchess of Fife, and Alfred Salter. Mr. Price, gardener to F. P. Bulley, Esq., Fairford, was second, and Messrs. Blair & Shackle, Ascot, third. For twelve reflexed Mr. Price was an easy first. For six Japanese, one variety, nine stands were staged. Mr. Galt was first with a superb stand of Mrs. H. Weeks, Mr. Cole second with Phœbus, and Mr. Fagents third with Australie. For six incurved Mr. Neville was an easy first with Chas. H. Curtis, Mr. Galt second with the same variety, Mr. Paddon third with Mrs. R. C. Kingston. There were five exhibitors of a single epergne, Miss Phillips being first, and Mrs. Wadmore second.

Non-competitive exhibits were not particularly numerous, neither were some of them of any great merit. The most conspicuous was an arrangement of floral designs from Messrs. Phippen & Sons, Reading. This was exceptionally beautiful, and elicited an unusual amount of interest.

Messrs. G. Bunyard & Co., Maidstone, staged a grand collection of Apples. The exhibit comprised sixty dishes, and all the best varieties were represented. Fruits of several kinds were splendidly shown in competitive class, but space is not sufficient to give detailed notice of this section of the exhibition.

CARLISLE.—NOVEMBER 17TH AND 18TH.

THE Carlisle and Cumberland Horticultural Society held its second annual show of Chrysanthemums and other flowers, fruit, vegetables, and honey, in the Drill Hall, Carlisle, on Wednesday and Thursday. The Society is making good progress, and as Mr. Crowder, at the opening, said, it fills a want which has existed in the city for many years, a want which suburban places like Stanwix and Wetheral have tried in vain to fill. The first show proved most encouraging to the Society, Mr. J. W. Watt, the Hon. Treasurer, having a balance of £35 to the good after all expenses were met. The work of preparation for the show now held was therefore undertaken by the Hon. Secretary, Mr. A. R. Sale, and the Committee with hopeful anticipations of an equally satisfactory result; and it was pleasing to find, says a local contemporary, that the exhibition turned out to be both larger and better than the first.

The prize list was similar to that of last year, but the entries numbered ninety more, being spread over all sections. There were some classes in which competition was wanting, but there was a hearty feeling generally in the show, and it was evident that the Society is doing good work in arousing fresh interest in the beautiful autumn flowers, which are this season so exceptionally abundant. The display of Chrysanthemums was luxuriant, and some of the blooms, so richly varied in colourings, seemed to be even larger than were shown last year. There would appear to be no end to the development of the size of Japan's national flower, and certainly no limit to the varieties, new examples constantly occurring. There were numerous classes for the large specimens, and where they

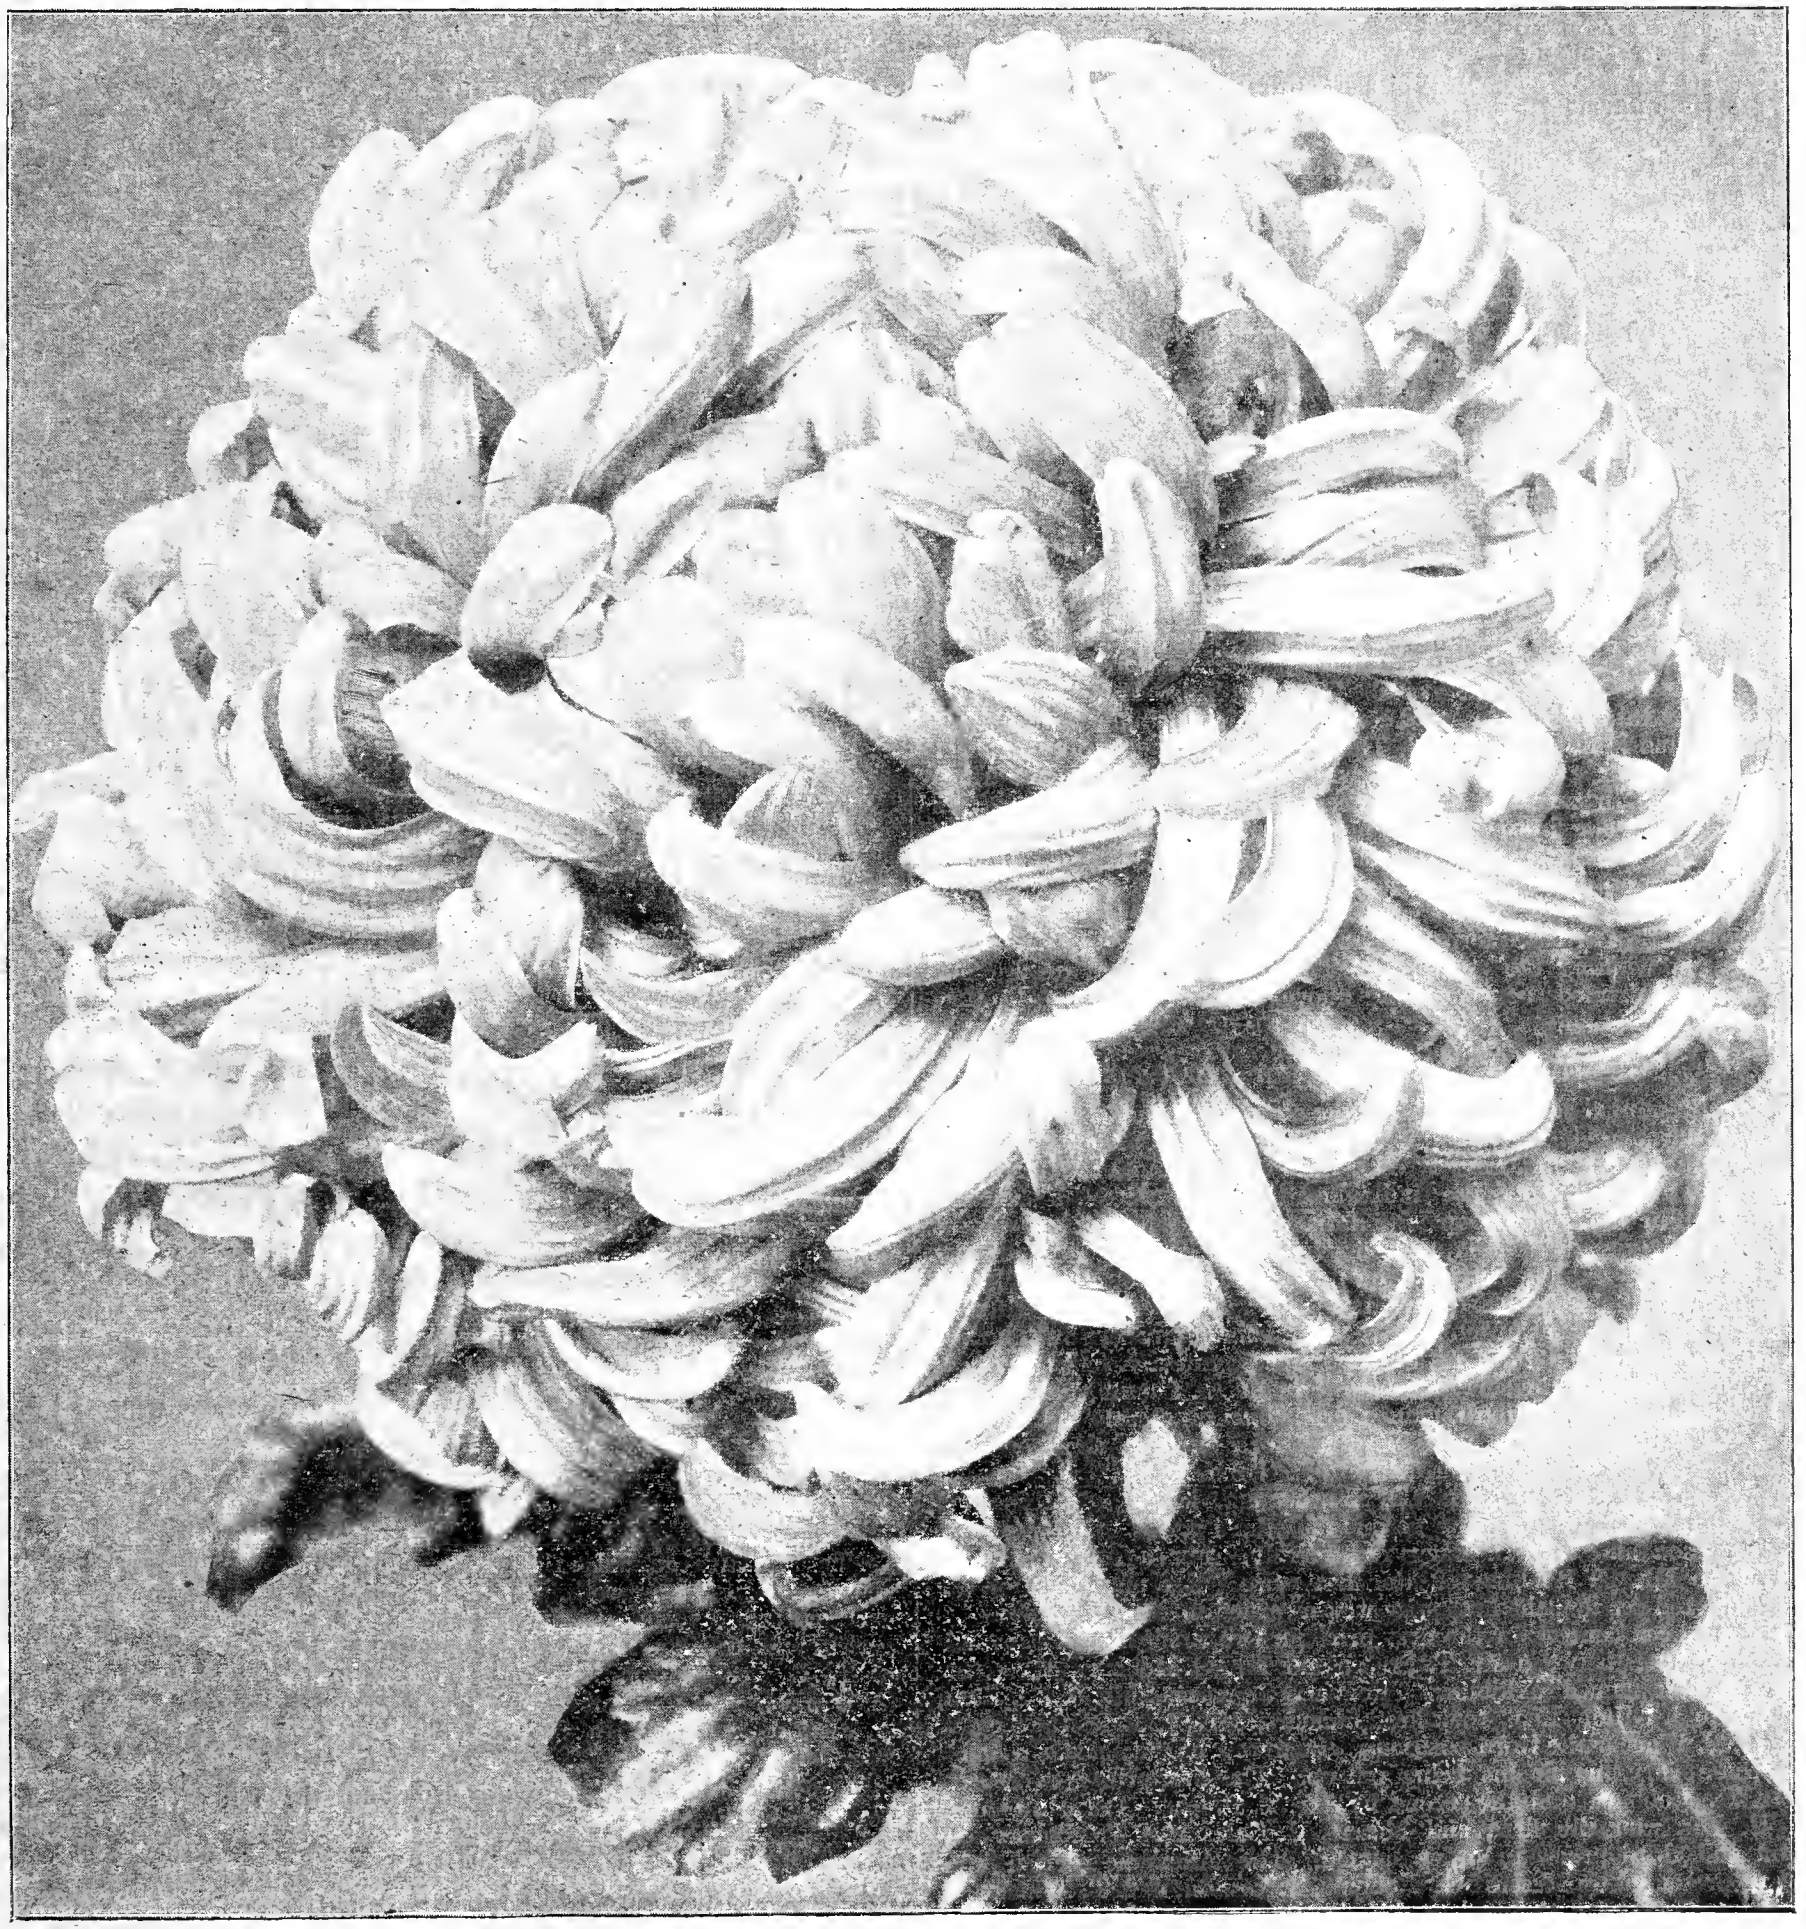

FIG. 75.—CHRYSANTHEMUM GEORGE FOSTER. (*See page* 503.)

were collected visitors were at once attracted by the blaze of bloom. The smaller kinds, however, were not neglected, and there was variety in other directions to add interest to the show. There was a splendid display of fruit and vegetables. There were classes for amateurs and private gardeners combined, for amateurs alone, and open classes. There were large stands for exhibition purposes from Messrs. Little & Ballantyne, who never compete at local shows. One formed a magnificent semicircle on the floor in front of the platform, and consisted of decorative flowers and plants, among which Chrysanthemums were conspicuous, affording a striking contrast against the foliage plants. Its highly artistic arrangement was only what one is accustomed to see in work carried out by the firm. There was also a large stand of vegetables on exhibition by the same firm.

In the open competitions Messrs. Fairbairn & Son's group of Chrysanthemums and other plants was properly awarded first place. It included large Chrysanthemums, Eulalias, Palms, Dracænas, and Ferns. The second prize went to Messrs. McMillan & Son with a stand not quite so well filled, but very bright and tasty. Mr. R. Hall, Botcherby, was first for four Japanese Chrysanthemum plants with fine specimens of W. H. Lincoln, Viviand Morel, John Seward, and Charles Davis. Messrs. Fairbairn & Son were second. Mr. Hall won for a specimen Chrysanthemum plant with a Charles Davis full of fine bloom. In cut blooms Mr. James Hay of Houghton Hall was first for twelve incurved Chrysanthemums with specimens which were rather smaller than the second, but better finished. Mr. Horne, Netherhall, who was second, showed scarcely so many varieties, but they included a very fine C. H. Curtis. Messrs. Fairbairn & Son won in the class for twenty-fours, and Mr. Potter, Whitehall, was second with larger but rougher blooms. In the class for six blooms, one variety, Mr. Hay was again first with half a dozen blooms of Mdlle. M. Hoste. The second and third, from Mr. Horne and Messrs. Fairbairn & Son, were both Edwin Molyneux.

The competition for bouquets was open, and was won by Messrs. Fairbairn & Son. There was a good entry, and all were shower bouquets, the winning exhibit being a tasteful arrangement of Lilies of the Valley. Messrs. Fairbairn also won for basket of Chrysanthemums, with a simple and elegant arrangement of white, yellow, and bronze Japanese flowers and grass. The first prize ladies' spray was made by Mr. Hall, Botcherby, and consisted of bronze and white Chrysanthemums and Maidenhair Fern. The second prize went to a very neat spray of white single flowers, from Messrs. J. Hammond & Son, St. Ann's Hill. Messrs. Fairbairn also won for epergnes, in which the competition was very keen. The first prize epergne was a trifle faulty at the bottom, and the second, from Messrs. Hammond, was wanting in decoration of the middle, but on the points, after a very close contest, Messrs. Fairbairn won. In the class for epergnes of cut flowers, ladies being the competitors, a high standard of artistic merit was shown. Miss Fairbairn, Botcherby, succeeded in winning the first prize. The prizes in the several other classes were divided between the above named and many other competitors.

SOLIHULL.—November 17th and 18th.

The fifth annual show was held on the above dates, and proved to be a distinct advance on any of its predecessors. The seven groups of plants made a very imposing effect, and in the main were tastefully arranged, whilst some of the individual blooms were of a superior character. For the best group with foliage plants admissible the first prize and a silver medal (the latter given by W. A. Upton, Esq., for the most meritorious exhibit in the show) was awarded to Mr. D. Bagg, gardener to W. E. Perks, Esq., Ashley, and was deservedly bestowed. The second prize was awarded to Mr. G. Robbins, gardener to Thomas Hewitt, Esq.; and the third to Mr. T. Preece, gardener to S. Leitner, Esq., Alderbrook. In the smaller group class Mr. T. Leeson, gardener to H. H. Chattock, Esq., Solihull, gained first honours, closely followed by Mr. T. Warner, gardener to W. A. Upton, Esq., and the third position was secured by Mr. J. Dixon, gardener to L. Grinsell, Esq.

For one trained Japanese Chrysanthemum, Mr. G. Robbins led with a good Viviand Morel, the second and third prizes being accorded Mr. T. Leeson and Mr. D. Bagg respectively. For a single plant of incurved to Mr. G. Robbins fell the first prize. For one plant of the single flowered section, the first prize was awarded to Mr. G. Robbins.

It was a keen contest for the first prize for twelve blooms of Japanese Chrysanthemums between Mr. T. Preece and Mr. G. Robbins, the victor being the first named exhibitor. For six Japanese, Mr. G. Milton, gardener to J. Gillot, Esq., took first honours, Mr. J. Eales the second, and Mr. T. Warner the third positions. Incurved blooms made a good class, some very fine blooms being put up. The first prize was secured by Mr. G. Robbins, and the second by Mr. T. Preece. For six blooms Mr. H. Dix won the first, and Messrs. J. Eales and T. Warner the second and third prizes in order named. The Anemone section was nicely represented by Messrs G. Robbins, T. Leeson, and T. Warner in their respective order. The class for six Japanese cut blooms, any one variety, was worthily represented by Mr. G. Milton, with fine examples of Niveus, Mr. T. Preece, with very good Modesto, and Mr. T. Leeson by another variety, the prizes being awarded according to their order named. For six plants for table decoration Messrs. J. Eales, D. Bagg, and H. Dix were the respective winners.

SOUTH SHIELDS.—November 17th and 18th.

The spacious and beautifully decorated hall, known as the Assembly Rooms, was resplendent with a very fine display of Chrysanthemums—groups, table decorations, bouquets, and cut blooms—on the above dates. This is the sixteenth annual exhibition, and it speaks well for its management that this is the only Society in the county that has survived so long. The present was without doubt a great advance of any previous exhibition. The groups were good, the bouquets and epergnes of an exceptionally high order of merit, the Orchids and other choice flowers employed in them being quite an exhibition in themselves. The cut blooms, Japanese, incurved, and Anemones, very bright, clean, and of excellent quality, there being as many as ten entries in the twelve Japanese, and the other classes being also well filled.

The leading prize was for twenty-four Japanese, in not less than twelve varieties, for which a silver cup and £6 in money were offered as the first prize. For this Mr. J. Corbett, gardener to the Marquis of Normanby, Mulgrave Castle, Whitby, was a good first with the following:—Viviand Morel (2), Mutual Friend (2), Mons. Panckoucke, Etoile de Lyon, Waban, Mrs. W. H. Lees (2), Golden Gate (2), Silver King (2), Eva Knowles, Duchess of Wellington (2), Florence Davis (2), Chas. Davis, International, Phœbus, Thérèse Rey, and Duke of York. Messrs. Fairbairn & Son, Carlisle, were a good second; and Mr. P. Blair, gardener to the Duke of Sutherland, Trentham, third, with large flowers, but many somewhat past their best.

In the class for twenty-four incurved, in not less than twelve varieties, the prize was the same as in the Japanese—a Jubilee silver cup and £6 in money. The first was taken by Mr. J. Coultess, gardener to Alderman Harding, Hollyhurst, Darlington, with J. Agate (2), M. Bahuant (2), Chas. Curtis (2), Empress of India (2), Robert Petfield (2), Queen of England (2), Emily Dale (2), Lord Alcester (2), George Haigh (2), Madame Darier (2), Alfred Salter, Miss M. A. Haggas, Refulgens, and Baron Hirsch. The second was taken by Mr. P. Blair; the third by Mr. G. Shotton, gardener to H. Andrews, Esq., Swarland Hall, Northumberland.

For eighteen Japanese, in not less than twelve varieties, the first prize was awarded to Mr. P. Blair, for an excellent stand. Second, Mr. Corbett. Third, Messrs. Fairbairn & Son. In the corresponding class for eighteen incurved Mr. P. Blair was again to the front, the second being taken by Mr. John McIntyre, gardener to Mrs. Gurney Pease, Woodside, Darlington. Third, Mr. G. Shotton. In the class for twelve Japanese, distinct, Messrs. G. Fairbairn & Son were first; Mr. P. Blair second; Mr. McDongal, gardener to H. Pease, Esq., Arcot Hall, Dudley, Northumberland, third. For twelve incurved, distinct, Mr. J. Coultess was again first with a neat stand of the leading varieties; Mr. P. Blair second; and Mr. Shotton third.

The Anemone classes were well contested with some of the finest stands that have been exhibited this year. The first prize for twelve was awarded to Mr. George Shotton, with a fine fresh stand, with well-developed cushions; second, Mr. G. Smith, Floral Cottage, Hull; and Mr. McDougal close up third. For twelve reflexed Mr. Shotton was first; and Mr. McIntyre, Darlington, second. The prizes for Pompons were won by Mr. T. Chalmers, gardener to S. P. Austin, Esq., Cocken Hall, Durham; Mr. Methersol, gardener to H. Wilson, Esq., Westoe; and Mr. J. Fairlee, gardener to T. T. Maberne, Esq., Westoe, in the order of their names.

In competition for the medal and £5, offered as first prize for a group of Chrysanthemums and foliage plants arranged for effect, Mr. John McIntyre, Darlington, was a good first with a very artistic arrangement of Kentias and Cocos Palms, Crotons, and Pandanus, surmounting pinnacles formed of cork, and interspersed with good Chrysanthemums; Calanthes and Anthurium Andreanum being employed with pretty effect in the dells. The second was taken by Mr. McDougal; third by Mr. Gilchrist.

Messrs. Clibran exhibited a very good group of Celosias and Chrysanthemums (not for competition). Messrs. C. Wood and R. Robson, as Staging Committee, arranged everything for the Judges in methodical order, and Messrs. H. Hinde, A. Purvis, Dr Turnbull, and others assisted Mr. Bernard Cowan (the Hon. Secretary) to carry out the arrangements and work in connection with this very successful exhibition.

SUTTON COLDFIELD.—November 17th and 18th.

The twelfth annual exhibition was held in the Town Hall on the above dates, and was well up to the standard of previous occasions. The chief feature was undoubtedly the splendid half-circular bank of Chrysanthemums, arranged for effect, exhibited by Mr. A. Thorpe, gardener to T. E. Pears, Esq., Elsmore, Manor Hill, and to whom the N.C.S.'s silver-gilt medal was awarded. The second prize was awarded to Mr. A. Jenkins, gardener to W. A. Wills, Esq., Wylde Green; the third prize being given to Mr. T. Padbury, Erdington.

Cut blooms were grandly shown, and the stand of twenty-four Japanese exhibited by Mr. A. Jenkins contained several superb examples. The second prize was awarded to Mr. A. Hughes, gardener to W. L. Hodgkinson, Esq., for also an excellent stand, and the third prize to Mr. W. Pearce, gardener to Mrs. Jerome, Holland House.

For twelve blooms, Mr. T. E. Pears was awarded the first prize with a very good stand, the best blooms being Simplicity, Niveus, Etoile de Lyon, M. Hoste, and Mrs. Lees, the second and third prizes falling to Mr. A. Hughes and Mr. A. Jenkins. For twelve incurved, the premier prize was awarded to Mr. A. Jenkins for beautiful blooms of such as C. H. Curtis, J. Agate, R. G. Kingston, Baron Hirsch, T. Musten, and Miss Simkins. The second prize went to Mr. A. Hughes with also a meritorious lot.

For a basket of dwarf Chrysanthemums with foliage plants, arranged for effect, the first prize was awarded to Mr. A. Hughes, the second to Mr. A. Jenkins, and the third to Mr. A. Jeffs, all with effective contributions.

YORK.—November 17th, 18th, and 19th.

For the purpose of a Chrysanthemum show few societies have at their disposal so suitable and grand a building as the Fine Art Exhibition Building in this city, and the Ancient Society of York Florists has again sustained its reputation in promoting one of the best shows in the north of England. The prizes here scheduled for Chrysanthemums are on the most liberal scale, and are supplemented by others equally tempting for fruits and vegetables. To those important factors to success is to be added the business abilities of the Committee, so well represented in the able Secretary, Mr. Lazenby, whose duties in carrying out the arrangement were most courteously performed, and all the work in connection therewith smoothly and expeditiously got through without a hitch of any description. The receipts on the three days amounted to £320, an increase of £60 on the previous year.

In the open cut bloom classes for eighteen incurved and eighteen Japanese, Mr. J. Folkard, gardener to Sir Jas. Walker, Bart., was first, showing fine examples of incurved: (2) C. H. Curtis, (2) Lord Alcester, (2) Queen of England, (2) Golden Empress, (2) G. Haigh, (2) Robt. Petfield, Wm. Tunnington, Mrs. R. C. Kingston, J. Doughty, Empress of India, C. B. Whitnall; Japs: Mrs. W. H. Lees, Edith Tabor, Australie, General Roberts, Thos. Wilkins, Mons. Andre, Australian Gold, Etoile de Lyon, Louise, (2) Mrs. H. Payne, (2) Ed. Molyneux, (2) Madame Carnot, and (2) Mons. Chenon de Leché. Mr. Goodacre, gardener to the Earl of Harrington, was second; and Mr. Hotham, gardener to J. E. Wade, Esq., Brantingham Thorpe, third.

For eighteen incurved, Mr. Folkard was again first with meritorious blooms of C. B. Whitnall, J. Agate, Mrs. R. C. Kingston, Lord Alcester, Geo. Haigh, Mrs. J. Kearne, Mrs. Robinson King, Violet Tomlin, Mrs. S. Coleman. Robt. Petfield, Miss M. A. Haggas, (2) C. H. Curtis, (2) Empress of India, (2) Queen of England. Second, Mr. G. Anderson, gardener to A. Milnthorpe, Esq., Tower Hill, Whixley; third, Mr. Goodacre. Mr. Folkard again secured first place for twelve incurved; Mr. Hotham second; Mr. Picker, gardener to F. R. Pease, Esq., Hesslewood, near Hull, third.

For six incurved, Mr. Hotham was first, and Mr. Folkard second. For six incurved, one variety, Mr. Picker was first with fine blooms of C. H. Curtis.

For eighteen Japanese Mr. D. Williams, gardener to the Earl of Feversham, Duncombe Park, was first with Chenon de Leché, Phœbus, Good Gracious, Niveus, Eva Knowles, Thérèse Rey, Chas. Davis, M. A. de Galbert, Mrs. H. Payne, Edith Tabor, G. C. Schwabe, Florence Davis, Ed. Molyneux, Thos. Wilkins, Viviand Morel, Australian Gold, Mons. Panckoucke. Second, Mr. Picker. Third, Mr. Hotham.

For twelve Japanese Mr. Williams was first with Mrs. C. H. Payne, Chenon de Leché, Mons. Panckoucke, Eva Knowles, Thérèse Rey, Col. B. Smith, Edith Tabor, Ed. Molyneux, M. A. de Galbert, Viviand Morel, and C. Davis. Second, Mr. Picker. Third, Mr. Folkard. The citizens' challenge prize, value £10, and £3 added, for eighteen distinct varieties, was won by Mr. C. H. Dobson, gardener to R. Lawson, Esq., Ousecliffe, Mr. Everard, gardener to Mrs. Gutch, second, and Mr. D. Dickinson, gardener to W. B. Richardson, Esq., Elm, third.

Groups of Chrysanthemums, interspersed with foliage plants, arranged for effect on a space of 120 square feet. Two of the groups in this class placed the judges in a tight corner; whilst three of them gave their verdict in favour of one group, the other three Judges were in favour of the other, and as neither side could give way an umpire was called in, who again was unable to decide as to the relative merits of the two groups so as to bring the balance in favour of one over the other. It was decided to bracket the awards as equal first, one falling to Mr. McIntosh, gardener to J. T. Hingston, Esq., and the other to Mr. Geo. Cottam, Alma Gardens, Cottingham; the other group, receiving a fourth prize, belonged to Mr. J. Wragge, Burton Lane, York.

In the group of Chrysanthemums arranged for effect, of 100 square feet, the competition was again very close; four groups competed. The prize was won by Mr. Dickinson; the second by Mr. Everard; third, Mr. Pettinger, Strawberry Vale Nurseries, Harrogate; fourth, Mr. Jarvis, gardener to Mrs. Whitaker, Hessle Cliffe. The Chrysanthemum plant classes are always well filled at York, and the specimens reflect the highest credit upon the cultivators. For four plants of incurved Mr. Dickinson was first; Mr. Everard second; Mr. T. Smith third. Four Japanese, Mr. Everard was first; Mr. Dickinson second; Mr. T. Smith third.

The trade exhibits by Messrs. W. Wells, Earlswood, and W. Bousal, Harrogate, deservedly received certificates of merit. The same distinction was awarded to a fine representative collection of Apples exhibited by Messrs. Jas. Backhouse & Son, York. Fruit and vegetables were of the highest quality, and made an imposing show.

BARNSLEY.—November 18th and 19th.

This show was held in the large Concert Hall of the Harvey Institute, and was highly successful, the local classes showing decided and steady progress from year to year. This improvement was especially noticeable in the plant and group classes, and the open cut bloom classes were of a high standard of merit.

The first for eighteen incurved was awarded to Mr. Vaughan, Birkenhead, for grand flowers of Wm. Tunnington, C. H. Curtis, Dorothy Foster, J. Agate, Ma Perfection, Mrs. R. King, Lord Rosebery, Mrs. J. Gardener, Robt. Petfield, Bonnie Dundee, Robt. Cannell, Mrs. R. C. Kingston, George Haigh. Second, Mr. A. Alderman, Worksop; third, Mr. Ketchil, Ackworth.

For eighteen Japanese Mr. Vaughan was again first with good blooms of Mrs. H. Payne (2), Phœbus (2), Chas. Davis, Ed. Tabor, Hairy Wonder, Mutual Friend (2), Miss M. Blenkiron, grand; Mr. C. H. Payne, Mrs. H. Weeks, Duke of York, Oceana, Lady Ridgway, G. C. Schwabe, and Australie. Second, Mr. Alderman; third, Mr. Findlay, gardener to H. J. Jones, Esq., Badsworth. For twelve Japanese Mr. Vaughan was first, Mr. Aldermau second, Mr. Ketchil third.

For the challenge cup for twenty-four cut blooms, open to exhibitors residing within a radius of eight miles from Barnsley, Mr. Dunn for the second time in succession was placed first for neat flowers—incurved, C. H. Curtis (2), Mrs. R. C. Kingston, Princess of Wales, Golden Empress (2), Robt. Petfield, Empress of India, Bonnie Dundee (2), J. Agate; Japanese, Lady Hanham, Madame Carnot, Etoile de Lyon, Rose Wynne, Chas. Davis, Duchess of Wellington, Van den Heede, Florence Davis, and Mrs. Harman Payne. Second, Mr. F. Weatherall, Barnsley.

In the Chrysanthemum group class Mr. Weatherall was first with a neat and effective arrangement. Mr. E. Wilson, gardener to Guy Senior, Esq., second. Mr. Winter third. For a group of miscellaneous plants Mr. S. Ballanger, gardener to — Fox, Esq., was first. Mr. Shaw, Barnsley, second.

BOLTON.—November 18th and 19th.

The Committee of the above Society is to be congratulated on the excellent show opened in the Town Hall—a show fit to rank for quality with anything seen this year. Messrs. Smith, Hicks and Hughes have striven hard for many years to make their work known, and Bolton people have a treat which cannot fail to please the most exacting.

The first class was for twelve incurved and twelve Japanese, distinct. A silver challenge cup, value 10 guineas, to be won two years in succession, with good money contribution, was the first prize, and here a comparatively recent exhibitor, Mr. W. Whittle, gardener to R. G. Allen, Esq., Aigburth, Liverpool, who, on the previous Saturday, won the 20-guinea cup at Grassendale, was awarded the coveted honour with a fine stand, the Japs being really excellent. The varieties were Mons. Panckoucke, Graphic, Phœbus, Chas. Davis, Silver King, Duke of York, Mdlle. Thérèse Rey, R. Dean, Lady Ridgway, Mdlle. M. A. de Galbert, G. C. Schwabe, Edith Tabor, Queen of England, F. W. Flight, Lord Alcester, W. Tunnington, J. Agate, Major Bonnaffon, Mr. J. Kearn, C. H. Curtis, Mrs. R. C. Kingston, R. Petfield, Harold Wells, and Lucy Kendall. The second went to Mr. Bellis, gardener to Sir C. H. Rouse, Ludlow, with a very bright stand. Mr. Bible, gardener to Lord Trevor, Ruabon, was a close third, Japs being splendid, and Mr. Kirkman, gardener to J. Stanning, Esq., Leyland, received an extra prize.

Mr. Bellis won for twenty-four Japs with a capital stand of International, Van den Heede, Edith Tabor, G. C. Schwabe, V. Morel, J. Seward, Ad. Chatin, Rd. Dean, Mrs. C. Blick, Phœbus, Mrs. Dr. Ward, C. W. Richardson, M. Panckoucke, Jules Ferry, Miss Rita Schroeter, Sunstone, A. G. Hubbuck, Madame Carnot, Australian Gold, Mrs. G. Carpenter, Bellem, Mons. C. Molin, Duchess of York, and Mrs. F. A. Bevan. Mr. P. Blair, gardener to the Duke of Sutherland, Trentham, was placed second; and Mr. Bible third. Mr. Bellis won for twelve incurved, grand being W. Tunnington, Major Bonnaffon, and Perle Dauphonoise.

In the class for six incurved and six Japanese, none of the exhibitors complied with the schedule; but the Committee was generous enough to award extra prizes. The prizes for nine incurved and nine Japanese went to Mr. Eastwood, gardener to Mrs. Chas. Taylor; and Mr. Callow, gardener to Jno. Harwood, Esq., both exhibits being somewhat below the average as regards quality.

The local classes showed a very great improvement in quality, Mr. Eastwood winning the silver cup for twelve incurved and twelve Japanese with good blooms of M. Chenon de Leché, Mutual Friend, Mons. C. Molin, Mdlle. Thérèse Rey, C. H. Curtis, J. Agate, Mrs. R. C. Kingston, and Violet Tomlin. Mr. J. Wainwright, gardener to Miss Cross, was a capital second. Mr. J. Callow won with a very creditable twelve incurved, and Mr. Eastwood for twelve Japanese. Other smaller classes were won by Messrs. T. Hindle, W. Crawshaw, W. Eckersley, H. Shone, and Howarth.

The miscellaneous groups arranged for effect were particularly striking and handsome, Mr. H. Shone, gardener to J. W. Makant, Esq., Bolton, being awarded chief honours. The second prize went to Messrs. L. & G. Bury, Darwen, with a bold and novel idea worthy of much consideration. For a group of Chrysanthemums with Ferns for effect Mr. J. Abbatt, gardener to James Musgrave, Esq., took first; and Mr. Geo. Pawson, gardener to Jno. Heywood, Esq., second.

Plants were a very great advance, and were represented by many classes to suit all growers. The principal prizewinners were Mr. H. Shone; Mr. Hicks, gardener to Mrs. Haslam; Mr. James Callow; Mr. J. Barclay, gardener to Thomas Walker, Esq., J.P.; and Mr. W. Eckersley, and for a basket for effect Mr. Abbatt.

BURY ST. EDMUNDS.—November 18th and 19th.

The annual show, held in the Corn Exchange, Bury St. Edmunds, on the above dates, was a decided success, thanks in a great measure to the efforts of the courteous and energetic Hon. Secretary, Mr. G. A. Manning, who, we regret to learn, is severing his connection with the Society. A better or more popular Secretary will be difficult to find, and the best wishes of everyone connected with the show will be with Mr. Manning in his new sphere of action, for we hear he is leaving the neighbourhood of the fine old Suffolk town.

Groups were of excellent material, well arranged as to colour, but of

hard and circular outline as usual. Mr. Burrell of Westley Hall (gardener, Mr. A. Bishop) led both in the Chrysanthemum group and that of miscellaneous plants, being followed in the former by Mr. G. A. Partridge and Mr. Gibson Cullum, in the latter by Mr. Johnstone and Mr. Partridge in the order named.

The class for thirty-six Japanese, distinct, was closely competed for Mr. Berners, Woolverstone Park, Ipswich, repeating his success of last year by taking first position with a very even stand of medium sized, well-finished flowers. Mr. Notcutt of Ipswich was an extremely close second. In the winning stand the varieties shown were Australie, H. H. Spencer, Mrs. C. Blick, Phœbus, Violetta, Thos. Wilkins, International, Niveus, Eda Prass, Simplicity, Mrs. Ormstead, Snowdon, Graphic, Amiral Avellan, M. de la Rochetiere, Mons. Panckoucke, Duke of York, Madda, M. de Guilbert, Etoile de Lyon, L'Isere, M. E. Capitant, Rose Wynne, Charles Davis, Madame G. Henri, Silver King, Madame Thérèse Rey, Mrs. F. Bevan, J. Seward, Mons. Gaymer, Triomphe de la Laurente, Mrs. G. Carpenter, Western King, Colonel T. C. Bourne, M. Carnot, G. C. Schwabe, and Mutual Friend.

For twenty-four Japanese Lord de Ramsey (gardener, Mr. Musk) had a heavy and good stand of the leading varieties, including a grand bloom of Mrs. W. H. Lees. Mr. Berners was second, and Mr. A. F. Hills of Woodford third. Much the same order followed in the twelve and sixes, while Lord de Ramsey had the best Japanese bloom in the show, a splendid flower of Viviand Morel. Mr. J. Watts was almost the only exhibitor in the incurved classes, but in each case the flowers were good, as shown by the fact that the premier incurved bloom was in his stand, a superb Chas. Curtis.

In the decorative class E. Dresden, Esq., of Livermere Park (gardener, Mr. Tallack), won from Mr. Notcutt, the winning stand containing the beautiful single Mary Anderson. The same exhibitor was first for the best arranged basket and best arrangement of autumn foliage.

The table decorations were very pretty, but nothing unusual was shown. The first prize hand bouquet from Messrs. Frewer of Stowmarket, was well made and contained many choice Orchids and other flowers now in season. Mr. Henley, gardener to Mr. E. J. Johnstone of Rougham Hall, put up a pretty ladies' spray, composed of Dendrobiums, Phalænopsis. Ferns and foliage plants, table plants, fruit and vegetables were all well shown, principally by local exhibitors. The fine collection of the latter, shown by Mr. Rogers, gardener to Lord Rendlesham, being of quite exceptional merit, as it must have been to defeat the stand put up by Mr. Tallack of Livermere Gardens.

Trained plants were a marked improvement on last year, Mr. Bishop, gardener to Mr. Burrell of Westley, showing in the highest form. In the second division the honour for six of one kind of Japanese fell to the same exhibitor for a fine stand of Phœbus, while incurved blossoms were finely shown by Mr. B. Booth, his stand of six Charles Curtis being especially good. Mr. R. Davidson, gardener to the Earl of Cadogan, Culford, put up a large and brilliant group, consisting chiefly of Chrysanthemums, some large bunches of Grapes, and other fruit, and some immense Gourds in variety. The amateurs' division had the classes well filled up, but space does not admit of any further reference.

EDINBURGH.—NOVEMBER 18TH, 19TH, AND 20TH.

NEVER before has the Waverley Market been so severely taxed to hold the exhibits entered for the annual autumn exhibition of the Scottish Horticultural Association as upon the occasion noted. Many fine honorary exhibits from local and other nurserymen had to be refused, so keen were exhibitors in various parts of the country to participate in this famed show. This great increase was, no doubt, traceable to the special nature of the prize schedule issued. The executive had determined to celebrate the Diamond Jubilee of her Majesty in a fitting manner, and thus offered prizes the like of which had never been seen before at any Chrysanthemum show. £150 was the sum set apart for this special class. This was no doubt a bold step, but the results justified the venture, for one of the grandest shows was to be found here that has even been seen. Not only was the show a success in a horticultural point of view, but it was financially so also. In a great measure this was due to the fact that the Council announced that any surplus obtained this year should be devoted to charitable institutions in the city. We are pleased to say that there is a possibility of at least £250 being the nett result for this laudable object. No less than £744 was taken at the gates on the two first days. This is indeed a handsome sum, irrespective of the income from other sources. No less than 40,000 persons visited the show on the two days named. An executive who is bold enough to engage the Grenadier Guards band for the three days deserves well for its spirit of venture. The Committee know from experience that good music is appreciated, and act accordingly.

The Scottish Horticultural Association is managed by a strong executive Committee, divided into sub-committees, all of which work harmoniously. The President for the year is Mr. Dodd, Stoney Bank, Musselburgh. Mr. R. W. E. Murray, Mr. A. Milne, and Mr. Grieve are the conveners of the various Committees. The important post of Treasurer has long been held by Mr. A. Mackenzie, Warriston Nurseries, and filled, too, with credit to all concerned. Mr. Robert Laird is Secretary, and under his able guidance the whole of the machinery runs smoothly. Mr. J. H. Murray is the hardworking, indefatigable Assistant Secretary, and by his geniality of manner and indomitable perseverance, valuable aid is rendered.

In the exhibition itself the chief interest centred in the cut bloom classes; the principal one was the Jubilee class previously noted. The conditions were: Twenty vases of Chrysanthemums in twenty varieties, three blooms of each, Chrysanthemum foliage only to be used. The first prize was £50 and the Victorian gold medal of the Society; second £30 and a silver medal; £15 and a medal for third, with £10, £8, £7, and medals for the three remaining prizes.

Nine competed, the result being the finest exhibit of its kind ever seen. Mr. A. Haggart, Moor Park, Ludlow, was the fortunate winner of the premier prize. Not one inferior bloom did this stand contain, all were of huge size, grand quality, and beautifully staged. The varieties were Western King, Charles Davis, Graphic, M. Gruyer, Simplicity, J. Bidencope, M. Panckoucke, Madame Ad. Chatin, Mrs. Herman Kloss, Edith Tabor, Lady Ridgway, Phœbus, Etoile de Lyon, Niveus, Mrs. W. H. Lees, Mons. Chenon de Leché, M. Taillandier, Mrs. Weeks, Viviand Morel, and R. Dean. Mr. W. H. Lees, gardener to F. A. Bevan, Esq., Trent Park, New Barnet, was a good second. The blooms in this exhibit were a trifle less even in size; they were beautifully fresh and well staged. Especially good were Madame Carnot, Mons. Chenon de Leché, Western King, Mrs. Weeks, Phœbus, C. Davis, and Mutual Friend. Mr. McHattie, gardener to Duke of Wellington, Strathfieldsaye, Berks, was an extremely close third. Many grand examples of cultural skill were apparent in this exhibit. Mr. P. Waterer, Fawkham, Kent, was fourth, and when we remember that he is truly an amateur, this exhibit was indeed a success. Mr. P. Blair, gardener to Duke of Sutherland, Trentham Park, was fifth; and Mr. Divers, gardener to the Duke of Rutland, Belvoir Castle, sixth.

Ordinarily the class for forty-eight Japanese, distinct, for which the City of Edinburgh cup, value £25, is offered, is the leading class. This time the handsome prize was also secured by Mr. Haggart with a grand exhibit. Mons. Chenon de Leché, Etoile de Lyon, Mrs. C. H. Payne, Pride of Madford, C. Davis, James Bidencope, Madame Carnot, Moor Park, Edith Tabor, Mrs. W. H. Lees, Mrs. Maling Grant, D. Seward, M. Blenkiron, Madame Marius Ricoud, Madame Ad. Moulin, L. Snnderbruek, Simplicity, M. C. Molin, J. Seward, A. H. Wood, Phœbus, Mdlle. Thérèse Rey, Niveus, Duke of York, Australian Gold, Lady Ridgway, Mrs. Weeks, Mdlle. M. A. de Galbert, Western King, G. C. Schwabe, Mrs. Herman Kloss, R. Dean, Australie, Mrs. F. A. Bevan, E. Molyneux, Miss D. Shea, C. W. Richardson, Oceana, M. Montigny, International, Modesto, Van den Heede, Viviand Morel, Mutual Friend, Rose Wynne, and Mrs. B. Ironside were the varieties. Mr. J. Beisant, Castle Huntly, Longforgan, was a capital second, staging many magnificent blooms. Mr. J. Fordyce, Bonally Tower, was third with smaller and uneven blooms. Mr. D. Niccoll, Rossie, third.

Eight entered for the Scottish challenge cup for twenty-four blooms, distinct. Mr. J. Beisant won this coveted trophy somewhat easily with really fine specimens of Chenon de Leché, Mrs. W. H. Lees, Mutual Friend, Simplicity, and others. The second prize fell to Mr. T. Lunt, Keir Gardens, Dunblane, for a good stand. Mr. J. Day, Galloway House, Garlieston, third. Twelve Japanese was a strong class; eleven staged. The premier award went to Mr. T. Lunt for a good stand of well-coloured blooms. Mr. J. Martin, Corndean Hall, Winchcombe, second. Mr. W. Nicholson, Condon Castle, Dollar, third. Six Japanese were staged by seventeen competitors. Mr. G. Chaplin won first with a good lot. Mr. D. Mackay, Cardross Villa, Cardross, second. Mr. G. H. Pearson, Viewforth, Stirling, third. Col. Chase, in splendid condition, won for Mr. Lunt premier award in the class for six Japanese, one variety. Mr. Haggart second with a golden bronze incurved seedling named Moor Park. Mr. J. Martin followed with Simplicity.

Prizes were offered for special varieties, six blooms of each. Australian Gold was best shown by Mr. W. Galloway, Ferneyside, Liberton. Mr. J. Martin, second. Mr. R. Addison, Blackhouse, Skelmorlie, third, all staging well. Charles Davis was much best staged by the last named, really well coloured examples of this popular variety. Mr. J. Foster, Wellwood Park, second. Mr. D. Buchannan had the best half dozen Edwin Molyneux, richly coloured shapely specimens, amongst eleven stands. Duchess of York was much better shown here than elsewhere this season, Mr. R. Addison winning the premier award. Brilliantly coloured blooms of Edith Tabor won for Mr. J. Day the leading place for this variety. Mr. J. Bird, Raehills, Lockerbie, staged the best Emily Silsbury. Mr. J. Bird had President Borel, and Mr. Addison Viviand Morel. For twelve Japanese, in three varieties, there was stiff competition. Mr. Lunt easily won with creditable examples of Duchess of York, Lady Byron, and Mutual Friend. Mr. T. Gordon, Ewanfield, Ayr, second.

In addition to the Jubilee class for Chrysanthemums in vases six other classes were provided for this means of staging them. The leading class was that for twelve vases, three blooms in each, open to Scotland only. The leading prize was £7 and the gold medal of the Association. Mr. R. W. E. Murray, Blackford House, Edinburgh, just won the coveted award with grandly developed blooms neatly and effectively staged. Mrs. W. H. Lees, Chenon de Leché, Charles Davis, Edith Tabor, and Commandant Blussett were especially noticeable. Mr. D. Niccoll second with good blooms, but not so well staged. Mr. J. Foster, Wellwood Park, Selkirk, was third.

For four vases, of six blooms each, Mr. Foster won the premier award amongst nine other competitors with blooms of capital quality. Mr. D. Mackay second. Mr. Murray third. Mdlle. M. Hoste, in faultless condition, won for the last named the leading place for twelve blooms in one vase. Mr. Foster, with Mutual Friend, followed closely.

Single flowered varieties were encouraged. Mr. T. M. Whitehead won first prize for a capital exhibit of mixed varieties in one huge vase, and well they looked in their association of various colours. Messrs. J. Holmes and P. Hunt were second and third respectively. Decorative varieties made a good display in vases of three, distinct, the blooms to

be shown in undisbudded clusters, Mr. J. Waldie won premier position with dark and yellow varieties, in free masses. Mr. T. Gordon second.

Incurved Chrysanthemums are, as a rule, only moderately exhibited in Scotland. The show in question was no exception in this respect. The principal class was for twenty-four distinct varieties. Mr. J. Martin won the premier award with fair examples of leading varieties. Mr. J. McHattie second, Mr. P. Blair third. For twelve varieties the exhibits were an improvement on the former class. Mr. Lees won easily with medium sized examples beautifully staged. Messrs. Martin and Day secured the remaining prizes in the order named. J. Agate was the variety staged in the class for six, any one sort, Mr. J. Henderson being the prizewinner. Prizes were offered for six blooms C. H. Curtis. Here an improvement was manifest, Mr. Martin, with large, fully developed blooms, winning easily. The last named secured the award for the premier incurved bloom in the show with a fairly good one of C. H. Curtis. In the Japanese section Mr. Haggart won a like position with a grandly developed bloom of Mrs. W. H. Lees.

Chrysanthemums arranged in vases or epergnes, with any kind of foliage, made an effective display, Miss Todd, Edinburgh, winning somewhat easily.

Plants are not well cultivated by Scottish growers of Chrysanthemums, though they were largely staged. The plants are large enough but the blooms lack quality. The principal class was for six, distinct. Mr. D. Cavannagh, St. Edwards, Murrayfield, won easily with freely flowered plants, much too tall to display their blooms in a satisfactory manner; Mr. Joseph Holmes, Winton Castle, Pencaitland, second. Mr. Cavannagh won also for four specimens. Pompons were freely flowered, but the blooms lacked quality. The best of four specimens came from Mr. P. Hunt, Coltbridge Hall, Murrayfield.

Groups of Chrysanthemums arranged in circular form were of moderate quality. Mr. W. Jobson, first; Mr. J. Downie, second.

Vegetables are generally a feature at the Edinburgh shows, this proving no exception to the rule. Amongst the most successful exhibitors were Messrs. W. Harper, Tullibelton House, Perth; A. E. Cameron; J. W. Scarlett, Inveresk; W. Smith, Newtonairds; G. Ormiston; and T. Galloway, Kirk Hill Farm, Broxburn. Fruit, as usual, was staged extensively and well. Space, however, forbids more than a note of the fact that Messrs. D. Airdrie, Larbert House; J. Paterson, Benochie Park, Kirkcaldy; J. Leslie, Piteullen House, Perth; T. Lunt; McIntyre, The Glen, Innerleithen; and J. Day were successful competitors.

Non-competing collections made an interesting display. Mr. H. J. Jones secured the Society's gold medal for a grand exhibit of Chrysanthemums, Begonia Gloire de Lorraine, Ferns, and Palms. No less than 350 cut blooms were staged. First-class certificates were awarded to Chrysanthemums Western King, Chebagne, and Madame Laurence Zédé in this collection. Mr. W. Wells, Earlswood Nurseries, Redhill, Surrey, contributed several dozen Chrysanthemum cut blooms; certificates were given to G. J. Warren, Julia Searamanga, and Georgina Pitcher. Messrs. Dobbie & Co., Rothesay, had Chrysanthemums in quantity. Mr. T. Fortune, 17, Queen's Ferry Street, had a charming exhibit of bouquets.

The banquet, held in the Royal British Hotel on the opening day, was a brilliant affair, over seventy sitting down. Several members of the National Chrysanthemum Society were present, including Mr. T. W. Sanders, Mr. Witty, and Mr. Orchard. Mr. Ross, Hon. Secretary of the R.H.S., Ireland, was also present, the chair being worthily occupied by Mr. Todd, the President.

Mr. Robert Laird, whose portrait we have pleasure in publishing (fig. 76), is the third son of the late Mr. R. B. Laird, and was born in 1859. Mr. Robert Laird manages the office and seed department at 17, Frederick Street, while his brother, Mr. David Laird, attends to the sixty acres of nurseries where the raising of seedling forest trees is particularly well carried on. Mr. R. Laird is a typical Scot, his commanding presence, jovial good humour, and unbounded heartiness entirely fit him for the position he so worthily occupies, whether as a partner in the nursery business, or as the Secretary of the Scottish Horticultural Association, a post which he has filled for the last seven years. It is in no sense of flattery when we say that it is doubtful if another society in the United Kingdom has made such rapid progress as this since he has filled his present post. Members of the Scottish Association enjoy many privileges. The annual subscription is only 2s. 6d., this small sum entitling them to attendance at the twelve monthly meetings held during the year, as well as to a free pass on the three days of the autumn exhibition. The photograph was by Moir & Halkett, Portobello.

CHESTER.

THE annual exhibition promoted by the Chester Paxton Society is every year becoming more successful. The seventh show, says a local contemporary, was a decided advance both as regards the number of entries and the quality of the exhibits. The Assembly Room of the Town Hall, in which the exhibition was held, was taken full advantage of, the arrangement of the Chrysanthemums and the fruit in a slightly different manner to that which obtained last year producing a beautiful effect. Among the exhibits in the fruit section was one from the Duke of Westminster (Mr. Barnes, gardener), who sent a meritorious collection of sixty dishes of Pears and Apples, which had been grown in the open in the Eaton gardens. Next to this the most conspicuous collection was that of Mr. John Watkins of Withington, Hereford, who was represented by fifty dishes of Apples. It may be here mentioned that Messrs. Dicksons', Limited, again occupied the whole length of the lower end of the room with an imposing and miscellaneous exhibit of flowers and fruits. The whole arrangement was one that had not yet been equalled at any previous show held in Chester, and contained excellently grown specimens of Chrysanthemums, Cyclamens, Carnations, and Palms, the front being finished off by luscious looking fruit from the Upton and Newton Nurseries.

A new departure has been made in the Chrysanthemum classes, this being the arrangement of the groups of plants in the centre of the room instead of at the sides. The change adds greatly to the general attractiveness of the whole exhibition. The entries, oddly enough, were those of exactly the same five exhibitors at the last show, when Mr. J. Wynne Ffoulkes, Old Northgate House, took first prize. Mr. Wynne Ffoulkes repeated his success at the present show, the other four groups, however, being also of excellent merit. A new feature in the Chrysanthemum classes was that for an epergne filled with such of those flowers as are suitable for table decoration. Nine competitors have entered the lists in this class, and although Mr. Edge of Hoole Bank was not perhaps so advantageously placed as the others, he managed to carry off the first prize in the face of strong opposition. The class for the six best plants of the Japanese varieties had not induced quite so large a number of entries as could be wished, but the quality is very good, the first prize blooms from Mollington Hall (Mr. Worker) being almost perfect.

For a group of Chrysanthemums arranged for effect:—First, J. Wynne Ffoulkes, Esq. Second, Mrs. R. S. Hudson, Bache Hall. Third, E. Dixon, Esq., Littleton Hall. Fourth, Mrs. Potts, Hoole Hall. Six plants, Japanese or incurved:—First, Captain Fielden. Second, Mrs. Logan. Third, Miss A. Wynne, Waverton. Four plants, single varieties:—First, C. Wigg, Esq. In the open class for twelve single trusses naturally grown Chrysanthemums:—First, C. Threlfall, Esq. Second, Mrs. Townsend Ince. Third, J. Tomkinson, Esq. Twelve cut blooms:—First, T. Brocklebank, Esq., Heswall. Second, J. Tomkinson, Esq. Third, C. Threlfall, Esq. Six cut blooms, Japanese:—Second, Colonel Read, Dee Banks. Six cut incurved blooms:—First, Mrs. Ince and J. Mosford, Esq. Second, Captain Fielder. Third, J. Tomkinson, Esq. Three cut Japanese blooms:—First, J. Wynne Ffoulkes, Esq. Second, C. Wigg, Esq. Third, Hon. H. C. Gore, Malpas. Three cut incurved blooms:—First, C. Wigg, Esq. Second, Hon. H. C. Gore. Best arranged box of cut single Chrysanthemums:—First, J. Tomkinson, Esq. Second, Mrs. Townsend Ince. Third, J. Mosford, Esq. Best arranged epergne of Chrysanthemums:—First, C. Wigg, Esq. Second, J. Tomkinson, Esq. Third, T. Brocklebank, Esq. Premier blooms, best incurved:—C. Threlfall, Esq. Best Japanese:—T. Brocklebank, Esq.

FIG. 76.—MR. ROBERT LAIRD.

HULL.—NOVEMBER 17TH AND 18TH.

MANY magnificent autumn exhibitions have been held under the auspices of the Hull Chrysanthemum Society in years past, but it is doubtful if one has ever been held before that exceeded the present, either in extent or quality. Groups have long been famous here for their magnificence; this year they were quite equal to any that has previously been seen. Cut blooms in some sections were a distinct advance, notably Anemone, Reflexed, and Pompons. Plants were a decided improvement on recent years. Table decorations, by their number and the taste may be described as progressive. The management here, always of the best, was quite up to the high standard attained. Messrs. Harland

and Dixon are to be once more congratulated on the magnificence of their fourteenth annual show.

Cut blooms were numerous and good, the schedule of prizes being extensive and varied. The principal classes were those for twenty-four incurved and for the same number of Japanese. In the first named six competed, making a fine display. The premier award fell to Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate, for a uniform collection of medium sized well-finished blooms of the following varieties :—C. H. Curtis (2), Lord Alcester (2), Mrs. R. C. Kingston (2), Mrs. Gardiner (2), J Agate (2), Duchess of Fife, Golden Queen of England, Madame Ferlat, Major Bonnaffon, Miss D. Foster, G. Haigh, Mrs. N. Davis, Mr. J. Kearn, Barbara, H. Shoesmith, Lady Dorothy, Mrs. Heales, Violet Tomlin, and Jeanne d'Arc. Mr. J. P. Leadbetter, gardener to A. Wilson, Esq., Tranby Croft, Hull, was second with blooms a trifle smaller ; and Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, third.

Mr. Mease was an easy first in the Japanese class, with grandly developed blooms of Madame Carnot, Phœbus, Etoile de Lyon, Baron Ad. Rothschild, Viviand Morel, Mrs. Weeks, Mrs. G. Carpenter, G. J. Warren, Julia Scaramanga, Mrs. J. Lewis, E. Molyneux, Mutual Friend, Mrs. Bernard, Mons. Chenon de Lecké, Mdlle. M. A. de Galbert, M. Ricoud, Mrs. C. Blick, Miss Storer, R. Owen, V. Hambleden, M. Gruyer, Simplicity, M. de la Rocheterie, and Mrs. W. H. Lees. Mr. Salter was a good second ; and Mr. W. Backhouse, The Bar, Beverley, third. For six Japanese, any one variety, Mr. Salter won with fine blooms of Chenon de Lecké. Mr. R. Walker, gardener to Col. Stacey Clitheroe, Hotham Hall, Brough, second with the same variety ; and Mr. C. Jennings, gardener to W. Maw, Esq., Barrow-on-Humber, third with Phœbus.

For twelve Anemone flowered, Mr. Salter staged grandly developed examples of W. W. Astor, Mrs. H. Gardiner, Sir W. Raleigh, John Bunyan, Robin Adair, Descartes, Gluck, and Delaware, and secured the premier award. Mr. W. Mason, gardener to Col. A. K. Dibb, Kirk Ella, won second place with a fine stand. Mr. G. E. Smith, Floral Cottage, Hull, was a close third. Mr. Salter also won premier place in the class for twelve reflexed, with blooms leaving little to be desired. Mr. G. Picker, gardener to F. R. Pease, Esq., Hesslewood, Hull, second ; Mr. R. Walker, third. Mr. Salter also led the way with Pompons, and was followed by Mr. R. Walker, and Mr. J. W. Bearpark, Thornton Street, Hull, third. Mr. Waterhouse, gardener to J. N. Owbridge, Esq., Cheny Garth, Cottingham, staged the best singles in twelve bunches ; Mr. Sinclair, gardener to B. Mackrill, Esq., Thwaite, Cottingham, second.

In the district class for eighteen incurved blooms Mr. V. Waterhouse was first with good specimens in all respects. Mr. G. Wilson, gardener to Sir J. Reekitt, Swanland Manor, Hull, a good second. For twelve incurved Mr. R. Walker won first place with neat fresh blooms. Mr. Thos. Down, gardener to H. S. Constable, Esq., Wassand, Hull, second with a bright stand of blooms. In the district class for eighteen Japanese there was brisk competition, and a good display. Mr. C. Jennings was first with a grand exhibit of popular varieties. Mr. R. Walker second. Mr. H. Thompson, gardener to C. J. Ringrose, Esq., The Grange, Cottingham, third. No less than eight competed in the class for twelve Japanese. With a very fine exhibit Mr Thomas Down, gardener to H. S. Constable, Esq., Wassand, Hull, won first place with extra good blooms. Amateurs staged creditable examples in the classes set apart for them.

An interesting class was that for two vases, each containing six blooms, one variety, Japanese arranged for effect, with any kind of foliage. Mr. F. Mason, gardener to Alexander Smith Esq., Woodleigh, Hessle, won with creditable examples of Niveus, and Thos. Wilkins, associated pleasingly with Asparagus plumosa. For two baskets or vases, each containing twelve blooms, distinct, one of Japanese and the other incurved, arranged for effect with any kind of cut foliage, Mr. G. Wilson was first, and Mr. Waterhouse a good second.

Groups are here always pleasing, and of the finest quality. This year they were no exception. A silver challenge cup with £6 is the premier prize, therefore it is not to be wondered at that there is invariably keen competition. The conditions are thus :—A group of Chrysanthemums, interspersed with foliage plants, arranged for effect in a space of 100 square feet. Four competed. The first prize was awarded to a group belonging to the Hull Corporation ; but as this cannot take a prize the honour fell to the second in merit, that arranged by Mr. G. Wilson. The former received the certificate of merit given by the N.C.S. Both were grand groups. The quality of the Chrysanthemum blooms in the Corporation group, combined with a pleasing arrangement at the back, won for it the place of honour. Mr. G. Jarvis, gardener to Mrs. Whitaker, Cliffe House, Hessle, was a creditable second ; and Mr. E. Poulsen, The Nurseries, Hull Road, Cottingham, third. Miscellaneous plants, arranged for effect in a space of 100 square feet, made an imposing display down the centre of the principal room. Mr. G. Wilson easily won the premier award.

An interesting class was that for a decorated drawing-room mirror or panel group of Chrysanthemum plants, interspersed with foliage plants arranged for effect, in a space of 9 square feet. No less than seven entries were received. The first prize was awarded to Mr. J. P. Leadbetter for a pleasing arrangement. Mr. G. Wilson was a good second, and Mr. G. S. Coates was third.

Plants, as previously stated, were an improvement upon recent years. For three trained specimens, Mr. H. Thompson, gardener to C. J. Ringrose, Esq., J.P., The Grange, Cottingham, staged freely flowered specimens, and was awarded the premier position ; Mr. W. Mason second. Mr. Thompson also won first honours for three standards, freely flowered ; Mr. Mason second. A class is provided for "cut-backs," quality of bloom, with dwarfness and good foliage, to be the chief points of merit. Mr. Waterhouse won with good plants ; Mr. E. West, Cottingham, being second. Bush grown plants were well represented by Mr. R. Smith, gardener to H. Sawman, Esq., Walkergate House, Beverley, who secured the premier position. Mr. R. Theisk, Grovehill Road, Beverley, second. The last named staged the best trained specimens in three varieties, as also did he in the leading amateur classes, and really good examples they were.

Table decorations, open to ladies only, have long been a feature of the Hull shows, a special room being set apart for them. The prineipal class was for a dessert table 8 feet by 4 feet, completely laid for six persons. Chrysanthemums, with any kind of foliage or grasses, to be used in its decoration. Six entered, making a grand display. Mrs. F. S. Wheeler, Chepstow, Prince's Avenue, Hull, was first with bronze and yellow Chrysanthemums and Ferns, lightly disposed. Miss Kirk, Owstwick, Benstick, Hull, second. Mrs. Arthur Dibb, Kirk Ella, Hull, third. Mrs. F. S. Wheeler also had the premier award for the most tasteful arrangement of miscellaneous flowers, Chrysanthemums, foliage and grasses. Miss Ethel G. Fisher, Willerby Hall, Hull, was second. Miss Pudsey, 6, Crown Terrace, Anlaby Road, Hull, had the best epergne, decorated with Chrysanthemums and any kind of foliage, grasses, or berries.

Messrs. W. Cutbush & Sons, Highgate, had a pleasing exhibit of Begonia Gloire de Lorraine and Chrysanthemums, which was a source of attraction to the numerous visitors.

THE HARTLEPOOLS.—NOVEMBER 19TH AND 20TH.

THIS year's exhibition was held in the new public hall of the Technical College, West Hartlepool, and, as a local show, it reflects great credit upon promoters and the exhibitors. It was well supported by the residents of both the Hartlepools.

In the cut bloom classes much interest centred in the challenge cup for twenty-four blooms distinct, twelve incurved, twelve Japanese. There were four exhibitors, and the competition was very close, the prize eventually falling to Mr. George Harvey, who, having secured premier position for the third time in succession, the cup becomes his property. The stand was made up of very neat and compact and fresh blooms of—Incurved : C. H. Curtis, Princess of Wales, Geo. Haigh, J. Agate, Mrs. Heale, Miss M. A. Haggas, Violet Tomlin, Jeanne d'Arc, Prince Alfred, Lucy Kendall, J. Salter, and Nil Desperandum. Japanese. Graphic, Chas. Davis, Viviand Morel, Edith Tabor, E. Molyneux, Commandant Blusset, Mutual Friend, Mons. C. Molin, Oceana, Australie, Pride of Exmouth, and Madame Gustave Henri (very fine, and premier Japanese bloom of the show). Second, Mr. D. Reid. Third, Mr. T. Smith. Fourth, Mr. A. Taylor.

In the class for twelve Japanese and twelve incurved Mr. Harvey was again first with the same varieties as in the cup class ; second, Mr. T. Smith ; third, Mr. A. Taylor. Mr. Harvey was also first for twelve incurved ; second, Mr. A. Taylor ; third, Mr. D. Reid. Twelve Japanese. —First, Mr. Harvey ; second, Mr. Stokill ; third, Mr. A. Taylor.

Groups of Chrysanthemums were very effective, all the exhibitors showing fine fresh blooms and well arranged. First, Mr. D. Reid ; second, Mr. T. Smith ; third, Mr. G. Harvey ; fourth, Mr. A. Taylor. Group of miscellaneous plants.—First, Mr. Pattison ; second, Mr. Wharton. Vases of Chrysanthemums, baskets, bouquets, and epergnes were very effective, the prizes falling to Messrs. Taylor, Pattison, Barker, Huyton and Wharton.

[Owing to late arrival this, with several other shows, has had to be considerably abridged.]

SWEET PEAS.

SICILY, a large island in the Mediterranean, a few miles from the coast of Italy, enjoys the honour of being the native home of the Sweet Pea (Lathyrus odoratus), whence it was introduced into England in 1700 —nearly 200 years ago. There is some uncertainty as to its original colour, some authorities asserting that more than one variety of the species came over. Philip Miller, however, in his "Gardeners' Dictionary," mentions it in 1731 as the "broad-leaved, soft, hairy chickling, with large and very beautiful purple, sweet-smelling flowers, commonly called sweet-scented Peas." Chickling is an old name formerly applied to the Pea or Vetch. This must be considered good authority, and it gives us, as far as I can learn, the first reliable date of its existence after its introduction. I think purple or bluish-purple was probably its original colour, as there is a tendency to revert to this more than to any other shade.

I have a copy of "Mawe's Gardener," published in 1800, in which annuals are ranked in three sections, and Sweet Peas are placed in the third, or lowest class, containing the hardiest and commonest plants, so that its position at this date could not have been a very high one. The work mentions five varieties—the Purple, the Black Purple, White, Scarlet, and Painted Lady. This shows the position of the Sweet Pea 100 years after its introduction, or its centenary. Its bicentenary will soon be here, and, as it has become the custom in modern times to commemorate these periods in a favourite flower, we shall no doubt in 1900 show our due appreciation of this most beautiful of all annuals.

The variety of colour in 1800 was very good, seeing that there were a white, scarlet, purple, and a bicolor called Painted Lady, and it is remarkable that the last named variety has retained its position up to the present day. In Page's "Prodromus," published in 1817, a striped variety

is mentioned, bringing the number up to six. In 1842 a list was published which still contained only the six varieties, so that for twenty-five years there was no addition to the number. In 1860 nine varieties are recorded in the leading catalogues. In 1865 what are known as the Invincible strains began. First the scarlet, then purples, white, striped, and perhaps the most beautiful of all, the Carmine Invincible. These were undoubted improvements on the old varieties, and are still grown. Fairy Queen, probably a sport from Painted Lady, now became known, and was soon followed by Crown Princess, Adonis, Butterfly, Princess Beatrice, Violet Queen, Princess of Wales, and a few others.

About the year 1877 the great improvement in Sweet Peas began. Mr. Henry Eckford, at that time gardener to Dr. Sankey of Boreatton Park, in Shropshire, and who has since established a business at Wem, has done more than any other man to popularise this beautiful flower, by bringing out a great number of charming varieties much improved in form, size, and constitution, and of almost every shade of colour, so that Eckford's name has become a household word in connection with Sweet Peas.

There must be many persons who have visited Messrs. Sutton & Sons' seed trial grounds, and seen their immense collection of Sweet Peas, brought together from all sources, not only those of British origin, but from continental and American raisers, and numbering in 1896, I believe, not far short of 150 varieties. To me, as I am sure it must have been to many others, it was intensely interesting.

The question as to what constitutes a properly formed Sweet Pea, or, in other words, should we have a perfect ideal flower to work up to? has been the subject of some controversy. This really means, should the Sweet Pea rank as a florists' flower? The matter has been already brought before the Committee of the Royal Horticultural Society, and I think this body very wisely decided not to include it as a florists' flower. Some may consider this a slight on so beautiful and popular a plant, but I do not think so. To surround it by hard and fast rules would mean intercrossing only with those varieties most likely to approach a given standard of perfection, to a great extent irrespective of constitution and natural beauty. We have plenty of evidence in the florists' Auriculas, Polyanthus, laced Pinks, florists' Carnations and Hollyhocks, how the constitutions have become enfeebled.

It has, fortunately, in all the plants I have mentioned given rise to what may be called side issues. To quote the case of the old and debilitated laced Polyanthus. The public enjoys much more the healthy strains of the beautiful border varieties, and does not discard a good kind because it happens to have a pin-eyed instead of a regulation thrum-eyed flower. We have also our garden or border varieties of Pinks, Carnations, and Hollyhocks of good strains. The true florists' Dahlia is cared for only by the very few, the Cactus and decorative varieties are the favourites. A really good and popular flower cannot remain long fettered at the present day. These side issues, as I have termed them, are sure to break away, although they may be, and are, considered rebellious by the strict old florist. Raisers and lovers of beautiful flowers can, I think, be trusted not to encourage or develop anything likely to bring discredit, at any rate on the Sweet Pea.—(*Paper read by* Mr. G. STANTON, *Park Place, Henley, at a meeting of the Reading Gardeners' Association.*)

(To be continued.)

BRIEF NOTES ON ALPINE FLOWERS.

(*Continued from page* 488.)

THE SEASON AND ITS NEEDS.

THE mild weather which has prevailed for some time is not very favourable for many flowers in the rock garden. It is to be feared that they will suffer when frost comes, unless it be accompanied by their natural covering of snow. It will be prudent, therefore, to be prepared with some protecting material for use in the event of severe frost. This is not required by many alpines, but with a considerable number it is a profitable precaution. Some very early flowering plants, such as Saxifraga apiculata or S. Burseriana, may either have a glass cover put over, but well above, them, or a little loose material placed lightly over when severe frost is apprehended.

I prefer, for many things, some of the more woody stalks of herbaceous plants, nothing being better than those of the Asters. They should be placed very thinly, so as to break the intensity of the frost without intercepting air. Some very early plants are worthy of this care, so interesting are they in the beginning of the year. This covering should be removed in all favourable weather. Care ought also to be taken that alpines with silky or downy foliage are carefully protected from heavy rains. Anything to throw off rain, and at the same time raised so much above the plants as to allow the free play of air, will do. Squares of glass, slates, boards, or similar things, may be used. These are not always ornamental. Neither are umbrellas nor waterproofs to the human race, but they serve a useful purpose, and are therefore tolerated.

In the use of these protectors for the plants it must not be forgotten that the drip may be injurious to neighbouring flowers, and the shelters must be placed in such a way that the drops will not damage the other plants. For instance, it will not do to have the drip falling into the centre of a choice Saxifrage or Primula; nor will it do to direct it into the pocket occupied by an alpine which likes a dry soil in winter. It will be seen that even in what appears a thing so simple there is room for the exercise of some thought and experience.

DRAINAGE.

Another seasonable remark to make is that the advantages of properly constructed rockwork providing ample drainage will now be apparent. Some make rockeries with "pockets" for the plants, which are literally cups filled with soil, and without any means for the escape of surplus water save by means of the natural overflow when the earth is saturated to its utmost capacity. Such a state of matters—which, remember, will last for days and sometimes weeks in winter—is fatal to many plants, and unlike the natural conditions in which so many of them grow in their native habitats. This is, perhaps, enough to say on this point, with the exception of a remark that the necessity of good drainage is as great for alpine as for border flowers.

TREATMENT OF SMALL PLANTS.

This is not a good season at which to procure new plants, but it is, at times, necessary or convenient to have them secured in the middle of winter. Large plants which have had full exposure to the weather and have been grown in pots may, however, be planted out with safety if they have balls of earth attached. Even these require some attention, as in the event of frost a crevice or cavity may appear between the old ball and the adjacent soil. It is by far the better plan to allow the plants to remain in the pots, or, if not in these receptacles, to place them in clean, well-drained pots with suitable soil. They may then be plunged in some light material under glass and kept until spring comes round. Frames are generally used for the protection of alpines in pots, but unless great care is taken there is likely to be a large percentage of loss.

Damp is the cause of much of this, and to avoid this evil nothing equals (it may almost be said nothing avails but) a free circulation of air. In bad weather the frames are liable to neglect, especially if the alpine grower is an amateur, not unduly enthusiastic, or a gardener overwhelmed with work, as too many are, at all seasons. Nothing can be so convenient as a low alpine house constructed with both roof and side ventilation, and with a small modicum of artificial heat for use in unusually severe weather. In such a house young plants will make rapid progress. The pots are often plunged in ashes, but my experience is that these are sometimes unsatisfactory, and occasionally lead to the loss of valuable plants. Fine gravel, rough sand, or cocoa-nut fibre refuse will all be found preferable when they can be obtained.

Failing a properly made alpine house, a cool greenhouse where very little artificial heat is employed should be preferred to a frame. In either an alpine house or a greenhouse the flowers are readily accessible, and they afford many opportunities of enjoying the beauties of the alpine flora at an earlier season than in the open garden. The plants should not be stimulated by much heat, or they will be weakened and made more susceptible to harm from spring frosts after they are placed in the rock garden in their permanent positions.

These hints of the season are, as it were, rudimentary, and past masters in the craft may think them unnecessary. They are not so, however, as one finds that it is often these matters which if neglected check and, too frequently, stop finally the aspirations of the tyro in growing the flowers which form the subject of this series of notes. What are truisms to some are unknown to others, to whom we desire to lend a helping hand in the pursuit of a branch of gardening calculated to give true and lasting pleasure.—ALPINUS.

THE YOUNG GARDENERS' DOMAIN.

CULTURE OF THE GRAPE VINE.

(*Concluded from page* 466.)

FOR protecting outside borders of early vineries a thickness of straw or Oak leaves must be placed on before the temperature of the soil falls too low. This will retain warmth in the borders and hasten root action. It is also good practice to put some hard protecting material over the covering to throw off heavy cold rains. As the weather becomes warmer the greater portion of this protecting material must be removed to let the sun get at the borders. During dry hot seasons the outside borders of all vineries ought to receive a thorough watering, afterwards placing a thickness of manure on each border to prevent evaporation.

When the colouring of the Grapes commences rather more air must be admitted by day, and a little left on the house all night, as it is impossible to get well coloured Grapes from a close atmosphere, or if the leaves are crowded or badly attacked by red spider. From this period onwards so much moisture must not be allowed, but endeavour ought to be made to keep a growing atmosphere until the Grapes are fairly well coloured. When ripe, give plenty of air day and night. If the weather be hot and bright the Vines derive benefit from the paths being damped down at mid-day. Some Vines are more subject to scorching than others, especially Muscats. Early and careful ventilation, combined with watchfulness, are the remedies. If the leaves are observed scorching badly, a slight shading must be afforded in bright weather, just sufficient to break the strong rays of the sun. Scalding is the one great failing of Lady Downe's. It takes place when the berries are stoning until colouring commences. As a preventive air must be left on the house all night, and if the mornings be bright the supply must be increased early, to allow the condensed moisture to evaporate and escape before the sun gains much power. Scalding will easily be perceived by the under side of the berry, or in some cases the berry altogether turning black. At this season, with this Grape, one needs to be especially careful, as in the case of negligence great harm may be done. Houses are now constructed with

such improved methods of ventilation that we may hope ere long scalding of the berries will be a thing of the past.

When late Grapes are hanging some time after being ripe all means for their protection must be resorted to. Dead or decaying leaves should be removed daily, and the bunches looked over at least three times a week, removing all bad berries. It is astonishing how quickly one berry, if left, will ruin a bunch, therefore this operation needs especial care. The house must be kept dry and well aired on all favourable occasions, and should the weather be damp a small amount of pipe heat must be resorted to, but do not get it too fierce, as it will aid shrivelling, especially in Muscats. The outside borders must also receive protection of some kind from the wet, as should the borders become too moist at this season, premature decay may take place in the berries. This protection should be removed as soon as the Grapes are cut.

Late keeping Grapes must be cut sufficiently early to afford the Vines a good rest. The Grapes will keep well if cut, and the piece of cane attached placed in bottles filled with clear soft water. It is advisable to leave a length of wood beyond the bunch. The bottles must be so fixed that when the stem is placed each bunch will hang quite clear. The bottles must be examined two or three times to see that the Grapes do not lack for water, especially early after bottling, as it will then be found the bunches have taken up a considerable amount of the water. The bunches must also be frequently examined, cutting out all decaying berries.

Red spider, thrips, and mildew will generally be found the worst enemies gardeners have to deal with. For the former, slightly dusting affected parts with flowers of sulphur will hold it in check. For thrips, if they become troublesome, sponge the leaves with lukewarm water in which a little insecticide has been placed. For mildew, on its first appearance, sulphur must be used. If this enemy once get a strong hold it will play terrible havoc, not only with the leaves, but also the bunches; therefore we must be especially watchful for a first appearance of it.

In writing these few articles, I hope I may have been a little service to the younger members of our craft; I dare not hope for the older ones. I have endeavoured to give the cultivation of the Grape Vine as I have seen it for better or worse. I hope I have succeeded.—SEMPER.

DENDROBIUM PHALÆNOPSIS SCHRÖDERIANUM.

I THINK Dendrobium Phalænopsis Schröderianum might well be called king of the genus, both for its freedom of growth and flowering. It is very early grown, adapting itself anywhere where it can get a sufficiency of light, heat, and moisture. An ordinary stove will suit it as well as a house purposely for them.

It should be placed as close to the glass as convenient without the pseudo-bulbs touching the glass, and after once being started into growth should never be allowed to get dry. Shading must only be resorted to in the hottest part of the day, syringing the plants thoroughly when closing the house, as this will induce strong, healthy growths, and help to check thrips and other insect pests which are apt to disfigure the plants and retard the growths from full development. After the plants have finished flowering they should be given a thorough resting.

The colours of the flowers of this delightful plant range from almost pure white to velvety crimson, and are borne on spikes averaging from 18 inches to 2 feet in length, bearing from sixteen to twenty flowers. It is so useful for house decoration in a cut state, and when in flower on the plant for grouping, for which it seems to be an especial favourite, as we see it used so extensively in all the premier groups at the leading shows.

The pests that infest these plants are thrips and scale, which can only be kept down by frequent sponging. There is also a small weevil, or beetle, which bores its way into the bulbs, and there deposits its eggs, which cause the bulb to decay, and can only be exterminated by frequent fumigations of XL vaporiser.

Another great thing it has to commend it is the moderate price at which it can be purchased and the small amount of room it requires, which is a consideration where space is limited. One often hears visitors, when passing through Orchid houses, remark, "What a lot of dry-looking sticks they are!" when out of flower (which is very rare). Yet when they see them in flower they are aroused to a state of enthusiasm not often seen.—J. B., *Bowden, Wilts.*

PERNETTYA MUCRONATA.—This is one of the few shrubs which take foremost places in more than one division. It can be put into a front place among evergreens, it is one of the very best ornamental fruited shrubs, and although individually the flowers are small, the great freedom with which they are produced makes it interesting as a flowering shrub. Looked at as an evergreen, it forms a low-growing compact bush with small ovate, lanceolate leaves half an inch or so long. They are dark green and glossy, and are relieved by the red bark of the young wood. The flowering period is spring, though a few flowers may be found at almost any time. The flowers are small and white, and are followed by bright coloured fruits. The fruits are produced in dense clusters, and have a wide range of colour in the various varieties. Some are white, some pink, red, or purple, with many shades of each. The plant is not very particular regarding soil and position so long as the soil is not too heavy. It is useful either as a single plant or grown in a mass, while a bed containing a dozen or so of the best varieties is very interesting. The stock of plants can be readily increased by division or from seeds, the latter being the slower method. The seeds should be sown in sandy peat, and the seedlings pricked off in pans or boxes until large enough for the nursery border, when they should be treated in a similar manner to Ericas.—K.

FRUIT FORCING.

Cucumbers.—The growing of clean straight fruit in winter is no easy matter. There is nothing like plenty of heating surface for growing winter Cucumbers. The heat not being radiated at a high temperature is good for vegetation, and the water in the pipes not having to be kept near boiling point the results are satisfactory in produce and cost of production, for hard firing means a corresponding waste of fuel. Very little air will be needed now, yet a change of atmosphere whenever a favourable opportunity offers will be of great service in hardening the tissues, always, however, excluding sharp and cold air, turning off the top heat when the sun is very bright and likely to raise the temperature much over 85° or 90°. In bright weather damp the house in the morning and afternoon, but be careful not to wet the embryo fruit, for water hanging on it will cause decay. Water will be required at the roots about twice a week, always affording it equal in temperature to that of the bed. Maintain the night temperature at 65°, 5° less on cold mornings, and 5° higher in mild weather, 70° to 75° by day, and 10° to 15° advance from sun heat.

The plants from the August sowing planted out in September have covered the trellis and are fruiting plentifully, but this must be allowed moderately if the plants are expected to afford full supplies at a later period. Young plants, however, always give the best results; hence when they become strong the better plan is to fruit them and have a succession to follow when they indicate exhaustion. Attend frequently to stopping and thinning, also tying the shoots, avoiding overcrowding, as stout foliage better endures the trying ordeal of wintry weather. Canker must be held in check by quicklime rubbed well into the affected parts. Removing old useless leaves is good for the plants, and may keep off attacks of red spider; but the best safeguard against this pest and white fly is a little sulphur on the hot-water pipes, also for mildew. Aphides succumb to fumigation with tobacco paper or vaporisation with nicotine essence, but neither must be used excessively or the foliage will suffer; besides, either operation on two or three consecutive evenings in moderation makes sure of the pests and thrips.

Figs.—*Earliest Trees in Pots.*—To have fruit ripe at the end of April or early in May the trees should be started in December, and they must be of the early varieties. After trying most we find St. John's and Early Violet, with Pingo de Mel and Brown Turkey, unequalled. Dress the trees with an insecticide, adhering closely to the instructions. Stand the trees on loose brickwork pillars, so that they may not settle with the fermenting material, which, being placed in the pit and brought up about the pots, will afford a genial warmth and moisture, but the heat about the pots must not exceed 65° until the trees are fairly in growth. The top heat may be 50° to 55° at night, and 65° by day, the trees and house being damped in the morning of fine days, and again in the afternoon, but it must be done sufficiently early to allow of the trees getting fairly dry before night. Water must be given at the roots to render the soil evenly moist, supplying it at the same temperature as that of the heat about the pots; but avoid overwatering or a wet condition of the soil, as that neither favours root formation nor a sturdy development. Also avoid a close moist atmosphere; the moisture arising from the fermenting material, with an occasional damping of the paths and walls, will be sufficient in dull weather.

Early Forced Planted-out Trees.—The earliest house should be closed in December to have ripe Figs in May. Where, however, the earliest Figs are obtained from trees in pots, starting the trees in borders may be deferred until the new year, so as to afford a succession. Planted-out trees, even with the roots confined (as they should be for early forcing) to narrow inside borders, will not ripen the fruit so early as trees in pots with the aid of bottom heat, hence if started at the same time they will afford a close succession to that from the trees in pots. The trees having been pruned and dressed with an insecticide, the house thoroughly cleansed and the border top-dressed, attention must be given to the moisture of the border. Assuming the soil has become dry, apply water in a tepid state to the roots at frequent intervals until the soil is thoroughly moistened, but not made sodden by over-supplies. In the matter of temperature proceed as for the house with trees in pots.

Succession Houses.—Prune the trees when the foliage has fallen. Shoots which have reached the limit of the trellis must be cut back to where the succeeding shoots start in order that they may occupy their places in the ensuing season. Cut away all elongated spurs, reserving, however, as there is room, a few of those which are short-jointed and fruitful. Loosen the trees from the trellis, thoroughly cleanse the woodwork with soap and water, the glass with clear water, limewash the walls, adding a little sulphur, and wash the trees with soapy water, afterwards dressing them with some approved insecticide, avoiding, however, those containing substances injurious to the bark. Tie the trees to the trellis, leaving sufficient space in the ligatures for the swelling of the branches. Lightly point the border, remove the loose material, supply fresh loam with a sprinkling of bonemeal, and scatter a few sweetened horse-droppings on the surface. Ventilate freely in mild weather, only closing when frost prevails.

Pines.—*Successional Plants.*—Span or three-quarter span-roofed pits or small houses properly ventilated are the most suitable for small stock, which at this season often suffer irreparable injury from being kept too close and warm, the plants being drawn and weakly. A temperature of 60° at night and 65° in the daytime will keep all young stock gently progressing, admitting a little air at 65° at the top of the house, leaving it on all day, but not to lower the temperature below that point; and when the sun raises the temperature to 75° a free circulation of air should be allowed. The bottom heat must be kept steady at 80°. Avoid anything approaching a damp atmosphere; moderate humidity only is needed at this time of year. Apply water when the plants become dry, and then afford a thorough supply of weak liquid manure. It is essential that the plants be kept well up to the glass, and be given plenty of room.

Suckers.—Those ready for starting now should be kept until March, and if there is likely to be a scarcity of suckers any recently potted may be retained in 5-inch pots, affording them a light position in a rather moist pit with a temperature of 55° at night and a slight bottom heat, keeping them rather dry. Take every opportunity of collecting leaves whilst dry, Oak and Beech being the best, and whenever a favourable opportunity offers push forward whatever may be necessary in the renewing or augmenting the permanent beds, effecting this without giving a check to the plants.

Strawberries in Pots.—A start must be made early in next month to have fruit ripe early in March. La Grosse Sucrée has been for many years, and still remains, our standard early forcing variety, with some plants of Vicomtesse Hericart de Thury and Royal Sovereign (of late years) introduced at the same time. The plants have always done best with us in a three-quarter span-roof house facing south, there being a bed in front for Cucumbers or Melons, a path at the back, and a narrow border at the foot of the wall for Tomatoes now going on towards fruiting in pots in another structure, they coming into the Strawberry house soon after starting. The Strawberry plants are placed on an improvised stage, tier fashion, so as to admit of ready access for watering from the path, and about 15 inches from the glass. The plants to be introduced should have the drainage seen to, rectifying it if defective, making sure that it is free, removing the loose surface soil, and supplying a top-dressing of horse droppings rubbed through a ¼-inch sieve, adding a good handful of some approved fertiliser, then watering it with a rose watering pot, so as to bring into a moist state and consolidate the material, otherwise it washes off in watering the plants. Plants so treated push surface roots freely, and the manurial elements are taken up by them. Wash the pots, remove the decayed leaves only, and place in position, taking care to keep the soil moist, for dry soil causes the loss of roots.

THE KITCHEN GARDEN.

Forcing Asparagus.—No vegetable is more easily forced than Asparagus, and early dishes are invariably fully appreciated. It is somewhat expensive to produce, because forcing many plants usually means breaking up one or more well established beds to get them. Once forced they are of no further value. Those who annually force Asparagus in the ordinary way form a new bed every season, and every winter break up the oldest or least valued bed among those that have been established several years. If Asparagus is wanted for Christmas the start should be made at once. Heated pits with depth enough for a hotbed of leaves, or leaves and manure, is the best position, and failing this a box frame on a mild hotbed is preferable to all fire heat. The bottom heat must not be violent. Prepare the leaves and manure in the usual way, and put them together firmly as a partial preventive of overheating. Cover with a layer of rich soil, and when it is seen the heat is not above 65° the plants may safely be introduced. These ought to be carefully lifted, and at once arranged closely together on the hotbed, covering with 4 inches of good fine soil. A moist top heat of 60° to 65° ought not to be exceeded, hard forcing, and also poverty at the roots, leading to the production of weakly shoots. In cold weather the frames or pits may be constantly matted over.

Rhubarb.—Rhubarb is now most often forced in Mushroom houses and other heated structures. After they have produced leafstalks to their fullest extent the clumps are thrown away, so that in this case again young plants must be constantly prepared to take the place of the old ones. When lifting clumps for forcing save a little soil about them and move into a house or pit, the temperature of which can be kept at from 55° to 65°. They may be arranged together on a mild hotbed or on a solid bed of rich soil, in either case banking over with rich moist soil. Keep the clumps constantly moist, allowing them to become very dry ending in the production of weakly leafstalks. The colour and flavour of Rhubarb grown in the dark is usually preferred.

Seakale.—Strong one or two-year-old plants are the best for lifting and forcing. These can be partly cleared of coarse roots, and packed somewhat closely together in large pots or deep boxes of rich soil. Enough to form several successions may be lifted and potted or boxed off at one time, introducing them into heat at intervals of a week or ten days between. If pots or boxes are placed into ordinary forcing houses, not far from the hot-water pipes, or are arranged on hotbeds, these must have other large pots or boxes inverted over them to exclude the light. If kept constantly moist at the roots the crowns may be cut over twice, the second crop of shoots frequently doing good service.

Protecting Seakale.—Ordinary Seakale is quite hardy, but the lily white form is not. All the plants of this variety, popular because most delicately flavoured and attractive in appearance, required for forcing, ought to be lifted now and stored thickly in moist soil where they can be protected from frost. Any left in the ground should have a ridge of ashes placed over them, later on banking soil over this, the first by way of protection from frost, and the soil to keep the growth blanched for use when it starts next spring.

Endive.—There ought to be no further delay in storing or providing protection for the greater portion of Endive grown. After sustaining slight injury from frost decay is rapid, but if uninjured, the plants tied up and then moved into a pit, frame, or vinery, surrounding the roots with moist soil, they will keep good for several weeks—always provided additional protection is afforded whenever necessary. Endive will also keep for several weeks in sheds and other makeshift places. Blanching may be effected either by tying up each plant with raffia, or they may be covered a few at a time with mats. Where there is a Mushroom house available, this will be found a good place for blanching Endive.

Horseradish.—When Horseradish is left in possession of the same plot of ground for several years in succession the quality of the roots deteriorates greatly. It is best when grown quickly and strongly. Should the weather continne comparatively mild and open fresh beds may be formed now instead of waiting till the spring, when so much other important work has to be done. Clear an old bed by trenching deeply, saving all the roots found. Prepare a fresh breadth of ground by trenching, mixing good solid manure with the bottom spit of soil only. Dibble in young straight roots to their full length 1 foot apart each way. One year later abundance of very fine roots ought to be available.

THE BEE-KEEPER.

Flowers for Bees.

Do bee-keepers study the requirements of the bees by planting suitable plants, shrubs, and trees, which in their season will yield pollen or honey, and at the same time beautify our gardens or landscape? I am afraid the reply must more often than otherwise be in the negative. There are many bee-keepers who, if they had the will, have not the opportunity. Fortunately there are many gardeners who are interested in bee-keeping, some of whom may have opportunities of planting, it may be a tree or shrub, which in its season will be of great benefit to the bees. I was reminded of this fact within the past few days on passing a plant of Ceanothus Veitchianus in full bloom, and which was covered w th both the hive and wild bees which were evidently obtaining honey as well as pollen from its flowers. Owing to the fine weather experienced throughout the autumn there are still many hardy flowers in the garden, which is very unusual in the dark days of November. In addition to the plants mentioned in previous notes as useful to the bees, and which may be planted at this season, may be mentioned the different varieties of bulbs, the earliest of which is the Winter Aconite, commencing to bloom, if the weather is favourable, early in January.

Tulips are very showy for either beds or borders, and when carpeted with a dwarf-growing plant, such as Aubrietia, which, by the way, is a capital bee plant, they are invariably much admired, and are appreciated by the bees on account of the pollen obtained from them. Many of the bulbs are quite at home when planted in the grass, where they may be allowed to remain undisturbed for years. The scarlet Duc Van Thol Tulip is a charming object for this purpose, so are Scillas, Aconites, and many other bulbs which are of value to the bees. The grass must not, however, be cut until the foliage of the bulbs has died down.

The different varieties of Salix, or what are commonly called Willows, must not be omitted from the list, as they yield abundance of pollen throughout the early spring months, when it is so necessary for the well-being of the stocks. Willows, too, have a handsome appearance when planted on the margin of a lake or pools of water—in fact, they will grow in any damp place where no other tree will exist, except it may be the Poplar, which, however, is of no use for the bees.

The Palm Willow should be planted if there is only room for one variety, as it is the best, and is also the earliest, commencing to flower early in February and continuing for several weeks. It produces more pollen than any other tree with which I am acquainted, and it comes at a season when it is most required.

Bottom Ventilation for Bees.

Now that there is no danger of robbing taking place, it will be advisable to open the entrance to the hives their full length, as this will cause a full circulation of air, and will dispel damp, which is so

detrimental to the welfare of the bees. Someone may ask, Why is it necessary to have a free circulation of air in the hive during the winter months? Would it not be better, owing to the hive being warmer, if the entrance were closed, so that space was left for the bees to pass out?

In practice it has been found that bees winter better, and are altogether in better condition the following spring, if the entrance to the hive has been opened several inches than when it has been nearly closed. It does not admit moisture, as some may imagine. On the contrary, the floor board will be found drier than will be the case with one, say, opened half an inch.

Some bee-keepers advocate perforated zinc floors, but after experimenting with them for several years I have finally discarded them, as I found the stocks did not increase at such a rapid rate during the early spring months as was the case with other stocks in which the entrance had been reduced for a few weeks at that period when breeding was going on apace.

Although the weather was excessively wet last winter, and the hives were facing due west, those hives that were wedged up a quarter of an inch from the floor board all round proved to be some of my strongest stocks last summer. The wedges were removed in the spring, and otherwise treated the same as the other colonies.

Rendering Wax.

One of the most unpleasant operations in connection with bee-keeping is what is usually termed making wax. But in the strict meaning of the word this is not true. The bees make the wax, the operator is simply rendering it from the combs which chiefly consist of wax. I have, however, yet to meet the bee-keeper who has said he really likes the job. There are many ways of obtaining the wax from the combs, but whatever plan is adopted heat in one form or other is necessary.

The old-fashioned plan, still much in vogue in some country districts, is to place the combs in a bag, which is put into hot water, and when the combs are well saturated the bag is placed on a slanting board, one end of which is in a vessel of cold water. The other end the operator places against his chest, and with a stout rolling pin he presses out the wax through the porous bag, which falls into the cold water and forms a cake of wax on the surface. The bag is returned to the hot or boiling water again as often as necessary, and the operation is repeated until no wax remains.

Another plan, which is preferred to the above, is to place all the combs in a bag which is placed in a copper and covered with water. The bag must be securely tied, and if a heavy weight is placed on it to keep it at the bottom it will be an advantage. If this is not available some other means must be taken to keep the bag at least 2 inches under the surface of the water, the reason of which is apparent, as directly the wax melts it will float to the top. When the water has become quite cold the wax may be taken off the surface in a thick cake. If the bag is not kept below the surface the wax could not be taken away in this manner, as it would stick to the bag.

When treated in this manner the under part of the wax will be dirty, caused by the débris and dirt in the combs. This may be scraped off. The wax must then be placed in vessels and put in the oven to be melted, afterwards pouring it into moulds. There will probably be a sediment at the bottom of each, which should be scraped away, and if necessary the wax may again be melted in the oven. If this process is repeated too often the colour of the wax somewhat deteriorates.

A solar wax extractor may be made by placing a sheet of glass over a shallow vessel containing the combs. If this is fixed at the right angle to catch the sun's rays in the middle of a bright day in August, it is surprising how quickly the wax is rendered from the comb. Some experiments I made during the bright weather that prevailed last July was quite a success.—An English Bee-keeper.

TO CORRESPONDENTS

All correspondence relating to editorial matters should, until further notice, be directed to "The Editor," **8. Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Table Plants (*Novice*).—The following are all useful for the purpose indicated: — Dracænas angustifolia, Sydneyi, and Ernesti; Crotons elegantissimus, Countess, angustifolius, and interruptus aureus; Aralias Veitchi, gracillima, and elegantissima; Geonoma gracilis, and Cocos Weddelliana, Carex viridis and variegata, and Pandanus Veitchi. The pots should not be larger than 48-size, and it is well to cover the surface of the soil with Selaginella or Panicum variegatum.

The Silver Tree (*E. H. Bayly*).—The plant of which you sent a leaf is a member of the natural order Proteaceæ, and is known to botanists as Leucadendron argenteum. It is a native of the Cape of Good Hope, where it is known to the Dutch colonists as Witteboom, or Silver Tree, a name which it owes to the silvery appearance of the leaves. The plant is in cultivation, and may be seen at Kew and in a few other establishments where large collections of old and curious plants are grown. It was introduced towards the close of the seventeenth century, so that it is by no means a novelty. Leaves are imported for decorative purposes with the Cape Everlasting Flowers, and may be frequently seen in Covent Garden Market. A figure of the plant was published in the "Botanical Register" in 1826, but it does not show the peculiar whiteness of the foliage.

Mealy Bug on Vines (*Perplexed*).—You will not find it easy to exterminate this pest, as the insects find safe quarters before the Vines are pruned, and some will reappear after growth is started. We have not found anything better as a winter dressing than syringing the house well in every part with a petroleum mixture, a wineglassful to 4 gallons of water, kept well mixed by one person syringing into the vessel whilst another applies it thoroughly to every part of the structure and Vines. Then, after pruning the Vines, stripping off the rough and loose bark, wash them with a softsoap solution 3 ozs. to a gallon of water. Afterwards apply with a brush a petroleum emulsion 4 ozs. softsoap dissolved in a gallon of boiling water and a wineglassful of petroleum churned violently for several minutes with a force pump or garden engine into the same vessel until thoroughly emulsified. Keep a sharp look out for bug in spring, and if any appear touch each with a very small brush dipped in methylated spirits.

Utilising South-west Wall Alternating with Tomatoes (*S. J.*).—All the plants you name would probably flower a fortnight to three weeks earlier against the wall than in the open ground, but there would certainly not be any profit in such plants as Lilacs, Gueldres Rose, Andromeda floribunda, Pyrus japonica, and Deutzia gracilis. Tea Roses, such as Comtesse de Nadaillac, Isabella Sprunt, The Bride, Adam, W. F. Bennet, Sunset, Madame de Watteville, Amazone, with Niphetos, which you have. Noisettes: Celine Forestier, Maréchal Niel, and Wm. Allen Richardson. Of Hybrid Perpetuals Brilliant, Charles Lamb, Emperor, and Empress are good for buttonhole work. The Roses would best serve your purpose, growing them in pots, which must, of course, be plunged, and to secure flowers early it would be necessary to have canvas to pull up and down so as to afford protection in frosty weather, otherwise the late spring frosts would damage the young growths and flowers or retard the flowering, the great thing being to have the blooming early, and not interfere with the Tomatoes, which will need to go out in May, and that is the time when the Roses will be at their earliest. For those reasons it is a matter of some importance as to whether the Roses could then safely be removed from their position against the wall. By affording slight protection, or giving a sheltered situation, the difficulty might be overcome. Of course, by giving protection in winter, the Roses would flower considerably earlier and give flowers more or less right through the season, so that, all points considered, they are likely to be profitable as well as suitable for the alternate system. Even in mild seasons they would give blooms late in autumn or early winter.

Insects in Peach House (*Anxious Inquirer*).—No. 1 is the larva of a snake millipede, evidently Julus terrestris, which, in the larval stage, feeds on decaying animal substances and decomposing vegetable matter; but in the adult form attacks Potatoes, Beet, Carrot, Parsnip, ripening Strawberries, and the young roots of various trees, such as Vines, and Peaches. The best dressing for the larva is quicklime, as this both kills the pests and takes away the decaying matter by converting it into inorganic substances, and bettering the soil in every way. We should not use more than 14 lbs. per rod, slaking and spreading evenly on the border, leaving there or very lightly forking in. We find, however, that a mixture of best chalk lime, air slaked, and good soot in equal parts by measure, using at once at the rate of ½ lb. per square yard and immediately pointing in, acts much the better for the trees, and also effectively against the millipedes, both larva and adults. No. 2 is, as you believe, the grub of the black Vine or grooved weevil (Otiorhynchus sulcatus). The pests are very tenacious of life, living several hours in solutions of nitrate of soda, kainit, &c., but always succumbing in the end; also to chemical manures, which slowly but surely compass their destruction. To act quickly, use soluble phenyle, a wineglassful to 3 gallons of water, giving that amount per square yard; or if the grubs are numerous and near the surface, as they usually are, use a gill (¼ pint) to 3 gallons of water, and apply 1 gallon of the solution per square yard by means of a rose watering can when the soil is in a moist (neither wet nor dry) condition before application. The solution will also destroy the Julus larvæ; but the lime or lime and soot will not kill the weevil grubs unless the lime comes into immediate contact with them.

Silver Fir Infested by Insects and Fungus (*A. W.*).—The insects on the piece of bark in the cottony substance are mostly the eggs of the Pine bug (Chermes laracis) but there are also plenty of the moth (so-called) Chermes, and even some larvæ. The pest is best destroyed by now dressing the trunk with a solution of soluble petroleum or some other approved insecticide, applying with a brush, spraying the other parts of the tree with the solution, as this cannot well be brushed on the leafy parts. The eggs are readily seen by a pocket lens, being of a pale reddish purple colour, becoming darker just before hatching, and the young are also rosy purple coloured, these soon fixing on the bark, and covered with a whitish meal. The spraying may be repeated about the second week in April, when the young, or rather eggs, are being produced again abundantly, choosing a dry time and wetting every part of the tree, as the insects fix themselves at the base of the leaves, especially on Silver Fir. The insecticide should be applied warm (130° to 140°). The twig from the younger tree also had a few patches of bug, but this has nothing to do with the enlarged axis of the shoots, unless the insects have punctured the buds—a very unwarrantable conjecture. The swellings on the one(this) and two-year (last) old wood, terminal and base respectively of shoot, are due to a fungus, Peridermium elatinum, giving rise to canker, and this without either producing witches' brooms or œcidia in the leaves, but the latter are, or rather were, in the shoot at the terminal buds, even spores remaining, and some of these germinating, as you may see on making a longitudinal section of a should-have-been bud and examining with a microscope enlarging not less than 100 diameters. The mycelium of the fungus is perennial in the tissues, which also may be seen as a dark reddish purple stain, penetrating the cambium and the wood, even with the unaided eye, by making a transverse section. Sooner or later witches' brooms will appear on the tree, and the leaves on that part produce œcidia and then falling, the witches' broom being deciduous in that case, and the remainder of the tree evergreen. We have seen some very fine specimens on the Silver Fir, and have also seen it on Abies (Picea) Pinsapo. On aged trees it does not do much harm. The witches' brooms are very curious, especially when not becoming leafless: but on young trees the canker knobs kill the young growths, causing the buds to become "blind," and the trees have a very stunted appearance, many dying outright, as almost every growth in some cases is affected. The only preventive is to cut off all witches' brooms and cankerous swellings on old trees, and clear away affected young ones in the thinning. We have lost many hundreds when from 5 to 8 feet high simply because we had several old trees bearing the witches' brooms near by.

Names of Fruits.—*Notice.*—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*T. C. R.*).—1, Hoary Morning; 2, Golden Knob; 3, Scarlet Nonpareil, 4, Dumelow's Seedling. (*Nemo*).—1, Court of Wick; 2, Ribston Pippin; 3, Marie Louise d'Uccle; 4, Winter Nelis. (*H. D. J.*).—1, Adam's Pearmain; 2, Cellini; 3, Gloria Mundi; 4, Bramley's Seedling; 5, Beauty of Hants; 6, Golden Winter Pearmain. (*J. W. A.*).—1, Waltham Abbey Seedling; 2, Kerry Pippin; 3, Wellington (Dumelow's Seedling); 4, unknown. (*F. G.*).—Autumn Bergamot. (*J. J. T.*).—Mère de Ménage.

Names of Plants.—We only undertake to name *species* of plants, no varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*P. F.*).—1, Vanda cœrulea; 2, Adiantum pubescens; 3, Gymnogramma chrysophylla. (*H. N.*).—1, Begonia nitida; 2, Arabis alpinus variegatus; 3, Euonymus europæus, the Spindle Tree. (*Fern Grower*).—1, Polystichum angulare; 2, Lastrea propinqua; 3, Adiantum cuneatum grandiceps; 4, Polypodium aureum; 5, Asplenium bulbiferum.

A MODEL.

We suppose that the objects of a home farm are to supply dairy produce, poultry, and other products for the owner's private consumption, and to provide him with an object of interest near his own doorstep at little or no cost. To fulfil, however, the latter requirement,

the farm must be large enough to be practically self-supporting, whilst not being so large as to become a commercial enterprise.

It will thus become somewhat of a model farm, and therefore should be in a ring fence with the buildings in a convenient position. As an illustration, we will imagine that we have to deal with a farm of 100 acres. For such a farm it is obvious that the fields must not be of large size, and seven acres would be quite large enough for the fields of such a farm, and certainly for the arable part of it.

If we suppose that about half is grass, we might divide the arable portion into eight fields of about seven acres each, say fifty-six acres; this would leave forty-four for grass and hay. Of the grass four acres would be required for the dairy cattle, four acres for the farm horses, and twelve acres to graze with growing and breeding cattle. This would leave twenty-four acres for hay. We seldom find the haystack too large, and any surplus would always find a ready market at the Hall stables.

With regard to the cropping of the arable land, of course the supply of suitable food for the milch cows would be a first consideration, also the production of such crops as are required for house or stable use, and are beyond the usual scope of a gardener's domain. Carrots, Mangold, Potatoes, would come under this heading; whilst of corn crops Oats would be a favourite crop, the straw being most valuable, and the grain going to the hunters and carriage horses at a market price.

The eight arable fields would be most easily managed on an eight-years rotation, and granted only that the soil be fairly deep and of medium strength we should recommend the following as being suitable cropping for the purposes stated:—

1,	One field,	7 acres.	Potatoes, 4 acres; Tares, 3 acres.
2,	,,	7 acres.	Wheat.
3,	,,	7 acres.	Clover, for grazing.
4,	,,	7 acres.	Oats.
5,	,,	7 acres.	Carrots, 2 acres; Mangolds, 5 acres.
6,	,,	7 acres.	Barley.
7,	,,	7 acres.	Turnips and Swedes.
8,	,,	7 acres.	Oats.

The above should make the best use of the land available, and each field would be cropped in rotation—*i.e.*, Potatoes and Tares, followed by Wheat, then Clover, and so on, the eighth crop (Oats) being followed by Potatoes.

There would thus be 28 acres of straw crops, and if well treated with manure, artificial as well as natural, very fine grain crops should be grown with a heavy weight of straw, in this case a thing much to be desired.

To take the crops in order. Both Tares and Potatoes require very heavy tillage, but in different ways. The Tares should be sown partly in autumn and partly in spring, one sowing about September 20th, one about a month later, one in March, and a sowing of spring Vetches in May. The land must be well cleaned as soon as the Oat crop has been harvested, and a good coating of manure should then be ploughed in, with 6 or 8 cwt. of basic slag. The first sowing will be made immediately after ploughing, when not much harrowing will be needed, but the chisel harrow will have to be freely used before the later sowings, or the seed may be difficult to cover.

For the Potatoes plough deeply after as much autumn cleaning as possible or necessary. If there is a supply of good spit muck handy put it on before ploughing, which may be postponed to any convenient time before the new year, but it is a great point to get the ploughing done before severe frost sets in, for a frost mould is of great value to this crop, particularly if the land be on the strong side. If manure is not available apply 3 cwt. of kainit and 4 cwt. of basic slag before ploughing. The Potatoes should be planted about April 1st. It is All Fools' Day, but he is no fool who plants his Potatoes on that date.

The Wheat crop requires little notice. It should be drilled as soon as the land is ready after September 30th, and the Potato portion should have a top-dressing of nitrate of soda in April, about 1 cwt. per acre.

The Clover should be sown amongst the young Wheat the end of March or beginning of April, the mixture most suitable for the soil and locality will be easily ascertained from tenants or neighbouring farmers.

The Oats after seeds should not require manure, and there would not be any to spare for them. The seeds might be grazed until Christmas, and ploughed any time before February 14th when the weather will allow. We believe in deep cultivation for Oats, and would plough the land at least 8 inches, if possible, with chilled ploughs, and leave it as open to frost influence as is consistent with effectually turning over the sod.

March is the best month for drilling Oats, and as no farmyard manure has been used we should advise the application of 150 lbs. per acre of sulphate of ammonia and 300 lbs. of superphosphate, all to be harrowed in before the drill.

For Carrots and Mangold alike the land should be well cleaned as for Potatoes. The Mangold would be drilled late in April, 7 lbs. to the acre. Twelve loads of farmyard manure must be used, with 5 cwt. superphosphate at sowing time, and 2 cwt. nitrate of soda when thinned out. Carrots should be drilled about April 20th to May 1st, 8 lbs. to the acre, 22 inches apart in the rows. Farmyard manure is beneficial, but should be placed at least 10 inches deep. This can be done if the manure be spread on the surface, and ploughed in with a heavy chilled plough, using skim coulters to turn the manure into the furrow. We shall deal with the rest of the course and live stock next week.

WORK ON THE HOME FARM.

We have had a little more rain, but not much, and one slight frost with ice of the thickness of a penny; this was followed immediately by a slight rain, and the weather is now as mild as ever—this is all in favour of the Wheat we are now sowing after Potatoes. We tried to buy some small seed for this purpose; but have not succeeded, so have thrashed some of our own, and shall sow the tail corn from it. This is quite contrary to the teachings of high authority; but where larks abound only small, quickly exhausted seed will escape their ravages.

Mangolds are taking up exceedingly well, and are going into store in likely condition for keeping. We hear that Mangolds taken up early, like Potatoes, are not keeping well. Swedes are still growing fast, and had better remain a little longer before being stored. A good frost or two would check the flow of sap, and both make them easier to pull and improve their keeping qualities.

Cabbage for use next July may still be planted, and as long as the weather be mild they are better planted now than in spring; they make better roots, and grow much larger without being ready any sooner. Cabbage cannot be tilled too heavily, and will do very well with twenty loads per acre of good muck; but it must be well rotted, and if ploughed in in the ordinary way with a furrow about 10 inches wide, the Cabbage plants may be put in every third seam, and thus be 30 inches from row to row; a very practicable distance, for Cabbage is a crop that requires a good deal of hoeing, and room must be left for the horse hoe if economy is to be considered.

Some people keep making successional sowings of Tares; but it is now too late, for birds would get nearly all the seed before it could have much chance to grow. The next sowing would be better deferred until March.

Notwithstanding the much improved prospect for roots, and the mild autumn, enabling stock holders to keep their cattle out so much longer than usual, markets for stores are no better, but if anything worse, since November came in. Supplies have been heavy in almost every market except in the case of pork, which is both scarce and dearer.

REST IN PLANT LIFE.

IT is an indispensable part of the great plan that all life should have rest. This is an axiom generally accepted; and that all life obtains it under some or other of its varied forms may also be admitted, as well as that the more perfect the rest the more conducive it is to the well-being of the subject. In the vegetable kingdom, difficult though it may be in some particular instances and under certain conditions to recognise this great natural law asserting its rights, the fact remains that Nature's great restorer is not, cannot be denied to any of her subjects for an unduly protracted period without detriment to health, if the deprivation is not indeed sufficiently de-vitalising to result in death.

Possibly there is a greater affinity between animal and vegetable life in these respects than our present somewhat superficial knowledge of the subject has recorded. The illustrious Swede, Linnæus, in his exhaustive studies relative to other phases of vegetable physiology, touches upon this one, which he terms "The Sleep of Plants," and thus paves the way for higher researches into what is comparatively a mystery of the vegetable kingdom. Under normal conditions of atmospheric influence much, of course, may be noted of what is commonly occurring, either in the closing of blossoms as night approaches, or the folding up of composite leaves with the prostration of others; and in the exceptions to this night sleep we may see a close resemblance to the animal kingdom in those subjects of it whose habits are nocturnal. Were anything wanting to establish the similarity which undoubtedly exists in many ways between the animal and vegetable kingdoms, it is found in sexual relationship, and the bar which Nature has put equally upon both against the reproduction of monstrositics in the way of mules; and where we find so much in common it is but reasonable to suppose that in direct relation to our subject the divergence is not great, although the methods may be obscure.

Having touched upon a somewhat abstruse question, which to say the least is an interesting one, we may turn to that portion of it which is of immediate concern, especially at this particular

season, the season of rest with so many objects of our care. Indoors and outdoors, with practically all of these, we know how essential it is that rest should be afforded, and most cannot fail to have observed how any transgression in this respect brings its own punishment. The more obvious this is when we reflect upon the sensitiveness of plant life to undue excitement. Much of this as belonging to outdoor vegetation is, indeed, beyond our control, but there are again notable instances in which a ministering hand helps the subject to perform its functions at the proper season, and to pave the way for a better fulfilment of natural laws under adverse circumstances. But with the objects more directly under control is our present concern, and here the sins of omission and commission are not rarely noticeable.

Both in plant houses and fruit houses the penny wise policy is so often adopted during our all too short summers of trusting to the sun, or at any rate of a remissness as regards firing, which results in the mistaken endeavour to push on plants when they should be at rest, or to complete the finishing process of fruit when too late. In either case a pound of coal is, figuratively, better in early summer than a ton in late autumn. I have lately seen a fine house of Gros Colman Grapes, fine in every respect but the final finish of colour, quite spoiled for that market for which they were intended owing to a laxity in the employment of artificial heat as a balance to make good the deficiency of solar rays earlier in the season; and although considerable effort at some expense was made from mid-September to retrieve lost time, the attempt, it is needless to say, was utterly futile. This is, however, a little aside of our subject. More direct to the point was an instance which came under notice of a young head gardener who found in his new charge a fine house of Crotons. Pressure of work—and new work presses the heaviest—led to a little laxity much as in the way of the Grapes, and an all too short season had waxed and waned ere vigorous measures begotten of anxiety were taken. The effects in this case were disastrous, for the stirring into activity at that time, when the most perfect rest we can give these plants is required, resulted in all but collapse of the whole collection.

In contrast to this one could not but recall the practice of a one-time leading exhibitor of plants. Perfect rest at the proper time and for as long a time as was consistent with the plant's health, or the purpose for which it was intended, was with him a *sine quâ non*. To obtain this each particular plant, as an important unit of the group for which they were intended, was studied to a degree which would, possibly, be a revelation to many of later days; and how well they enjoyed this rest until gently awakened into sturdy, vigorous growth was a revelation too. The successful grower of exhibition plants—and presumably this is the highest test of excellence—insists upon due recognition of this essential requirement, and the means generally employed in intelligent practice are too well known to detain here. Once our exotic plants by skilful management become responsive to control under possibly divergent treatment to their native conditions, and granted that such favourable conditions are maintained, the rest is comparatively easy; otherwise it is an open channel to a sea of troubles in plant growing.

In the infinite variety of character met with in plant life we can surely see much that is analogous to our own phase of existence. With plants, as with ourselves, are to be found those exciteable beings which rest badly, and others there are which sleep like a top during any abnormal elementary disturbance. That plants enjoy rest only when the functions of a season's growth are completed is obvious, and any attempt to compel them, either by withholding water or a reduction of temperature, to adapt themselves to a treatment for which they are unprepared, cannot but lead to constitutional deterioration. Some few years since, during one of those winters of almost Arctic severity which occasionally visit us, the heating apparatus of a range of plant houses in a certain high-class garden gave way under the temporary strain imposed upon it. This, with a fine collection of stove plants, appeared as if unqualified disaster would result. Such, however, was not the case, and it was a matter for surprise, even to the head gardener, that his choice plants came through the ordeal practically uninjured. All possible protection was of course afforded during several severe days and nights ere temporary repairs could be effected, yet what these plants endured, little short of actual freezing, can be imagined. The secret of escape laid in the fact that they were, so far as it is possible for a general collection of plants to ever be, at perfect rest; and, generally considered, the nearer we can habituate our tender stove and greenhouse plants to two seasons only—a season of growth and a season of rest—the latter during the dark days of winter, the better it is for them and all concerned. Other aspects of this question there are, which of course is one that cannot be limited to hard and fast lines; some of these are, perhaps, worthy of further consideration.—INVICTA.

(To be concluded.)

BATAVIAN ENDIVE—PROTECTION.

BATAVIAN Endive, when well grown, is one of the most useful of the winter salad plants. To obtain good results, I find the best time for sowing it in this district (North Midlands) is the middle of July. As soon as the seedlings are large enough in August they are transplanted 15 inches apart in rows a foot asunder. If the soil be moderately light, so much the better, and a position on a border facing the south or east is a suitable one. The ground requires to be deeply dug, though I never have it manured at the time of digging; but if the previous crop had had a dressing of manure so much the better. Two or three hoeings are necessary to prevent weeds and also to promote growth, so that by the beginning of October, when the summer Lettuces are getting over, the Endive will have covered all the ground, in the form of large plants 15 inches across with good hearts, Care should be taken when hoeing not to force the soil into the hearts. as salad must be clean to be properly appreciated.

One difficulty at this time of the year is to find Endive sufficiently dry to tie up to bleach, and without white hearts it is nearly useless. Sometimes, in the first half of October, it can be had perfectly dry, and the quantity, according to requirements, can be tied. In a fortnight these are fit for use, but after the middle of October I have found it harder and have been forced to adopt another plan. White frosts commence, and although Endive will stand a few degrees with impunity, 10° or 12° will injure it almost enough to render it useless, so that some sort of protection must be resorted to. One of the best protectors I know of is the Bracken Fern. Sufficient should be cut about the beginning of October to make a covering a foot in thickness. It lays lightly, is clean, and will keep out a large amount of frost and bleach the hearts at the same time. This, however, cannot always be had, or it may, as in my own case, be growing many miles away, so some other method must be found. For many years I saved the Pea haulm, and this answered fairly well laid on a foot thick, but if much rain or snow fell it became too heavy and decaying destroyed the Endive by about the middle of December. Another drawback was, that if a few old pods of Peas were left on they encouraged mice, and sometimes rats. I have also put a layer of mats on, but that plan was not a success, as the covering did not keep the frost out, and as the hearts became whiter and more tender, its power to resist frost was less. If no frost prevail slates or tiles laid on the plants will bleach them, also long boards laid on the rows. I have sometimes taken the plants up with good balls of earth and put them in a cold frame, but they have never eaten so crisply as when left in the ground where they have made their growth. The damp has also decayed them more quickly.

During the last year or two I have kept Endive well till February, and it is a plan that is within the reach of most gardeners. It is to cover the plants as growing with leaves. We have three or four old Plane trees within easy reach, similar to those planted so extensively in the London thoroughfares, and their leaves are found capital for protection. They are large and weigh lightly, and moreover do not decay so rapidly as the leaves of some trees. About the middle of October, or as soon as frost is likely to present itself, some of these leaves are used just to hide all the plants; but if a quantity of Endive is wanted for immediate use, enough leaves are applied to make a covering 6 inches in thickness, not only for keeping out the frost, but also for darkening the plants to bleach white. By the middle of November all the bed may have this thickness, and this will be found to keep out 10° or 12° of frost. But later, if harder frosts set in, enough leaves can be heaped on to make the covering a foot thick.

As the October and November supply of Endive is cut I let the Plane leaves remain on the ground, and these not being at all decayed are found useful for heaping on the later plants for January and February. By this method I have had good Endive from October to the end of February, a period of five months. After this time strong roots of Witloof or Chicory, introduced into a dark Seakale and Rhubarb house, will maintain a supply of salading till the spring Lettuces are ready.

It is true that a strong wind will blow off or displace some of the leaves, but this inconvenience is well worth attending to for the sake of having good salad in winter. If plenty of mats or netting were at hand, these might be employed for laying on the leaves to keep them secure. One point is to have the leaves raked up as clean and dry as possible. I have not tried the Horse Chestnut leaves, but if I had no leaves of the Plane I should do so, for they are large and fairly light if gathered up as fallen from the trees. The Improved Broad-leaved Batavian Endive if well bleached is not at all bitter, as are the curled varieties sometimes, and makes a salad much appreciated by those who require it throughout the year.—A. HARDING, *Orton.*

[We have found the plan of protecting and blanching Endive by covering the plants with leaves, as described, excellent. The samples sent to us by Mr. Harding were the best we have seen this year. They were not in the least bitter, but white and crisp, with an agreeable "nutty" flavour.]

VEGETABLES FOR HOME AND EXHIBITION.

(*Continued from page* 434.)

PEAS.

To maintain a constant supply of this most popular vegetable requires considerable judgment on the part of a gardener, particularly as it is seriously affected by the caprices of climate. This season we have had striking proof of this. The protracted drought and great heat of summer had much influence over the crop, inasmuch as it caused premature ripening of the straw of early Peas and brought the midseason and late varieties on so quickly that in some cases they were all in at once, and the whole season only lasted a few weeks. To avert this as far as possible judgment is necessary in the proper preparation of the soil, successive periods of sowing, and the choosing of the best varieties.

The Peas most suitable for the dinner-table are the best for exhibition, and they should be shown just when they are in the best condition for cooking. A variety that is heavy cropping, produces large well filled pods of good-flavoured peas, is the best to grow for supplying the kitchen, and as a Pea of this character fills all the requirements of the exhibitor there is no need to make any discrimination between the two. Some vegetables are subject to special treatment at the hands of exhibitors in order to get extraordinary specimens for the show table, but with Peas it is not so. The treatment that gives the best returns to the cultivator also results in the finest pods for show, so that in following out the most accurate details of culture, with soil and climate suitable, the advantages are mutual.

Frequent opportunities have occurred during the past summer of marking the difference in crops of Peas. In some gardens the cropping period was infinitely short, presumably on account of the drought, but in another garden under exactly the same conditions of soil and weather, the crop was considerably heavier and lasted longer. The latter state of affairs may be traced to deep cultivation, for no vegetable pays better for deep and thorough working of the soil. An excellent way of preparing Pea ground is to dig out trenches to a depth of a couple of feet and two spades wide. Place a layer of manure in the bottom, and fill up with alternate layers of soil and manure, adding a little loam from a pasture if obtainable. Several trenches may be prepared in this way during the early months of the year, and the sowings take place in succession.

The ambition of everyone who has a kitchen to supply is to get Peas as early as possible in the season, and keep this up as long as is practical. Artificial forcing of this vegetable has not taken the attention of gardeners to any extent, but whether this will be so in the future is an open question. An old and common mode of forcing is that of sowing Peas at the end of January or early in February in pots or turves cut into small squares, and placing them in a heated pit or hotbed frame. They must be kept close to the glass or they will become drawn and weakly, and after being gradually hardened they should be planted in the permanent quarters in April, by which means Peas may often be gathered a week or so earlier than if sown in the open ground. In some favourable districts a little time is gained by sowing in November, but the risks are too great to be generally recommended.

A south border having the shelter of a wall is the place for early Peas, the sowing of which may take place during favourable weather in January, having previously made the soil friable by thorough working and free use of well-decayed manure. It is an open question which is the better to sow for the first crop—an early dwarf variety like Chelsea Gem or English Wonder, or a taller grower such as William I. The last named is one of the best known Peas for early use, and has no superior; but if the border be a narrow one a dwarf grower will be more profitable, as the rows may be 2 feet apart, and if run parallel in a slanting direction, at an angle of about 60°, a longer length of row is obtained. Where mice are troublesome it is a good plan prior to sowing to wet the Peas and roll them in dry red lead. When the Peas appear they must be carefully watched and dusted with soot to prevent slugs, and also guarded against birds. As soon as they are a few inches above ground it is an excellent practice to draw up the earth to the row on each side, as this forms an excellent means of protection. In addition to those named, Daisy, American Wonder, and William Hurst are useful varieties.

For succession there must be sowings at intervals, and if William I. and Ringleader are sown about the same time as the dwarf varieties mentioned the whole will provide a good early supply. Other sowings of early and midseason varieties should be made in March, including Stratagem, Veitch's Perfection, and Sharpe's Queen. Some growers raise objections to the tall growing later sorts, but they are so prolific they cannot be dispensed with. Telephone, Ne Plus Ultra, and Duke of Albany form a capital trio, though it must be remembered that to obtain the best pods, fit either for exhibition or table, abundance of room must be given between both rows and plants, and stout stakes provided, otherwise they become top-heavy. Attacks of mildew among Peas during the past season have been very common, in most cases the result of drought. As a preventive deep cultivation to begin with and afterwards soakings of water or liquid manure are recommended, but after water has been given the rows should be mulched with strawy manure, litter, or short grass from the lawn, so as to conserve the moisture. Sulphide of potassium at the rate of half an ounce to a gallon of water, sprayed on affected parts, will destroy the mildew, but when once Peas are badly attacked they rarely recover fully.

Large pods for show are sometimes obtained by stopping the growth of the plant after the pods are formed, and then feeding with liquid or chemical manure; but if plain practical methods of culture are adopted pods quite capable of winning a first prize may be picked from the row that is supplying the kitchen.—GROWER AND JUDGE.

SUCCESSFUL GRAPE GROWING.

HAVING seen in the *Journal of Horticulture* an interesting account of Grape-growing at Cobham, on page 452, and a photograph of the vinery (page 459), I thought I should like to send you a photo of the vinery at Tilehurst Nurseries, near Reading, also a bunch of Grapes, so that you may examine the colour and sample the flavour.

When this photograph was taken there were 4635 bunches in the house, some of them weighing 3 lbs., and on the average the bunches would not weigh less than 1 lb. These Vines were only raised from eyes in February, 1892, and planted in February, 1893. The site is over 200 feet above the Thames on the Berkshire side of the river, and until 1892 grew only Briars, Brambles and Furze. It was, in fact, common land. Part of it was let to a farmer for £1 per acre, but he had to give it up in despair, so you see the soil was poor while the aspect is bleak.

The soil is composed of a mixture of sand, gravel, and irony clay. It is only about 9 inches in depth, so I had to take the top off the places where the buildings were going to be erected. This I mixed with bones, and made the border 5 feet wide on each side of the house. Two years afterwards I added 5 feet more on each side, and have still 5 feet of space in the centre of the house, which I hope to fill up this season.

The house photographed is 151 feet by 25 feet. I have taken over 6 tons of Grapes from it since 1893. Of course I do not expect to keep cropping the Vines for fifty years. I should expect to plant three lots of Vines in that time for market work.

The Vines are planted 5 feet apart at the back of the pipes, each Vine consisting of two fruiting rods. One-rod Vines were planted 5 feet apart in front of the pipes to get a crop of Grapes at the top of the house.

The first season after planting, the Vines were allowed to carry six bunches each, on a 10 feet length of rod. Only the front row Vines were allowed a length of 10 feet for fruiting, the back 3 feet each season. The rafters of the house are 15 feet. The second season the house looked pretty full of Grapes, the fourth season's crop you can see by the photo; it was taken by an amateur photographer in the village.

Trusting this will interest you, and possibly encourage your readers by showing them that they need not despair in growing Grapes, even if they have only "common" soil to work with. The nurseries are ten acres in extent, and contain fourteen houses, thirteen of them 151 feet by 15 to 25 feet; one house 100 feet by 18 feet. The proprietor is Ambrose Petrocokino, Esq.—JOHN BRADLEY, *Manager.*

[The bunch of Grapes received was an excellent example of the Black Alicante. The photograph is, unfortunately, far too dark for reproduction, but evidently represents superior cultivation, and both proprietor and manager are to be congratulated on the change they have effected from "Briars, Brambles, and Furze" to splendid fields of Grapes.]

CHEMISTRY IN THE GARDEN.

(*Continued from page* 212.)

We find it necessary to leave somewhat abruptly our consideration of soils, because we think it of little practical value to give attention to the absorptive power they have for certain compounds, unless it can be shown that these substances are of value to crops. We shall now proceed to describe (1) of what substances plants consist, (2) from where they are obtained, and (3) how they may be applied; and then we hope to be in a position to point out the value of soil absorption when certain manures are applied to the soil.

The Food of Crops.

When we try to fathom the mysteries of plant life and what substances constitute their food, we soon find out how little we know concerning this subject; but we also ascertain how simple is the food of plants, and what a few ingredients are needed to nourish them. True it is that manure merchants offer us many dozens of different compounds which may be applied to the soil for the purpose of supplying crops with food; but we shall find that although the array of manures is great, the ingredients they supply to plants are few.

In our first article on chemistry in the garden we stated that ten elements or simple substances were present in all plants. However, to refresh our readers' memory, we may be allowed to again give the names of these elements, which are as follows:—Hydrogen, oxygen, carbon, nitrogen, phosphorus, sulphur, potash, lime, magnesia, and iron. Soda, chlorine, and many other elements are also present in most plants, but we may look upon the first ten as being those of vital importance to crops.

Hydrogen and oxygen, as previously described, are two gases, but when they are chemically united they form the substance we know as water. Water, therefore, is composed of the two gases just named, and no other two substances in the world could form this liquid. The greater part of all plants is water. We all know that if the soil in which plants are growing is allowed to get dry they wilt or flag. Plants take up the water from the soil by means of their roots, and after passing through the stems into the leaves most of it is given off into the atmosphere in the form of invisible vapour. If there be not a sufficient supply of water within the reach of the roots the plants wilt or flag because more moisture is evaporated or transpired from the leaves than is absorbed by the roots. Put a bladder on the water tap and turn on the water. The bladder fills and becomes stiff or turgid. Allow the water to run out and the bladder becomes soft or flaccid. A plant is built up of millions of tiny bags or bladders called cells. When the roots have plenty of water at their command these cells are filled with water and keep the plant turgid; but if, on the other hand, they cannot get sufficient moisture, the cells are not filled, consequently they are flaccid, and the whole plant flags. Water also enters into the composition of the plants and performs other work which will be considered in due time; but from these few facts we see that water is a part of plants.

If we set fire to a heap of wood, and when it is burning cover it with soil, the wood will char or only partly burn, and a black substance known as charcoal will be formed. Now charcoal is a good example of the substance we call carbon. But supposing, instead of covering the burning wood with soil, we had allowed it to burn. All the charcoal or carbon would have disappeared, and only a small quantity of a greyish ash, called wood ashes, would have remained. If we burn leaves, roots, or any part of plants, we always get a certain amount of ash from them, showing that the ash, of whatever it consists, is present in all kinds of vegetation.

Take equal weights of dried wood and dried soil, and try to set fire to them. The wood will burn freely, but the soil—unless it be of a peaty nature—will not do so. The wood is composed chiefly of carbon, and this substance will burn readily; but the soil contains scarcely any, consequently will not burn. Try to set fire to a heap of wood ashes, and you will find that these will not burn any better than soil. This shows us that wood ashes and soil are similar in character, inasmuch as neither of them will burn, and as we proceed we hope to be able to show that the part of plants which burns is the portion they have derived from the atmosphere, while the ash which remains and cannot be burnt is the part which has been obtained from the soil.

I suppose every reader of the *Journal of Horticulture* knows what valuable substances wood ashes are to apply to every kind of crop, it matters not whether they be grown in the garden or greenhouse. They contain the very essence of plant food, as the following experiments will show:—A well-known agricultural chemist (Boussingault) carried out a series of experiments with plants growing in sand. He filled four pots—two with pure sand, and two with pure sand in which he mixed a small quantity of plants' ashes. In each pot he placed two Sunflower seeds, and these were watered with pure water until they had germinated and began to grow. After they had grown for a short time, one of the pots containing the pure sand and one containing the pure sand and plants' ashes he watered with pure water; the other two were always watered with pure water, in which was dissolved a small quantity of nitrate of potash.

The seedlings in the pure sand and plants' ashes, which were watered with pure water, absolutely refused to grow more than about 1 inch in height. The seedlings in the pure sand, which were watered with the weak solution of nitrate of potash, did not grow any better than the two last named; but those seedlings growing in pure sand and plants' ashes, and watered with the weak solution of nitrate of potash, grew into perfect plants, which produced normal flowers and seeds. Indeed, these plants were quite as large as if they had been grown in fertile soil instead of sand. What do these simple experiments teach us? Firstly, that plants cannot grow unless they have a supply of food given them; secondly, that sand, water, and plants' ashes do not contain all the elements of food unless nitrate of potash be added; and thirdly, that plants' ashes and nitrate of potash contain all the elements necessary to produce fully developed plants.—W. Dyke.

(To be continued)

INTELLIGENCE IN PLANTS.

(*Concluded from page* 498.)

In the Arctic regions it is too cold for seeds to germinate with any prospect of future success, and the plants are quite alive to the fact, and, as a rule, develop none. Instead of seeds they send out suckers, or the stems run along or under the ground and take root. In some cases trailing roots are dropped from the plant. Wheat taken there but educated here to depend on the autumn sun, retains its vitality for years, but has no opportunity of going through its usual curriculum and fails; but I fancy if a few bushels were carefully distributed, it is likely enough some of it would discover a *modus vivendi*, and adapt itself and probably get rechristened as a new plant.

Now let us go a little farther. Perhaps some of us may by this time have conceded the question of intelligence, and think that by doing so all difficulties are at an end; but they are not. They are rather beginning again. By conceding intelligence to plants and to their visitors, the insects, also, we land ourselves not exactly in clear daylight, but in denser fog than ever. If we say a bee has senses of sight, hearing, touch, and smell, also a memory, and profits by its experience, we go a long way; but it is not far enough, as you will see by noting what takes place in the fertilisation of the Yucca plant. The flowers each open for one night only. You need not ask me why, for I don't know; but when the flowers open a guest enters. The moth, Yuccasella, collects the pollen, packs it into a bag, and flies off to another flower, clearly knowing where the, as yet, undeveloped seedlings are, and inserts her ovipositor—a hollow tube with horny apparatus attached, and down this tube drops her eggs amongst the future seeds. This would be no use if she did not afterwards proceed to the stigma of the same flower and empty her bagful of pollen there; but she never forgets, for it is her life mission. Without all this these seedlings could never be fertilised, and her own grubs, which hatch out in a few days, would die for want of food. But note, when these grubs hatch they devour the future seedlings; but not all of them. Somebody or something knows that would not do, and some fertilised seedlings must be left to continue the race of the plant, and they always are. Where and whence has she learnt her life duties?

Clearly we are not within sight of the ultimate facts and factors of life. There are deeper and yet deeper depths for human intellect to fathom, and to learn yet more to wonder at and to adore the great and unknown Core of things, for we shall have to credit the cells of which all animal and plant life are composed with that wondrous intelligence, and look on man, animal, and plant, not as an individual, but as a co-operative society, each one of which is an individual endowed with all potentiality for progress.

What is a flower? By what conglomeration of incidental happenings has it been formed? What, or who planned out these multitudinous modifications? It is only a modified leaf, specialised for the production, protection, and distribution of seeds, but specialised with wondrous ingenuity, such self-evident forethought and intelligence, such cute and cunning adaptation of means to their ends. An Orchid, weird and bizarre as it may be, is just three sepals, two petals; three pistils and four stamens make the column; the lip is a petal and two petal-like stamens. The nectary is several modified stamens. Of the seven organs which form the column, four have given up their proper functions; one anther and two stigmas do their usual business, and the others just help them; three anthers no longer producing pollen, but protecting the one that does. What wondrous change of function! what a curious abnegation of self in all this! and by what law, what force, and by what intelligence? One apart and outside the plant, or an intelligence in the plant?—(*Read by* Mr. W. Pickard *at a meeting of the Sheffield Chrysanthemum Society.*)

ERYTHRONIUM REVOLUTUM.

THERE are many Erythroniums in cultivation in gardens, and several of them are very charming, with their attractive flowers and handsome leafage. From time to time these are exhibited at various shows, while occasionally rarer ones are also seen. Amongst these latter may be classed Erythronium revolutum, which was staged at the Drill Hall on April 13th of this year by Messrs. R. Wallace & Co., Colchester. The plant is a native of California, and is said not to have flowered in this country prior to the time of its exhibition. As may be seen from a glance at the illustration (fig. 77), the plant is well named. The colour of the flowers is white, delicately flushed with rose. The Floral Committee of the Royal Horticultural Society awarded it a first-class certificate on the occasion indicated.

SWEET PEAS.

(*Continued from page* 513.)

BEFORE I come to the cultivation and the selection of what I consider the best varieties, I should like to say something on the fertilisation of the Sweet Pea. It may be said they are never, or very rarely indeed, fertilised by insects, though not because bees and other insects do not visit the flowers, or that they never collect pollen or honey from them. In the case of the Sweet Pea, and I think I may include the culinary Pea and many others, of what are called papilionaceous, or butterfly flowers, fertilisation takes place before the flowers open, so that it is impossible for either insect agency or the wind to have any effect on the essential organs. That fertility does take place before the flowers open can easily be proved by opening a flower bud a day or two, or perhaps two or three days, before it expands, when it will be found that the anthers have discharged abundance of pollen, and that the stigma cannot help being fertilised. This function being performed in the flower bud has not been much understood. It is, indeed, an exception to the general rule, and it will explain, I think, the reason why so few varieties have occurred up to a comparatively recent date. I should say that the varieties up to twenty-five or thirty years ago were the results of sporting variations in the plant, observed and perpetuated, and not the result of any cross-fertilisation. Artificial fertilisation, with the object of obtaining new varieties, must be done with great care. The flower bud has to be forcibly opened and the anthers removed before they discharge their pollen, and the foreign pollen introduced. It requires some experience to know the exact time for this operation.

A papilionaceous or butterfly flower has five petals; the upper and largest one is called the standard, the two side ones the wings, and the two lower, often united, form the keel. These fold one over the other so beautifully that they completely shut out all insect agency until the flower has expanded, when a bee can, by settling on the wings, prise or press out into view the anthers and stigma, and so collect pollen; but the function of fertilisation has already been done. It has been said, and I am not going to say that it is not true, because I believe as a rule it is true, that there is more potency in foreign pollen than in own pollen—that is, pollen brought from one flower of the same species and applied to the stigma of another flower of the same species, is more effective, and further, that benefit has been derived from crossing between individual or separate flowers on the same plant.

Yet it is worthy of remark that the variety Painted Lady Sweet Pea has been known for at least a hundred years, and that its constitution is equal in vigour now to many of the newer varieties, and yet it has all this time been fertilised exclusively by its own pollen. Sir John Lubbock says in his interesting book, "British Wild Flowers in Relation to Insects," that it is probable that all flowers which have an irregular corolla are fertilised by insects. Now we all know that the Sweet Pea has the most irregular of corollas, and Darwin says, "Everyone who has studied the structure of papilionaceous flowers has been convinced that they are specially adapted for cross-fertilisation," and then goes on to say, "The case of Lathyrus odoratus is curious, for in this country it seems invariably to fertilise itself." Darwin does not think the flowers are fertilised at an early stage. He acknowledges that the anthers discharge their pollen in the bud, and that it adheres to the viscid stigma, yet he found the pollen tubes were not exserted. Darwin is inclined to believe that with other and larger insects, such as may exist in the original home of the Sweet Pea, the flowers would intercross, and he quotes the authority of an Italian professor, who says "That it is the fixed opinion of gardeners there, that is, in Sicily, that the varieties do intercross, and that they cannot be preserved pure unless they are sown separately." I may say we grow a collection in their separate colours in the immediate neighbourhood of six or eight hives of bees, and have never had the varieties mixed in the slightest degree.

Respecting the seed of Sweet Peas, there are a few peculiarities worthy of note. White flowering varieties, as well as the primrose coloured, have seeds of a light colour, with the exception, I ought to say, of Mrs. Sankey, which is dark. This is curious; but as this variety has a tendency to become tinted it may explain the anomaly. Again, we have several varieties of pale blue and kindred shades which have somewhat small, wrinkled seeds. When I have sent these varieties away with others, I have more than once been told that certain kinds were old and no good. To expose my own ignorance: when I had the wrinkled seed for the first time (I think it was Countess of Radnor) I did not like to sow it with the other kinds in case there should be a blank; so I sowed it by itself, and, of course, it grew as well as the others. I have sown five or six-year-old seed, and if a little slower to move, it turned out almost, if not quite, as well as that obtained the previous year. In picking the pods for seed, which is generally done when the pod is brown, it is a mistake to shell the seeds at once, as they are not often at this stage thoroughly matured. They should be kept in a dry place for a time and shelled later, when they will be thoroughly ripe.

In the cultivation of the Sweet Pea several methods have been suggested. Some recommend sowing in trenches, like Celery; but this, I think, should only be adopted when the soil is very shallow, sandy, or gravelly. We heavily manure and trench our ground in the autumn, and never grow them two years in sucession in the same place. We always select a good, open, and prominent position for our collection of named varieties, and have them in short, 6 feet rows with walks between each series of rows. As our collection numbers about 100 varieties it occupies a considerable space, and this spot is more visited during the Sweet Pea season than any other part of the garden.

Our two earliest rows of Sweet Peas are generally mixed, and sown in boxes early in February and transplanted when ready in the same way as the garden Pea. Our general collection we sow, if the ground is

FIG. 77.—ERYTHRONIUM REVOLUTUM.

in good working order, the first week in March. For the drills we use a 6-inch flat hoe, and make them about 3 inches deep. It is easier to distribute the seed in a drill 6 inches wide than in one drawn only with the corner of the hoe. We almost always sow too thickly; 3 inches apart is quite near enough to produce the best results. I, in common with most others, sow more thickly. In the case of the Sweet Pea it is somewhat excusable, for we have in view the probable depredations of our three great enemies—birds, mice, and slugs. With the greatest care we frequently have them gappy and patchy, and have often to transplant from the thicker places to make up the vacancies. To prove that thin sowing is better than thick, the new kinds that come out are expensive, and very few in a packet. We have sown these—or, rather, as we generally do, transplant them from pots—4, 5, or even 6 inches apart, and they always make the strongest rows and produce the largest flowers. I have heard on good authority of one single Sweet Pea plant bearing 200 fully developed flower-stalks at one time. After sowing the seed we cover it with about 2 inches of soil, so that the drills are left a little hollow.

As soon as the seedlings are through, we draw the soil up on each side of the drills, and well tread on both sides. This is strongly recommended by Mr. Eckford, and should be repeated several times, and to a distance of 18 inches on each side of the rows. This is considered so important in America, where the Sweet Pea is exceedingly popular, that they call it "Firming the soil."

The staking is generally done by one man who understands the work. A little brushwood is first put along, then the stakes to the desired height. In some seasons they grow much higher than in others. When very hot and dry, especially in sandy or gravelly soil, they become stunted

and quickly go out of bloom. I read the other day—not, I think, in a gardening paper—that the higher the sticks, the higher the Sweet Peas would grow, and this is not perhaps quite without a suspicion of truth. Heavy waterings will occasionally be necessary, and a weak application of liquid manure is beneficial. Light waterings are of no use; a good syringing would be better. Mulching is of great value. In our case we are not able to mulch, as the birds, especially the pheasants, which abound with us, scratch it all over the place.

Small clumps of Sweet Peas in the herbaceous border or wild garden are very charming. I ought to mention here that we grow our earliest supply of Sweet Peas in pots, and flower them in a cool house; they well repay the trouble. These are always grown in distinct varieties.

Autumn sowing of a portion is to be recommended, as the plants get more firmly established, and will stand the dry weather better, and give earlier bloom. Market growers adopt this system, I believe, and a good row of autumn-sown Sweet Peas is highly remunerative.

Nothing is more charming and refreshing, I think, than to see the earliest sprinkling of flowers on the nice green foliage of the first row of Sweet Peas. When this happens, cutting may begin, and the more it is persisted in the better, for if we allow the pods to form, the succession of flowers will gradually stop. The plants cannot work for long in two opposite directions. This, then, is a most important point, to keep all pods as soon as they show carefully picked off. It is not an easy matter, especially in very hot weather. I once tried a row during a spell of dry weather, and picked off not only the pods, but all the flowers, and the relief to the plants was remarkable.

It is possible, when the pods are carefully picked off, for one sowing to last the season; but we generally make one or two later sowings. Pinching in or stopping, when weakness in blooming shows itself, is often done with good results. Shearing the rows like a hedge I have heard recommended; but the after growth in this case is what we call stubby, and the produce is generally but one or two flowers on the stalk. In cutting Sweet Peas, we find it best not to cut the bare flower stalks, but just below. This includes open flowers, flower buds, leaves, and tendrils. A bunch cut in this way is far more charming and agreeable as a present than a dense one of bare Sweet Pea flowers, and so much more convenient and effective for arranging in vases. It may be considered a sacrifice to cut the tips of the plants as I have described, but we do not find it so; on the contrary, it is an advantage, as it tends to promote continuous flowering, and is really a gradual system of stopping, which is to be preferred to the usual plan of heading them all back at one time.

Some strong growing varieties give four flowers on a stalk. I think I prefer three, as the odd number seems more effective and pleasing than four or two. When we have shortened back in the ordinary way, the kinds that have given us the best second blooming were Princess Beatrice, Royal Robe, Princess May, Dorothy Tennant, Meteor, Mars, Celestial, Firefly and Salopian. These were the first to recover. The flower stalks were in all cases shorter, and the flowers, as a rule, were one less on a stalk than in the first blooming.—(*Paper read by* Mr. G. STANTON, *at a meeting of the Reading Gardeners' Association.*)

(To be concluded.)

A BENIGNANT NOVEMBER.

NATURE for some weeks past has had a spring-like aspect, atmospheric influences resembling those of April without its characteristic showers. Very often of late, looking out from the windows of the manse upon the majestic Bay of Luce, calm as a sleeping child, I have been instinctively reminded of those words of the great "High Priest of Nature," "The gentleness of Heaven is on the sea."

I am interested to learn from his frequent contributions to this Journal, that the horticulturist of the Solway, Mr. S. Arnott, has still so many beautiful flowers around him, for I feel assured that this gifted naturalist is never happier than when fondly contemplating, or, with graphic pen, delineating the still lingering life and sweetness of these.

Here, too, there are many reminiscences of autumn, and even—as I have indicated—of virginal spring. At present (November 27th) I have many Auriculas in bloom, while other varieties, touched as if by a vernal inspiration, are rapidly preparing to follow in their train. This evening I cut several very charming half-blown Roses from Madame Pernet Ducher, White Lady (positively her last appearance this season), Comte de Raimbaud, one of the most reliable, especially in late autumn, of our Hybrid Perpetuals, and therefore manifestly a Rose that should be included in every comprehensive collection; Gloire Lyonaise, the always graceful Anna Olivier, and Medea, the finest yellow Tea Rose that our country has produced. Another of Mr. William Paul's latest and loveliest productions, Enchantress, is enchanting me at present by her winter activities in the special direction of flowering shoots. Should Empress Alexandra of Russia, with its uniquely beautiful colour, prove equally floriferous, it will undoubtedly rival, if not surpass, the noblest productions of the late M. Guillot, of whose greatness as a rosarian I have many gleaming memories in my garden every year.

The sweet-scented Violet and the Naked-flowering Jasmine console me for the absence of the fragrant Viola, whose beauty has been relegated to the regions of memory till Nature silently assumes her vernal transfiguration, and we realise once more the deep beauty and divine significance of that annual earth poem, the resurrection of the spring.—DAVID R. WILLIAMSON.

BRIEF NOTES ON ALPINE FLOWERS.

(*Continued from page* 513.)

EVERGREEN SHRUBS.

THE furnishing of the rock garden is a question of considerable difficulty, and any answer to it would be necessarily subject to the taste of the owner and the design of the garden itself. It may, however, be taken for granted that no collection of Alpine flowers is complete unless it includes a number of evergreen shrubs of dwarf habit. There are doubtless a very large number of the smaller Alpine flowers which are of non-deciduous habit, but the inclusion of a considerable addition of taller growth will do much to improve the appearance of the rock garden and increase the pleasure of its possessor. This is generally accepted, and should be acted upon even in the case of rockeries of a simple nature, and but slightly elevated above the soil. Skilfully planted, the shrubs may not only be objects of interest in themselves, but be also of value in sheltering others from cold blasts or in giving the slight or deep shade some plants require.

There is a wide choice among these. If the rockery, a picturesque structure formed of large boulders or blocks, some of the Ivies may be used to cover these, and give a welcome greenery in midwinter. Among the large stones may be grown some of the dwarf Conifers, Rhododendrons, Escallonias (in mild districts), Ericas, Euonymuses, Pernettyas, Cotoneasters, Veronicas, Eurybias, Genistas, Berberises, Cratægus pyracantha, Juniperuses, Sedums, and a number of others. In addition to their foliage, never more pleasing than in autumn and winter, many are decorated with coloured berries, which, so long as fresh and undevoured by the birds, are objects of great beauty and interest.

The flowering evergreen shrubs are of especial interest to many, as, in addition to the value of their leaves, we have that of charming flowers at other seasons. One thinks that they may thus be taken notice of now, especially as some remove readily with a ball attached at almost any time.

ALPINE RHODODENDRONS.

It is doubtful if any evergreen shrubs suitable for the rock garden attract more admiration than the Rhododendrons, of which we have several admirably adapted for the choicest collection of Alpines In large and picturesque rockwork some of the best of the larger hybrids may also be grown, but it is to the dwarfer species and their varieties that we must principally look at present, and it is therefore my intention to give a few notes on these, supplemented afterwards by references to other flowering evergreen shrubs.

RHODODENDRON CAUCASICUM.

The first in alphabetical order is R. caucasicum, a valuable and pretty species, introduced from the Caucasus about 1803. It grows about 1 foot high, and has corymbs of pretty flowers, white inside, and rose-coloured outside, and ovate-lanceolate leaves, rather iron-coloured beneath. Perhaps the best of its varieties are R. c. Nobleanum and R. c. pulcherrimum, both of which have rose-coloured flowers and oblong leaves. Like the others named, it should be sheltered from cutting winds.

RHODODENDRON CILIATUM.

This is one of my special favourites; but it has the disadvantage of being a little tender, and should have a sheltered position from cold currents of air. It is sometimes badly cut by severe frosts, and its beauty much destroyed for a time. The writer is never likely to forget the effect of a fine plant of this Alpine Rose on a steep bank of a rock garden, in which is a *recherché* collection of Alpines. The variety was that known as R. c. roseo-album, and in combination with other plants in bloom at the same time nothing could be more beautiful. It flowers in May, and grows taller than R. caucasicum. The flowers of the typical species are of a light purple in terminal heads. They are of good size, and in combination with the pilose and prettily ciliated elliptical leaves look exceedingly beautiful. The variety mentioned is even more beautiful, and should have a place wherever there is room and a suitable position for it. About 2 feet is the height given in works of reference; but this varies according to soil, position, and moisture. It comes from the Sikkim district.

RHODODENDRON FERRUGINEUM.

This is one of the commonest of our dwarf European "Alpine Roses," and is frequently mentioned by writers who visit the European Alps. Its marked feature is the rusty appearance of the under surface of the leaves, caused by the colour of the dots which are so profusely scattered over them. It can hardly be said that this is an improvement to the beauty of the shrub, but this colouring is only seen in certain positions, and thus does not to any great extent detract from its usefulness. The oblong leaves are smooth and glossy above, and the flowers are of a fine scarlet marked with yellowish dots. It grows from 1 foot to 1½ foot high, and flowers from May to June. It is one of the hardiest of the Alpine Rhododendrons, and may well be planted more extensively than hitherto. It is also comparatively cheap and removes well. There is a pretty white flowered variety.

There are a few other species and hybrids which, with notes on the most suitable soil, will be dealt with in a succeeding issue.—ALPINUS.

ORCHARD HOUSE FRUIT.

I FIND from records of my father's that in 1848 Pears were all destroyed by May 2nd, and that in June of the same year the Cherries and Plums were an entire failure, but the crop of Apples a partial failure. In 1849, on April 19th, there was snow, while on the 21st the thermometer fell to 22° Fahr., destroying the crops of Pears and Plums. In 1850 the thermometer registered 23° on May 3rd, which seems to have destroyed the Pears and Plums then in full bloom. In 1851 the record on September 30th is :—"No Pears, no Plums, except Early Prolific. Apples abundant." In 1852, on April 19th, the record is :—"Frost very severe ; thermometer down to 20°. Fruit suffered severely, and appears to be all killed." In 1853, on April 25th, there was a steady fall of snow, and I find a remark that the winter has been fatal to many trees, Apricots and Peaches killed, and, to complete the destruction, another fall of snow on May 9th blocked the traffic on the Yorkshire railways, and the record of the year is that there was nearly a total failure of out of doors fruit in the South of England. In 1854, after a deliciously warm early April, the weather changed on the 25th, and the thermometer fell to 25° Fahr., the fruit trees, which were then in full bloom, suffered severely, and appeared to be entirely destroyed. My father adds that he never knew, up to the above date, a spring so dry, so sunny, and so full of promise. On July 15th he wrote :—"No fruit, and all the fruit trees, young and old, covered with aphides."

I have made these extracts to show how, under these adverse circumstances, the orchard house would command the attention of fruit growers weary of constant losses from the weather. The gardener could not be responsible for the weather, and when a new method of protection and culture was pointed out it was eagerly appreciated. There were, of course, many mistakes. Perhaps the system was made too easy ; but it is a fact that the most successful were those who went to work with an open mind and employed men who were not professed gardeners, and who would obey the instructions given in the book which my father, with a happy knack of choosing titles, called the "Orchard House." The houses which he recommended were span-roofed, with side and roof ventilators, the side ventilators being formed of a plank 18 inches wide in 16 feet lengths, opening on hinges downward. Roof ventilators, three on each side of a 100-feet span-roofed house. This ventilation is very effectual. There are now many labour-saving methods which were not existing when orchard houses were first designed.

A house 100 feet by 24 feet will provide an ample supply of fruit from May to October, the number of Peaches and Nectarines gathered from one house amounting to 3816, the same house giving shelter from spring frosts to Pears, Plums, and Apples, these being turned out in the summer. Another size for a smaller garden is a span house 60 feet by 18 feet, 10 feet to the ridge pole ; this is constructed like the other, and will give a large supply of fruit. I do not recommend lean-to houses, the light given by the span being much more plentiful, and the flow of air uninterrupted. I may mention that the floor of the house should not be paved, the soil giving off atmospheric moisture which is very acceptable to the trees.

PEACHES AND NECTARINES.

After building the house the next proceeding is to furnish it, and most cultivators, after securing the luxury of an orchard house, will naturally desire to grow the most luscious fruits. As Peaches and Nectarines cannot be grown in the open air with the same facility as Apples and Pears, they naturally take the first place under glass, and to bring about success, the soil for potting must be the first consideration. After many years of experience I find the following preparation the most useful : Take the top spit of an old pasture consisting of a calcareous and tenacious loamy soil, dug and exposed to the air for three months ; it must be carefully examined, and all larvæ of the cockchafer destroyed, also all beetles ; surface soil, if of good quality, may be used if no pasture is available, but the second spit should be avoided, and also all soil dug from a pit. Two-thirds of loam and one-third decayed manure should be chopped up together, not sifted ; if lumpy so much the better. The tree must be firmly planted ; if lime is not present in the soil it should be added.

After providing the soil, the next proceeding will be to choose the trees. Peaches and Nectarines will be the principal kinds, and with these the house may be furnished from the beginning of July to the beginning of October, the sorts for this purpose, arranged in order of ripening, consisting of—July 1st, Alexander, Waterloo, Amsden June (which I believe to have changed places with Alexander), Early Beatrice, which ripens generally in the orchard house from July 6th to 10th, and, though much smaller than Alexander, is hardier and will produce a crop year after year ; Early Louise, from the 10th to the 14th ; Early Rivers, which is liable to split at the stone, and hence requires artificial fertilising. Then come Hale's Early, Early Alfred, Early Silver, Rivers' Early York, Dagmar, Early Albert, Condor, Merlin, Crimson Galande, Dr. Hogg, Falcon, Early Grosse Mignonne, Goshawk, Magdala, Alexander Noblesse, Grosse Mignonne, Violette Hâtive, Bellegarde, Dymond, Noblesse, Royal George, Stirling Castle, Prince of Wales, Barrington, Walburton Admirable, Sea Eagle, Gladstone, Princess of Wales, Neetarine, Osprey, Lady Palmerston, Late Admirable, and Comet. The best Nectarines are Cardinal, Early Rivers, Advance, Lord Napier, Dryden, Improved Downton, Goldoni, Stanwick Elruge, Spenser, Newton, Milton, Byron, Humboldt, Rivers' Orange, Pineapple, and Victoria. I seem to give more varieties than necessary, but in a large orchard house room can be found for all, and as they all vary slightly in growth and maturity, they will be found interesting and useful for maintaining the supply without a glut of any special sort, as sometimes happens with wall trees.

The orchard house is responsible for the numerous seedlings which we have introduced into culture. These seedlings began with the introduction of the Stanwick Nectarine into England in 1843, first put into commerce in 1846. This Nectarine brought a new strain into England. My father raised the Victoria Nectarine, followed by the Stanwick Elruge, both bearing distinct marks of the Stanwick race. Following this good example, I fertilised many Peaches and Nectarines, and have, I think, succeeded in establishing a race of these fruits very distinct from the old and well-known kinds which have not changed for centuries.

APRICOTS.

The Apricot is another orchard house fruit of great value, although it is said by some to be difficult of cultivation. It ought not to be, for it is a native of very cold districts. In Knight's "Where Three Empires Meet," page 163, he says :—"At Bazzo, 13,400 feet above the level of the sea, Apricot trees in full bloom." Again, on page 253 :—"A succession of orchards of Apricot, Cherry, and Walnut. Oasis of Kapalu.' Mrs. Isabella Bishop in her book, "Among the Thibetans," page 78, says :—"The lower Nubian Valley is wilder than the upper, its Apricot orchards are more luxuriant, access to the villages is usually up stony beds of streams, over-arched by Apricots. The camping grounds are Apricot orchards. Apricot foliage is rich, and the fruit small but delicious. The largest tree I saw measured 9 feet 6 inches in girth. Strangers can eat as much fruit as they please provided the stones are returned to the owner. The kernels are used for a very clear, white, fragrant, and highly illuminating oil ; this is used, and very largely, in cookery, children are rubbed with it daily, and are fed on it mixed with barleymeal made into a paste.' In "Heart of a Continent,' Captain Younghusband says :—"Saser Pass, 17,800 feet—Chitral. By the beginning of April the Apricot burst into blossom and the valley was covered with clouds of white bloom. Peaches, Pear, and Apple trees came into leaf." This proves that it is anything but a tender tree, and, in the orchard house, it should have abundance of air when flowering. It is not so liable to canker when grown in pots ; lime is absolutely necessary. The varieties Peach and Moor Park are the best to grow. The Royal and Alberge de Montgamet Hâtif are also very good.

CHERRIES.

Cherries are pre-eminently orchard house trees, as, although they are orchard trees, the amateur gardener has little chance of eating the fruit unless he tackles it half ripe. The fondness for Cherries exhibited by birds, who content themselves with taking a piece of the ripening fruit, prevents the owner from enjoying it. Sir Richard Owen called this "salary to the orchestra," and said it was worth paying for, but I do not think people would generally agree with him. Under glass, however, all is changed. Ventilators covered with wire netting prevent these depredators from doing more than gaze with wistful eyes, for it is generally death to enter. Cherries under glass may be enjoyed from the end of May until the end of August, and, carefully selected, the sorts will last as long as Grapes. The earliest kinds of Cherries are : Bigarreau de Shreken, Early Rivers, Belle d'Orleans, Frogmore Bigarreau, Bigarreau Noir de Guben, Guigne Annondy, and others, which will prolong the season until the beginning of September. Some of my Cherry trees, although bearing annually large crops of fruit, have lived in the same pots for fifteen years or more, and are yet perfectly healthy and fruitful. A Cherry house, either in bloom or in fruit, is a picture of the greatest beauty.

PEARS.

Pears must be included, but they do not need more than two or three months of protection. Placed in the house in February the trees can be taken out when the danger of frost is passed, if this period can be determined satisfactorily. During the winter months, after being duly potted, they can be stored very closely, being carefully protected from any possible degrees below zero. In February the clumps may be opened, and the trees set out ready for transmission to the orchard house. I have never found these trees suffer from frost, and although the fruit does not follow the promise of the bloom, which is excessive, there is always enough left for the trees to mature. It is said that Pears grown in an orchard house lack flavour, but this, I suspect, is want of management. Pears are greedy, and if the water supply is not kept up with something more generous the flavour is apt to suffer. It is hardly necessary to say that for pot culture the sorts should be strictly confined to those which are large and handsome.

For a selection I would suggest Jargonelle, Beacon, Clapp's Favourite, Bon Chrêtien (Williams's), Beurré Superfin, Souvenir du Congrès, Louise Bonne of Jersey, Marie Louise, Conseiller de la Cour, Glou Morçeau, Doyenné du Comice, Pitmaston Duchess, Beurré Diel, Beurré Bachelier, Beurré d'Anjou, Princess, Winter Nelis, Josephine de Malines, Easter Beurré, Passe Crassane, Beurré Rance, Olivier de Serres, and Doyenné d'Alençon. All these are good, large, and grow well. It must be remembered that north of the Trent many of the Pears which ripen in November in the South of England will there keep good till Christmas. In all cases of cultivation undertaken for Pear growing I should recommend the use of perforated pots and annual root-pruning. An avenue of fifty or 100 trees, 10 feet wide, in a garden, with the pots carefully concealed, and the trees full of fruit, is a sight that must be satisfactory both to gardener and owner, and this can be produced year after year with no more fear of failure than should attend the cropping of Cucumbers.

Apples.

Apples grown under glass develop a flavour and colour hardly ever attained in the open air, especially some English and American varieties. The best of these are the Cox's Orange Pippin, which I have seen almost as full of juice as an Orange, with cells as fully developed as a Nectarine, and as rich in flavour; Ribston Pippin, rather hard, but very good; Golden Pippin, small, but capital; Braddick's Nonpareil, and all the varieties of Nonpareil, of which there are many; Calville Blanche, the Pearmains, and King of the Pippins are among the best of the English Apples; of the American Apples Newtown Pippin, Northern Spy, Mother, Reinette du Canada, the Melon, and Washington are the best. The trees require the same treatment as Pears. Provide the fruit buds by stopping the first summer growth at five buds from the base when the shoot has made from nine to ten leaves; after the first stopping allow growth for a time, generally till about the end of July, and then repeat the pinching; with a tree full of fruit much summer pruning will not be necessary. I have recommended the removal of Pears to the open air during the summer, but Apples will endure the heat of a glass house without loss of flavour; on the contrary, it is developed to an extraordinary extent. The trees require as much sun and as good a position as the Peaches and Nectarines, and must be fed with the same care; the more food the better the fruit, and it is worth the trouble.

Plums.

In selecting varieties of Plums some care is required, so as to have fruit through the summer and autumn. The very early and very late Plums in the South of England seem to ripen in the orchard house without any loss of flavour; but the midseason Plums, such as the Green Gage, De Montfort, and the Jefferson, are, I think, improved in flavour by being ripened in the open air. About the end of June they should be removed in some warm and sheltered situation. In wet and moist climates, where the Green Gage ripens with difficulty, they must remain under glass all the summer. For the first take the Early Favourite and Early Prolific, two excellent sorts which ripen about the middle of July. Next in succession come the Czar, Early Orleans, Early Transparent Gage, De Montfort, Denniston's Superb, Green Gage, Angelina Burdett, Kirke's, Guthrie's Late Green, Reine Claude de Bavay, Purple Gage, Coe's Golden Drop, Jefferson, Grand Duke, Golden Transparent, and Late Transparent, these last being sweetmeats if left long on the trees. These are all dessert Plums; but some of the well-known culinary Plums are also worth growing. An orchard house of Plums offers an agreeable sight in the autumn if the colours are arranged. I have been fortunate enough to obtain some seedling Plums that prolong the season to the end of October; these are the Primate and the Late Orange. Some Plums of the future have been sent from California under the title of Japanese Plums, but it is doubtful if they will succeed in unheated orchard houses. Any advance in cultivated fruit is a distinct gain, and the so-called Japanese Plums may be an improvement; but I think the Green Gage and its relatives will be cultivated for some generations yet to come.—(*Paper read by* T. Francis Rivers *at a meeting of the Horticultural Club.*)

EDGBASTON BOTANICAL GARDENS.

A recent casual visit to these interesting gardens disclosed a fine collection of Chrysanthemums (about 1200 plants), amongst which were contained several of the leading varieties. Some of the earlier sorts, however, were past their best, though such varieties as Edith Tabor, Niveus, Mutual Friend, Graphic, Mons. Panckoucke, Souvenir de Petite Amie, Mdlle. M. Hoste, Rose Wynne, Viviand Morel, Miss Ethel Addison, Mrs. H. Weekes, Duchess of Fife, Phœbus, Charles Davis, Lord Brooke, Etoile de Lyon, Mrs. C. Blick, J. Agate, and many others were fresh and bright. We were informed that the display had proved a source of considerable attraction for several weeks past to the numerous visitors to the gardens.

When passing through one of the houses our attention was drawn to a fine and well-grown collection of Primulas in close association with several plants of the useful winter flowering Plumbago rosea. Here, too, was observed Begonia insignis with its flesh pink coloured flowers, now too seldom seen, and which, when well grown, as it was by the writer upwards of forty years ago, still plays second to none for late autumn and winter work.

A visit to the Orchid compartments almost at any season of the year is sure to evolve something more or less interesting, and on this occasion attention was especially drawn to a new hybrid Cypripedium raised by Mr. Latham, the courteous Curator. The plant was displaying its first blooms. Its specific name is Deedmanianum, in honour of the expert grower, Mr. Deedman. The hybrid in question is a cross between C. Spicerianum (the seed parent) and C. Chamberlainianum, and though it evidences markings of both, it may be considered a glorified Chamberlainianum both in foliage and flower. Its dorsal sepal resembles in colour and markings the seed parent.

Conspicuous amongst other Orchids in bloom were two or three specimens of the extremely pretty and interesting Cœlogyne (Pleione) maculata growing in baskets suspended from the roof of one house. A large specimen of Cymbidium giganteum, with several long racemes of brownish-purple flowers growing in close proximity to the former, was especially attractive, as also were examples of such as C. Mastersi, Vanda Kimballiana, Cattleya Bowringiana, and the delicately green-tinted and sweet-scented Lycaste lanipes. Healthy specimens of Lælia autumnalis were on the eve of making a fine display. Amongst Cypripediums several specimens of the good old insigne and C. Spiceriannm contributed to the spectacle, whilst Cattleyas, of which there had been an attractive display, were on the wane.—W. G.

LILIUMS.

Amongst the most beautiful of our flowering plants, Liliums must undoubtedly be accorded a first place. They are so useful, both in the town and country garden, that everyone should grow them. They are of easy culture, and reasonable in price, two very great advantages to many growers. Liliums are, I might almost say, essential in every greenhouse; their place cannot be taken by any other plant in cultivation. The majority of them are free flowering, and last when in bloom for a considerable time in a most perfect state. Yet another distinct advantage which belongs to these plants is, that if by any accident a bud should get broken off, it will, when placed in water, open quite perfectly. The fragrance is most delicious, perhaps a trifle too pronounced for some, but not so much as to render them objectionable to anyone. They have been grown in our gardens and greenhouses for many years, and appear to have been known from time immemorial. Shakespeare mentioned them in the following words:

"Like a Lily,
That once was mistress of the field, and flourished."

And Spenser speaks of the Lily as the

"Lady of the field."

These lines are singularly appropriate and applicable to the chaste beauty of the Lily.

One of the most important features in the cultivation of Liliums is to provide a suitable compost for them. They will certainly grow in almost any soil that can be procured, but according to the old adage, that "A thing worth doing at all is worth doing well," applies to Liliums. It is always advisable to get the best, and the following will be found to meet their requirements:—Three parts of good turfy loam, one part thoroughly decayed cow or horse manure, one-sixth part of coarse sand, with a small quantity of crushed charcoal and bonemeal. If it is found difficult to procure manure, decomposed leaf mould can be substituted with a certainty of almost equally as good results, and road drift can be used for the sand. It is important that these ingredients should be thoroughly incorporated. The compost ought not to be wet, neither should it be dust dry; if used when it is pleasantly moist the bulbs will not require watering after potting until they start into growth.

In potting the bulbs, which should be procured now, care must be taken not to place them too high in the pot, as the stems of Liliums emit roots, rendering when they are making rapid growth a good top-dressing necessary, which should consist of a compost containing a rather larger percentage of leaf mould or manure than that recommended for potting. The size of the pot must of course be regulated by the species grown and the size. The same sized pot would not do for a L. lancifolium as would be suitable for a L. longiflorum. Good drainage must be accorded to them, for though water may be given in great quantities with absolute impunity, Liliums do not like soil which has become sour and sodden. Under such conditions the bulbs, owing to their scaly substance, rapidly decay. A little rough material should be placed immediately over the drainage, which helps keep it clear and free.

After potting the pots may be put in any cool place. If space in the greenhouse will not permit of their being placed in during the whole of the initial stages of growth, they may with safety be put outside, the pots being plunged in ashes or cocoa-nut fibre refuse to prevent the frost either getting to the roots or cracking the pots. Do not, no matter where they are placed after removal from the plunging bed, allow the young growths to become drawn and weakly by full exposure to the light, as if they do no one can expect to have a good quantity of fine flowers as a reward for their labour.

The finest Lilium for pot culture is L. auratum (Golden-rayed Lily of Japan). It is very beautiful, deliciously scented, and one of the easiest to grow, success with ordinary care being practically certain. There are various forms of it, but the one most commonly seen is very fine, and is, moreover, very reasonable in price. L. speciosum (lancifolium) rubrum and album should not be omitted from any collection however small, the pure white recurved flowers of the latter being most charming. The Bermuda or Easter Lily (L. Harrisi) is another, which is an acquisition to any collection, no matter how large, its long trumpet-shaped pure white flowers having a most chaste and exquisite appearance. It can easily be had in flower at Easter, hence its common name, when it was very largely used for church decorations.

Amongst the many other very beautiful varieties well worthy of cultivation are the following, which are chosen for their easy culture, certainty of flowering, and bright, cheerful appearance when at the summit of their beauty:—L. Thunbergianum, red; L. Krameri, blush pink; L. Krætzeri, pure white; L. canadense, the flowers of which vary from yellow to orange, and are spotted with black; Humboldti, golden yellow, with crimson spots; Washingtonianum, the flowers of which are white tinged with lilac; pyrenaicum (Turk's Cap), yellow with black spots. Superbum is a beautiful variety with orange coloured flowers having black spots; and szovitzianum, which has reflexed flowers of citron yellow colour sparsely spotted with black.—D. R.

Notes & Gleanings

WEATHER IN LONDON.—There was a very sharp frost during the early hours of Friday morning, and it continued cold throughout the day. In the evening, however, rain commenced to fall, and continued at intervals through the night and over Saturday, Sunday morning being also wet. During the evening of the latter day the wind gained strength, and blew strongly until Monday evening, when a little rain fell. It was cold, and the streets and gardens were quickly dried. There was rain again on Tuesday evening, but not for a very long time. Wednesday was fine.

—— WEATHER IN THE NORTH.—The last two weeks of November have been very dull, with a brightish day now and again and an occasional approach to frost. Saturday, 27th, was a good coldish day, but a storm of wind and rain began in the evening and continued throughout Sunday. The hills all round were covered with snow, and in the evening pelting sleety showers were almost continuous. Monday, again, was calm and clear, but the night was wet, and Tuesday morning drizzly, but later it promised to become more settled but cold.—B. D., *S. Perthshire.*

—— UNSEASONABLE FLOWERS.—This abnormal season will long be remembered by the various freaks which Nature has assumed during the last two months. Here we have spring flowers, including the wild Primrose, Strawberry, and a sprinkling of Apple bloom fully expanded, with Dahlias, Michaelmas Daisies, and other autumn flowering plants. Such an anomaly is seldom witnessed to the extent it is at present. But the most remarkable is a Honeysuckle, trained to a cottage wall in this parish. It has a crop containing both ripe and unripe fruit, and is now in bloom with two crops of leaves, the matured ones of summer, and a fresh crop of pale young leaves and growth; such a state of affairs is rarely seen at this date, 23rd November.—J. EASTER, *Nostell Priory.*

—— BEGONIA GLOIRE DE LORRAINE.—The magnificent group of this plant shown at the Edinburgh Chrysanthemum Show by Mr. H. J. Jones of Ryecroft Nursery, Lewisham, was much admired by visitors, and will doubtless lead many of our Scottish friends to grow it themselves. I find it one of the best colours for use under artificial light, and it is therefore one of the very best table plants we have for this dull season of the year, especially when there is a quantity of silver ornaments on the table. But I imagine it is open to the same objection as other Begonias if left for many hours in the rooms—viz., dropping of the flowers. An intermediate temperature appears to be necessary for it, and it is not so free growing as many of the fibrous-rooted Begonias.—W. H. DIVERS.

—— MR. ASTOR'S ROUND TABLE.—Large as may be this wonderful slab of Redwood Mr. Astor has imported here from California, I should hardly care to be one of the forty guests destined to sit round it when fashioned into a table, even were the feast spread to be a vegetarian one. For if the diameter be 16 feet 6 inches, the entire circumference as it is would be but 49 feet 6 inches, and that would allow elbow room for each guest of but 14½ inches. I do not think there are many persons who would care to be so compressed before dining, much less afterwards. But if this millionaire will cut out 8 feet from the centre of the slab, leaving a table all round 4 feet broad, he could then sit twelve guests in the circle at 24 inches apart, and in that way would find pretty ample room for the other twenty-eight on the outside. However, all this would, after all, have little connection with horticulture.—A.

—— A TREATISE ON FERN GROWING.—We have received a small treatise thus entitled, written by Mr. John Bowlby, published by Messrs. Whitehead Bros., Wolverhampton. The writer is evidently very well acquainted with Ferns and their cultivation, and he gives useful practical information; but when he says, "Nearly all Ferns are gifted with male and female fronds, without which the spores would not come to fructification," he lets us know that he has still something to learn. It is also a pity that he did not employ someone to correct the proofs of his treatise, and prevent at least 150 blunders in less than forty small pages. The treatise is written to be of service, as it may be, to the inexperienced—the very class who need education in correct nomenclature. Apart from the abounding inaccuracies in the representation of the names of Ferns, we find Saxifraga "Sacrementosa," a name which surely cannot be found elsewhere in the whole vast range of garden literature.

—— NATIONAL DAHLIA SOCIETY.—We are informed that the annual meeting of the National Dahlia Society has been arranged for Tuesday, December 14th, at 2 P.M., in the rooms of the Horticultural Club at the Hotel Windsor.

—— ROYAL GARDENERS' ORPHAN FUND.—We are pleased to notify that Mr. P. C. M. Veitch of The Nurseries, Exeter, has consented to preside at the annual friendly dinner of the Committee of the Royal Gardeners' Orphan Fund at Anderton's Hotel, on February 18th, 1898.

—— "KEW BULLETIN."—A number of this useful publication has recently been issued which embodies a list of the staffs in botanical departments at home, and in India and the colonies. If evidence were wanting as to the estimation in which Kew is held in distant lands it could be found in this book, for at every page appear marks that denote the fact of some officer having been trained at Kew, or recommended by the Kew authorities. There are about 125 names given as attached to colonial and Indian stations, of whom nearly one-half have been at, or were recommended by Kew.

—— VACCINIUM CORYMBOSUM.—Among the plants which assume brilliant colouring late in the autumn, says an American contemporary, none equals, perhaps, the common high-bush Blueberry, Vaccinium corymbosum, which early in November lights up many northern swamp borders with its flaming foliage. The value of this Blueberry as a garden plant has been often insisted on, for it is one of the most beautiful of all hardy shrubs. Beautiful in early spring with its waxy-white bell-shaped flowers, beautiful in summer with its bright blue fruit, and especially beautiful now after the leaves have turned. It is a tall shrub, and in good soil soon grows into a shapely specimen.

—— PRIMULA OBCONICA *versus* PRIMULA STELLATA.—Most gardeners, like myself, who have to provide abundance of flowers have found the old Primula obconica very useful both as a plant for vases and likewise for utilisation as cut flowers. On account of its poisonous nature I was obliged to throw away the whole stock; after which I endeavoured by every possible means to find a substitute. I am glad to say I have succeeded by growing stellata. I consider this is preferable in every way to P. obconica. First, one is not liable to eczema; second, it is pure white, and much larger; third, it has longer stalks and good dark foliage. Whether it is quite as free-flowering I cannot yet say, as this autumn is my first experience with it; but, of course, the size of P. stellata will make up for any deficiency in quantities compared with obconica.—A. J. L.

—— CAMPANULA ISOPHYLLA ALBA.—The account given by the raiser of this plant (Mr. R. Irwin Lynch, page 501) is very interesting. The plant when in flower is admired by everyone who sees it, and few things equal it for draping the front of conservatory stages and similar purposes. It has also achieved great fame in this neighbourhood as a window plant for cottagers, and some very fine specimens are occasionally met with in this way. Sometimes the blue form is seen by its side, though generally the white variety is preferred. Mr. Lynch is to be congratulated on having raised such a useful and beautiful plant. I have not yet tested its hardiness outside, but possibly it will survive in dry sheltered positions, and no doubt it has done this in many instances in the southern counties. It is easily propagated by division in the spring, and the plants grow to a useful size the same season, but as a hanging plant for windows or conservatories the large specimens are best.—W. H. DIVERS, *Belvoir Castle Gardens, Grantham.*

—— THE HESSLE GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—A meeting of the above Society was held on Tuesday, November 23rd, when Mr. Wilkinson of Claughton read a very interesting paper entitled "Serving the Kitchen." The essayist stated that he had tried to bring before the members a few hints on one of the gardener's duties, and one which no gardener could afford to lightly pass over. He referred to the most suitable size of vegetables necessary for the dining-room; the best method of preserving them, if the supply were larger than the demand; and also the most suitable appliances used for the purpose of gathering them. He further mentioned that one cause of friction between the cook and the gardener was taking vegetables, such as Peas and Beans, into the kitchen when too old. Reference was also made to the advantages derived by young men, when commencing their gardening career, by serving the kitchen garden, as it gave them an insight, both of the quantity and quality, of the vegetables they would be called upon to supply later in life. There was a good attendance of members, and a pleasant discussion followed the essay. A vote of thanks to the essayist and Chairman terminated the meeting.—G. W. G.

—— Potato Reliance.—One of the most promising Potatoes of recent introduction—either for exhibition purposes or for the daily supply of the household—is Suttons' Reliance; an enormous cropper of true kidney shape, with shallow eyes and a robust constitution The tubers here, in a moist climate, were perfectly free from disease, while other varieties in close proximity were nearly all diseased. Such are its merits, that we do not hesitate to say that when better known it will drive away from our markets others of inferior quality, and will prove valuable alike to cottagers and gardeners.—C. Foster, *Aberpergwm.*

—— A Gardener's Mistake.—We are sorry to learn that Mr. T. H. Crasp, late gardener to the Right Hon. F. J. S. Foljambe at Osberton, had last week to meet a charge before the Worksop Magistrates of not accounting for ("embezzling") certain monies, amounting to £8 5s., which he had received for the sale of garden produce. Mr. Wilson, in defence, said Mr. Crasp was astonished when he found the four amounts had not passed through the books. It was all a pure mistake, and better men than his client had made mistakes. He also wanted to show that his client had bought for Mr. Foljambe goods to the amount of over £100, for which he had not been paid. He was perfectly willing to go to trial to establish his client's innocence. Defendant was formally committed for trial at the Nottingham Assizes on December 3rd, bail being allowed as before, himself in £50, and two sureties in £25 each.

—— Watercress in Pots.—This useful and wholesome salad may be grown in pots throughout the autumn and winter months. In September we fill about four dozen 32-size pots with a compost consisting of equal parts loam, leaf soil, and old potting soil, with a liberal admixture of mortar rubble, taking care to previously well drain the pots. The cuttings are inserted 2 inches apart and well watered. They are placed in a cold frame, kept close and shaded until well rooted, and then gradually inured to more light and air. At the same time abundance of moisture must be maintained both at the roots and overhead, keeping the plants cool at all times, in severe weather covering the frame with mats, or in the event of exceptionally sharp weather remove to a greenhouse, placing the plants on a stage which has a layer of shingle or similar material thereon. By this method abundance of young shoots may be obtained throughout the season.—H. T. M., *Stoneleigh.*

—— Thinning Fruit.—In a paper on Thinning Fruit read before the Hudson Valley Horticultural Society, Professor S. A. Beach gave an account of experiments in thinning fruits on Apple trees. In the first experiment two heavily fruited Baldwin trees were selected, and all the knotty, wormy, and otherwise inferior fruit was picked off one of the trees, leaving one fruit of a cluster. Of marketable fruit the thin tree yielded nine and four-fifths per cent. more first-grade, and four and one-half per cent. less second-grade fruit than the unthinned tree. Six Baldwin and six Greening trees were used in the second experiment. Three trees of each kind were thinned by taking off all poor fruit and leaving the fruit on the trees at least 4 inches apart. The Baldwin trees which had been thinned gave 26 per cent. less of marketable fruit, but 22 per cent. more of it graded No. 1 than of the fruit from the unthinned Baldwins. Or, differently stated, although the unthinned trees carried above a fourth more fruit altogether, they actually each yielded $1\frac{1}{4}$ bushel less No. 1 fruit than the thinned trees. With the Greenings this difference was even more marked, for the thinned Greening trees on an average produced $2\frac{1}{4}$ bushels more No. 1 fruit than the unthinned trees. Two trees of Hubbardston were used in the third test. On one tree the fruit was thinned to at least 6 inches apart. The thinned tree bore seventeen and four-tenths per cent. more of No. 1 Apples than the unthinned tree, and seventeen and one-tenth per cent. less of No. 2 grade. In all these tests fewer Apples dropped from the thinned trees, and their fruit was superior in quality and more highly coloured, and was worth from 10 to 15 per cent. more in market. The thinning and picking took about twice the time required for picking alone. The second method in these tests proved superior enough to the first to more than pay for the extra work involved; that is to say, the work paid best where it was thoroughly done. From the figures now at hand a satisfactory comparison of the second and third methods cannot be made, nor of the effect of thinning the fruit on the succeeding crop. In a season of an enormous crop, as in 1896, when many growers did not realise returns sufficient to cover the cost of packages and of picking and handling, thinning early in the season might be expected to decrease the yield of low-grade fruit and increase the amount of first grade, with a consequent advance in prices. Relieved of the drain of excessive bearing, the trees could ripen a fairly large crop of superior fruit, and better develop fruit buds for the following year.—("Garden and Forest.")

—— Distribution of Seeds from Kew.—The issue of the "Kew Bulletin," comprising the seeds for distribution from the Gardens, has just come to hand. The brief introduction says: "The following is a list of seeds of hardy herbaceous annual and perennial plants, and of hardy trees and shrubs which, for the most part, have ripened at Kew during the year 1897. These seeds are not sold to the general public, but are available for exchange with Colonial, Indian and Foreign Botanic Gardens, as well as with regular correspondents at Kew. No application, except from remote Colonial possessions, can be entertained after the end of March.

—— Beet for Sugar Production.—The following has been sent to us:—"Some 8,000,000 tons of Beetroot are annually turned into bounty-fed sugar for consumption in this country. Why should not British farmers grow it? There seems to be every reason why they should do so, if experiments recently made in Essex, a county by no means an agricultural Paradise, may be taken as a sample of what may be done on a larger scale. A farmer there has grown Beetroot alongside Mangold-Wurtzel, and treated it exactly in the same way. Analysis has shown that the root grown contains 14·01 per cent. of saccharine, against 13·97 per cent. for this year's German crop, which is regarded as a record one. Moreover, the English crop weighs out at over 16 tons to the acre, whilst German crops average 13 tons. Yet Germany is considered the champion country for Beetroot."

—— Sun Pictures of the Norfolk Broads.—The third edition of this charming publication has reached us from the Great Eastern Railway Company, and a perusal of its letterpress by E. R. Suffling, with an examination of the photographs by Payne Jennings, accentuates our opinion of the beauty of the Norfolk Broads. As holiday resorts, the many places on these Broads are decidedly recommendable, for they possess varied attractions to the visitors. True, there are not many things that may be found at Lowestoft or Yarmouth, but if care be taken one may choose a resting place—such, for example, as Oulton Broad—which adds to its own native attractions the advantage of being within easy walking distance of the first-named town. Those interested in fishing or yachting will find enough here to satisfy them, while the seeker for the calm peacefulness of rural England has his want filled to the letter. "Sun Pictures of the Norfolk Broads" is an excellently printed book of 101 pages and 100 splendidly executed illustrations.

—— Sweet Peas.—I notice in his excellent paper on these flowers Mr. Stanton expresses himself as gratified that they are not to be classed amongst florists' flowers. I have in reading that expression wondered how far that inclusion, were it so, would affect the status of the flowers in the least. Called by what appellation we may, the Sweet Pea would remain a Sweet Pea still. It is none the less observable that what improvements have been made in Sweet Peas have been effected on florists' lines. Thus we see now much larger, stouter, and more erect standards, and equally finer and bolder wings. These are exactly the qualities the florist would seek for. Possibly some growers may prefer those having drooping standards. I dislike these because the flowers wear the aspect of being in a condition of staleness, and flagging. It will not be a matter for surprise if the erect standard does not displace the falling one some ten years hence. Of variety we have enough, but we may yet see much expansion of size and stoutness. For what has been done great thanks are due to that unhonoured raiser Mr. H. Eckford.—D.

—— Inscriptions on Gourds and Melons.—Herewith I forward for your inspection portion of a skin of a Gourd with an inscription upon it. We have practised this sort of thing for some years now on Melons, Marrows, and Gourds. Melons with their names inscribed on them are always of some interest on the dinner-table. Gourds and Marrows with suitable mottoes or texts upon them are a useful addition to church decoration at harvest festivals. It was for this purpose our first was prepared. The operation is a simple one. When the object to be written upon is about one-third of its natural size mark with a large pin whatever words are required. The clearer they are written the better they come out. Mr. John Snell, our foreman, has done ours for years past, including the one sent. I do not think there is anything very new or very important in the matter, but, to say the least, such fruits are interesting.—H. J. C., *Grimston, Tadcaster.* [The practice is by no means new. We have occasionally seen inscribed Gourds at cottagers' shows, and once at a Crystal Palace Show; but we have not seen any of such writing so well done—in bold, clear, "large hand"—as by Mr. Snell on the samples before us, wishing "Success to the York Chrysanthemum Show," and to "The Ancient Society of York Florists."]

—— GISHURSTINE.—With the drenching rain of a few days ago, and the consequent wet grass and puddled roads, came the usual annual samples of the great leather preserver and damp preventer—Gishurstine—which has proved so serviceable to many during the winter months. This preparation seems to hold its own from year to year as a dressing for the boots of gardeners, farmers, gamekeepers, and pedestrians generally, and it is difficult to imagine anything that could serve the purpose better. As is generally known, it is produced in the great manufactory at Battersea known as "Price's."

—— MANURES FOR VEGETABLES.—Under the title of "Cultivation of Vegetables with or without Chemical Manures," Mr. F. W. E. Shrivell, F.L.S., delivered a lecture before the members of the Chiswick Gardeners' Society in the R.H.S. Gardens on Thursday last. Mr. S. T. Wright presided. The lecture chiefly consisted of details of a series of experiments with fifty loads of manure, twenty-five loads ditto, certain chemical manures with the latter, and certain chemicals without ordinary manure, per acre, the crops being Cabbages, Broccoli, Beets, Asparagus, Rhubarb, and various other products conducted in Kent by Mr. Shrivell and Dr. Bernard Dyer. The results generally were made to show in favour of the chemical manures. Mr. A. Dean of Kingston, who was present, and exhibited eight samples of artificial manures, referred lengthily to the matter of the lecture, though not adversely, chiefly asking for information on various points, and was followed by Mr. Gibson of Devonhurst and others. After Mr. Shrivell had replied, a cordial vote of thanks was carried. There was a good attendance, nearly all being young men.

—— GROWING LACHENALIAS. — While admitting the truth of "H. T. M.'s" remarks on page 502, relative to the beauty of Lachenalias in baskets, I must put in a plea for their culture in pots. Every year we have a number of 6-inch pots filled with them, and the effect they produce in the conservatory is decidedly effective. We do not, however, confine ourselves to L. pendula, which "H. T. M.' justifiably recommends, but grow also L. Nelsoni, whose yellow flowers on their long spikes are so brightly beautiful. I would advise your correspondent to try it both in pots and baskets as it is certain to give him satisfaction. No better course of treatment could be adopted than that recommended in the note referred to, as we have frequently proved.—H. ROSE.

—— COLOURED BARK FOR WINTER EFFECT.—I was much interested in the article on this subject by "W. D." on page 498, as I have seen several of the plants mentioned utilised with wonderful success. Considering the wide range of colour that may be secured from the barks alone of many plants, without taking their flowers or foliage into consideration, it is a matter for surprise that they are not more generally seen. If anyone wishes to see some of the Dogwoods, Spiræas, and others admirably employed they should visit the grounds of Lord Aldenham at Elstree, where Mr E. Beckett has planted several immense beds that materially enhance the beauty and interest of those fine gardens, both in the summer and winter.—SOUTH LONDONER.

—— FRUIT CURES.—The so-called "fruit cure," although not much heard of in this country, is well recognised at various places on the Continent, where so-called Grape-cure stations have been established. In a recent number of "Modern Medicine and Bacteriological Review" there is an interesting article on the subject, in which the historical side of the question is dealt with. Thus we are told that many medical authorities in the tenth century become enthusiastic in their writings over the remarkable curative virtues of Grapes, whilst a certain Van Swieten, of a more modern date, is said to have "recommended in special cases the eating of 20 lbs. of Strawberries a day." The same gentleman also reports a case of phthisis healed by Strawberries, and cites cases in which maniacs have regained their reason by the exclusive use of Cherries as food! These instances rather savour of the miraculous; but there is no doubt that the so-called Grape cure for indigestion and other evils is carried on in many places on the Continent, and that people betake themselves to Meran, Vevey, Bingen, or to Italy and the South of France with the intention of devoting six weeks to the cure, during which time they are expected to have gradually accomplished the feat of consuming from 3 to 8 lbs. of Grapes daily, as the case may be. Grapes are said to exercise a salutary action on the nervous system, and to favour the formation of fat—that is to say, when fruit of good quality is employed; if the Grapes are not sufficiently ripe, and are watery and sour, the patient may lose rather than gain in weight. Dr. Kellogg, Director of the Sanitarium Hospital and Laboratory of Hygiene at Battle Creek, Mich., is of opinion that the valuable results obtained by a fruit diet in cases of biliousness which he has observed are due to the fact that noxious germs habitually present in the alimentary canal do not thrive in fruit juices.—("Nature.")

—— ECCREMOCARPUS SCABER.—This pretty climber is of vigorous growth, and if planted against a south wall it will endure the winter provided the roots are protected with long litter or leaves. It flowers from July to November. The orange scarlet corollas are freely produced on the young growths. When the seedlings are large enough they may be potted singly into thumb pots placed in heat a few days until established, when they should be moved into the greenouse.—L. J.

—— ZEPHYRANTHES ATAMASCO.—Though several of the Zephyranthes are frequently seen in gardens, either in the borders or in pots, the Atamasco Lily seems to be somewhat neglected. The reason of this is somewhat difficult to define, as it is of easy culture and its flowers are of refined beauty. Flowering through May, June and July, in the open garden, and a little earlier under glass, it is of great beauty, and I should be glad to see it more grown. Provided the soil of the garden is fairly good, this North American plant thrives admirably, as does it in pots, if a compost largely comprising loam and coarse sand be utilised. I am not aware whether it may be forced successfully, but perhaps some other reader will be good enough to state his experiences on this point. The colour of the flower is white delicately flushed with pink.—H. ROSE.

—— "PHOTO PICTURES IN EAST ANGLIA."—Such is the title of a beautifully produced book, published with the countenance of the Great Eastern Railway Co., and a copy of which is now before us. In its 134 pages it comprises 103 photographic reproductions by Payne Jennings of Ashtead, these representing varied scenes and places of interest in the eastern counties of Essex, Suffolk, and Norfolk, with occasional glimpses of noteworthy places outside the boundaries of the shires named. The diversity of the subjects illustrated not only proves what beautiful places may be found in the erstwhile somewhat despised East Anglia, but also that the photographer possesses the true artist's conception of what is beautiful in Nature and in Art. The letterpress which accompanies each picture is gracefully written by Annie Berlyn, who places before her readers several facts that are little known anent many of the portrayals. The entire book is a work of art, which reflects much credit on all concerned in its production.

—— ANEMONE JAPONICA ALBA.—Times almost without number able writers have written, telling of the beauty and utility of this Japanese Anemone, but I feel constrained to return once again to the subject. I am the more encouraged to this by the magnificent effect our plants have produced this season, better perhaps than we have ever had before. The plants made splendid growth, and continued producing flowers of exceptional size and substance over a much more extended period than is customary. We have them in beds and in borders, sometimes as a mass and in other positions single plants, but all alike have done well. Some of the flowers towered to a height approaching 6 feet. We consider them worth growing well, and so provide good soil and insure perfect drainage, both of which we consider necessary to secure the best results. There are several varieties now in commerce, but so far we have not seen the advantage of discarding the old well-tried favourite for the new. Easy of culture, free in flowering, and readily propagated, Anemone japonica alba is by no means sufficiently seen in perfect condition.—M. R.

—— A BOOK ON MANURES.—I have recently been asked to recommend a cheap book dealing with the application of manures, animal and artificial, to fruits and vegetables, giving proper quantities for each crop, and other minute details. That is rather a large order, and if anyone is ambitious to rush in to fill the void they are welcome. That a small book dealing with manures, explaining their nature, origin, constituents, adaptabilities, methods of application, and other really practical information might find a sale is possible, but if highly spiced with analytical tables, with chemistry, and with smatterings of science it would be valueless to the general public. There seems to be about artificial manures such a capacity to make money, or apparently so, that pens to praise them, even lavishly in trade interests, are plentiful. All books so originated should have a wide berth; I would commend them to no one. To furnish in any book, however impartial, information to meet every case would be impossible.—A. D. [We have reason to believe that a small, cheap book dealing with manures (though not exclusively) on the lines suggested, will be shortly forthcoming. The author of it is not a "smatterer in science,' but a genuine scientist, yet is so practical withal as to eschew the bewildering and, to many, puzzling and tedious analytical tables that are so common. We happen to have seen some of the proof sheets of the work, the title of which is registered "The Chemistry of the Garden," and observed some rather trenchant remarks on the "fallacies of plant ash prescriptions." The author declines to give any formulæ founded on tabulated figures. "A. D." is always drawing something out of somebody.]

THE CONSERVATORY AT WESTONBIRT.

THE corridor that may be seen in the photographic illustration is situated on the west side of the mansion. It is 30 yards long, and leads to the conservatory, which has an arrangement of four large beds, filled with specimens of Bananas, Palms, Ferns, Bamboos, and other imposing plants. Large pillars support the roof, and on these are growing Hibiscus in variety, which succeed well, making shorter growths and flowering more freely than in the stove. On the sides are arranged flowering plants, brought from the other houses in season, making a pretty effect.

Two large plants of Olea fragrans are in bloom, which scent the whole of the conservatory. It is an excellent plant, which is rarely found in conservatories, but those who object to the perfume emitted by the leaves of the Chrysanthemum will find it very pleasant. The creepers hanging from the roof (in view) are Cobœa scandens variegata, Tropæolum Fire King, Abutilons, Lapagerias rosea and alba, Fuchsias, Bignonia Cherere, and Lasiandra macrantha. The latter is now in full bloom, and contrasts splendidly with the yellow blooms of the Chrysanthemums.

On the walls on each side of the corridor are Camellias, which are in splendid health, the old C. althæflora just now expanding hundreds of bloom.

On each side of this corridor are arranged two long banks of Chrysanthemums, comprising all the leading varieties, preference being given to the Japanese incurved. The waxy texture of the blooms has a more massive appearance, and they are found to resist the damp better than the more loose type of Japanese varieties. Amongst the largest blooms are Edith Tabor, Oceana, Phœbus, A. H. Fewkes, Pallanza, Australian Gold, Modesto, Boule d'Or (Calvat's), Amos Perry, very fine; Philadelphia, Sunflower, Mons. Panckoucke, and Noces d'Or of the yellows. Niveus, extremely large blooms; Avalanche, Stanstead White, Mdlle. Marie Hoste, Mutual Friend, Mdlle. Thérèse Rey, Madame Carnot, Lady Esther Smith, Souvenir de Petite Amie, very dwarf and good; Kentish White, and Lady Byron, whites. The higher coloured varieties are C. W. Childs, Wm. Holmes, Elmer D. Smith, W. K. Woodcock, Owen's Crimson, Octoroon, Khama, Lady Randolph, Commandant Blusset, Viviand Morel (terminal buds), Maggie Blenkiron, and Nyanza, with others.

Huge bushes are grown and arranged in the front row, carrying several hundreds of bloom of Sir Admiral Symonds, Mons. Lemoine, White Jane, Source d'Or, Chevalier Domage, W. H. Lincoln. These form fine masses of colour, and show off the larger blooms to perfection.

N.C.S. ANNUAL DINNER.

THE annual dinner of this Society was held on Wednesday, the 24th ult., at Anderton's Hotel, Fleet Street, Mr. T. W. Sanders being in the chair. There was a numerous company present, and the proceedings were of the usual hearty nature. Among many others we recognised Messrs. P. Waterer (the Vice-Chairman of the General Committee), Harman Payne, R. Ballantine, T. Bevan, G. Gordon, J. Scott, T. W. Wilkinson (Secretary of the Royal Aquarium Company), H. J. Jones, W. Mease, H. Cutbush, Leonard Brown, and R. Dean.

The usual loyal toasts having been duly honoured, the Chairman rose to propose "The Glorious Chrysanthemum and Its Devotees," which was a toast he felt sure everyone present would heartily welcome. He could safely say that not even the Rose, beautiful as it was, could claim to have so great a share of admiration and popularity as the Chrysanthemum had obtained. It was a flower that united men of all creeds, all nations, all shades of political opinion in a bond of brotherhood and love. The Chrysanthemum had exercised its wonderful influence in China, in Japan, and other places abroad; and had it not long since had the same beneficial effect upon us in the West? It was a flower that had done much to make horticulture a more tempting pursuit to many who could not otherwise have taken up the cultivation of flowers at all. The Chairman then referred to the East End of London, where it was surprising to find such admirable displays, and proceeded to show how the cultivation of the flower had spread throughout the United Kingdom, and even into our far off Colonies beyond the seas. Wherever we go we find people taking more interest in its culture than ever. Much of this he considered was due to the N.C.S., which provided fine shows and useful literature on the subject, and by admitting societies into affiliation they have helped to continue the good work. These societies were situated in almost every county in England, and at the present moment numbered 148. In conclusion, the Chairman expressed the hope that the N.C.S. would continue its good work, and so spread the love of the flower in those quarters where its beauty and usefulness had not yet penetrated. The toast was drunk with enthusiasm.

Mr. G. Gordon proposed "The Donors of Special Prizes," and said that the N.C.S. was largely indebted to its honorary members and donors of special prizes, and he should be pleased if anything he could say would induce others to follow the example already so worthily set, and coupled with the toast the names of Mr. H. J. Jones and Mr. P. Waterer, the latter of whom had recently shown them at Edinburgh that he could win an important prize in a competition where the best blooms in the United Kingdom were staged. Mr. Waterer and Mr. Jones both replied in suitable terms.

The presentation of the national challenge trophy was then made to the representative of the Bromley Society, Mr. J. Scott, who replied, saying he was proud of the position he occupied that evening in the absence of their President, Mr. Coles Child. The Bromley Society had had the honour on a previous occasion of winning the trophy, and were now again successful. The blooms shown were the product of ten different members of the Society, and they would be quite prepared to contest it again.

At this point, on account of the time being somewhat advanced, the health of the visitors was proposed, and responded to by Mr. Spencer Hughes, of the "Morning Leader," and Mr. Leonard Brown.

Next came the presentation of the Holmes Memorial cup to Mr. Mease, the Turner Memorial cup to Mr. N. Davis, and various gold and other medals to Messrs. Cutbush, W. Wells, H. J. Jones, and John Laing and Sons.

"The President, Vice-Presidents, Officers, Auditors, and Committees" was proposed by Mr. J. W. Wilkinson, who said he was sure they would all regret the unavoidable absence of their esteemed President, Sir Edwin Saunders, who took so keen an interest in the Society's work. With regard to the others, the value of their work must be measured by the success they had achieved. He would specially mention Mr. R. Ballantine, Mr. R. Dean, Mr. Harman Payne, Mr. Wm. Holmes, and Mr. T. Bevan. Mr. R. Ballantine replied, and felt proud at being one who had inaugurated the affiliation scheme, which had done much to extend the area of operations, and felt sure, from his own experience, that in holding out the hand of friendship to our friends across the water they had done the right thing; and if anyone belonging to the N.C.S. ever found themselves in our Colonies where there was an affiliated society there would be sure to be a hearty welcome for them. Mr. Harman Payne's name being also coupled with the toast, referred to the work of the various committees, and to his being brought into contact with foreigners of many nationalities, he also responded.

Other toasts were "The Chairman," proposed by Mr. Gordon; "The Secretary," proposed by Mr. Ballantine; and "The Press," by Mr. Cutbush, all of which were suitably responded to. The musical arrangements were under the direction of Mr. H. Myers, and the room was decorated with plants, kindly lent by Messrs. Cutbush & Sons of Highgate.

N.C.S. FLORAL COMMITTEE.

ON Monday last the Floral Committee of this Society held a meeting at the Royal Aquarium, Mr. T. Bevan presiding over a somewhat small gathering. First-class certificates were awarded as under:—

Mrs. J. R. Tranter.—A Japanese with fairly long florets, curling and twisting, and of medium width. Colour creamy white, edged and streaked rosy purple. Shown by Mr. J. R. Tranter, Henley-on-Thames.

Violacea.—Immense Japanese with numerous florets of medium width, twisting and intermingling, making a capital show bloom. Colour, pale rose violet, white reverse. From Mr. E. Beckett, Elstree.

Mrs. W. Butters, a pretty white Japanese, and Sam Caswell, rosy pink spidery Japanese, were commended.

N.C.S. AND THE ROYAL AQUARIUM.

I AM of the same opinion as your correspondent "A. D." (page 503), that the important exhibitions of the National Chrysanthemum Society are worthy of a better place as regards convenience and effect than is afforded them by holding the shows at the Royal Aquarium. The greatest fault to be found lies in the cutting up of the exhibits which have, perforce, to be accommodated where they can. Thus there is no room for a general effect, such as some of our provincial shows can present, though the material is there and in plenty. The next fault is in the wretched light in the west gallery, which on the occasion of the last exhibition was simply disappointing, in the evening at all events. The long rows of magnificent cut blooms were in an atmosphere of semi-gloom. The front of the gallery from which a view of the stage is obtained had been closed with an effective barrier of paper. Probably this was done with the intention of preventing a crush of gazers upon the entertainment. The light, too, which fell upon the groups in this gallery was insufficient, and rendered more so by the groups being arranged under the lights instead of between them.

The arrangements at last year's exhibition were much better. The October show this season was not open to the same objections in these respects. It was less bulky, and taking it altogether a very attractive and instructive exhibition. The east gallery was excellently lighted, and the cut blooms could be well examined, but access to it below the organ was often blocked with two streams of visitors.

In St. Stephen's Hall there is ample space, well lighted. Here were staged the vegetables, fruit, and trained plants of Chrysanthemums. If the cut blooms had occupied this hall they could have been examined better.

I say nothing about the "objectionable surroundings." It is a matter of opinion. Some like these accessories to an exhibition, and some do not. Provincial shows place some dependence on music and singing, and find it advantageous, but of course the National Chrys-

anthemum Society could do without music hall assistance, for where the leading Society holds its annual carnival of all that is first and best in Chrysanthemum culture, there will its supporters assemble to witness.—E. D. S.

"A. D." (page 503) is having his annual fling at the N.C.S. He does not like the Royal Aquarium. There is plenty of room for difference of opinion on this point That the November show in particular is appreciated by thousands is demonstrated by the crowded state of the building when the show is on. The public appear to like the arrangement of the exhibits also. They regard them as a desirable and an appreciative break away from the formal straight lines of the Drill Hall and the Temple shows.

For the space of twenty-one years a Chrysanthemum show has been held at the Royal Aquarium. It is now much larger than it originally was, the quality of the exhibits and their variety much greater, and the attendance equal to the utmost capacities of the building to contain it. Why should the popular element be deprived of their annual display of Chrysanthemums at Westminster because "A. D." does not like the place?

Your correspondent of last week is as barren of suggestion and resource as the rest of the critics (very few, indeed) who take the same line. They name no alternative place. If they could there might be some use in their criticism; but they do not, because they cannot. The Crystal Palace (occasionally suggested) is out of the question. Two years ago the executive which he invokes appointed a Committee to look for and suggest more appropriate sites for the November show; they failed to discover a single one. Will "A. D." supplement their labours

Photo by Mr. E. T Lamb, Tetbury, Glos.

FIG. 78.—THE CONSERVATORY AT WESTONBIRT.

by indicating any of which he has a knowledge? If he has no alternative site to suggest, why is he so unpractical as only to growl? But happily nobody minds him.

The members of the executive are fully aware of certain disadvantages attaching to holding the shows at the Aquarium; but the corresponding advantages are much greater. Are they not wise, then, in bearing with the disadvantages, and refraining from any change of place (if such can be found) with the certainty of added difficulties heavy expenses, risk, labour, anxiety, and probable failure?—ONE OF THE EXECUTIVE.

[While readily affording space for our able correspondent to state his view of the case, we think he will find that some more notice will be taken of the letter which he already notices. We have reason to believe that all the members of the executive are not satisfied with the Aquarium for the purpose of the show. We are also inclined to think that "growls" have usually been the precursors of many great reforms, which at the time most persons regarded as impossible of accomplishment. The last word has not yet been said on the N.C.S. and its policy, but we have no more space at disposal this week.]

CHRYSANTHEMUM SHOWS IN 1898.

WE are officially informed that the Highgate and District Show will be held next year on November 8th and 9th, and the Winchester Show on the 15th and 16th of the month.

YELLOW SPORT FROM CHARLES DAVIS.

I NOTE your correspondent "E. D. S.," in his remarks upon Chrysanthemums (page 504), observes that "Dwarf primrose coloured varieties are rather scarce." It may interest "E. D. S." and other fanciers to know that I have a sport from Charles Davis this year of a beautiful soft yellow colour, the reverse of florets a primrose shade. It is a good deep flower, well formed, and in every respect equal to its parent. The branch on which the flower appeared was not more than 3 feet in height; it was the first crown bud. Two or three growers who saw the sport were delighted with it. I hope to have it on its own roots next year, and if it comes as good as it did this time the public will have the opportunity of seeing it. I should be interested to know if anyone has seen anything similar to it.—R. M.

REPORTING CHRYSANTHEMUM SHOWS.

I OBSERVE you have given reports of most of the Chrysanthemum shows in other counties, but fail to see that you have reported on what has taken place in Devonshire. Subscribers to the *Journal of Horticulture* in Devon like to see their shows reported. I venture to say there were as many cut blooms shown at Plymouth as at the N.C.S., except those shown by trade growers, and blooms quite equal, if not superior, to those shown at the N.C.S. in the class for forty-eight blooms. There were nine competitors from Cornwall, Devon, Somerset, and Dorset, and the same can be said of Exeter.—A DEVON TWELVE YEARS' SUBSCRIBER.

[We are pleased to hear of this Western success. It has only been by the kind co-operation of friends in different localities favouring with notes of the shows in which they are interested that we have been enabled to publish so many reports, and we tender to all who have so aided our best thanks. We do not remember rejecting any reports from Devonshire, nor receiving tickets reminding us of the dates of shows.]

THE DERBY CHRYSANTHEMUM SOCIETY.

THIS Society held its annual show in the Drill Hall on Friday and Saturday, November 13th and 14th. The display was really a fine one, doing credit to Mr. Bell, the energetic Secretary. Although the weather was anything but good, the show was well patronised on both days, when, besides the floral attractions, were promenade concerts, and on Saturday a performance was given by Neapolitan concert party. The open classes were well contested for, especially in the cut bloom section. For twenty-four Japanese Mr. Burrows, Berwick House, Shrewsbury, won first honours, Mr. Week, Thrumpton Hall, being second. For twenty-four incurved Mr. Evans, gardener to Sir Henry Wilmot, first; and Mr. Holder, gardener to Earl Ferrers, second. For a group of Chrysanthemums Mr. Gough, gardener to Mr. Malin, Overdale, was first, Mr. J. B. Chapman second. Mr. Holder also won for table decorations, and Mr. J. Wood for hand bouquet. The prize for specimen plants was won by Mr. J. B. Chapman.

CARNARVON CHRYSANTHEMUM SOCIETY.

THE fourth show was held on November 11th, and in every respect it was much superior to its predecessors. There were forty more entries than last year, and the Judges remarked that the exhibits were well up to the standard. Fruits and vegetables were included, and were admirably shown. The principal prizes were taken by S. Taylor Chadwick, Esq., Beaumaris. He was successful in annexing the challenge cup for the best twenty-four blooms. Mr. Howard, gardener to Mr. Chadwick, secured the two silver medals, one for the best incurved bloom in the show, and for the best Japanese bloom in the show. There was a strong competition in all classes. Mr. Davis, Carnarvon, was successful in winning the Society's silver medal for the best single stove plant in the show; and Mr. G. Tyler, gardener to Charles Jones, Esq., Bron Hendre, Carnarvon, took the gold Diamond Jubilee medal with his group of Chrysanthemums, which was very much admired by all. The show was well attended, but is worthy of more support.

CHRYSANTHEMUMS FROM LIVERPOOL.

I HEREWITH send you a few Chrysanthemum blooms as illustrative of the mildness of the season. They were all grown outside in a garden, fully exposed, close to town of Liverpool, and also the Mersey. The varieties are Mons. R. Bahuant, Baron Hirsch, Florence Percy, Mrs. Forsyth, W. Holmes, Viviand Morel, and Sœur Melaine. We have many more varieties, besides various other plants in full flower.—AN OLD SUBSCRIBER.

[The flowers forwarded were of excellent quality, and forcibly illustrate what a remarkable season we have had.]

LEAF RUST IN CHRYSANTHEMUMS.

I AM much obliged to you and to Mr. Abbey for the examination of the diseased leaf of Niveus forwarded by me. It seems somewhat of a coincidence that the rust should have appeared in England and Italy at about the same time, and I think it would be interesting and perhaps useful if you would allow a brief statement of the circumstances attending the appearance of the disease with me for comparison.

The first signs I observed early in September after several days' rain, the plants being very saturated. There were some 300 in pots, and every leaf right up to the flower has been affected. The disease has been always on the "ascent." By this I mean that it has appeared on the lower leaves first, and gradually ascended the stem; thus the lower leaves were covered with the "rust," while the upper leaves were only slightly speckled. I suppose from this fact it may be inferred that the disease emanates from the roots. I may here observe that there was practically little or no feeding, such as is understood in England.

During the whole of the season I have had under glass some dozens of seedlings and a few plants of Philadelphia (I find this variety succeeds in this way cultivated like summer Tomatoes in England under glass), and not a sign of the rust has appeared on these. Of two or three hundred plants grown in the open everyone was more or less affected, but not so badly as those in pots, the lower leaves, however, blackened and fell off. I may state that vegetation here is very rapid and sappy, and when disease affecting the growth appears it spreads very quickly—*e.g.*, a week or so ago after the rain some seventy-five Tomato plants grown in the open were all black from top to bottom, and this happened during very hot weather.

I enclose a Raspberry leaf similarly affected with a "rust." I think, therefore, it is only fair to attribute the appearance of the rust amongst my plants to excessive moisture at the roots.—H. BRISCOE-IRONSIDE, *Pallanza, Lago Maggiore, Italy.*

STAGING CHRYSANTHEMUMS AT EXHIBITIONS.

I FEAR an "Old Exhibitor," page 503, has little experience of present day shows or the methods adopted by modern exhibitors to convey their blooms to autumn exhibitions several hundred miles away. His remarks on this phase of the subject are somewhat in opposition to facts. He states, "Should any society offer all its prizes in the cut bloom classes for flowers on long stems it would have to depend upon local growers for exhibits." If he had seen, or even read the report of the Edinburgh show, page 510, he would there find that the largest prizes ever offered for Chrysanthemum blooms in any form were on long stems. He would also find that the whole of the six prizes were taken by exhibitors residing several hundred miles from the show. Had an "Old Exhibitor" seen the exhibits alluded to he would have hesitated before penning his article.

The remarkable freshness of the blooms staged, and the almost total absence of any signs of injury during transit, was a distinct refutation of the notion advanced. The nine competitors who made the magnificent display have reason to be proud of their achievement. Even the three who failed to win a prize deserve credit for the manner in which they not only presented their blooms, but for the individual quality of each.

My experience of present day exhibitors differs considerably from that of an "Old Exhibitor" in the matter of how they stage their blooms. During a somewhat lengthened tour of the principal shows now nearly at a close I was particularly struck with the great improvement in the methods of staging. In few instances did I find flagrant errors, and many times I remarked upon the advance made in staging. It was apparent that even the bulk of old time offenders had profited by the object lessons that are so numerous now at the leading shows.

Probably the worst instance of bad staging that came under my notice was at Devizes. There I found a badly set up stand of blooms belonged to an exhibitor who was making his maiden attempt. Certainly the flowers had been well grown, or he would never have secured a prize at all. A kindly admonition, accompanied with an illustration of how to stage the blooms well, as compared with the reverse, was accepted in the proper spirit, and I expect so apt a pupil to profit by such experience.

To illustrate the advance made in staging the blooms, an exhibitor I knew twenty years since as then very much lacking in taste of arrangement, appears to be no longer in the background, but is now quite up to the forefront in this most important detail. An "Old Exhibitor" would be adding to the already numerous duties of judges if committees were to stipulate that the blooms should be a certain number of inches above the stand. Strong complaints are common enough now about the very thing an "Old Exhibitor" would have us continue—viz., uniformity in the arrangement of the exhibits. Nowadays the great cry is for variety, not a lack of it. I quite agree that good staging is important. My opinion is that rougher examples of incurved blooms are seen now than formerly. The reason is not far to seek—viz., the inclusion of varieties that are not

strictly belonging to the true type of Chinese or incurved blooms. Too many are mongrel bred, the result of seedling raising now becoming so much more common than formerly.—SADOC.

TREATMENT OF LATE CHRYSANTHEMUMS.

THE season for large and extraordinary sized blooms having now approached its end, and the last of the exhibitions are being held, greater attention is paid to the varieties which are found to possess blooms in a fresh presentable condition, yet of fair average size. Some blooms remain in splendid condition for a long time. For instance, Rose Wynne among the light blooms, Col. W. B. Smith among the bronze, W. Seward among the dark varieties, Silver King of those of rosy mauve colours, with several other representative sorts, all seem to keep well for weeks.

The conditions which enable growers to preserve the colour, freshness, and form of the flowers are simple, yet important. In my opinion they are these:—Previous good culture, including right selection of buds, judicious feeding, healthy foliage, correct watering, constant circulation of air among the plants after housing, comparative freedom from mildew, disposing the plants thinly, if possible, in a light, airy structure; freedom from drip or deposition of moisture on the blooms, either by sudden variations of temperature and moisture, or exposure to fogs; applying clear water only after the blooms are two-thirds expanded; examining state of soil for water every day; picking off dead leaves; and shade from strong sunshine. The more growers think and act on the majority of the points alluded to above, the better will they achieve success in perfecting and preserving the blooms.

Chrysanthemums approaching to or in bloom do not need at any time a high temperature by means of fire heat. However, artificial heat is of great assistance in preventing the temperature descending so low as to become cold and saturated with moisture. To this end it should be used, and not to cause excessive evaporation from the foliage and the soil; 50°, with a little ventilation even in cold weather, is a good average, rising in mild weather and descending a little in colder.

The smaller and useful blooms now developing for a late display are even better adapted for preservation in fine condition than those of large proportions and multifarious florets. The conditions for keeping them are usually more favourable in December than any other time. Large numbers of plants which have gone out of bloom have been cut down and taken out; room is, therefore, available. It is frequently easier to preserve the blooms after they are fully open than it is to induce them to expand properly. Checks at the roots may cause the centre florets to cease growth, when decay sets in and the blooms are spoiled.

The best possible treatment ought to be accorded Chrysanthemums in bloom at this period and midwinter, for they are among the brightest and freshest flowers available; and no matter how small the flowers may be, if of good shape and decided colour they are sure to be appreciated.—S.

SHOWS.

LEAMINGTON.—NOVEMBER 25TH AND 26TH.

IN being favoured with fine weather after a succession of depressingly foggy days, the above Society was singularly fortunate in regard to its annual show, which was in every way a pronounced success. Although in a few classes the entries were not numerous, the quality of the exhibits throughout was of a high order of merit. The show was opened by the Mayor (Councillor Gordon Bland), and the attendance being good, will help to place the Society on a more sound financial basis than heretofore. Mr. L. L. Lawrence, the popular Hon. Secretary, was indefatigable in his exertions to make the exhibition a success, and in this laudable endeavour he was well supported by an enthusiastic Committee, with Mr. J. Kitley as Chairman.

For a group of Chrysanthemum plants arranged for effect in a space not exceeding 60 feet, Mr. R. Greenfield, jun., Ranelagh Nursery, Leamington, secured the first prize with an exhibit composed of well grown plants carrying many fine blooms, the whole being arranged well and finished in good style. The same exhibitor secured the premier award for one Japanese Chrysanthemum plant, and for three and six.

Cut blooms were wonderfully fine considering the lateness of the fixture, and in many instances the competition was remarkably close. For twenty-four Japanese, distinct, the premier award was well won by Mr. A. Chandler, gardener to the Hon. Mrs. Arthur James, Coton House, Rugby, who staged flowers of fine size, substance, and colour. The varieties were—Back row: Madame Carnot, Richard Dean, Mons. Panckoucke, Mons. Gruyer, M. Demay-Taillandier, Phœbus, and Silver King. Middle row: Simplicity, Graphic, L'Isere, Mons. Chenon de Leché, Boule d'Or, Etoile de Lyon, Florence Davis, and Golden Gate. Front row: Miss Dorothea Shea, Oceana, Mr. Dr. Ward, Master B. Spaulding, Hairy Wonder, Mons. C. Molin, Edith Tabor, and Maggie Blenkiron. The second prize fell to Mr. R. Greenfield, jun., whose best blooms were Amiral Avellan, Madame Carnot, and Miss E. Teichmann; Mr. H. Blakeway, gardener to — Muntz, Esq., Dunsmore, Rugby, being a close third. Mr. Chandler also won for twelve Japanese, with a stand containing heavy blooms throughout; Mr. W. Pearce, gardener to S. Loder, Esq., Flore House, Weedon, being a very close second, splendid blooms of Madame Carnot, Simplicity, and Mephisto were noticed on his stand. The third award went to Mr. Blakeway. For six Japanese, Mr. Pearce turned the tables on his opponents, winning with good blooms; the second prize went to Mr. Blakeway.

Two classes were provided for incurved, twelve and six being the number required. Mr. R. Jones, gardener to C. A. Smith-Ryland, Esq., The Gardens, Barford Hill, Warwick, won somewhat easily in both classes, the blooms being deep, good in form, and were well staged; the varieties being C. H. Curtis, C. B. Whitnall, Lord Alcester, Mdlle. Lucie Faure, Bonnie Dundee, Ma Perfection, W. Tunnington, Chas. Gibson, and J. Agate. Mr. Pearce was second for both twelve and six. His best blooms were grand ones of W. Tunnington and Bonnie Dundee. Mr. R. Greenfield secured the third award for the twelve incurved.

Mr. R. Greenfield secured the first prize for a bouquet of Chrysanthemums; and Messrs. Finch & Co., florists, Milverton, won for a cross of Chrysanthemums and foliage. The latter firm was deservedly first for a "table of devices" with a most attractive exhibit. Mr. J. Kitley, Castle Nursery, Warwick, proved an easy winner in the class for six table plants; and Mr. Chandler was awarded the first prize for six flowering ones, with some beautiful specimens.

Mr. H. Liney won the £3 offered for the best collection of fruit, to consist of three bunches of Grapes, three dishes of Apples, and three dishes of Pears, his exhibit being an excellent one throughout. Only one collection of six dishes was staged; for this a second prize was awarded to Mr. G. Hopkins, Hilden, Milverton. Mr. Williams, gardener to Mrs. Mann, Leamington, secured the first prize offered for two bunches of Grapes by Thomson & Sons, Clovenfords, and Mr. Chandler won for three bunches of black. Mr. Liney secured the first prize for dessert Apples; and Mr. T. Marsh, Warwick, a similar award for culinary Apples. A silver medal was awarded Mr. F. Perkins of Leamington, for a delightful exhibit, in which Palms were used as a background to a series of beautifully made floral devices.

Messrs. Clibran & Sons, Altrincham, staged a good collection of Apples and Chrysanthemums and some fine plants of Celosia pyramidalis. These plants were of a fine branching habit of growth, and as the colour of the plumes was bright and attractive they should become popular for decorative purposes during the autumn months.

PALLANZA, LAGO MAGGIORE, ITALY.

NOVEMBER 6TH, 7TH, AND 8TH.

I HAVE much pleasure in informing you of the immense success of our first Chrysanthemum Show, which took place at Pallanza on the 6th, 7th, and 8th ult. There were in all about forty competitors, in addition to several who exhibited "not for competition."

Classes were arranged for groups, trained plants, collections of cut flowers under various conditions, also for decorative work, in which Italian gardeners usually excel. The exhibition was also extended to include Cyclamens, Violets, and foliage plants, which are a feature in this part.

As may have been expected, cut flowers and plants were exhibited in almost every conceivable manner, medicine and soda water bottles being to the fore, but the primitiveness in some instances lent a charm to the flowers, and to my view relieved the sameness and monotony so often met with at the exhibitions of Chrysanthemums in England. One method adopted was in moss to the depth of several inches being placed on tables, and kept in position by a narrow edging of wire netting nailed round. In this moss were bottles obscured from view in which the blooms were inserted. The flowers having some 9 or 10 inches of stem with foliage were seen to advantage, and the effect was at the same time simple and artistic.

Considering that this was the first exhibition held, and that the climate is so very hot, blooms and plants were very fairly represented, but large Japanese are evidently the favourites here, as at the English shows, the other sections of the Chrysanthemum being entirely disregarded except by myself, and of these the Rundles, Mdlle. Elise Dordan, King of Plumes, and the single Marguerites were much admired. This last variety, which I think is not very well known, or rather, perhaps, not often exhibited, would not look at all amiss as a front border to a large group by reason of its dwarf growth and prolific flowering.

I should like to say a word in praise of the exhibits in the decorative class, which were to me novel and attractive without the aid of epergnes or vases, which are evidently not in vogue here. One exhibit consisted of a huge bunch of some 200 blooms 4 to 5 inches in diameter, cut with very long stems and arranged loosely, but evenly, in an oak stand covered with Ivy; another resembled a bassinette with a hood beautifully executed; while a third exhibitor fixed upon a doorway with a stone pillar and arch for his labours, the pillar being entirely covered with regular slanting lines of yellow and purple blooms, and the arch with immense sprays artistically arranged.

Of groups there were few. The popular fancy is for lightness and plenty of foliage plants. I am sorry to say that I was called to account by some for making my group too solid; but, personally, I hold the view that when the flowers are fairly large they are more advantageously exposed to view for comparison when close to one another, and in the case of small blooms they are more favourably exhibited with plenty of foliage plants; but this, of course, is entirely a matter of taste, and I bow to those who hold a contrary opinion.

The King of Italy's gardener, who, by the way, is a member of the N.C.S., sent several blooms from Monza, which consisted of some promising seedlings. New varieties were also well exhibited by the Italian Chrysanthemum specialists, Messrs. Fratelli Radaelli.

The exhibition was followed by the usual dinner, with a firm determination to hold a Chrysanthemum show every year, and I hope next year to be able to say that the Society, which is called the "Societa Orticola Verbanese," is affiliated to the National Chrysanthemum Society of England.

But I have been writing this when, by the side of me, I find our local

journal giving a clear and detailed account of our exhibition, which I venture to enclose.—H. Briscoe-Ironside.

[We are very much obliged by this excellent description of the show written by our correspondent, which will be perused with interest by many Chrysanthemumists. We append a sample of the "clear account" of the show from the local journal *Il Toce*, and hope our gardening friends will enjoy it as a change from our orthodox methods of reporting:—"Fuori Concorso (not for competition). Gran Diploma Medaglia d'Argento dorata, dono del signor Marchese Felice D'Albertas, Presidente Onorario della Società orticola verbanese, al signor Henry Briscoe-Ironside per la splendida e farzosa esposizione di Chrysanthemi in fiori recisi ed in piante, di uno straordinario e perfetto sviluppo e par la elegante confezione e disposizione dell' insieme dei diversi suoi lotti, i quali destarono la generale ammirazione." We cannot equal the smooth charm of the Italian language, but can, in our rugged, stereotyped way, congratulate our respected compatriot on his success.]

THE PENTSTEMON.

A bed of well grown seedling Pentstemons has a charming appearance in the garden. To insure the best results the soil must be prepared by trenching in the autumn or early winter months, working in at the time a good dressing of decayed manure, while if the soil be naturally heavy a quantity of leaf soil should be added.

Presuming that the seed was sown in July in pans of light soil, and the seedlings pricked off into a cold frame and kept hardy throughout the winter, they will be dwarf sturdy plants by the following spring. In March they may be lifted carefully and planted into the prepared bed at a distance of 18 inches between the rows, and 15 inches from plant to plant, which distances will allow for perfect development. Pentstemons may also be raised from cuttings, which if inserted in pots or in a prepared bed in a cold frame in August or September, will make nice plants for removal to summer quarters by the spring. When the cuttings are rooted they may be pinched to induce a branching habit. These plants are susceptible to damping in the winter months, therefore great care should be exercised to maintain a dry and buoyant atmosphere, admitting abundance of air on all favourable occasions.

Due regard must be paid when planting to the various heights and colours of the varieties, and the effect produced will amply repay any extra trouble and preparation the cultivator may bestow upon them. Provided the flower spikes are removed as soon as possible after the full beauty is past. the plants will throw up a second crop of flowers, which will be much appreciated in the dull season of the year. It will be found advisable to either lift the old stools in the winter, or in mild localities to cover with coal ashes or other protecting material. A little attention given to crossing any good varieties where it is intended to save seed will be amply repaid.—H. T. M.

IN THE VALE OF NEATH.

The present autumn has been a remarkable one in many ways. Never do I remember seeing such a wealth of fresh bright flowers to mingle with the varied and rich colour of the autumn leaves. Our terrace walls, clothed as they are with the old China Blush Roses (Rosa indica), carry one's thoughts back to early June rather than November; while an old chimney is an object of great beauty, covered, as it is, with the crimson variety of R. indica. Even the Hybrid Perpetuals are loth to depart, and fine buds of Général Jacqueminot, John Hopper, Ulrich Brunner, and that lovely Bourbon Souvenir de la Malmaison, and others are still fragrant.

Dahlias are to be had in galore. At the recent Cardiff Show Mr. Wm. Treseder had a grand exhibit - not merely one or two, but hundreds of charming blooms in almost endless variety, excellently set up, and judging by the crowd of visitors around it, the exhibit was being accorded the praises it fully deserved. Chrysanthemums in the open have enjoyed the dry sunny weather, and never do we remember seeing them so clear in colour. Even the annual kinds are still flowering in profusion, while such tender annuals as Nasturtiums are still holding up their heads, and long lines of Calliopsis Drummondi and grandiflora—exquisite flowers for table decoration—are wonderfully bright.

We were fortunate in having a good bed of Marguerite Carnations, and since July hundreds of fragrant flowers have been gathered. With the protection of some old lights the flowers still continue to open, and should the present weather continue we shall have plenty at Christmas without the trouble of lifting into pots. This class of Carnation is invaluable for buttonholes, sprays, and decoration of any kind; being deliciously scented and charmingly fimbriated, it has a grace and beauty about it quite its own.—Exile.

CABBAGES.

The present autumn has been one of the most favourable experienced for some years for growing crops, and although the rainfall has not been so heavy as to make the Brassica family unduly succulent, many of the spring Cabbages have attained a size approaching what we should often be glad to see in early April rather than November. Should severe frost occur without snow, which affords such good protection, I fear many of the plants will be crippled; therefore another plantation made at the present time might save much inconvenience and annoyance in the spring, for with a good breadth of Cabbages to cut from when other vegetables are at their lowest ebb a blank is prevented. We usually make two good plantations of Cabbage—the earlier one on a south border, and a larger one, not many days later, at the bottom or north end of the garden. Not infrequently following severe winters the northern ones, from not being subject to the full rays of the sun after a severe frost, are the best.

Varieties, as with other vegetables, are numerous enough to suit all classes, but for the mainstay of the establishment we rely on that well-proved variety Ellam's Early, and taking everything into consideration it would indeed be hard to beat. Another good and popular variety in the West is Wheeler's Imperial, while those who require a large Cabbage can be suited by growing Daniel's Defiance. Sutton's Flower of Spring is also an excellent Cabbage in every way, and Sutton's April (quite new) is sure to make a reputation. Miniature Marrow affords a new feature to what we have previously seen in the way of Cabbages, and it is a novelty likely to prove useful to those who place excellent quality before size. It may be planted in rows 1 foot apart. The plants keep in good condition over a lengthy period without splitting after being fully grown.—Grower.

ROYAL HORTICULTURAL SOCIETY.

November 23rd.

Scientific Committee.—Present: Dr. M. T. Masters (in the chair); Mr. Douglas, Rev. W. Wilks, and Rev. G. Henslow (Hon. Sec.).

Gall on Jasmine.—With reference to the specimen brought by the Secretary to the last meeting, Mr. MacLachlan reports that it is quite impossible to fix on anything in particular in the way of a cause, but the puncture of a Phytoptus is the most probable.

Phyllotreta on Cruciferæ.—He also observes, with regard to the beetles shown by Mr. Michael as destructive to Stocks, that "the genus is the one to which the 'Turnip flea' belongs. There are about a dozen species in this country, all being much alike. They all frequent the *Cruciferæ*, and the fact that this one was also found on Tropæolum only intensifies the fact that most things which feed on the former will also feed on the latter, as—*e.g.*, the larvæ of 'Cabbage whites,' the interpretation being that both contain the same chemical vegetable products."

Dahlia, Hybrid (?)—Flowers were received from Mr. E. J. Lowe of Shirenewton Hall, Chepstow, supposed to be the result of crossing a Dahlia with the pollen of a Sunflower. The appearance was that of a Dahlia, the disc alone being rather larger. Dr. Masters undertook to examine them more minutely.

Cypripedium, Monstrous.—Mr. Veitch sent a plant of C. Tityus bearing a single flower. It had no lip, but two columns. It was referred to Dr. Masters for further investigation.

The Copper Plant.—Dr. Masters exhibited an illustration of *Polycarpæa spirostylis*, F. von Muëller. It has the above name, as it is said only to grow where copper is to be found, and that its presence is an indication to miners of the existence of that metal in the neighbourhood. It is found by the mines of Watsonville, N. Queensland.

Chrysanthemum, Proliferous.—A specimen bearing three flowers was received from Mr. B. Greaves of Broome Hall Gardens, Dorking. They were remarkable for consisting of a dense mass of minute heads instead of distinct florets. Some of the Show Dahlias, Dr. Masters observed, consisted of this peculiarity, the separate heads combining to make a single large "flower." The peculiarity is characteristic of the genus *Echinops*, only the individual heads contain but a single flower each.

Fruit Committee.

In last week's issue you report in the proceedings of this Committee an award of merit to an Apple Lady Falmouth. That award has the distinguished reputation of having been made by six votes for and four against. The variety bore so striking a resemblance to high-coloured Court Pendu Plât as often seen, and beyond being soft of flesh had no other merit, not even of size, that several members opposed the granting of the award. Very different was it the case with Mr. Rivers' excellent black Grape, Directeur Tisserand, which obtained a unanimous award of merit, and will probably get a higher honour if it can be shown some two or three months later as a good keeper.

Prior to the close of the meeting the present very unsatisfactory method of voting awards was discussed, and although some difference of opinion was elicited, yet it was ultimately carried without opposition "That the Council be invited to frame a regulation requiring any awards by the Committee to be made only by a majority of two-thirds of the members present." Should the Council accede to this request almost a revolution will be effected in the present system of voting awards, as rarely do all the members vote. On the recent occasion fifteen members were present, and yet a minority of six only carried an award, four being opposed and five neutral. It will be undoubtedly an advantage that every member be obliged to vote. This rule would compel the taking of active interest in everything which comes before the Committee.

The case quoted above as to awards being carried by minorities is not at all an unusual one, and perhaps accounts for the too frequent making of such awards. Members of the Committee should not plead they do not know anything of the exhibits before them. They ought to know, as that is the object for which they are made members, and in accepting those positions they cannot shirk responsibility.—D.

ORCHIDS

Vanda Sanderiana.

This interesting Orchid was first introduced into this country in 1882 by Messrs. F. Sander & Co., and has since attained an immense popularity. It produces leaves that are upwards of a foot in length and about 1 inch in breadth. The flowers, which are borne on long racemes, average about 4 inches across. The dorsal sepal is pale rose, lateral ones yellowish with red veins finely marked; petals rose, each with a small patch of red spots; the lip is small, dull yellow with red streaks. We hope this information, with the woodcut (fig. 79), will be of service to "Young Orchid Grower," and also to others.

Vanda cœrulea.

This is one of the most charming Orchids in existence, the lovely pale blue flowers comparing favourably with those of any other kind. A great deal of variation exists among the blossoms, some being of quite a deep blue, others much paler, while some, and these are usually looked upon as the poorest, are only a shade or two from pure white. The width of the segments, too, varies considerably; the edges of these overlapping in its best forms, and these make up a beautiful and bold flower. The spikes are graceful, and freely produced on healthy vigorous plants, making a fine display during the autumn and early winter. Its culture is not difficult when a suitable position for it is found, but this is not always easy.

There has recently been a good deal of controversy in the gardening press respecting the length of life under cultivation of various Orchids, and without entering into this it may be at once admitted that there are certain species that for many years—an indefinite time, in fact—go on and flourish under our care. Year after year adds to the bulk of the specimens, and small pieces lopped off, or divided portions, as the case may be, are grown to specimen size with little trouble. On the other hand there are kinds that, although they do well for a few years in Orchid houses, ultimately find the conditions not to their taste, and a backward tendency sets in that it is difficult, if not impossible, to arrest.

In the latter category this beautiful plant I am afraid must be placed, for although instances of successful culture over a long series of years may be on record, there is no disputing the fact that Vanda cœrulea as a rule pines under cultivat on for the ever-changing, yet always correct climate of its native haunts; for the buoyant atmosphere of the hills whereon it is found in such luxuriance; for the boundless canopy of Nature instead of the strictly limited one we provide for it in our Orchid houses. To yearn for the unattainable, however, is not the fashion among cultivators, and it behoves us to do our best with the means at command.

What, then, are the conditions under which this plant is found growing naturally, and how can we best replace these under cultivation? Collectors tell us that on the Khasia Hills the temperature often drops far below the freezing point, and this very Orchid is often covered with hoar frost. During the warm season, owing to the thinness of foliage on the trees it inhabits, it must be exposed to nearly the full power of the tropical sun. This is tempered by frequent drenching rains, causing always a damp atmosphere, but none the less these conditions are much too extreme for us to imitate under cultivation, and we have to strike a balance as near as may be between them, lessening the heat in summer on the one hand, and the cold in winter on the other.

The East Indian house is too hot for the plant, without doubt, and I know of no better position for it than one close to the glass, and if possible close to the ventilator, in the highest and sunniest part of the Cattleya house. In such a position I have had the best results, for there is plenty of warmth and moisture to encourage free growth, while the abundant light and free circulation of air tends to consolidate the system of the plant and the individual leaves as they are formed. During winter, or when growth is inactive, it may have even colder quarters, for there are few in this section that rest more perfectly than the species under notice.

For years I kept several plants in a house devoted to winter flowering greenhouse plants, generally where on cold nights the temperature was frequently below 40°, and although this seems very low, I can only say that the plants were subjected to it and did well, starting vigorously in early summer, and flowering profusely every autumn. When growth is active, light dewings of this Orchid several times daily are of great assistance, but this, of course, would be discontinued in dull or rainy weather, and when the flower spikes appear. While in bloom it is well to keep in mind the fact that too little atmospheric moisture is injurious to the plants, but too much shortens the life of the blossoms by damping.

With regard to a rooting medium this may be described as the least important point in its cultivation. By this I do not mean that it will thrive with careless potting, blocking, or what not, but that the roots are not fastidious about what they lay hold of, and seem to thrive equally well about the rods of a wood basket, over the surface of rough blocks, or planted in pots of sphagnum moss. But the rooting medium must be well drained, and err on the side of poorness rather than richness, or a close heavy description of material. The smaller the receptacle in reason the better, for the roots of V. cœrulea are not nearly so ambitious in pushing away from the centre of growth as are those of most Vandas of a like habit.

They grow and thrive when coiled around each other and over the sides of the pot or basket, and as long as moisture is provided they will be all right. Insects are not as a rule troublesome, and may be kept under by ordinary vigilance, but drip must be carefully guarded against, many fine specimens having been ruined by cold icy water falling from the roof into the centre of growth. As noted above, Vanda cœrulea is a native of the Khasia Hills, where it was discovered by the Indian botanist, Griffith, many years before it was introduced to cultivation by Mr. Thomas Lobb, who sent plants of it to the Messrs. Veitch.—H. R. R.

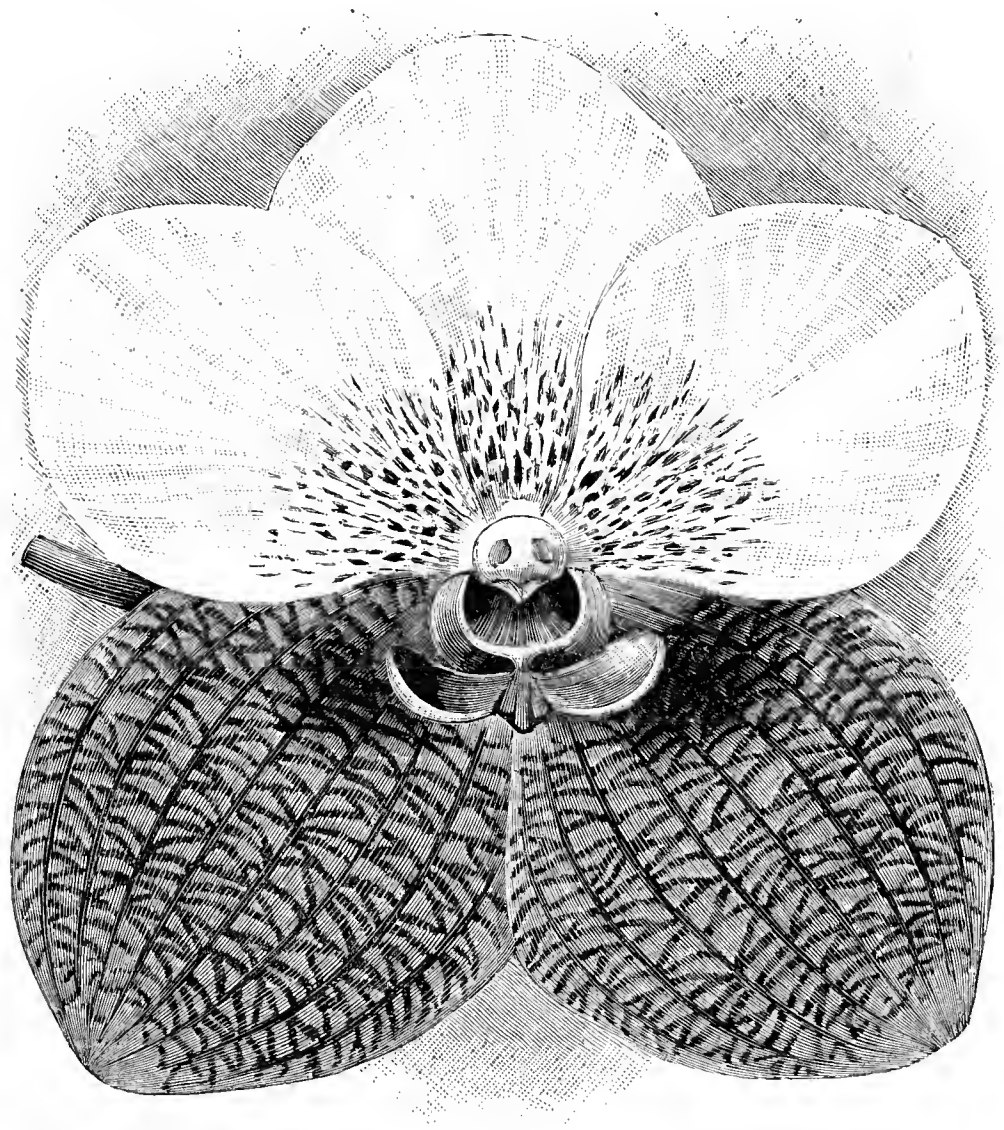

Fig. 79. Vanda Sanderiana.

BERICOTE HOUSE.

Pleasantly situated on rising ground a few miles from Leamington Spa is the delightful residence of Captain Starkey. Being in the neighbourhood a few days ago I thought I would call upon Mr. J. Tancock, the energetic gardener there, as I felt sure I should find something of interest, even at this dull season.

Although not an extensive place it is exceedingly well kept, and in summer time the grounds around the mansion must be delightful indeed, for from the grassy slopes and level stretches of lawn a fine view is obtained of the open country in front, which rises gradually up to the pretty Warwickshire town, whose waters are famed for their medicinal properties. In the plant houses I found the best of order was maintained, the plants being also in splendid health. Crotons, Palms, Ferns, and

Asparagus, of the right type for decorative purposes, were there in abundance, and Poinsettias and Gesneras added plenty of colour to the scene.

In a cool house at the end of the range I noticed a grand array of Cyclamens, plants of large size, having fine leathery leaves and a wealth of flower buds just beginning to expand. They are fine examples of cultural skill, and will, without doubt, be highly prized at Christmas time. Winter flowering Pelargoniums are also well grown here, the favourite variety being Kate Farmer, a soft salmon pink with large flower pips. Chrysanthemums made a good display in the conservatory, and although they are not grown for exhibition many of the flowers were wonderfully fine. The plants grown on the large bloom principle are found particularly useful for dotting among Palms in the conservatory, and for arranging at intervals among those grown as bushes; indeed, for such purposes a few large blooms ought to be grown in every garden.

A good sized Peach case has recently been erected. In this young trees are advancing well, and the wood being thinly disposed and not too strong, must ripen well. A few large bunches of Alicante Grapes remained in the late vinery. All the Vines are, however, old, and the borders are being renovated as quickly as circumstances will allow. On a shelf near the glass in one of the fruit houses Malmaison Carnations were to be seen in splendid condition, each leaf being perfectly free from disease and of a deep green colour.

The soil at Bericote is good, being a sound loam, rather heavy, just such a one as most gardeners delight in after it has been well worked. This is being done, and there are evidences on every hand at Bericote that Captain Starkey has a practical gardener who delights in his work, and performs with a will the duties entrusted to him and his assistants.—WANDERER.

ROSE CRIMSON RAMBLER.

How much has Mr. William Paul's recent note on this fine climbing Rose evidenced the value of euphony in a name. Who would have cared for a Rose under the name of "Engineer" or "Paniculata?" I hope that these harsh sounding appellations, whatsoever their priority, will be buried and forgotten. No name could have been happier than is that of Crimson Rambler, and evidence of its suitability to the plant has been furnished by the way it has caught on with the public. The case illustrates the need there is for more names that are of a catching and pleasing nature. We have, especially in Roses, far too many of what I may term epitaphal names, because they have served to rescue from merited oblivion so many living or dead persons never previously heard of. Very questionable honour is paid to worthy persons when flowers are named after them. Perhaps they are named in one year and found worthless and forgotten the next. Such is floral fame.—A. D.

AUTUMN PRUNING.

In many instances inexperienced growers whose Roses have made shoots 4 feet and 5 feet in length during the summer and autumn are tempted to cut them back with the view of making them look tidy during the winter. Others have an impression that when the wood has been formed and matured the sooner it is pruned the better; but all pruning in autumn is a mistake, and should never be done. Its injurious effects may not be seen immediately, but in the majority of cases they will become disagreeably visible before the summer. I have rarely known long uncut well-ripened Rose shoots injured by the severity of any ordinary winter; but when they were cut in autumn I have frequently seen them die back a considerable way from the cut part in passing through a winter of no uncommon severity, while intense frosts and bad weather killed many of them.

Again, it is well known that the buds at the tops of Rose shoots always start into growth first in spring, and when the weather is mild in February the shoots on the tops of the branches may become some inches in length; but the keen winds experienced as a rule in March destroy these to such an extent that all chance of their becoming useful ends. It is after this that the great advantage of being able to cut back the growths until sound plump buds are reached gladdens the cultivator; but with autumn-pruned plants no benefits of this kind can be experienced, as they are cut in until only a few buds remain, which may be induced to start prematurely in spring, when they are killed. If not quite killed these early growths are almost certain to be checked, and fail to become so strong or bloom so freely as later growths.

I would rather see my Rose buds quite dormant about the beginning of March, then the young shoots, several inches in length in April and May, would be free and vigorous, and this can only be properly managed by entirely avoiding autumn pruning. Some growths may be so long and straggling now that to allow them to remain so might injure the roots of the plant through their being twisted by the wind, and in such cases firm staking and tying is best; or if cutting must be done, the shoots should only be shortened back without going so deeply into the wood as to call it pruning.—ROSARIAN.

CONIFERS AND THE LATE WINDS.

THE gale that passed over this district (North Midland) on Monday, November 29th, was the most severe since the one in March of 1895. The last named did a large amount of damage, not only to property, but was also so destructive in the uprooting of fine trees, particularly the Coniferous family.

The strong north-westerly gale of last Monday destroyed or mutilated many of this family, notably a fine example growing here of the Greek Silver Fir, Abies cephalonica. This tree was feathered from the ground to the apex with healthy branches and foliage, and annually produced large numbers of its beautiful cones 7 to 8 inches in length. This year there were many hundreds of them, and their fine chestnut-brown colour was a striking feature in the autumn sunshine. The tree was 66 feet in height, with a trunk 7 feet 6 inches in circumference at 3 feet from the ground.

Although it has withstood the force of winds for perhaps fifty or sixty years, it happens that when these Silver Firs attain to a certain height their tops or heads spread out and become heavier, so it demonstrates their unfitness for the planting of avenues. The gale of 1895 was particularly destructive to the Silver Fir family, most notably Abies pinsapo, A. cephalonica, A. lasiocarpa, and A. excelsa, all upwards of 60 feet in height. The Lebanon Cedar also suffered severely, many fine specimens being blown down, and others broken about badly.

Not a tree in the long avenue of Wellingtonias here has been disturbed by the winds, and the giant Arbor Vitæ, Thuia gigantea, of which there are large numbers of fine specimens, 60 feet high, stands the strong winds well. The same may be said of Libocedrus decurrens. These three species of Conifers are certainly most useful for their wind-resisting power to anyone contemplating avenues of Conifers, but for their successful well doing, a good loam of sufficient depth is necessary. They are growing here in a soil with an average depth of 2 to 3 feet, with gravel beneath.—A. HARDING, *Orton*.

THE YOUNG GARDENERS' DOMAIN.

EARLY FORCING STRAWBERRIES.

In many establishments the earliest Strawberries are usually started early in December, and will produce fruit in March or April if desired. To maintain a continual supply it will be necessary to take in quantities of plants at intervals of about three weeks or a month.

All dead or decayed leaves must be removed from the plants, and the pots be well cleaned. Place the plants close to the glass in a temperature of 45° by night, with 5° or 10° higher in the day. After a few weeks the temperature may be raised from 5° to 10° higher. The syringe may be used twice daily in favourable weather up to the flowering stage, when it should be discontinued until after the fruit is set.

During the flowering season the atmosphere ought to be kept somewhat drier, and a free circulation of air should be maintained on every available occasion. Give the flower trusses a gentle tap about midday, as this will assist the distribution of the pollen. In many cases it may be advisable to thin out the fruit, when the remaining ones will be of much better quality. As soon as the fruit commences to swell the temperature may be raised gradually to 60° or 65° by night, with 5° to 10° higher in the day. A top-dressing of some artificial manure will prove beneficial to the fruit, but in my opinion it is best to be applied only after the fruit commences to swell. The flavour of the fruits is much improved by admitting more air.

Strawberries do not force well more than one season, so that a fresh supply of plants should be prepared annually. The soil most suitable is a strong and rich loam, with the addition of some decayed manure. Royal Sovereign is one of the best for early use.—J. F. D., *Yorks*.

CALANTHES.

THERE are many useful Calanthes, some of which are of evergreen foliage, while others, such as C. vestita, Veitchi, and Turneri, are of a deciduous nature. They generally lose their foliage about the time they commence flowering. When arranged tastefully with Ferns and other foliage plants they produce a charming display for a considerable time, while they last a long time, either as cut flowers, for which they are of great value, or when allowed to remain on the plants. Nearly all the species have striking and attractive flower spikes, the majority of which are large and of an erect habit. They are of easy cultivation, and are unsurpassed by any plant as regards their usefulness.

The compost I have seen them most successfully grown in is good fibrous loam and peat in equal parts, one-quarter part dried cow manure and silver sand. On this occasion they were grown in 6 and 7-inch pots, which were clean, and about half full of crocks. The pseudo-bulbs were sorted out, and three or four, according to their size, were placed in a pot. They had been previously rooted in boxes in a temperature of 65° by night, and from 5° to 10° higher in the day. The boxes had 1 inch of sphagnum in each, which seemed to suit the Calanthes admirably.

After potting they were kept close and well syringed about the pots, but the foliage was not wet at all. We watered them very carefully until the plants were well established, when they were removed to a temperature of 55° by night, and 10° higher in the day. A cleaner or healthier collection of Calanthes I have never seen. The greatest possible care was exercised in admitting air, and the plants were well shaded from the hot sun; but as much light as possible was afforded to them by removing

the shading as often as required. An occasional watering of clear soot water or prepared liquid manure was given each week after the pots were well filled with roots. The evergreen species should be kept rather dry during their resting season, which should commence as soon as flowering is over. The deciduous kinds require drying gradually as soon as they commence to lose their foliage until they are quite dry at the roots. These require a long and thorough rest after flowering.

Calanthes seem to be more subject to brown and white scale than any other pest. Red spider will sometimes attack them; but owing to the somewhat moist atmosphere which should be maintained this pest is well kept under. All kinds should be diligently sought for and destroyed if good results are expected. The best mode of propagation, to my knowledge, is division of the plants and preserving the smallest pseudo-bulbs, which are placed either in pans or pots and grown with the others.—J. F. D., *Yorks.*

Notes on Violets.

The Violet has always been a universal favourite, and deservedly so, for its innocent beauty and charming perfume claim the admiration and appreciation of all To insure success in the cultivation of Violets for gathering in winter, three essential points may be observed. 1, Plant early, thereby providing a long season of growth for the development and maturing of well ripened crowns. 2, Freedom from insect pests, or weak unsightly foliage and impoverished crowns will be in evidence, in lieu of dark green, glossy foliage and robust crowns. 3, Careful management after lifting throughout the winter, especially in ventilating and watering.

I have seen three methods of propagation, each giving good results. By division, selecting soft crowns which have not flowered the previous season, but merely auxiliary growths attached to the main crown by a subterranean stem, generally possessing at the junction good feeding rootlets, which also issue from the stem. By inserting cuttings early in March in boxes, using a good rooting medium, in ratio of 2 to 1 loam and leaf mould, with plenty of sand, placing in cool house or frames; and by layering the first-mentioned soft crowns or runners between the plants in a frame selected for propagation. Place about 2 inches of soil as above, having previously just loosened the existing soil. Secure the layers firmly with wire pegs or their equivalents, and water thoroughly. Syringe twice daily in bright weather, and keep the soil in a moist condition always. Roots will soon be plentifully emitted close to the crown.

This latter method is, I think, preferable. The afternoon prior to planting the plants should receive a thorough soaking, when if lifted with care sufficient soil will adhere to the plant to give it a fair start without a check. The advantage is also seen at flowering time, better colour and more substantial blossoms being the result.

The date of planting will be governed somewhat by climatic influences. For warm localities the first week in April is very suitable, but in colder parts the plants may be allowed to remain attached to the parents till favourable weather prevails. The site selected for planting should be open, and protected if possible from easterly winds. A good friable loam, in which has been incorporated plenty of Mushroom bed refuse or decomposed leaves and manure used for hotbeds, with the addition of a good sprinkling of soot, suits them well. When planting allow 12 inches asunder each way, which greatly facilitates the successional hoeings; water well, then give a light mulch to conserve the moisture. The frequent use of the Dutch hoe will be necessary during the growing season to keep weeds in subjection, as constant stirring the soil prevents undue evaporation during dry weather.

During very hot weather spraying as the sun leaves them is very beneficial to the plants, besides preventing the ravages of red spider. Should the pest make its appearance, syringe forcibly, especially the under side of foliage, with a solution of flowers of sulphur, adding a little soft-soap to aid adhesion. After the Violets have been planted from six to eight weeks, give a slight dusting of soot, and again at intervals of two to three weeks onwards, interchanging sometimes with guano. If possible manure in showery weather, or water it in. Remove weakly and surplus runners as they appear. If the soil be very light about the middle of August give the bed a good treading, as this tends to throw the strength into the plants rather than in the production of runners. This is the summer treatment; a few more lines for winter management shall follow in due course.—H. Turner.

GARDENERS' CHARITABLE AND PROVIDENT INSTITUTIONS.

The Gardeners' Royal Benevolent Institution.—*Secretary* Mr. G. J. Ingram, 50, Parliament Street, London, W.C.

United Horticultural Benefit and Provident Society.—*Secretary*, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

Royal Gardeners' Orphan Fund.—*Secretary*, Mr. A. F. Barron, The Royal Gardeners' Orphan Fund, Chiswick, W.

A Useful Almanac.—We have recently received a copy of Holloway's Illustrated Almanac for 1898, and find it contains much useful information relating to everyday affairs. This is beyond the ordinary calendarial matter, while in addition illustrations, accompanied by letterpress explanations thereto, are given of several of the sports of the world.

HARDY FRUIT GARDEN.

Planting Raspberries.—Suckers which issue from the soil some distance away from the main stools form excellent plants for present planting where it is desired to renew or extend the Raspberry quarters. The suckers selected for this purpose should possess some vigour, which is best indicated by the mass of fibrous roots attached when lifting, rather than the thickness of the canes.

The soil for Raspberries ought to be well and deeply prepared, enriching it during the operation with a liberal quantity of rich farmyard manure. The possibility of making the soil too rich is not to be feared in this case, because it is essential that the roots have good feeding in order that strong vigorous canes be produced, without which profitable crops cannot be secured. Raspberries form strong roots, which descend deeply, and near the surface a mass of fibrous roots. The presence of these latter affords a good reason why the ground previous to planting must be thoroughly prepared. The practice of digging among the plants, especially close to the stems, is not a good one owing to the certainty of destroying these roots wholesale.

Raspberry plants are usually arranged in lines or clumps of three plants. In the former method stout posts are fixed at each end of the rows, these being 5 feet apart. Three lengths of wire may be fixed along each row, stretching them tightly. If the rows are long support in the middle also. The lowest wire may be a foot from the ground, the others 2 feet asunder above. The plants may be placed 15 inches apart in the rows. Clumps should be in rows also, 5 feet or 6 feet apart. Each clump may be 3 feet from the next one, three plants in each. A stout stake must be fixed in the centre, to which the canes from each plant must be eventually trained.

In planting spread out the roots in shallow holes, and cover with fine soil distributed upon them from the stem outwards, making the whole firm without injuring the roots. Mulch the soil with short manure.

Previous to growth commencing in spring the canes of all newly planted Raspberries must be shortened to within a foot of the soil. This induces the buds at the base to push strong growths, a selection of which is retained for the following year's fruiting. Prince of Wales, Baumforth's Seedling, Superlative, and White Antwerp are good varieties.

Planting Bush Fruit.—*Gooseberries.*—This is the best season for planting either small or large bushes, but it is more satisfactory to plant those not older than two or three years. It pays to liberally manure and thoroughly move the soil in preparing the site, so that the plants may obtain a good start. Gooseberries succeed very well planted between Apple trees, if both are planted at the same time and neither crowded. When planted in a quarter to themselves the distance, both between the rows and the plants, should be 6 feet.

Growing Gooseberries against walls or espalier fences is a method which might be more freely practised, inasmuch as good crops are secured and the buds are not so frequently picked out by birds as from bush plants. The branches should be trained as upright cordons. In establishing these, shoots are trained horizontally right and left of the main stem. From these upright shoots are laid in, training them straight. As these produce side shoots the latter are stopped in summer at the third leaf. This induces the formation of spurs near the stems. The winter pruning each year consists in cutting back the summer stopped shoots to within an inch of their base.

Bushes in the open quarters are best when plenty of young wood is annually retained at regular distances without crowding. Six good and useful varieties of Gooseberries are Red Warrington, Crown Bob, Early Sulphur, Matchless, Whitesmith, and Pitmaston Green Gage.

Red and White Currants.—These fruits require identical treatment in planting, training, and general culture. Soil, aspect, and distances apart may be the same as for Gooseberries. They also succeed on walls and espaliers. The pruning must be on one principle only, whether growing the plants as bushes or upright cordons. The formation of bushes consists in originating five to seven main branches. Shorten the side shoots in summer, and in winter spur them back to the buds at the base. The main branches may extend about a foot yearly, or a little less, according to the vigour displayed—that is, the leading shoots should be pruned back in winter to the extent named, until the height desirable is reached. When the plants attain to a free fruiting condition apply liberal mulching of manure annually over the roots. Good varieties of Red and White Currants are Red Dutch, White Dutch, and Raby Castle.

Black Currants.—Healthy young plants with strong shoots must be selected. Rather moist and heavy ground, though well drained and fertile, is better adapted for Black Currants than for Red and White. The chief point in the management of bushes is to retain sufficient young wood annually to furnish them, cutting out the old.

FRUIT FORCING.

Cherry House.—The trees must now be pruned. Full-grown trees, properly attended to in stopping during growth, will require very little pruning now. Any summer shoots that have grown considerably should

be cut back to about an inch of their base, and the worn-out spurs may be shortened or removed as required. Cut out dead spurs and thin those that are crowded, always reserving sufficient for producing a crop. The terminal shoots in the case of trees extending must not be shortened, but when they reach the extremity of the trellis they will need shortening, always to a wood bud. Young trees will require to be cut back as may be necessary, the central shoots being shortened so as to originate others for filling the space regularly, but it is not desirable to start them too closely together, as that may cause the branches to press against each other, and this commonly results in gumming. Fan-training is unquestionably the best for the Cherry, as it admits of replacing any branch falling a prey to this disease, and of renewing worn-out limbs. Thoroughly cleanse the house—the woodwork with soapy water and a brush, the glass with clear water, limewashing the walls, using freshly burned lime with a handful of flowers of sulphur to each pailful of whitewash. Syringe the trees with hot water, 130° to 140°, to subdue any hybernating pests, and if infested with red spider dress with a solution of caustic soda and pearlash in equal parts, using 2 ozs. of the mixture to a gallon of water, and applying by means of a clean, half-worn, painter's sash tool, so as to wet every part evenly, especially the cracks and crevices of the bark, taking care not to injure the buds. Remove the loose surface soil and supply fresh loam, with a fourth of well-rotted manure intermixed, sprinkling on the surface a good handful per square yard of some approved fertiliser, scratching in very lightly with a fork. The roof-lights being off they need not be replaced until the time arrives for starting the trees, which should be about the middle of this month to have Cherries ripe early in May. The very early varieties will ripen sooner, such as Belle d'Orleans and Rivers' Early, these being followed by Governor Wood and Black Tartarian. Cherries must not be brought forward too rapidly, especially when forcing them for the first time. Trees under fixed roofs should be well supplied with water to keep the soil moist; but fixed roofs are great mistakes in the early forcing of Cherries, unless these are grown in pots, when they will be placed outdoors after the fruit has been gathered and wood sufficiently developed. Trees in pots are readily forced, and afford excellent fruit at the end of April or early in May, when fresh ripe fruit is not over-plentiful, Cherries are then always appreciated at table.

Vines.—*Earliest in Pots.*—The Vines started from the beginning to the middle of November to afford ripe Grapes at the end of March or early in April, require the temperature increased to 60° at night after the buds break, gradually increasing it so as to have 60° to 65° at night when they are in leaf, 65° by day in dull severe weather, and 70° to 75° by artificial means when mild. Moderate ventilation should be given under favourable external circumstances, and early, but without lowering the temperature, so as to effect a change of air, allowing an advance of 10° to 15° from sun heat, and closing at midday or soon after. It is a good plan to admit a little air at 70° under any circumstances, thus allowing the pent-up moisture to escape and entirely displace the vitiated atmosphere by fresh, but with a rising temperature, keeping 80° to 85° from sun heat, and closing so as to gain 5° rather than to lose any benefit from the sun. In sharp weather enough air will gain admittance by the laps of the glass without admitting any through the ventilators; but modern structures are so improved in close fitting lights and large panes of glass that it is necessary to admit air when the sun is powerful and the external air keen, and the object to secure is a sweet atmosphere without checking growth. Tie the Vines in position as soon as growth has well commenced, and before the shoots are so long as to be liable to damage in the process. Add fermenting materials to the bed so as to maintain the heat about the pots at 70° to 75°. These will give out a genial moisture and a little ammonia, and are far better than evaporation troughs kept charged with liquid manure. The house requires sprinkling with water two or three times a day in bright weather, avoiding a very moist and stagnant atmosphere. Disbudding should not be practised until the bunches show in the joints of the shoots, the extra foliage encouraging the formation of roots, and if the superfluous growths are gradually removed, the sap will be diverted into and strengthen those which are left.

Houses to Obtain Grapes in May.—The Vines to supply Grapes in May should be well established in inside borders, and have ripened the growths early, so as to allow of their being pruned and given a few weeks' rest before starting. Black Hamburgh, Buckland Sweetwater, Foster's Seedling, and the fine Muscat Madresfield Court are suitable. If Muscat of Alexandria be required early, the Vines must be started now to ripen the Grapes by the end of May or beginning of June. The outside borders, if any, should be protected from frost by dry leaves with a little litter over them, and in due time be covered with two-thirds of leaves to one of stable litter, mixed and moistened so as to promote fermentation and give a mild, lasting warmth. This will need to be added to from time to time, removing some of the spent material so as to maintain warmth through the winter, or it does more harm than good; yet Vines with the roots entirely outside—not by any means rare—must have warmth when early forced. The inside borders should be brought in a moist, not saturated, condition by applying tepid water, and in the case of weakly Vines liquid manure. Start with a temperature of 55° at night and 65° by day, unless the weather is severe, when 55° will suffice until the buds commence swelling; but young Vines will require the higher temperature to induce them to start promptly. If a bed of leaves and stable litter can be placed on the floor of the house and turned daily the moisture and warmth will contribute to a good break and save fuel. Maintain a rather moist atmosphere by syringing the Vines two or three times a day. The rods of young Vines should be depressed to a horizontal line, or below it, to insure the regular breaking of the buds.

Succession Houses.—The Vines to afford ripe Grapes in June, being started at the new year, will have been pruned some weeks back and kept cool and dry, but if this has been delayed it must be attended to at once, dressing the cuts carefully with styptic, patent knotting or French polish; the latter stops bleeding, but the house should be kept cool so as to cause the sap to recede rather than flow with the warmth. Dress the Vines after thoroughly cleansing the house, and supply a top-dressing of loam with some enriching material, after removing the loose surface soil, a little well-rotted manure and sprinkling of approved fertiliser on the top giving good results.

Midseason Vines from which the leaves have fallen, and most, if not all, the Grapes cut, should be pruned. Any Grapes still hanging may be cut and placed in bottles of clear rain water in a cool dry room, where they will keep much better than on the Vines, especially where there are plants in the house, and air cannot be freely admitted on that account. It is a decided advantage to prune the Vines as soon as the leaves have fallen, as it secures them a long period of rest, and any circulation of the sap is concentrated on the primary buds, so that they start promptly at the proper time. In pruning adhere to the practice that has proved satisfactory. Vines in good condition will usually give sufficiently large bunches if pruned to one, or at most, two eyes, and bunches of 1 to 2 lbs. weight are generally more in demand for home use, and even for marketing, than larger, as it is essential that the table or customer be supplied with fresh fruit. If larger bunches are desired, or the Vines from weakness do not afford bunches so large as desired, leave more growth, only take care to select sound, round, well developed buds on firm well-ripened wood. Dress the Vines, merely removing the loose bark; cleanse the house thoroughly, and put everything into proper order, so that there need be no hurry and badly performed work at starting time. Light and cleanliness are important factors in Grape cultivation, and far too often overlooked, hence the resultant disasters.

Late Houses.—Every precaution should be taken against damp. The weather has been very unfavourable to the keeping of thin-skinned Grapes, and still continues to be disastrous to such as have to be kept in houses that have flat and leaky roofs. Thin-skinned Grapes are much better cut and bottled, especially where there are plants in the house, as they keep well in any spare room that is cool and dry, it only being necessary to exclude frost and look the Grapes over occasionally for the removal of decayed berries.

Late Muscats of the thin-skinned varieties, such as Muscat of Alexandria and Canon Hall, require a drier atmosphere and warmer temperature than other kinds of Grapes, the temperature needing to be kept at 50°, and the atmosphere not allowed to become stagnant, but be freely ventilated whenever the weather is favourable. When the weather is dull and damp, gentle warmth in the hot-water pipes will be necessary to keep the atmosphere moving and expel the damp, taking care not to allow the temperature to be raised by natural means without giving air, otherwise the moisture will be condensed on the cooler surfaces of the Gapes, and spotting and decay speedily ensue. Remove all leaves as they become ripe, and strip the Vines of any as yet green laterals, but allow the main leaves to fall naturally. All the thick-skinned varieties are best allowed to remain on the Vines until about the new year, as they thereby improve in quality. Sufficient fire heat to maintain a temperature of 40° to 45° is essential, closing the house in damp weather, and secure as far as possible a dry, cool atmosphere, and equable temperature.

PLANT HOUSES.

Chrysanthemums.—Whether good bushes or large blooms are required, cuttings should be inserted where they can be obtained. It is better to wait for a time before insertion, rather than utilise growths from the stem or poor puny cuttings. Those for large blooms if inserted singly in thumb pots, will root freely, even quickly, when placed under hand-glasses in a cool, airy house. When rooted under cool conditions the plants can be grown without subjecting them to heat. All that is needed is to protect them until they can be turned outside. Where large bushes are needed three cuttings may be inserted in each pot, and properly grown these will produce an enormous supply of flowers. For this purpose only free-branching and free-flowering varieties should be selected. The stools, after they are cut down, should be kept in a cool airy structure until the cuttings have been taken; nothing is gained by placing them in heat. The plants often die, and the cuttings produced are weak, and sometimes fail to root.

Hydrangeas.—Varieties of H. hortensis that have been rooted in small pots, have prominent flower buds, and the foliage has ripened naturally, may be potted from time to time as opportunity offers. Pots 5 inches in diameter are most suitable, and the plants should be potted so that the first leaves produced are close to the rim of the pots. These plants do well if placed in good loam, one-seventh of manure and sand. Old Cucumber and Melon soil mixed together will grow them splendidly. After potting the plants should be kept in a cool, airy house for a time, when a few may be introduced into a vinery or Peach house that is just started, or any structure with a similar temperature. Plants that are kept for stock may be cut close back and rested in any cool place, and then started into growth under the conditions advised for those that have formed flower buds. Plants of H. paniculata grandiflora that were potted while their leaves were on them will have formed some roots. The shoots may be pruned close back, leaving one or two of the eyes of the last year's wood. These plants do best if plunged in cold frames, and allowed to start naturally into growth.

Lilium Harrisi.—All plants that have been removed from ashes and have turned green should be placed on shelves close to the

glass, where they will make sturdy growth. Be careful never to allow the plants to become dry, and watch for aphides, which are very liable to attack the plants in their points. Aphides are readily destroyed by fumigating the house or plants with tobacco smoke, or some of the various inventions provided for the purpose.

Cinerarias.—The latest plants of these should be transferred into larger pots and placed in a cool airy house, where they can come forward slowly. These, if cared for, and kept free from aphides, will be found useful when all the earlier plants are past their best. Do not allow plants that are well developed and throwing up their flower spikes to be crowded together so that their foliage will damp. Water during the early part of the day, ventilate freely on all favourable occasions, and do not employ more fire heat than is really necessary. Clear soot water, or other weak stimulants, should be given every other time the plants need water. Keep the plants standing on some moisture-holding base, or they are certain to lose their lower foliage, and if a dry atmosphere is maintained they are certain to be attacked by aphides.

Primula obconica.—Well developed plants will soon come into bloom if they are introduced into a temperature of 50°. If the blooms are required for cutting only they can remain in this temperature; if for the conservatory, they can be removed to that structure as soon as they are presentable. Plants that are required for later flowering may be kept cool in any light airy structure where the temperature does not fall below 45° at night.

Double Primulas.—Plants that are wanted in flower may be placed where the temperature ranges about 50° at night. They will soon come into flower and continue for a long time. No attempt must be made to keep them in a close confined atmosphere, or they are certain to damp. A moderately dry atmosphere should be maintained, with a little air on all occasions when the weather permits of it, ventilators being opened.

Justicia flavicoma.—This much-neglected plant will make the conservatory gay at this period of the year. When the first flowers are over the plants should not be cut back or thrown away, for they will flower a second and even a third time. Very frequently the second flowering is decidedly the better one. The plants may be introduced again into warmth. When well grown the dark glossy foliage of the plant is attractive, and the contrast is very striking when large plumes of yellow flowers are produced.

THE BEE-KEEPER.

Seasonable Notes.

Usually at this season all is quiet in the apiary; bees settle quietly in their winter quarters before the dark days of November set in, and as the weather is often cold and wet throughout the month several weeks will often elapse without a bee being observed on the wing. The month now drawing to a close has been so exeeptionally fine that bees have been almost daily on the wing, their merry hum being heard in all directions, reminding one of spring, instead of what is usually looked on as the most gloomy month of the year.

As showing the mildness of the weather Heliotrope is still a mass of bloom in the open air, and as healthy and fresh-looking as at midsummer. This is remarkable for the county of broad aeres, as it is one of the most tender plants, and the first to suecumb after a slight frost.

The fine weather experienced throughout the autumn will have been favourable to the bees, if they have been well eared for and previous instructions carried out. Unfortunately, through various eauses, work that should have been done early in the autumn has been postponed to a more favourable season. No time should be lost in attending to the small details of bee management, as severe weather may get in at any moment.

In the first place examine all roofs to see that they are rainproof, and if they have not been painted as previously advised it should be done at once. If extra coverings have not been placed on the frames it will be an advantage to do so. Any warm material will answer the purpose, such as old pieces of carpet, sacking, or even paper. Several thicknesses of the latter, with a piece of board placed on the top, will keep the bees warm, and no harm will happen to them during the most severe weather.

A warm cushion may be made by taking an ordinary bag and partly filling it with cork dust, or chaff, or something similar. But whatever is used a quilt must always come next to the frames, afterwards using some earpet, and then the cushion on the top of all. Cork dust, when it can be procured, is doubtless the best, as it is warm and allows ventilation. I do not advocate waterproof coverings during the winter months, as moisture will condense on them.

If bees are short of stores give them a frame of sealed food, or a cake of candy on the top of the frames. It is not necessary to remove the coverings at this season, as it may do harm. By lifting the hive bodily one may tell at once if food is required.

Packing Hives for Winter.

All will depend on the elass of hive that is used, whether winter packing is required. The above notes on extra coverings on the top of the frames is in a sense packing them for winter; but what is usually known by this term is when there is an air or open space of one or more inches left round the sides of the hive, and an excellent plan it is to have hives made in this form. They are also known as double-cased hives, and is really one hive placed inside of another, as it were.

These answer admirably for all purposes. Some bee-keepers prefer the air space being left open both winter and summer; others prefer packing the sides with a light warm material for the winter months, removing it in the spring when the weather is warm. For this purpose there is nothing to equal corn dust or Wheat chaff, the former is preferred. The packing may be placed round the sides of the hive without disturbing the bees. In all probability the quilt will be securely fastened down on the top of the frames with propolis, as it is usual for the bees to fasten down the covering that eomes in contact with the frames, and also to fill up every crevice with propolis.

All that is necessary is to lift up the outside edge of the quilt if it overlaps the frames, and fill the space between the two sides as advised above. The packing should be placed in firmly, and the bee-keeper may rest assured that if the bees are healthy and well provided with stores, the most severe frost that may be expected in this country will not harm them; and bees treated in this manner invariably come out strong and healthy the following spring.

When hives are packed in this manner a word of caution is necessary—not to be in too great haste in removing it until fairly warm and settled weather is experienced in the spring, as the inmates will feel the effect of sudden changes in the weather. It is not necessary, as I have proved on many occasions, to pack hives of this description, as I have found bees invariably winter well when the air space is left open throughout the winter. Packing, however, has the advantage of keeping the bees warmer than they otherwise would be in exceptionally severe weather. The disadvantage of having all hives with an air space round the sides is that it makes them more bulky.—An English Bee-keeper.

TO CORRESPONDENTS

All correspondenee relating to editorial matters should, until further notice, be directed to "The Editor," **8. Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjeets them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at onee. All artieles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return eommunications which, for any reason, cannot be inserted.

R.H.S. Examination (*L. G.*).—If you write to the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster, enclosing a stamped direcided envelope, he will furnish you with all particulars relative to these examinations.

Worms in a Lawn (*E. A. L., Ascot*).—One of the best means of bringing worms to the surface is to dissolve a peck of newly slaked lime in 30 to 40 gallons of water. Mix the whole thoroughly well together, and allow it to stand a day or two. Then draw off the clear water and distribute it over the lawn with a large rosed water-can. Apply in damp weather, removing the worms which appear as soon as possible. If lime water is not effective try corrosive sublimate, dissolving half an ounce in 15 gallons of water. Apply after rain with a rosed can. Do not give the worms to fowls which are brought to the surface with this mixture, as it is poisonous.

Sulphato of Iron Solution for Vine Mould (*Vines*).—We have not found the solution at a strength of 15 per cent., 1 lb. of green vitriol of 1½ gallon of water, injure the current year's wood. It was not applied in excessive amount or a careless manner. We should not dress closely peeled Vines with it. The bark prevents the solution penetrating the living tissues. It simply requires to be applied as an ordinary winter dressing by means of a clean half-worn painter's sash brush, coating all parts of the rods whilst quite dormant.

Botanical Names of Pear and Apple Stocks (*W. M.*).—The botanical name of the Pear stock is Pyrus communis, and that of the Apple P. Malus; but you say "commonly used," and the botanical names of those stocks nobody knows, for they are seedlings from pips of Pears usually collected on the Continent or the perry making counties of England, and have no connection with the botanical name, being mere, and very remote, varieties. Similar remarks apply to Apple stocks. Paradise stock are varietal, originating in different countries. The Doucin is regarded as Dutch, Pomme de Paradis as French, and the Broad-leaved Paradise and Nonesuch Paradise as English.

Raising Crab Stocks (*Youngster*).—Crab stocks, so called, are raised by sowing the pips or seeds of Apples that are used in cider making, the seeds being separated from the pulp, washed, and dried. They should be sown as soon as they are available and the ground is in a suitable state, as they lose their vitality in a short time. If sown broadcast in beds the seeds must be thinly distributed, not covering them more than an inch deep with fine soil; but it is best to sow in drills an inch deep and 9 inches asunder. After depositing the seeds in them thinly cover with fine soil, and press close with the back of the spade. The situation should be open. In the autumn following the seedlings may be transplanted, placing them in rows about 3½ feet apart, and the plants 18 inches asunder in the rows, where they may remain until fit to bud or graft. Those are free. True Crab stocks are obtained from seeds of the wild Crab.

Black Currant Buds Swollen (*T. W.*).—Yes, they are infested with the Black Currant bud mite (Phytoptus ribis), and we are not surprised at the bushes not finishing their crops well for the last two seasons, as the buds then affected would more or less interfere with the supply of nourishment to the fruit. On a shoot of thirteen buds, ten are swarming with mites, several hundreds in a bud, and only three buds free from them. Trenching is of no use, though often advised, either before or after attack. The best thing is to end the mites, and the best plan will be to cut off every swollen bud at once, place them in a pail smeared inside with paraffin oil, and having a fire handy turn each pailful of the buds on it. This practical method, followed by spraying the bushes when dry with a solution of soluble petroleum, though tedious, will be found far away the best plan, as one-fourth of the buds may be thus saved for producing shoots and berries. The alternative plan is to cut the bushes down and burn the prunings, then dress the stumps with soluble petroleum; this means the loss of a crop of fruit, though in your case it must be a small one. Cut some of the worst bushes down, dress as advised, and communicate results in due time.

Diseased Malmaison Carnations (*R. Johnson*).—The "grass" is badly infested with a fungus, probably Puccinia Arenariæ, which forms small brown masses, often in irregularly concentric groups on the leaves of many Caryophyllaceous plants. The masses on Malmaison Carnation "grass" are larger than on Pinks, and are more disastrous to cultivated than wild plants, for this fungus infests a number of wild as well as garden plants of the class named; and, unless the fungus is very abundant the host plant is not materially damaged or hindered in its growth. The spores are pale yellowish brown and slender. They are abundant, and the mycelium of the fungus is unusually vigorous in the "grass" you sent. There is no remedy for these internal parasites, except by the removal and destruction of the infested growths; but the disease can be prevented by early treatment with copper, and bad as your plants are we advise your spraying them with precipitated carbonate of copper in suspension at intervals of seven days twice, and afterwards at fortnightly or three weeks' intervals. Use 1 oz. to 12½ gallons of water, merely covering the "grass" each time with a mist-like but even water film on both surfaces.

Grub in Plums (*T. W.*).—The grub, according to your description, appears that of the Plum moth, Carpocapsa funebrana, which sometimes causes the fruit to drop prematurely, thus spoiling the crop. It is very difficult to give a remedy, or even a preventive, as the moths come from neglected orchards, and even wild species of Prunus, depositing an egg in due course on each selected Plum whilst comparatively young. Thus, unless all the infested trees in your neighbourhood are treated, there will be little use doing anything. However, as you say your neighbours have used a certain article and failed, they may, perhaps, be induced to try the following, which we have found effectual in a locality where the surroundings were under control. 1, Dress the trees with a solution of soluble petroleum, following the instructions for winter dressing, for the prepared article varies in strength of different makers, and brush it well into the cracks of the bark where the caterpillar lies in a cocoon. This must be reached and the "silk" saturated with the soluble petroleum. 2, Remove all dead leaves and pieces of dead twigs and branches from under the trees and burn them, scattering the hot ashes on the ground under the trees. 3, Spray the trees as soon as the fruit is fairly set with Paris green paste, 1 oz. to 15 gallons of water, and repeat twice at intervals of a fortnight or three weeks; a shorter time if wet, a longer period if dry weather prevail.

Plants for Wall with North-West Aspect (*Ivanhoe*).—Ampelopsis Veitchi, a close clinging, free growing, miniature foliaged clinger, with leaves dying off with a purple tint; Berberis Darwini, an evergreen shrub with golden yellow racemes of flowers, only suitable for a low wall; B. stenophylla, grows much taller, and has very beautiful pale yellow racemes of flowers; Caprifolium periclymenum and var. alba præcox, free growing Honeysuckles; Corchorus japonicus, double yellow flowers, plant free growing; Cotoneaster Simmondsi, and B. microphylla, evergreen shrubs, bearing an abundance of scarlet berries in autumn; Jasminum nudiflorum, producing yellow flowers in winter. Ivies do better than anything on a north-west aspect. Hedera helix var. conglomerata, pretty for rockwork; cuspidata minor, Donerailensis gracilis, lucida, marginata aurea, marginata, marmorata variegata, and Wilkeana are handsome. Those, with Ampelopsis Veitchi, Jasminum nudiflorum, and the Honeysuckles are the most suitable.

Gooseberries in Pots as Cordons for Walls (*S. T.*).—The idea is good, and the method, if well carried out, would no doubt give fair returns under the best culture, and in time possibly equalling your estimate. You may either raise the plants as you propose or insert the cuttings in pots, and then proceed as for Chrysanthemums. The plants might be induced to make 2 or 3 feet growth in the season, but you must remember that spurs are of more importance than mere length. Pots 8 inches in diameter are large enough the first season. We have grown both Gooseberries and Currants in an orchard house, fruiting them in 10-inch pots, but we stopped them at every foot in height for spur formation. The success of the plan must depend entirely on the cultural skill and good judgment by which it may be carried out. You had better choose free upright growing varieties. You might obtain a little fruit the second year, but nothing worth speaking of. It is a question if the cordons would not be better formed by planting in rich soil outside than potting them.

Mr. Neild's Illustrated Vine (*H. S.*).—Mr. Neild obligingly supplies the following information in reply to your request:—The Gros Colman Vine that was grown in a quarter of a cubic foot of soil, and illustrated in the Journal, was propagated from a bud inserted in March, 1896. The Vine was 6 feet in length. My object in growing the Vine in such a limited quantity of soil was to confirm or otherwise my views with regard to the extravagant size of Vine borders. I should not expect the Vines to produce so good a crop next year, because the large crop had a very exhaustive effect upon them. We should have grown the Vines another year, in order to note the result, had it not been for want of a suitable house for the purpose. This year and last year they were grown in a house along with permanent Vines, but as there will be a number of lateral growths produced on those Vines next year we considered that the Vines in boxes would be too much shaded to afford them a fair trial, or to produce satisfactory results. The other varieties of Vines grown in small boxes were similar in every way to the one referred to. Information on your other question arrives too late for insertion this week.

Plants for Unheated Greenhouses (*Inquirer*).—If you have a border for a climbing plant the roof may be covered with the common Passion Flower (Passiflora cœrulea), which, hanging down in festoons, gives a very pleasing appearance and agreeable shade in summer. Of plants, Aralia Sieboldi and var. variegata, Bambusa Fortunei variegata and var. aurea, B. gracilis, Citrus trifoliata, Desfontainia spinosa, Daphniphyllum glaucescens, Elæagnus macrophyllus, Eugenia ugni and var. variegata, Eurya latifolia variegata, Fabiana imbricata, Grevillea rosmarinifolia, G. sulphurea, Laurus nobilis (Sweet Bay), Ligustrum sinense floribundum, Olea fragrans, Photinia ovata, Veronica Andersoni and var. variegata, Yucca filamentosa, and Y. recurva. Those are all evergreens, and would form a good setting for any hardy flowering plants that might be introduced in pots, such as bulbs in spring, Pelargoniums, Fuchsias, Begonias and others in summer, and Chrysanthemums in autumn. The Chusan Palm, Chamærops excelsa, and Fortune's Palm, C. Fortunei, are suitable for a cold house. The great difficulty is the freezing of the soil in the pots during winter, and then thawing rapidly. This may be to a great extent overcome by keeping the soil rather dry and protecting the pots in severe weather with dry material.

Blood Manure (*Leumas*).—The blood manure recipe, to which you allude, was given to Dr. Hogg by Sir Daniel Cooper, Bart., and first inserted in the "Horticultural Directory." The failure to produce the manure may have arisen from the weakness of the acid. The muriatic acid (solution of hydrochloric acid gas in water) of commerce usually contains 32·6 per cent. of real hydrochloric acid, and has a specific gravity of 1·16, while the saturated solution (and no doubt intended by Sir D. Cooper) of the gas has a specific gravity of 1·21, and contains about 42·4 per cent. of hydrochloric acid. In addition to the probable weakness of your muriatic acid, blood four days old is not sufficiently rancid; it requires to be kept until it "begins to smell," then the protosulphate and muriatic acid being mixed and poured on it the result will be an inodorous powder. The powder may be used at the rate of 2 ozs. per square yard as a top-dressing to all kinds of plants in pots or borders, or crops either indoors or outdoors. Perhaps the formula was not given in proper form before, and hence it may be repeated, as you say the blood still remains in clots and the remainder still liquid. "Muriatic acid, 4 ozs.; protosulphate of iron, 4 ozs.; blood, 16 lbs. As soon as the blood begins to smell strongly pour upon it the muriatic acid and protosulphate of iron previously mixed, and it will be reduced to an inodorous powder, which will keep any time, and is of a fertilising strength equal to guano."

Growing Ismenes (*Amateur*).—These plants will do very well in a mixture of good turfy loam, a fifth of decayed manure or leaf mould, and a tenth of sand. The plants require abundance of water, with all the sun possible while growing in spring and summer; less water, and to be stood in the full sun in order to ripen them in autumn, and little water while at rest in winter. Your plants are probably going to rest now. Water sparingly until the end of January, then keep the soil moist until the plants start growing, when they should have copious supplies of water. They can be stood out of doors in the summer months if desired, housing them in October.

Vines for a Greenhouse (*L., Reading*)—The greenhouse with a due west aspect would answer for Vines in an inside border. We should plant them about 3 feet from the front wall, and take the rods up so as to reach the trellis, fixed about 15 inches from the glass and that distance from the front. This would keep the stems from the hot-water pipes. The Vines would be best trained with two rods each, the canes having all the buds rubbed off or shoots pinched, but the two uppermost, and these taken right and left to form the rods. Plant the end Vines 3 feet 4 inches therefrom, and the other Vine midway of the distance; thus you would have three Vines, and with Black Hamburgh, Foster's Seedling, and Gros Maroc a good succession of fruit. You could only grow Tomatoes whilst the Vines were young, for when the rods are formed there would not be sufficient light for them to do well. You might grow the plants in pots for a short time, say one or two years, so disposed as to get as much light as possible. Better not plant them in the Vine border, but they may be grown against the back wall either in pots or planted out.

Names of Fruits.—*Notice.*—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*C. F. C.*).—1, Golden Reinette; 2, Lord Suffield; 3, New Hawthornden; 4, Catillac; 5, Uvedale's St. Germain. (*B. J.*).—1, Winter Nelis; 2, Bergamotte Esperen; 3, Souvenir du Congrès. (*S. T. G.*).—1, Bedfordshire Foundling; 2, Hormead Pearmain; 3, Winter Greening; 4, Braddick's Nonpareil; 5, Calville Rouge d'Hiver; 6, Scarlet Nonpareil. (*L. B. K.*).—1, Beurré Superfin; 2, Thompson's; 3, Cellini; 4, Newton Wonder.

Names of Plants.—We only undertake to name *species* of plants, not varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*G. N. S.*).—Æchmea fulgens. (*A. F. D.*).—1, Probably a Tricopilia, but so crushed as to render positive identification impossible; 2, Pilea muscosa; 3, possibly Fuchsia gracilis variegata, send when in flower; 4, Panicum variegatum. (*C. A.*).—1, Davallia canariensis; 2, Nephrolepis tuberosa; 3, Selaginella Martensi; 4, Adiantum pubescens. (*E. R. S.*).—1, Lælia anceps; 2, Pleione lagenaria. (*P. J.*).—1, Pernettya mucronata; 2, Pyrus torminalis; 3, Melilotus officinalis; 4, Agapanthus umbellatus variegatus.

EDITORIAL NOTICE.—**It is particularly desired that all communications, parcels, catalogues, and newspapers intended for the** EDITOR, **be sent direct to 8,** ROSE HILL ROAD, WANDSWORTH, **S.W.**

TRADE CATALOGUES RECEIVED.

Dammann & Co., Naples.—*Orchid-flowered Cannas.*
A. Findlay, Markinch, N.B.—*Potatoes.*

ABORTION IN COWS.

A STRAW will show the way of the wind, and it is curious how easily a subject or topic for an article may be suggested.

We are anxious at all times to interest and instruct our large circle of readers, but as we can never know them all personally we often wonder if we succeed in our efforts. People have such diversities of views, such wide interests, and most of us must confess to some or other hobby. We sometimes wish our friends were not so diffident in making suggestions. If in our power we would gladly, by means of a short article, clear up any doubtful points, giving all the information we could; we should feel then that we were of real service to our readers.

A remark in a letter lately received from a friend caused us to think that the subject of "abortion in cows" might be treated profitably; at any rate we hope to show that, dreadful as this disease is, it is possible to keep it in check.

The remark above referred to read as follows: "Another cow aborted, this makes twenty-two this season." This occurred on a dairy farm in the Midlands, a farm celebrated for Stilton cheeses, where the cows are the leading feature and the rent-payers. It is

capital grass land, and the tenant is a man always out and about. He thoroughly believes in a master's eye, and is a clever practical man. He is ably seconded by his active wife, who may, in the summer months, be found in her dairy much earlier than we should like to see ourselves out of bed. We mention these facts because we think they have a certain bearing on the case, and we feel we must look for a "first cause" that appears to be totally out of this gentleman's control.

All scientists agree that abortion is the outcome of over-civilisation. We do not want to be misunderstood. We mean this: It was for many years the object of breeders to produce the very best animals of the kind—best in quality and shape; best as meat producers at an early age, and the best mothers—*i.e.*, milk producers. This applies equally to sheep as well as horned cattle. We have arrived at something very near perfection; but we have made the life and the surroundings too artificial, and we have to pay the price.

Perhaps some of our readers think the subject is not so serious as to merit consideration. We will only mention the result of the inquiry of one gentleman living in a small town in North Yorks, on this question. We think facts speak for themselves. He took his own house as the centre, and considered the cases occurring within a four-mile radius. He does not consider he had knowledge of all the cases, as he found the owners of cows for some time very reticent in supplying information; but when we state that he had nearly 400 cases—authenticated cases—200 of which occurred within two miles of his house, we may fairly consider the subject needed investigation.

The investigations were spread over seven or eight years. None of the herds appear to have been very large ones, twenty-five cows forming the largest. Now the gentleman interested in this set of investigation was of opinion that the majority of cases arose from the consumption of hay or grass infected with "ergot," which is a fungoid growth infesting our grasses and food cereals.

In several cases where abortion occurred in a herd, upon change of hay the plague ceased. This might be only accidental, but it is a curious fact. To set against this, we have experiments tried by Professor Brown, where he fed in-calf heifers with ergot-infested hay, and when the supply of hay was exhausted, ergot, in a pure form, was administered without any evil effect.

In reading an article by Mr. C. Stephenson, of Newcastle, we are struck with some very lucid remarks he makes, and we think he hits the right nail on the head. There are, he says, two distinct kinds of abortion —one the result of accident, and spoken of as "Sporadic," the other, which assumes an epidemic form, or, more properly speaking, enzootic. He first considers the condition of life. High feeding and no exercise; bad, insufficient food, and exposure to the elements. Bad water, too, is an active agent in producing this disease, and close, ill-ventilated, dirty sheds. After attacks of foot-and-mouth complaint or other diseases, a cow will often readily abort, and the taint, "so often unsuspected," of tuberculosis, is often at the root of the evil.

When cows are out at grass, abortion in its early stages may not be easily detected; when up in sheds, the first symptoms ought to be noted, and the cow instantly isolated, and her standing disinfected with quicklime. All substances should be carefully destroyed, burned if possible, and the cow must regain her normal health before being allowed to breed again. This in a first case; after a second, fatten and kill. We give a cow the benefit of the doubt the first time; the second marks her as an inveterate sinner, and she must be cut off in her prime. This not only for her own sake, but for fear of causing the disease to spread, as it is quite possible for infection to be communicated to other cows. Cases have been often known where an unsuspected unhealthy animal may do endless mischief.

One thing is certain, cows are among the most excitable of animals, and in the case of a cow aborting when in company of other in-calvers, the excitement is abnormal, and the owner may consider himself fortunate if he gets off without further loss. Cows, too, are most inquisitive, and will investigate carefully any nasty matter they may find lying about.

Whether from it they become infected with some germ, or whether the smell alone may do the mischief, we cannot say, hence the necessity of close attention to in-calvers, and the careful removal of obnoxious matter. If possible (and this is really an important matter) split up the breeding herd into small bodies, and thus should abortion take place in one herd the area of infection is circumscribed, and further danger arrested. Plenty of disinfectants in the sheds is most desirable. Above all things, if the cow is designed to breed again give her ample time to recover her normal state of health. Cases of abortion have arisen on farms where for years they have had a clean bill of health, and these cases arise where a new cow has been imported, whose earlier career is wrapped in mystery.

No one sells a really good honest cow if possible unless there is some just cause, and people never like to "crab" their own goods There has been a proposition that all cows which have aborted should be marked in some permanent way; and the buyer then buys at his own risk. The losses incurred are too serious to be lightly considered—loss to the individual, and loss to the consuming public.

All men are to be treated as innocent till proved guilty is our admirable English law, and it is well to treat all diseases as infectious till they are proved to be otherwise.

WORK ON THE HOME FARM.

Autumn work is almost completed—at any rate, it ought to be, for the winter quarter is just at hand. Farm operations, however, cannot be ruled by time in a hard-and-fast way, and we have to make the best of the seasons as they are presented to us. One thing only is certain—the farmer's tasks, like the brook, go on for ever.

The same may be said as to the work of farm horses; still, on many farms the horses have more rest days in winter than in summer, and it is often the case that the farmer applies the axiom of "No work, no pay" to his horses as much as to his men. But is this fair? If the farmer takes a holiday, does he, for the day, confine himself to a diet of dry bread? Hardly so; therefore it is hardly fair if he, when he leaves home, takes the granary key away in his pocket, and leaves the waggoner with an empty bin and nothing but the straw or chaff (dry bread) for the horses until his return.

When horses are working hard they require well keeping, and there is nothing to be said against reducing the large ration when the need for it no longer exists; but sudden violent changes of diet are good for neither man nor beast, and should be avoided. This particularly applies to winter feeding, for a change to the animal's natural food (grass) during the warmth of summer must be beneficial, or Nature be at fault.

The natural foods available for summer or winter are good to follow and use; grass and Clover, straw or hay in their seasons; but horse-keepers in their choice of the adjuncts to these are most likely to err. For instance, Oats are a perfect food, but often indigestible as well as dear. The idea of many farmers is to give the strongest, as they think—*i.e.*, the hottest, food—viz., Maize and Barley—during the hard work of Turnip time; but during hot weather starchy foods should not be used, a mixture of Oats, bran, and beanmeal being an excellent working food for summer weather.

When we are approaching winter, however, things are different, and we think that for a winter horse diet there is nothing better than 56 lbs. of maizemeal and 28 lbs. of bran per horse per week. If 10 lbs. of linseed cake or 4 lbs. of linseed meal be allowed per horse, to be put in the water-tub (kept in the stable under lock and key), the horse being watered from that tub (after a good stirring) and from nowhere else, there should be little need for the services of the veterinary surgeon.

OUR FRUIT SUPPLY.

FOREIGNERS' PROFITS THAT SHOULD BE OURS.

UNDER the above heading, we find an article in the "Daily Mail" which, whether exact or not in respect to the whole of the figures presented, and granting that the great bulk and value of imported fruit is such that could not possibly be grown in this country, the article is not the less interesting and significant. It tells us clearly, to put the matter in a nutshell, that if we will not grow what the nation needs, in the supply of our national fruit, other countries will make good our deficiencies; or, in other words, they will do as the Danes have done in the supply of butter—get the upper hand in our markets.

"But," it may be asked, "can we help ourselves in the matter?" The answer is that not a few British cultivators of fruit are helping *themselves* to more profit than could be possibly obtained under the orthodox system of agricultural tillage and pasturage—a profit, it may be reasonably suspected, at least equal to that obtained by cultivators in other lands, who have to send their goods thousands of miles to our markets.

How do they manage it? The answer is simple. It is because, as a rule, fruit is *cultivated* in a systematic and intelligent manner by our rivals in production over the sea, also placed on our markets in the most tempting condition; while at home, as a rule, similar methods are not adopted. It is true there are exceptions, and these prove in a small way, and to a limited extent, what might be more general if the same methods were pursued by the many, who have opportunities, that are practised by the few.

It is not suggested that our hardy fruits can be grown profitably all over the United Kingdom. There is an enormous area of sites and a great variety of soils in which this cannot be done; and it is certain that many an attempt has been made to "make money" out of growing fruit where the essential concrete conditions were lacking, and the attempts of necessity ending in failure. On the other hand, in instances innumerable, where soils and situations were not unfavourable, the rough slipshod methods and haphazard routine, which are apparent almost everywhere, have nullified the effects of the natural advantages that existed, and

which might have been turned to good account if thorough cultural work, founded on knowledge and the requisite commercial rules of procedure, had predominated.

It is well to know what other nations are doing at present, and the preparations they are making for the future. The enterprise of peoples in other lands has been too long unknown, or if known ignored. We cannot in this island home of ours, which does not grow half enough food for the sustenance of its inhabitants, afford to remain in ignorance of what is being done elsewhere, nor rest apathetically in reliance on the old easy ways of the past, as if these were adequate to the requirements of these modern days, and those which must inevitably follow.

What may be regarded as new lands—in comparison with the long and densely populated patch of the globe on which so many are struggling in crude and rude ways to live—have an advantage over us in one important respect. They have no patriarchal orchards of rubbishy varieties of fruits, especially Apples, to rely on. They have had to begin with young trees, and in beginning they have begun with the best varieties for attaining the object in view. There, *plus* intelligent methods in management, rests the secret of the success that has been attained at our expense.

Much has been published from time to time on our old orchards and their restoration that it is feared has done as much harm as good, and, perhaps, in some instances, more. It is well to make the best of old trees to enable them, where possible, to be more useful than before; but if with this endeavour the action of their owners ends, as it has in many instances ended, we are bound to lag behind in the character of the national fruit supply as compared with that from newer fields of production placed in competition with it.

A great deal of the so-called renovation of ancient fruit trees amounts to mere patching and pottering, and can be of no permanent value unless done under the supervision of really competent men, and of no great service then in the absence of their seeing that necessary attention is given to the trees the following year. If the supply of fruit is desired to be increased and improved fresh sites should be chosen, the soil thoroughly prepared and planted with young trees in wisely chosen varieties, at the time that endeavours are being made to invigorate the old and enfeebled which are not too far gone to respond to sound treatment. In no other way can so much benefit be derived in localities which are favourable to fruit production; but unfortunately in too many instances attempts to mend ancient orchards, by certain and sometimes peculiar methods of doctoring, are regarded as equivalent to the planting of young trees, and this most important work is consequently not done. It is unfortunate that it should be so, but it is a fact—a fact founded on a fallacy.

Under those circumstances it must be apparent that home and foreign growers of fruit do not work under equal conditions, and we are unquestionably handicapped by our thousands of starveling trees and mixed medley of varieties, against their still more thousands of the youthful and vigorous bearers of superior fruit. It is only the well grown produce of young trees that can compete with any chance of success with the fruit that comes from such trees, wherever or how far distant they may be growing. It is only by choosing varieties wisely, and sites and soils prudently for growing them, planting the best, and the best only, and tending the trees properly that we can hope to maintain even our present unenviable position. Rely on the old and neglect planting the young, and there can only be one result—certain and sure retrogression. It is time, however, to come to the digest above referred to, and which has called forth these observations. Here it is, and let all who are interested make the best or the worst of it, as they may feel disposed.

Curious facts are revealed when we investigate the condition of our supplies of raw fruit. We have to depend mainly for cheap fruit upon Continental countries. This applies as well to the hardier fruits of the northern latitudes as to the produce of the southern lands of Europe. In the temperate climate of the British Isles the culture of Apples, Pears, and Plums could not be difficult and should not be unprofitable. But the taste for fruit as a wholesome and delicious diet has far outgrown the extent and yield of British orchards, which now supply but an insignificant portion of the fruit we see on sale. Stand before any of the cheaper fruit stalls of London and note how little of all these varieties have been home grown—the Apples are principally from the west of Europe or Australasia, or the northern hemisphere of America.

Great Britain, out of its 32,000,000 acres of pasture and arable land, uses not quite 225,000 acres for fruit trees; those are the outside limits of the British orchards. Through the south-western shires of Devon and Somerset, Hereford and Worcester, are spread, like a rich scroll, the chief orchards of England, with Kent on the other side; and so insignificant are the fruit tree areas of Scotland and Wales that even Cornwall equals, if it does not surpass, the combined totals of both Wales and Scotland. We do somewhat better in small fruit—there has been steady increase; we have more than doubled the acreage devoted to Strawberries, Gooseberries, Currants, and other small fruits, in seven years, from 32,776 acres in 1888 to 68,000 acres now. It is not a prodigious effort for all England; but the growth of small fruit in the remainder of the United Kingdom is trifling.

The inattention given to fruit culture in many parts of the British Isles is surprising. The south-west of Ireland, for instance, has a climate corresponding with that of Devonshire; and these counties are well adapted for growing the same productions as Galicia and the Asturias, in Spain.

Perhaps the occupiers of British land have a very inadequate knowledge of the enormous quantity and value of the fruits we take into the United Kingdom from abroad. The increase, too, is by leaps and bounds. Twenty years ago the average sum spent by each head of the population in the twelve months on imported fruit was calculated at 1s. 10d. Now, each member of a much-enlarged population spends 3s. 4d.; that is on foreign fruit only. In 1880 the import did not exceed 7,000,000 bushels; but within ten years (in 1890) it had risen to 10,000,000 bushels, and more recently it has increased to 14,000,000 bushels. The money value of this enormous supply of foreign fruit is £4,779,000.

For Apples and Pears alone we pay to foreign countries now £1,500,000 sterling. Is it not astonishing that, for fruits so hardy and thriving, and requiring less care than most agricultural produce, so large a sum as £1,500,000 leaves this country in a year. Between 4,000,000 and 5,000,000 bushels of foreign Apples come into the British Isles in twelve months, to supplement our own orchards; to this fact Londoners may attribute the cheapness of the Apples, which sell from 2d. to 4d. per pound.

We have, fortunately, the greatest Apple orchard of Europe almost at our doors. Belgium is not quite one-third the size of Ireland, and, after England, it is the most densely populated country in Europe, and it is, moreover, a country of small holdings; but its arable land is in many parts cultivated like a garden, and it exports to us now, in a year, more than 1,000,000 bushels of Apples. And not Apples merely. Belgium has taken to the cultivation of various fruits for export—Pears, Plums, and Cherries, in addition to Apples—on the same thorough and extensive scale that Denmark has followed in dairying.

The vast territories of the United States send us only a little more Apples (1,400,000 bushels), and Canada sends us a little less, about 1,080,000 bushels.

Belgium gives us everything—Grapes, Cherries, Plums, Pears, Apples, even Oranges and Lemons. Here is a lesson and a model in agriculture.

Spain, however, outstrips Belgium, not in variety, but on the grand total; it sends us over 6,000,000 bushels of fruit, mostly Oranges and Grapes; and Spain's contribution almost equals what we receive from the rest of Europe. This she owes to the popularity of the Orange. The consumption of this delicious fruit has been increasing among us at a furious rate. Four years ago we had only 4,500,000 bushels of Oranges for our year's supply; now we receive 7,500,000 bushels, for which we pay over £2,000,000, and 5,500,000 bushels of the total come from the sunny lands of Spain, where the commonest of all the sweet Oranges, round in shape and thick of rind, is cultivated in immense profusion.

The Oranges now on sale are the splendid variety which is grown at St. Michaels, and the Azores send us in the year about 50,000 bushels. The luscious Navel Orange of South America comes here through Brazil, but from that source we only receive from 10,000 to 13,000 bushels. Indeed, seventeen foreign countries give Oranges to the British Isles; no other fruit is so extensively supplied, or comes from so many different lands. Switzerland gives us no fruit whatever, and the imports from Greece and Russia are almost nil.

The quantities of fruit sent in the course of a year to the mother country by the colonies are surprisingly small. Apples, which deteriorate very little during long ocean voyages, make the bulk of the supply. Canada alone sends more than 1,000,000 bushels of Apples; and Tasmania and the Channel Islands also contribute, though not to a large extent. Outside Apples, the fruit from the British possessions

is trifling—no Cherries whatever, very few Lemons, less Plums; and hardly any Grapes and Pears, except from the Channel Islands and the Cape of Good Hope.

From the Cape we receive about 1500 bushels of Grapes, and 40,000 bushels from the Channel Islands; these exhaust the trade in Grapes. Between 18,000 and 19,000 bushels of Pears are sent by the Channel Islands. Malta gives about 6000 bushels of Oranges. But all the fruit from all the British possessions does not exceed 1,300,000 bushels, which is about one-thirteenth of the total supply. One small Continental country, Belgium, far exceeds the quantity which the British possessions contribute.

But the colonies are now learning the art of safely transporting tender raw fruits across the ocean. Their few experiments hitherto have been failures; for instance, South Australian Oranges last autumn, and Canadian Pears two years ago; but they were not hopeless failures—they pointed out the way, and the possibilities of the colonial fruit trade with the British Isles are immense. The trial shipment of Canadian Pears decomposed from the heat engendered in the railway cars on the journey to Montreal. Since that experience the fruit-growers of Ontario, and the Government of the province, have consulted, and used their fresh knowledge in the organising of a system of cooling stores and refrigerating railway cars and cold steamship chambers, in which to preserve delicate fruits from self-destruction due to ripening *en route*. These measures, it is hoped, will allow Grapes to be transported without losing their bloom, and preserve the delicate skins of Peaches, and the firmness of Pears.

The Government of Ontario has undertaken to pay the entire cost of the new experiment, and has guaranteed against the loss the fruit growers who have promised to contribute supplies to the first shipments. If the trial succeeds, next season the fruit-growers of the Niagara district will, according to the agreement, take over from the Government all the buildings and responsibility.

This interesting experiment will deal with Pears, and Grapes, and Peaches, in the first place—of which we do not now receive any from Canada It is regarded with much hopefulness, and will be extended, if successful, to Strawberries, and other fruits and vegetables. We need, therefore, have no fear of the decline in quantity or increase in price of so wholesome and agreeable a diet as raw fruit.—T. O. Moore.

DECEPTIVE APPEARANCES.

Readers of horticultural papers are indebted to scribes of the perambulating order for numerous valuable hints. But for them many successful practices would never come to light, and, all things considered, note-taking "chiels" are indispensable adjuncts to the horticultural world. If, however, we concede this point, it does not follow that these critical observers of our failures and successes should be regarded as altogether infallible. In reality, they in their turn must submit to the chastening influences of criticism, more or less friendly in character, according to circumstances. A casual visitor to a garden is not always admitted behind the scenes. He may be able to glean much useful information from those who accompany him in his rounds, and it is just possible that he may be hoaxed. He may be able to form his own opinion upon certain factors in the success or failure attending the cultivation of different fruits or flowers, and there is also the possibility of his being deceived by appearances.

Let me give a few instances of what might have proved misleading information and deceptive appearances. On inspecting a comparatively young orchard in Essex I found Apple, Pear, Plum, and Filbert trees, Gooseberry and Currant bushes, Strawberries, Asparagus, and other vegetables thriving grandly in what at first sight appears to be a large bed of gravel. Nowhere else have I seen better crops or finer fruit of some varieties of Apples on comparatively young yet very vigorous trees. Each variety was represented in long rows of a hundred or more, with scarcely a failure anywhere. Had I not been in the secret the chances are that a paragraph would have conveyed the astonishing assertion that fruit trees thrive better in smooth gravel, or the contents pure and simple of a gravel pit, than in a good loamy ground. As a matter of fact, about one-half of the soil in that large orchard is composed of smooth pebbles, one-quarter of sandy or gritty soil previously mixed with it, and the rest added loamy soil and manure. Only the stones are in evidence, but beneficial as may be the effect of these it would not be correct to give them all the credit. This instance also affords a good object lesson in what may be done by perseverance and the exercise of common sense. It was the added soil and liberal dressings of manure that were needed to make this stony ground fertile, and unless these had been given the fruit trees would have failed to become profitable.

A few years ago it fell to my lot to assist a well known expert in determining what might be advantageously done in the direction of converting a derelict farm at Bromham in Wiltshire into a profitable fruit-growing establishment. The soil generally was found to be very light and sandy, and apparently better adapted to the growth of Carrots than anything else. After closely observing the vegetation, including tree and hedgerow growth, of the farm, my colleague confidently asserted that the ground was not only more fertile than it might appear to a superficial observer, but that it was also capable of great things in fruit production if properly treated. Annual visits to this farm have amply satisfied me that the deductions were perfectly sound. The soil only requires plenty of manure, that of a nitrogenous character more especially to make it remarkably fertile. The fruit trees all grow strongly, but are yet most productive; Strawberries succeed remarkably well, many acres of them being grown, while the vegetables are equally satisfactory.

What is even more surprising to the uninitiated is the fact that Cucumbers under glass succeed admirably in this loose sandy soil, as also do Tomatoes, to the growth of which several long houses are mostly devoted. One span-roofed house, about 150 feet long and 30 feet wide, is wholly devoted to Grape-growing, and the Vines are planted in the ordinary sandy soil of the farm. The growth of these Vines and the crops of Gros Colman produced have been the talk and admiration of the district. What surprises gardeners most is the nature of the soil in which they are rooting. When I recently went through this vinery the dry, loose, much-trampled surface presented the appearance of a sand-bed, but appearances were misleading in this case. Mr. Vallis is satisfied with his sandy soil, but he does not forget to apply blood manure of his own preparation freely to supply the elements needed to meet the requirements of his heavily cropping Vines. The men who form Vine borders, and not those who take charge of them a few years after, best know what ingredients were employed, and casual observers are not competent to form very decided or reliable opinions upon what has been done in the way of ameliorating conditions.

Wishing to cover the whole of the border inside of a large vinery I own with a mulch of some kind to prevent the too rapid loss of moisture and to keep down dust, we last summer used strawy manure as far as the heap would go, and covered the central pathway with 2 inches of spent tanners' bark. Heat, moisture, and trampling favoured the comparatively rapid decay of the bark, and before very long Vine roots found their way into it, these forming fibres freely. Tanners' bark was also used as a mulch among Tomatoes, and where kept sufficiently moist, was fully occupied by healthy roots. Fruit growers who paid us visits were not slow in perceiving and condemning the tanners' bark; but on one occasion I overheard my foreman coolly remark to one more than usually critical gentleman that it was the best form of mulch that could be employed, and seeing that the crops were good an erroneous impression was conveyed. I should not think of using tanners' bark as a mulch if anything better were available. I consider this another case that may be regarded as deceptive in appearance, and might have misled the shrewdest of critics. Instead of giving all the credit to the soil in which Grape Vines carrying superior crops are growing, let me urge that visitors who report on these successes the necessity for attaching more importance to the general all-round treatment accorded.

My list of deceptive appearances is by no means exhausted, but I will be content to refer to two more only. Last season I and a friend paid a visit to a well-known specialist in Chrysanthemums, Begonias, and Tomatoes. The latter under glass were then at their best, and we were most impressed with the crops produced by a large number of roof-trained plants. The plants were confined to single stems in the usual way, and from the lower part of the trellis to the ridge were grandly furnished with clusters of handsome fruit. Apparently they only had a ridge of soil about 1 foot wide, and not so much in depth to root in. The proprietor without so much as a ghost of a smile stated that such was really the case, and also that he did not manure very freely. Having had an all-round experience both with Tomatoes and those who grow them we were not "had" in that way. The slate staging supporting the soil had previously been heavily covered with ashes for pot plants to stand on, and we found this completely matted with roots. Tomatoes can be grown successfully wholly in ashes, and as a matter of fact they will form more feeding roots in a bed of ashes, similar to that just alluded to, than in the narrow ridge of soil.

One more instance of appearances deceiving, which tells rather against myself, and I have done. This time the one most responsible was misled by appearances, as well as numerous gardeners who "gave us a call." Two Cucumber plants were, early in the year, planted in small mounds of soil on slates covering a water tank, heated by hot-water pipes. Twice top-dressings were given, each plant eventually having about one and a half bushel of soil to root in. Throughout a long season those plants remained in a healthy, productive state, without apparently forming many roots. When they came to be cleared off the water in tank underneath was crowded with active root-fibres, and it was these that principally supported the extraordinary top growth.—W. Iggulden.

NUT GROWING AND PRUNING.

I HAVE often wondered why it is that Nuts are grown in so few counties as a cultivated crop. This cannot be because the soil and climate are not adapted for Nut culture, because in many—I might almost say in all—parts of England we find the common Hazel Nuts produced in great profusion during warm seasons. The true explanation of this state of affairs may perhaps be found in the fact that many years ago the culture of Nuts was begun on a small scale in a few places, and by degrees extended to the districts around. Such in time became noted for their Nuts, and an impression was created that they could not be so well grown in other parts.

The success of the Kentish men in regard to Nut growing is not, however, solely accounted for by their soil and climate, but because they have practised an intelligent method of culture. Around Maidstone—a town which has lately suffered so greatly from a terrible epidemic—Nuts are largely grown. The soil there is in many instances very stony, but it is generally of fair depth, and has beneath it a strata of rock known as Kentish rag. The surface of the county is also extremely hilly, and the long level expanses of fields, such as we meet with in many counties, are not often seen in this part of Kent. From the above description it is easy to note that such land must be perfectly drained, and from the fact that Hops and fruit of most kinds thrive on similar soils in the neighbourhood, we may calculate that those soils are by no means deficient in fertility, although the inorganic matter they contain is largely in excess of the amount to be found in low lying districts, where the alluvial deposits of ages have formed a deep rich soil in which quickly growing garden or farm crops delight.

Those readers of the *Journal of Horticulture* who scan this note will doubtles recall to mind many stony soils and sloping banks which have come under their notice during the course of their peregrinations, or they may perhaps have land of a similar description under their charge which they have hitherto been unable to turn to profitable account. Let me advise them to take a bold course at once, and plant such places with trees of the Kentish Cob Nut. Good nuts are always in demand in both large and small establishments, and there are few gardens in which a sufficient supply is grown.

In preparing the soil for planting the work should be done thoroughly, because Nut trees, when well managed, will last at least a hundred years; and although the subsoil may be poor, it is necessary to loosen it so that the roots work freely in all directions. Trenching or double digging must therefore be practised; burnt refuse or thoroughly decayed manure may with advantage be worked into the subsoil if it is very poor, but none will be needed for the surface soil. When this trenching is done large stones will often be encountered; in all instances they should be removed, so as to secure a uniform depth of at least 18 inches. Small stones and others of less size than half a brick may be left, as the roots of Nut trees seem to delight in working their way between them in search of the particles of soil around; and this without doubt favours the production of short-jointed twigs such as the female flowers are produced upon.

PLANTING.

Strong trees ready for planting in their permanent positions may be obtained from the leading nurserymen at from 6s. to 9s. per dozen. Such have a clear stem about 18 inches in length, and from five to seven strong shoots. Young trees of this description are far better than older ones which have been cut back several times, as they establish themselves quickly, and enable the cultivator to secure the following season the requisite number of branches to form a well-shaped tree. Nuts require abundance of sun and air; it is therefore necessary to plant them a good distance apart. Some set them about 12 feet from stem to stem, others allow them a distance of 15 feet. I prefer to plant at the latter distance, and I consider that in many of the Kentish plantations the trees have been planted too closely.

If the distance settled upon is 15 feet, Currants or Gooseberries can be planted between, these to be cut away as the Nut trees extend. Apples may then be grown as a top crop, if standards are planted 30 feet apart, and these will to some extent protect the Nuts from spring frosts when in flower. In the actual work of planting of course it is necessary to cut away the jagged ends of roots, spread them out evenly over the soil, and not bury them too deeply, advice which applies with equal force to all kinds of fruit trees, and which has been so freely dealt with in the pages of the Journal recently that it need not be enlarged upon now. There is, however, one matter which requires noting—viz., if the soil is very poor and stoney, the finer portions ought to be carefully selected to place over the young roots, then when they become thoroughly established they are well able to take care of themselves. After planting but little attention is needed during the first year, save that of keeping down weeds by a free use of the hoe during the summer months.

PRUNING.

In many gardens where only a few Nut trees are grown, no particular system of pruning is adopted, except that branches are cut out here and there to admit light. Good crops are sometimes obtained when only such limited attention is given, but the trees carry a good deal of useless wood, and under a good system of pruning the crops are more regular, and the Nuts larger. A well-pruned Nut tree was to me in my school days an object which commanded admiration, and I looked upon a Nut tree pruner as a wiseacre whose knowledge was so profound that ordinary mortals could never hope to grasp it. I have, however, learned since that the work is simple enough when we once learn to distinguish between fruit-bearing and barren shoots, provided we also start with a young tree, instead of having to take our initial lesson in pruning on an old and neglected one.

After planting, the young shoots are usually left unpruned for a year, and the only regulation needed during the summer is to stop any shoot that shows signs of becoming unduly strong. The following winter these shoots are shortened back to within 6 inches of their base, this will cause strong leaders to grow the following season to form the foundation of the tree. Throughout the summer the side growths must be pinched to five or six leaves to secure a strong leader; and in the following winter these leading shoots ought to be cut back to within 9 inches of their base, taking care to prune to an outer bud. When growth commences in spring two leaders may be allowed to grow from each of these shoots, and thus the requisite ten or twelve branches are obtained. In order to encourage the saucer-like shape required, these branches must be tied out to pegs driven into the ground, or be kept out by means of a wooden hoop placed in the centre of the tree.—KENTISH MAN.

(To be continued.)

CESTRUMS.

THOUGH several genera of Solanaceæ furnish species which are more or less useful during winter as greenhouse decorative plants, it is questionable whether any single genus is more useful than Cestrum—or, as it is known in some places, Habrothamnus—at that season. Two or three species can be grown in pots with fairly good results; most of them planted in beds and supported by stakes will make bush plants, but to be seen at their best they should be planted against a pillar or wall, and trained loosely, so that the ends of the branches will hang gracefully from their support. When grown in the latter way it is difficult to conceive a prettier sight than a well-grown and well-flowered specimen of either of the species mentioned below. The period of flowering is also a recommendation, for, with four species a supply of flowers can be had from July to April, and odd inflorescences are not uncommon during the other months of the year.

Those best for ordinary purposes are C. elegans, aurantiacum, fasciculatum, roseum, and Newelli. The one most generally cultivated is C. elegans. It is a Mexican plant, and does best when grown against a wall or pillar. The individual flowers are red in colour, 1 inch long, tubular, and produced in large clusters. As almost every branch is terminated with flowers its worth is apparent. It is at its best from December to March, though a large plant is rarely without flowers.

C. fasciculatum is very similar in appearance to C. elegans, but the blooms are looser and longer, while the individual flowers are shorter. It commences to flower about September and keeps on until February C. roseum, like the foregoing, is a Mexican plant. It differs from the other two mentioned by the leaves being a little smaller and more abruptly terminated at the apex, and the flowers rose-coloured instead of red.

C. Newelli is one of the gems of the genus. It is quite distinct in growth, foliage, and flowers. The shoots are stronger, the leaves quite as long, but wider, and thicker in texture than in C. elegans, and the inflorescences are larger and not quite so loose as in that species. The colour of the flowers is scarlet. The flowering period is from Christmas to the end of April. Anyone wishing for a good pillar plant should give this a trial.

C. aurantiacum is very different in general appearance, but quite as useful. It is a native of Guatemala. It can be grown in pots with fairly good results, but looks at its best when the main stems are tied to a pillar and the young flowering growths allowed their freedom. The flowers are orange yellow, about three-quarters of an inch long, and produced in large, loose, terminal inflorescences. It flowers twice during the year, the first time about July, after which the growths break back and another brilliant display is made from the end of October to the middle of December.

With regard to cultivation no special treatment is necessary. Given a winter temperature of from 40° to 45°, and fairly rich soil, they will grow and flower well. After flowering (when the plants have attained the required size) they should be spurred back to two eyes. It is better, where possible, to grow them cool, as they are then not troubled so much by insects. After trying a selection of the species mentioned, one and all cannot fail to admit their worth as showy, easily cultivated plants, for the pillars or walls of conservatory or greenhouse.—K. R.

ORCHIDS

Vanda Agnes Joachim.

It is not by any means every day that new Vandas find their way to the exhibitions of the Royal Horticultural Society at the Drill Hall, and when one is shown it is certain to attract attention. On June 15th of this year Mr. W. H. White, Orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, sent a hybrid resulting from a cross between V. teres and V. Hookeriana named Agnes Joachim, and of which we now give an illustration (fig. 80). The flower was very lovely, and well worthy of the first-class certificate that the Orchid Committee bestowed upon it. The petals and upper sepals were delicate rose, while the lower sepals were pure white. The colour of the lip was purplish rose.

Pleiones.

These Orchids make a bright and pretty show during the dark, dull, wintry days, and their popularity seems to increase every season. Looking through a large trade collection recently, I remarked upon the small stock of these, and found that the demand for them had sensibly increased during the last few years, and this particular nurseryman had a difficulty in keeping up his stock of some of the more popular kinds. As a genus of garden plants they are perfectly distinct, but most botanists now refer them to Cœlogyne, a genus they very closely resemble in floral structure, but differ widely from in habit and general appearance. Their culture, too, is quite different, and as I do not remember noting them in the Journal, possibly a line on this may be interesting.

Few Orchids keep to such a regular routine, flower and grow so constantly and regularly, as Pleiones. Each season they need fresh compost; every spring they commence growing about the same time—though this time naturally varies with the different species—and they seldom refuse to flower if properly treated. Although they are probably strictly epiphytal in their native haunts, they need a good substantial compost to get the most out of them under cultivation, and the proper time to attend to this is just after the flowers are past.

Prepare a mixture of about equal parts of peat fibre, loam, and chopped sphagnum moss; add to this a good sprinkling of finely broken crocks and charcoal, and mix all thoroughly. The size and quality of the receptacle will vary according to circumstances and the fancy of the individual grower. Some prefer large broad pans, and excellent they are for the purpose, but personally I like small pots better. These are much more easily arranged in any class of group or other display of flowering plants, and as the plants at the time of flowering have no foliage on them, a large panful looks just a little garish.

But perhaps it is only a matter of fancy. At any rate, the compost is the same in all cases, and whatever is used the drainage is a very important point to consider. Fill the pans about two-thirds of their depth with crocks, and cover these with a layer of rough sphagnum. Pull the old plants to pieces, carefully separating every bulb, and as all the old roots will be dead, cut all these off excepting a small tuft to help to hold the bulb in position. Be very careful not to damage the new roots, if there should be any, but if taken directly they have finished flowering, not many of these will be present. Fix them so that the base of the bulb is barely buried, and dispose them equally over the surface at about 2 inches apart, giving them a slight rise to the centre in order to throw off superfluous moisture.

Dibble the compost firmly yet carefully about the roots, and place them at once in their growing quarters. The best position for them is one similar to that recommended for the warm section of Odontoglossums, but in the cool end of the Cattleya house they will also thrive. Hardly any water is needed after potting—in fact, it is harmful for a week or two; but when the young roots commence to push into the new compost the supply must gradually increase. When both root and top growth are active a very liberal supply is necessary, for they are thirsty plants when thoroughly healthy.

The moisture must be kept going until the growth has fully developed, when a short and sharp resting season is necessary. Red spider and scale are their worst insect enemies, the latter being especially fond of the foliage. These must be kept under if good results are looked for, frequent spongings being the best way to do this. There need be no fear as to leaving the flowers on the plants until they fade, as no harm is thereby done. To conserve them over as long a season as possible let them be arranged in quite a cool house, and be careful not to bruise them or to sprinkle them with water, as their texture is very delicate.

P. Hookeriana is one of the better known kinds and peculiar in retaining its foliage, or partially so, while the plants are in flower. It comes from the Himalayas, where it was discovered by Sir J. D. Hooker in 1849. It is rather variable, the typical form having rosy purple sepals and petals and a paler lip, the latter spotted with chocolate brown. The beautiful P. humilis is a dwarf grower with a very finely coloured lip. This is roundish with a fringe of long white hairs, the ground almost entirely covered with the brightest amethyst purple stripes and spots. The sepals and petals are pure white. It is one of the oldest known species, but was not introduced to this country until 1849, when it was sent to Messrs. Veitch by their energetic collector, Mr. Thomas Lobb.

P. lagenaria was sent by the same collector, and this has become perhaps the most popular of all the species. It has bright rosy lilac outer segments and remarkably fine highly coloured lip lined with purple, rose and golden yellow. P. maculata bears large flowers, which are pure white on the sepals and petals, the lip rather profusely spotted with purple and having a yellow centre. P. præcox and its variety Wallichianum are two fine kinds, the outer segments longer and

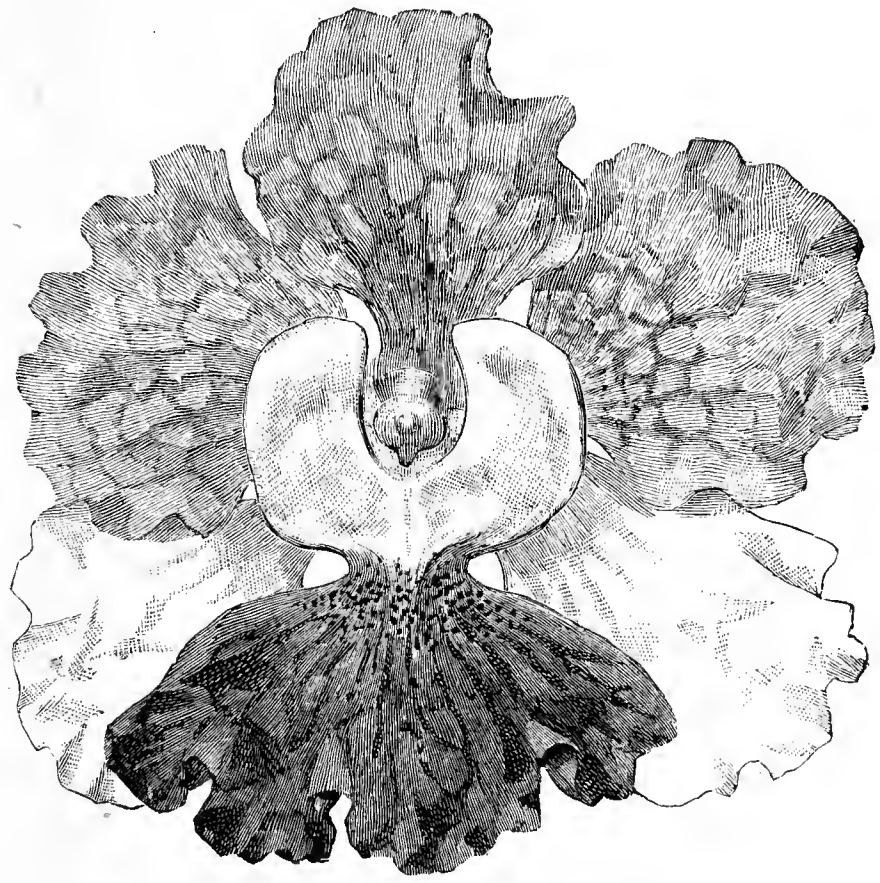

Fig. 80.—Vanda Agnes Joachim.

narrower than those of most other kinds. In the type these are pale rose, but the variety shows more colour. Both are natives of the Himalayan range, the type being introduced with P. Hookeriana, the variety many years later.—H. R. R.

ROOT EELWORMS IN TOMATOES AND CUCUMBERS.

Last year a great deal was written upon eelworms and their destruction. I promised Mr. G. Abbey that I would try some of the substances he recommended, and if I were successful in destroying the pest, I would give the honour to him to whom it was due.

Twelve months ago, when pulling up the old Tomato plants, I found at least 200 out of 4000 attacked by root eelworm. Strange to say, 95 per cent. of these were the plants next to the path. When visiting my friend's nursery, who had plenty of eelworm, did I carry some of them on my shoes? If so, it only shows how careful we ought to be; but to return again to our subject. I knew that to allow the pest to go on unchecked was not to be thought of, as that meant loss in future crops, and poor crops spell ruin nowadays.

After a great deal of consideration it was decided to use basic slag and kainit, for this, if it destroyed the eelworm, would also furnish food to the future crop. Having decided what to use, the next question was, How much of each to apply? I knew that to put on a few ounces per yard would be like throwing the substances away, so the hands went to work spreading what we thought to be a good dressing. The scales were next used to weigh out a similar lot, and the weighing proved that we were applying two pounds (2 lbs.) to the square yard. After the basic slag was spread we gave the soil a dressing of kainit. The same methods were used; but in this case only twelve ounces (12 ozs.) per square yard was applied, and this quantity made the soil look as if a snowstorm had fallen. The basic

slag and kainit were then forked into the soil, and left for the rest of the winter. In February the soil was again dug over with the fork, and the Tomatoes planted. They have now been again taken up, but not the slightest trace of eelworm is present on any of them.

A Soluble Phenyle Failure.

I should now like to pass a few remarks upon some trials with soluble phenyle that came under my notice this year. A batch of young Cucumber plants growing on a nursery where eelworm was known to exist were watered with soluble phenyle, not one part in ninety-six parts of water as advised, but one part of phenyle in 384 parts of water. When I saw the plants a week after the dose was given they looked as if they had received a severe check. In the same house I saw thirty empty pots, and on inquiry I learnt that Cucumber plants were growing in these similar in size to those to which I have just referred. Every one, however, was killed because they were watered with a solution of soluble phenyle—one part in ninety-six parts of water. One part of soluble phenyle in 384 parts of water was applied to Cucumber plants growing in borders, and to quote the words of the owners, "the plants hung their heads like wet clothes." Some plants growing in the borders were also killed when soluble phenyle was applied to them at the rate of one part in ninety-six parts of water. Perhaps some of your numerous readers have tried soluble phenyle; if so, will they kindly favour us with their experience? Mr. Iggulden and "By-the-Sea" might send a few lines of comment on the above case, re-stating the quantities of the "remedy" applied, with results.

I have yet to learn what soluble phenyle contains to make its application valuable to crops as food, as stated so many times in the *Journal of Horticulture*. Perhaps Mr. G. Abbey will kindly inform us.—W. Dyke.

[There has evidently been a mistake somewhere by someone, if not more than one. If in the experience of one person one part of soluble phenyle in ninety-six parts of water is safe, while another person finds a solution four times weaker dangerous, the subject obviously demands close investigation.]

THE GLOOMY TIME.

The sad days are upon us now, and the garden has little left to charm. Winter has as yet but breathed upon us with bated breath; he has not launched upon the flowers his fierce, cutting winds, which, like poisoned arrows, bring death in their train. Yet though he has come with almost invisible presence, we cannot but feel that he is here. No longer do we delight to linger over the flowers. No longer do we stay to admire the lustre of the petals, the beauty of the leaf. If we venture among the plants it is for a brief stay, and our enjoyment is more than tempered—it is saddened, by the death of the flowers. Leaden skies, weeping as they lower, hang over us. The silver lining is not in sight, and, human-like, we are filled with the mourning of the time. Through the fast thinning Whitethorn hedge the sea looks cold and grim and forbidding. From the hedge the brown and yellow leaves flutter and fall. The Clematis on the archway is a network of branches, no longer covered with leaves and flowers. Only a few of its seeds remain, and soon these will, like the others, float in the wind as their feathered awns catch the breeze. Herbaceous flowers are but skeletons of the dead; bare and brown, they are waiting until they are cleared away. As we look upon the garden and its inmates, we think of the songs and stories of the season's sadness—how poet and prose writer have told its tale. We seem to see through all the pain-worn poet, David Gray, and to hear his prayer—

> O, Winter, wilt thou never, never go?
> O, Summer, but I weary for thy coming.

Yet this man, thirsting as it were for the joy of the golden hours, could yet behold with ecstasy the winter sunset and the "eternal moon," finding in these something to allay the passionate longing for the resurrection of the glad summer time.

So may we, as we have done before, find our love of the garden, if unsatisfied, at least rewarded, by the revelation of some beauty in the midst of the shadows which overhang. The robin pipes a cheerful song as he sits near us. So may we find cheer amid the gloom. But for the shadows we would not enjoy to the full the light which follows when they are swept away. They are not for ever, and their coming gives us that change we desire. As Sir Edwin Arnold says in "The Shadow of the Cross:"—

> We know how weary the dawns would go,
> Lacking the promise of placid eves;
> We know how fiercely the hours could glow,
> Without the cool green dusk under the leaves.

These times, too, give us the opportunity and desire for other phases of beauty—other aspects in which the garden can give us enjoyment and satisfaction.

We see with, as it were, new eyes, and in these shadowed days are receptive of other, if more sober, joys. It is now that even the moss on the grey wall, the Stonecrop, and the Houseleek beside it or on the roof, acquire a new beauty. The moss, refreshed by the rains and undried by parching winds, is bright as emeralds. The heps of the Sweet Briars in the hedge are scarlet, and glow even in the gloom, so plentiful are they yet when frost has not driven the birds to clear the serried branches. The Cotoneaster is beaded with its dull red berries which before winter flies away will give the birds many a needed meal. The Mossy Saxifrages are mounds of brightest green, and the evergreen plants give cheer amid the decay around. The "Ivy green," of which Charles Dickens sung so heartily, is bright on the wall and the trellis. The Holly, with its glossy, prickly leaves, is never so welcomed as in this season, when its scarlet berries shine like jewels upon their branches. The Euonymus by the window is glossier than when the sun looked down upon it in dazzling splendour instead of, as now, weary looking with hiding behind the clouds. Now, too, we begin to realise the worth of some features of other plants which passed unnoticed when we were too much engrossed with the colour and beauty of the children of the light. Among these are some silver or silver grey plants to which we may devote a portion of the space which remains.

In the rock garden there is a good bush of the hoary Lavender Cotton, known to botanists by a name we almost shrink to write. It is Santolina Chamæcyparissus var. incana. What things are done, and what names given under the guise of science! For pity's sake we never, in speaking of it, use the many-syllabled name, and, in lieu, call it Santolina incana, or use the English name of Hoary or Silvery Lavender Cotton. It is a flowering plant, but its flowers are small, rayless, and yellow in colour, and its beauty lies in its silvery and attractive foliage. It looks as if powdered over, and a good bush, unless when thoroughly wet, is very pleasing on a dull and cloudy day. It grows rapidly on a light, dry soil and submits uncomplainingly to cutting back and reducing in size. In some cold gardens it is a little delicate, but with me it gives no trouble.

Hardly silvery, yet light enough in its glaucous green to give a brighter tint in its dark surroundings, is Othonnopsis cheirifolia, a succulent looking plant I have spoken of before, but from a different point of view. It is an uncommon looking plant with its flattened foliage, and now and then will give us a flower or two in the depth of winter. Even now some buds of this Barbary Ragwort seem as if a week or two would cause them to open into yellow Marigold-like blooms. Look into the little arbour whose lattice-work is covered with Roses all flowerless now, but not leafless yet. There is silver here also, but it is the silver of the penniless "Money-in-both-Pockets"—the Honesty. The outer coverings of the seed vessels have gone. The "money" (the seed) has fallen, and only the inner lining with its silver white colouring is left. It is still coveted for its use in the house as in long past years, but some plants are always left to keep up the stock from self-sown seedlings. A colony of these has been in the arbour for a year or two, and is equally pretty when in flower in spring and now, when showing the silvery linings. A little earlier than this they look shabby, but the compensation has come at the present time. Very pleasing, too, just now is a variegated form of Cheiranthus alpinus, which reminds one of a halcyon day at Carton. It originated there, and is known as the Carton Wallflower. Its green and white foliage is pretty now, and is at all times worthy of observation. Close by is a variegated form of Saxifraga Guthrieana, a very distinct gold and green leaved plant, resembling nothing more than the well-known Arabis lucida variegata, but more refined in every way. These variegated Arabises, of which there are several, are also bright and give the variety we seek at this time.

There are mounds of Alyssum saxatile—now in quaker grey, but adorned in spring with a mantle of cloth of gold. There are, besides, carpets of silvery Anthemises and Antennarias, and others of like colouring. Nor are these beauties of leaf-colouring all. There are waifs and strays left from the dispersal of the flowers. Some are weary with the struggle against the season's power, and look out wan and faint upon us as we pass. Crimson and pink Gladioli, Asters, Scabiouses (the Mourning Widows), some sprays of Alyssum gemonense, a very few Antirrhinums, a few spikes of Veronica parviflora, a small number of Violas; Linum flavum, whose yellow pointed buds cannot fully open from want of sun—these are present, with others besides. Potentilla alchemilloides, with its white flowers, has a partner in Geum pyrenaicum, a young plant of the latter giving its yellow flowers.

A bunch of double rose-coloured Colchicums has disconsolate, drenched rivals in the various Crocuses yet in bloom. There is a late-produced spike of Eryngium Oliverianum; there are annual and perennial Chrysanthemums, and here and there a scarlet or yellow Nasturtium is to be seen on the trellis. These, with a few others, are in company with double Primroses, a few Christmas Roses, a stray picking of Violets, even now "sweeter than the lids of Juno's eyes or Cytherea's breath," and other adventurous spring flowers, which the mild time has cheated into fancying it the new, and not the old year.

The shadows are here and over us, but they are only such; and we feel that behind them is the light which shall shine yet again. The clouds are leaden, but there are streaks and lines, which show that they will break up and pass away, giving us once more the garden's joy-giving beauty.—S. ARNOTT.

HARMFUL AND HARMLESS GARDEN MOTHS—12.

DURING the spring season, when there is so much to occupy the time and attention of gardeners, many plants are liable to the insidious attacks of the early brood of caterpillars, which sometimes escape notice until the mischief done can only be partially remedied by their removal. Thus, slim looper caterpillars often haunt our Roses while they are leafing; small, but hungry, and, extending themselves along the twigs, are overlooked by the gardener when they are young, their colour being green; fortunately the eyes of some birds are sharp. As they grow, occasionally the colours become darker; such is the fact with the caterpillar of the moth that is rather oddly called the shoulder stripe, or Anticlea badiata, which comes out during March to deposit eggs on the Dog Rose, also on the garden species, specially the Briar kinds. Green at first, this caterpillar afterwards has the head orange and black, the sides being shaded with purple, the back having numerous dots of white. It is frequent in the English counties, but not abundant enough to be mischievous. Also in the spring we see about gardens a less common and prettier species of the genus, A. derivata, or the "streamer;" the barred wings have a delicate gloss; it flies rather briskly by day. The green and red caterpillar eats Rose leaves during May, occasionally it is found on Honeysuckle.

The Dutch farmers have for centuries been famous for their Cabbages; at a time when plants of this tribe were not much grown in Britain, they were imported from Holland for the tables of the nobility. Perhaps the moth known as the flame carpet (Coremia propugnata) is more common in that country than with us; anyhow, the Dutch were the first to discover that the caterpillar fed on the Cabbage. It is of moderate size and greyish, marked with pink, occurring upon the food plant in spring, also in summer, since there are two broods each year. This is found throughout our islands, though not an abundant species. The moth, which is pale grey banded with chocolate, having a few white lines, flies about at dusk in May and August, but is seldom seen, or at least recognised. It is not a Cabbage foe needing to be hunted down by us.

Scarcely a garden throughout England fails to furnish us with specimens of the yellow shell moth in June or July, this being fond of lurking amongst evergreens and thick shrubs, from which it often flutters on the near approach of a footstep, only to seek shelter again speedily. This moth, called by science Camptogramma bilineata, has not only a couple, but many lines upon the yellow surface. Most of these lines are brown; three, however, are white on the upper, and two on the lower wings. This is a species which, when once observed, we are pretty sure to remember again if we come across it. The caterpillar feeds about fields or garden lawns upon a variety of grasses; it is green and yellow; during the day it hides amongst the roots, or under stones and clods. We may turn it up in April or May, but it is not deemed a caterpillar injurious to the grass crops.

I do not profess to know why an allied, but less species, received its Latin name of C. fluviata, but the English one of the "gem" is intelligible. Upon each fore wing is a white spot, enclosed within a dark ring, and when the moth is seen at rest where there is but little or dim light, this spot shines out like a gem, contrasting with the black surrounding. The wings are chiefly greyish-brown in the male, brick red in the female moth. It is a species which, from some unexplained cause, is commoner in the London suburbs than elsewhere, and is on the wing during July. The caterpillar feeds on groundsel in the autumn, and hides under the lower leaves; it is found both brown and green.

A pretty moth, which has rather distinctive markings, and occurs about gardens and hedgerows during the summer, is the small waved umber, Phibalapteryx vitalbata. Its wings are long for the size of the body, pale brown, with wavy lines of darker brown, two small black spots on the fore wings; the body is banded. In the autumn we may notice its caterpillar upon Clematis, or now and then upon Honesty. It has a fancy when at rest for making itself a sort of ladder between two leaves or stalks, by holding on across with the front pair and the last pair of legs. It is much wrinkled and warted, of some tint of grey, on which are blackish spots and stripes. About equal in size, lighter coloured, and indistinctly marked is the moth called the "fern," for no reason that I know of, since the food plant is Clematis. It is also P. tersata. This species is chiefly seen in the East and South of England. The caterpillars, which are brown, grey, and black, feed at the same time as the preceding, but only at night. If touched they drop, coiling up their slender bodies into a sort of Catherine's wheel. Allied to these is the larger and handsome moth, the tissue (Scotosia dubitata), which visits gardens in September to regale upon the honey their flowers afford, the females hybernating. The wings are brown but suffused with a rosy gloss, varied with white and grey. It is reared upon the common Buckthorn of our woods and hedges.

Then we get in gardens sundry representatives of another group of these geometer moths, the Cidarias, most of which are, in entomological books, called carpets, though really their markings are of a varied character. Several species make themselves conspicuous at the end of autumn by flying about the Ivy bloom, that of the Laurustinus, the winter Jessamine, and late garden flowers. The red-green carpet, C. siterata, is barred with red, the general colour being greenish grey; it hybernates amongst Ivy, or hides in sheds and outhouses; its caterpillar is seldom noticed, it has been taken on Apple, Lime, and Oak. Very similar in appearance and habit is the autumn green carpet, C. miata, a more abundant species, which the gardener may chance to disturb in its winter slumbers while he is pruning or tidying up. It is a harmless species, the food of the caterpillar being principally Birch and Elder leaves.

Only in the North of England do we find about gardens the netted carpet, C. reticulata, a moth with quite a style of its own; for upon the deep brown of the fore wings are arranged numerous white lines, which give a netted or tesselated appearance to the species. Its season of flight is July; the caterpillar is seldom discovered; it is one of the few which subsist upon the Impatiens Noli-me-tangere. Common throughout the British Islands is the small phœnix, C. silaceata, remarkably variable in colour and markings; its caterpillar is occasionally found on some species of Epilobium, specially E. angustifolium, in shrubberies; it is slender, pale green, dotted with brown. If touched it shows displeasure by shaking the head backwards and forwards until the annoyer departs. Larger, and also variable, but having fewer markings, which are black and white on the brown ground colour, is the phœnix, which greets us on July evenings, though in neither of the kindred species is there anything to suggest resemblance to the bird of fancy.

The Latin name of another moth, Cidaria ribesiaria, tells a fact in its history, the food of the caterpillar being Currant or Gooseberry leaves. It is not a scarce species, occurring in many counties of England and Ireland, but has not yet been reported as numerous enough to be hurtful to the bushes. About the middle of June the caterpillars are full fed, being dark green, having along the back eight lozenge-shaped black marks, which enclose white dots. The chrysalis is enclosed in a slight cocoon, the moth emerging during July, when eggs are deposited on the bark, remaining unhatched till the spring. Upon the Red and Black Currant, again, feeds the caterpillar of the Spinach moth, oddly so called, the C. dotata of Linnæus. A sluggish caterpillar of yellowish green, long and thin, yet a hearty eater, as some spare people are. Mr. Doubleday and others have noticed its effects upon the foliage of the bushes occasionally; it lies quiet, at full length, upon the twigs during the day, feeding after dark in April and May. The moth nearly resembles others belonging to the family. To add one more species, the treble-bar (Anaitis plagiata) is sometimes seen about gardens in May and August; the caterpillar lives upon some species of St. John's Wort or Hypericum. A peculiarity of this insect is that both moth and caterpillar are adorned with wavy lines.—ENTOMOLOGIST.

CHRISTMAS ROSES.

THE majority of persons who possess handsome specimens of these plants will be looking forward to the annual display of their welcome flowers, the better forms of which are so justly prized at this season of the year. The thought of attempting to transplant the roots at this time would undoubtedly appear somewhat ridiculous, as no doubt it would be to some extent were it recommended generally; but it is not, nor is there any occasion to disturb these specimens so long as the possessor is certain that they have abundance of suitable soil for their requirements, and the plants themselves by the luxuriance of their foliage and the abundant supply of their flowers afford ample proof that they are in good condition.

What I have to say just now about these very desirable plants is more especially directed to those who may be thinking of making new plantations, and my advice is to plant at once and not delay till the arrival of spring, a season that suits many of our best hardy plants admirably, but is altogether wrong for the "niger" section of this family, and particularly does this apply to all those localities where the soil is light or sandy, or, what is equally bad, a soil which for summer is overdrained.

Though not particular as to soil itself, these Hellebores are most happy in rather heavy loamy land, the depth of which cannot be too great, and finally a cool moist position where a free circulation of air is continually going on. Some few years since the whole of my Hellebores were planted on one of the open quarters, and though cared for as well as circumstances would permit, their appearance indicated the position was unsuitable, but better quarters were obtained for them, and they now grow in luxuriance between hedges of Oval-leaved Privet, well repaying by their rapid increase.

The full heat of summer sun they cannot endure, nor do they require the incessant cold and shade that a 9-inch wall affords. The shelter and shade they need is only partial, and should be afforded them by evergreen hedges wherever possible. This kind of protection is of great benefit, and in many instances the plants which are nearest the hedge, in spite of the latter robbing the soil by its mass of roots, as well as keeping off the rain, are decidedly more vigorous and the foliage more abundant than are those plants 5 feet away, and which have in consequence a far greater share of summer sun than those nestling at the foot of the hedge.

From these facts, then, it may be gleaned that a partially shaded spot is what they thoroughly enjoy, and such a one could, if sought after, be found in almost any garden ; for a couple or three shrubs or Conifers would supply the need if properly placed, and what more beautiful and useful than large handsome patches of these old-fashioned perennials? Not only does the foliage appreciate protection from sun and heat, for the roots also are equally fond of moisture, or, more correctly, of being continually cool, to insure which some amateur growers bury blocks of sandstone in the soil. But while admitting the great benefit accruing from such treatment, I fear it is too elaborate for the majority of those who grow Christmas Roses. Three feet depth of well enriched soil they fully value, and for dry, hot, much-drained soils, cow manure may be employed freely, keeping it a few inches below the roots at planting time.

No period is equal to the early autumn months for planting, and the earlier the better, thereby insuring as many newly formed roots as possible. When well established, these plants are much benefited by bountiful supplies of liquid manure in autumn and winter. I much prefer giving it to them at this time when the soil generally is well charged with moisture, for then it lies about the surface and descends gradually to the roots below ; while, if given in the summer time, it quickly passes through the soil, and affords little or no help to the plants themselves.

It is worthy of note that the varieties of Helleborus orientalis, as also H. colchicus, H. antiquorum, H. guttatus, and H. purpurascens, do not suffer in the same degree either from the effects of sun or spring planting as the varieties of Christmas Rose, and may therefore be planted in more open positions, and over a more extended period, without incurring any risk. Many of this last named section have very handsome foliage, which, coupled with their more or less beautiful and curious flowers, are always productive of good effect in the herbaceous border, the rockery, or the shrubbery.—H. E.

THE CHIEF ELEMENTS OF PLANTS.

THE generality of vegetable products are found on analysis to be composed of one-half carbon and one-half of the constituents of water—oxygen and hydrogen. Thus an ordinary sized Oak tree, weighing about 60 tons, contains some 30 tons of carbon. So also the immense quantity of sugar used is composed half of the same constituents.

The first idea that presents itself to the mind is that the enormous proportion of a solid element must be derived from the earth ; but chemistry demonstrates that the earth loses but little weight through the growth of plants. The following experiment, made nearly a century ago, is conclusive on this point :—Two hundred pounds of earth were dried in an oven and put in a large earthenware vessel, the surface moistened with rain water, and a Willow tree, weighing some 5 lbs., planted in it. For five years this was daily watered ; the Willow grew and flourished, and to prevent the earth from becoming mixed with the dust blown by the winds, the surface was covered with a perforated metal plate, suitable for the admission of air only. At the expiration of the five years the Willow tree was removed, and found to weigh over a hundredweight and a half, exclusive of the leaves which had annually fallen. The earth was taken out of the pan, again dried in the oven and reweighed. It had lost 2 ozs. only.

Thus a great substance had been produced, but from what source? It was concluded as a matter of course that the tree derived its increase in its contents from water, and it was left to later scientists to show that it is from the air we breathe that the solid element is obtained which enters so largely into the structure of the vegetable kingdom. The chemist can decompose the carbonic acid in the atmosphere, and produce solid carbon, but he is compelled to admit that the same process is performed by the leaves of trees in so perfect a manner as to put into the shade his skill.

The volume of carbonic acid produced by a healthy adult is so great that it is computed a million people exhale 165 tons of it every twenty-four hours. In the state of exhalation this gas is poisonous, but its deleterious effects are neutralised in a great degree by its diffusion through the air, and being continually decomposed by plants, which absorb it into their system as food, retaining the carbon, and emitting the oxygen, and so purifying the air whilst sustaining themselves.

Thus it appears to be the task of the vegetable kingdom to sustain the uniform balance of the constituents of the atmosphere. For we see no vegetable grows in vain ; from the stately Oak to the grass in the fields every individual plant is serviceable to man. If not always distinguished for some special virtue, yet ever taking part in the process of cleansing and purifying the atmosphere. In this connection such opposite plants as the fragrant Rose and the Deadly Nightshade alike co-operate. Nor even is the herbage nor the woods that flourish in the most remote and unpeopled regions unprofitable to us, nor we to them ; for the winds are constantly conveying to them our vitiated air, effecting a twofold purpose —relief to us and nourishment to them.—WM. NORMAN BROWN.

Notes & Gleanings

WEATHER IN LONDON.—Since our last issue went to press we have had a small taste of winter in the form of a very sharp frost. This occurred on Friday morning, and continued over the greater portion of the day. Saturday was also cold, but changing ; rain fell in the evening. There was a suspicion of snow in the morning, but it was very slight. Sunday was fine but not particularly bright. There was a heavy rain and wind storm on Tuesday night. Wednesday opened wet, but was fine later.

—— WEATHER IN THE NORTH.—From the 1st to the 4th inst. frosts averaging about 6° were a welcome change from the dull and wet weather preceding, and these days were generally bright and fine. Since then there has been a recurrence to former conditions. Monday was fair, but in the evening a good deal of rain fell ; the night was stormy, and Tuesday morning boisterous and wet.—B. D., *S. Perthshire.*

—— ROYAL HORTICULTURAL SOCIETY.—The last meeting this year of the above Society will take place next Tuesday, the 14th, in the Drill Hall, James Street, Victoria Street, Westminster, 1–4 P.M. The Fruit, Floral, and Orchid Committees will meet as usual at twelve o'clock. A lecture on "Sporting in Chrysanthemums" will be given at three o'clock by the Rev. Geo. Henslow, M.A., V.M.H.

—— NATIONAL ROSE SOCIETY.—The twenty-first annual general meeting of the National Rose Society will take place at the rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Thursday, at 3.30 P.M. to receive the report of the Committee, to pass the accounts, to elect the Committee and officers for the ensuing year, and for the transaction of other general business.

—— MR. JAMES BATEMAN.—We regret to have to record the death of this talented botanist and horticulturist, which occurred at Worthing, on November 27th. His interest in orchidaceous plants was intense, and besides inducing friends to send him plants, he sent out collectors at his own expense. The deceased produced a work entitled "Orchidaceæ of Guatemala," which was superbly illustrated with coloured plates, and also a "Monograph of Odontoglossums." He was one of the first to advocate a more rational system of growing Orchids, and thus did much for their popularisation. Mr. Bateman had attained to the age of eighty-six when he died.

—— ISLE OF WIGHT.—The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Saturday last. Dr. J. Groves presided over a large attendance of members. Mr. C. Martin, Clarence House Gardens, East Cowes, read a thoroughly practical paper on the "Cultivation of Crotons, Caladiums, and Dracænas." The lecturer dealt in detail with every phase of culture. Mr. W. W. Sheath, Macrocarpa, Ventnor, greatly added to the interest of the paper by staging specimen leaves of Crotons and Dracænas ; he also gave his experience as a grower of these useful plants. The subsequent discussion was entered into by many of the members present. Mr J. H. Silsbury, Shanklin, staged a fine bloom of the new Chrysanthemum Julia Scaramanga, which was greatly admired. The Association is developing latent talent in horticultural subjects, and continues to increase numerically. The annual meeting will be held on January 8th.—S. H.

—— BARDNEY MANOR HOUSE.—This is the residence of John Sharpe, Esq. A large garden adjoins the house, where many good hardy herbaceous plants find a congenial home. Apples and Pears are largely grown, and the vegetables show the result of careful selection. A conservatory is gay with Chrysanthemums. Other things are grown here, both for affording pleasure and profit combined, notably Grapes, Peaches, Tomatoes, and Tea Roses. Of the former large quantities are grown, the varieties hanging now being Gros Colman, Alicante, Mrs. Pince, Madresfield Court, Muscats, and Lady Downe's. A large dry loft serves the purpose of a Grape room. Racks are arranged to the roof as well as in the centre, for bottles, and in these many hundreds of bunches will be preserved in good condition till the spring. A large house is devoted to Tomato culture, and for testing the merits of numerous varieties, one of the best being Sharpe's Plentiful, a cross between Perfection and Glenhurst Favourite.—A VISITOR.

—— THE "DEVONIAN" POTATO.—This is the temporary name of a new Potato which has come into the hands of Mr. O. Thomas, of the Royal Gardens, Frogmore, and which I have been favoured to taste, after being well cooked. Not any time since the days of the once famous Victoria have I been enabled to taste so delicious a Potato. The flesh is tinged with yellow, as all the best flavoured ones are. It is flaky, starchy, soft right through, and quite delicious. Mr. Thomas will send some to Chiswick to grow there next year. The variety is of a longish flat form, some tubers almost kidney shaped; skin white, and roughly netted.—A. D.

—— MONUMENT TO THE LATE BARON VON MUELLER.—It is proposed to erect a monument of grey granite, 23 feet high, over the grave of Baron von Mueller in St. Kilda Cemetery, and donations are invited for that purpose by the late investigator's executors. Botanists will be pleased to know that the Baron's supplemental volume of the "Flora Australiensis," upon which he had worked for years and was preparing for the press at the time of his death, together with two volumes on his administration as Director of the Botanical Gardens, embracing a biography and complete bibliography of his writings, are to be published. His executors will feel favoured by the loan of any of his letters, or the communication of incidents in the Baron's life which his friends deem to be worthy of notice in his biography. Subscriptions for the monument, or material for the biography, should be sent to the Rev. W. Potter, "Vonmueller," Arnold Street, South Yarra, Victoria. —("Nature.")

—— ASTER TARTARICUS.—One of the most useful of late blooming herbaceous plants is Aster tartaricus. Very nearly all our native sorts, of which there is such a large variety out of bloom, but just as they are over and one thinks the herbaceous display is past for the season, out comes this beautiful Asiatic species. There are not many leaves besides the radical ones. The flower stalks arise to a height of 4 to 5 feet, carrying masses of large, light blue flowers at the summit, and these flowers are in perfection a long time. I write this, says Mr. J. Meehan in an American contemporary, on October 28th, and should it not freeze before, I am sure there will be a good display for two weeks yet, and there has been a two weeks' display already. This beautiful species spreads rapidly from its roots, soon forming strong clumps. It will be valuable for forming masses to give late flowers. There is no other herbaceous plant that I know that approaches it in appearance or in its value for autumn display.

—— A GARDENERS' MISTAKE.—Under this heading we referred last week to a case then pending at the Nottingham Assizes. The information was condensed from reports that were sent to us by three correspondents. We have now sent for publication the result of the trial as follows: — "Thomas Harwood Crasp, gardener, on bail, was indicted for embezzling sums of £4, £2, £1 14s., and 11s. respectively, moneys received by him on account for the Right Hon. Francis John Savile Foljambe, at Osberton, on September 15th, 1896, and other days. Mr. Etherington Smith appeared for the prosecution, and Mr. Snow Fordham for the defence. The prisoner had been employed by Mr. Foljambe for a year and three-quarters as head gardener, at a salary of £100 a year, with extras in the shape of rent, coals, &c., and it was his duty to sell flowers and produce from the garden, and render an account through Mr. Kaye, his master's agent. The allegations now were that prisoner had sold flowers to a Mrs. Mellish, a florist and greengrocer, at Worksop, to sell again, and had not accounted for the money. The Judge, in summing up, pointed out the impossibility of the prisoner forgetting about the money, and on the Jury finding him guilty, sentenced him to two months' imprisonment with hard labour." The nature of the defence was indicated last week. We can, of course, say nothing against the sad and severe sentence; but as to the "impossibility of forgetting," we happen to know that "forgetting" to send in accounts for money legitimately due is the reverse of an "impossible' occurrence. The sender of the above paragraph (from the Sheffield "Daily Telegraph"), and himself an employer of gardeners, adds: "Everyone I know deeply regrets that such an able man as Crasp should have got into this difficulty, and everyone deeply sympathises with his wife and family." Mrs. Crasp is in the greater need of sympathy as the victim of a double misfortune, for we are informed that her father died on the day of the trial. Her husband is admittedly one of the most competent of gardeners, and few men could have had better testimonials as to character and ability than he had from noblemen who appreciated his services. The importance of scrupulous exactitude in the discharge of duties of whatever nature is strongly enforced by this lamentable case.

—— ROYAL METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, to be held at the Institution of Civil Engineers, Great George Street, Westminster, on Wednesday, the 15th inst., at 7.30 P.M., the following papers will be read:—"Daily Values of Non-Instrumental Meteorological Phenomena in London, 1763–1896," by Mr. R. C. Mossman, F.R.S.E., F.R.Met.Soc.; "The Rainfall of Seathwaite, Borrowdale, Cumberland," by William Marriott, F.R.Met.Soc.

—— SUSSEX WEATHER.—The total rainfall for the past month at Stonehurst, Ardingly, Sussex, was 1·71 inch, being 1·96 inch below the average. The heaviest fall was 0·59 inch on the 27th. Rain fell on twelve days. The highest temperature was 59° on the 18th, the lowest 28° on the 26th; mean maximum, 49·25°; mean minimum, 39·15°; mean temperature, 44·20°, which is 1·43° above the average.—R. I.

—— NOVEMBER WEATHER AT DRIFFIELD.—Mean temperature at 9 A.M. (corrected), 44·41°; wet bulb, 43·35°. Mean maximum, 49·43°; mean minimum, 39·37°; highest, 56·8° on the 13th and 20th; lowest, 28·8° on the 16th. Mean of maxima and minima, 44·4°. Mean radiation temperature on the grass, 35·62°; lowest, 22·5° on the 16th. Rainfall, 3·04 inches; number of rainy days, twenty-one; greatest amount on one day, 0·6 inch on the 14th.—W. E. LOVEL, *Observer, York Road, Driffield.*

—— NOVEMBER WEATHER AT HODSOCK PRIORY.—Mean temperature, 45·1°. Maximum in the screen, 58·8° on the 20th; minimum in the screen, 28·2° on the 23rd and 30th. Minimum on the grass, 16·7° on the 30th. Number of frosts in the shade, five; on the grass, thirteen. Sunshine, thirty hours, or 12 per cent. of the possible duration. Rainfall, 2·02 inches. Rain fell on seventeen days; maximum fall, 0·66 on 30th. Rainfall from Jan. 1st, 20·53 inches. Difference from av., 2·65. Mild and very dull. Dry till the last few days, which were stormy.—J. MALLENDER.

—— WEATHER AT DOWLAIS.—The following is a summary of the weather here for the past month:—Average maximum temperature, 48°; highest reading, 62° on the 18th. Average minimum, 34·7°; lowest reading, 21° on the 29th. It was below freezing point on eleven days. Total rainfall, 5·03 inches, 2·65 of which fell on the 12th and 13th; greatest fall, 1·50 inch, which fell on the 12th. Rain fell on thirteen days The wind was in the N. and N.W. on seventeen days; very strong and cold for the first week, very thick fog every day of the second week, and culminating with the downpour referred to above. There were nineteen sunless days.—WM. MABBOTT.

—— THE WEATHER LAST MONTH.—November gave us much fog, and sixteen days were wholly without sunshine. It was also remarkable for a very high reading of the barometer, 30·708 inches, which is the highest reading here since 1893. The wind was in a southerly direction nineteen days. Total rainfall—1·42 inches; this fell on seventeen days, and is 0·98 inch below the average for the month; the greatest daily fall was 0·29 inch on the 14th. Barometer (corrected and reduced).—Highest reading, 30·708 inches on the 21st at 9 A.M.; lowest, 29·026 inches on the 28th at 10.30 P.M. Thermometers.—Highest in the shade, 58° on the 12th and 13th; lowest, 27° on the 26th. Mean of daily maxima, 49·23°; mean of daily minima, 38·50°. Mean temperature of the month, 43·86°; lowest on the grass, 23° on the 26th and 30th; highest in the sun, 84° on the 10th. Mean temperature of the earth 3 feet deep, 47·70°. Total sunshine, forty hours thirty-five minutes; there were sixteen sunless days.—W. H. DIVERS, *Belvoir Castle Gardens, Grantham.*

—— HACKTHORN HALL.—Calling the other day at Hackthorn Hall near Lincoln, the residence of E. W. Cracroft, Esq., I saw the splendid Black Hamburgh Grape Vine which was planted by the present gardener twenty-seven years ago. The house is about 50 feet long, and the Vine is planted in the centre about 5 feet from the back wall, and having a cane running right and left to the ends of the house. From this are ten other canes at regular distances trained downwards to the house front, with shorter canes from the main stem to the top. The Vine is wonderfully healthy, and is still carrying a heavy crop of well coloured bunches averaging about 1 lb. each. The total crop this year is nearly 500 lbs. Mr. Popple allows the Vine to break naturally, using a little warmth in the pipes as the berries begin to colour. A large piece of ground in the gardens is enclosed with wire netting for the cultivation and protection of small fruits, such as Currants, Gooseberries, and Raspberries. The plan has been adopted for many years with the most satisfactory results. A capital lot of Chrysanthemums in full flower filled the greenhouse. All the most useful varieties for cutting and decoration were represented. To show the mildness of the autumn, it may be mentioned that many Cactus Dahlias were in flower on November 22nd.—G. W. CUMMINS.

—— We are requested to state that Mr. Archibald Forbes, son of Mr. John Forbes, Buccleuch Nurseries, Hawick, was married on the 3rd inst. to Miss Eleanor Snowdon, eldest daughter of Mark Currie, Esq.

—— Chislehurst Gardeners' Association.—The balance of £5 15s. 6d. which was taken at the exhibition of Chrysanthemums held in St. Mary's Hall, Chislehurst, on November 17th, under the auspices of the Chislehurst Gardeners' Mutual Improvement Association, has been equally divided between the Cray Valley Cottage Hospital Fund and the Royal Gardeners' Orphan Fund, each of these institutions receiving £2 17s. 9d.—H. Yoell, *Hon. Sec.*

—— Small Holdings.—The "Rural World" has received the following account of a sale of land to small cultivators:—A most interesting land sale, said to be quite a new departure amongst friendly societies, took place at the Warwickshire village of Broughton Astley the other day. A six-acre field belonging to the society was marked off into plots for homestead allotments, and put up to the competition of members. It realised £350—just about £60 an acre—a remarkable price for village land in these days of depression. There were fifty-four lots, averaging an eighth of an acre each. Every plot was sold, and the competition was very keen.

—— Morden Cottage Garden Society.—At the monthly meeting of this Society, held at the Village Club, on December 2nd, a lecture was given by the Hon. Sec., Mr. J. H. Rewcastle, on Chemical Manures. Commencing with a sketch of the discovery and history of the manures, Mr. Rewcastle went on to describe, in an interesting and instructive manner, the practical use to which such manures may be put by cottage gardeners, who are often unable to obtain farmyard manure in sufficient quantities to properly nourish the plants. The different kinds of manure; the crops to which they should be applied; the times and seasons when they are most useful, were carefully pointed out; and at the close of the meeting, a paper prepared by the lecturer, containing full particulars as to quality, proportion, and price of chemical manures was handed to each person present. An interesting discussion and hearty vote of thanks to Mr. Rewcastle brought the proceedings to a close.

—— Veronica speciosa.—Of the many species of shrubby Veronicas which have been introduced from New Zealand this may be looked upon as one of the most showy and useful. Strictly speaking it cannot be called a hardy shrub, though in favoured localities it will stand outside uninjured through mild winters. The type, with its handsome, glossy, oblong foliage and dense cylindrical racemes of light blue or purple flowers, is well known and extensively grown as a window-box plant. The garden varieties, however, which are infinitely better as far as flowers are concerned, though not quite so hardy, are not so well known. A selection will be found worth growing in pots, outside, during summer and autumn, and lifted into a cool frame or greenhouse to flower during winter. A few of the best varieties are Constellation, Eclatante, Lemoine, and La Seduisante, which produce red flowers on racemes 2 to 3 inches long, with peduncles half that length, and Madame Chrêtien, with blue flowers on racemes quite as long. Besides being useful when in flower, large plants would be found useful where evergreen shrubs are in demand for house decoration.—K.

—— Tropical Fruit in New York.—An interesting collection of tropical fruits reached New York recently from the Botanic Gardens in Grenada, a British possession, the southernmost island in the Windward group. The consignment was shipped on October 23rd. A delay of ten days in entering the fruits at this port, due to the unusual character of the invoice and the want of established rates of duty, proved fatal to many of the more perishable kinds, but enough survived to give distinct character to the stock in one of the fruit stores on Broadway. These West Indian fruits included especially juicy Oranges of excellent quality. The Limes were remarkably good, and sold for forty cents a dozen. An unusual offering in this city were Citrons, the fruits of Citrus medica, familiar to housekeepers in their candied peel; there were undersized green fruits and mature ripe specimens. In this unique collection Sapodillas, the fruits of Sapota achras, were fortunate in showing to better advantage for the long time consumed in reaching customers, since these are at their best when more than fully ripened, and the greyish earth-coloured globular fruits were in the juicy sugary stage. A single specimen of the brownish-yellow fruits of Lucuma mammosa was exhibited, and some of the large brown nuts. Alligator Pears were among the fruits lost through the delay, and the few Bananas which were yet edible were remarkably good in quality, the yellow fruit of medium size having rich, creamy white flesh, while the red Bananas were of especially fine flavour. The latter, one of the most rare of all fruits in this market since the supply was cut off by the Cuban war, found eager purchasers. Several bundles of stick Cinnamon also sold readily. Among choice offerings now regularly in trade are Gros Colman Grapes, from England, and from Newport, the former costing $1 75c. a pound, and the latter 26 cents less. Hothouse grown Cucumbers and Tomatoes are as bright and attractive as the most showy of fruits.—("Garden and Forest.")

—— Grapes at Tilehurst.—Reading what Mr. Bradley wrote to you with respect to a house of Grapes at Tilehurst, Reading, of which he seems to have sent you a photo, I ventured to make a calculation as to the number of bunches each rod in the house was carrying, based on his own statement that there were in the house 4635 bunches. The house is 157 feet long, and on either side the Vines are planted at 5 feet apart, that gives thirty Vines on each side, and sixty in all. Each Vine has two fruiting rods. Mr. Bradley does not make clear whether the inner Vines are still existing or are removed. In any case each rod or rods has but 15 feet of rafter to cover. Now making the actual length of rod in each case to be 15 feet, that gives at the rate of 30½ bunches to each 15 feet of rod. Certainly, a very heavy crop indeed. The variety is Black Alicante, and ordinary bunches of that variety should average fully 1½ lb., and rather small at that weight. That should give 57 lbs. of Grapes to each 15 feet of rod. That would be out of all proportion, of course. If the crop be really so heavy it is not to be wondered if some bunches weigh 3 lbs., that the average weight per bunch should not be less than 1 lb. as to get so low an average many bunches must be under the pound. With roots 2½ feet apart and foliage and bunches so dense, it is no matter for surprise if the house was too dark to admit of a proper illustration being taken. I cannot but think that this cause is rather one of Grape production than of Grape cultivation.—A. D.

EATON HALL.

As a short article on Eaton Hall appeared in the pages of the *Journal of Horticulture* on July 9th of the present year, it would be superfluous to enter into any prefatory remarks. Suffice it to say that Mr. Barnes, who is head gardener to the Duke of Westminster, is successful in keeping the houses at all periods of the year in a gay and dressed appearance, no easy task where there is a considerable demand for decorative flowers.

The corridor, 360 feet long, is filled from end to end with a double line of Chrysanthemums on each side, which, with the climber-clad roof, forming a grand arcade of flowers. The Chrysanthemums were grown as bush plants, which becomes a necessity where flowers in quantity are in demand. As I do not profess to be a Chrysanthemum specialist, I shall only note a few varieties, mostly Japanese, which were in evidence. These comprised Edwin Beckitt, Gloire du Rocher, Source d'Or, Val d'Andorre, Souvenir d'Haarlem, Roseum superbum, Niveus, Phœbus, Rose Wynne, and Gorgeous. Single Chrysanthemums, which will be probably more largely grown where there are many vases to fill, were represented by Mary Anderson and George Cameron, both white and pure gold, a rich yellow.

Salvia splendens and S. rutilans were here in scores, and very bright they looked. Amongst the roof climbers in flower were Habrothamnus elegans, Brugmansia suaveolens, Abutilon Boule de Neige, Acacia lophantha, and Cassia corymbosa. The Water Lily house was as usual a picture of effective arrangement. The miniature groups of plants rising from a groundwork of Panicum and Ferns were in perfect harmony. Among the kinds utilised are Begonia John Heal, Impatiens Sultani, Reinwardtia tetragynum, and the delicate purple Justicia speciosa, as well as Coleus and Crotons.

On the eastern side of the corridor, and at right angles thereto, are eight plant houses, including the Water Lily house mentioned. One is a Palm house, and another gay with Cyclamens in flower and baskets of Asparagus deflexus hanging over the walk. Epacris and large Camellias, Malmaison Carnations in excellent health, winter-flowering Zonal Pelargoniums, mostly single flowered, and in full bloom, were seen in various structures. On the western side of the corridor, as lean-to against the wall, are four other plant houses, one of which contained about 300 plants in flower of Plumbago rosea, mostly in 6 and 7-inch pots. The next house was filled with very vigorous Arum Lilies in 7 and 10-inch pots. Bouvardias were in another division, while suspended from the roof were baskets of Centropogon Lucyanus. I also saw several fine plants of Peperomia arifolia argyrea.

Cœlogyne cristata, in the best of health, was largely represented. I only entered four of the Orchid houses. These were of teak wood, and their arrangement is something like what an Orchid house ought to be. They were in two ranges, in the first of which were healthy plants of Cattleya labiata autumnalis, now in flower, while Cypripedium insigne was flowering freely. The plants were arranged amongst Adiantum cuneatum as a groundwork, relieved by elevated plants of Adiantum farleyense in 7-inch pots, the fronts of the stages being draped with Panicum and Selaginella denticulata aurea. The next range had one division, with Calanthe Veitchi, C. vestita oculata, and C. vestita lutea in flower, and another was gay with Dendrobium phalænopsis Schröderianum. There were also several plants in flower of Cypripedium Harrisianum and C. Charlesworthi, the plants being arranged with Ferns interspersed as before mentioned. The stages were edged with Panicum and the lovely blue Saintpaulia ionantha.—F. Street.

REST IN PLANT LIFE.

Is it absolutely correct to assert that "it is an indispensable part of the great plan that all life should have rest?" I ask this because, being the opening sentence in your first paper of last week's issue, I felt that it constituted either an unquestioned dictum or set up an empirical theory. I am, perhaps, rather sceptical with reference to many assumed physiological "truths" in relation to vegetable life, for the somewhat obvious reason that, not only is our present knowledge of plant physiology somewhat restricted, but from time to time we find new ideas put forward that seem to be contrary to previous views, and these new ideas gradually develop into established facts. Now, I put aside all reference to animal life, because animal life and vegetable life are so essentially dissimilar.

In relation to the latter life, however, I ask the above question, because I see that in tropical countries, and in tropical houses here, there seems to be none of that "rest" which is found in vegetation in cold or temperate climes. Tropical Palms, Ferns, Crotons, Dracænas, indeed a large variety of ordinary plants, have to be kept at home as they are in their native habitats—always growing. If they cease growth at all, relatively it is only when temperature is reduced and natural requirements are not furnished. But such conditions are not furnished to enforce rest, but merely to suit the gardener's necessities. There is in the case of all this tropical vegetation absolutely no proof that what is empirically termed "rest' is necessary.

But what is with vegetation this so-called "rest?" True, we see in deciduous or herbaceous plants complete defoliation in the autumn, and, apparently complete cessation of growth. That may be as much due to the reduced temperature of the season, just as the increased temperature of the spring time compels active foliage production. But if the temperature of January or February, with general absence of sunlight were continued on into June or July, would the trees and shrubs put forth leafage then simply because they had had their customary season of apparent rest, or would they remain resting until warmer weather compelled activity? It is very evident that in considering this matter we have to separate "rest," if such be an essential element in plant life, from dormancy or inaction enforced by low temperature.

What are plants, shrubs, or trees doing during what is termed this resting season? Are they like the seed which seems not to have changed in any sense from the time gathered in the summer till sown in the following spring? Rest is a relative term, because it may mean one thing or another. Thus to some it simply means sleep, a kindly torpidity, without change of any sort, a mere waking up to find just what went to sleep. How vegetation can be in any sense benefited by such rest it is hard to understand. Then there is the wider and more apt interpretation of the term "rest," which means in this case recuperation; a common assumption, yet perhaps not the correct one, seeing that recuperation means making good some exhaustive effort, and where do we find exhaustive efforts in vegetable life, seeing that every effort of growth rather strengthens than exhausts?

It may be said that the fruit tree which carries an unduly heavy crop of fruit must recuperate, as it has in carrying the crop suffered exhaustion. How is that proved? There is really no proof that the tree or Vine or bush has become exhausted, but the soil in which the roots range may have become so and needs replenishing with food, or time is required to enable the roots to go farther afield to find soil that is not exhausted. Oh, but it will be said, if the tree be not exhausted, how is it that it does not produce a crop of fruit the following year? That is not good argument, because it is so obvious that whilst the tree is carrying a fruit crop it could not manufacture fruit buds. It is not recuperation to say that in producing fruit buds the following year it was getting it. The tree is simply doing one thing or another because it is not possible in one season to do both.

That fact is so well recognised in fruit culture generally, that thinning down of crops to suit the capacities of the tree or Vine, and yet enable it to perform fruit bud production, is invariably practised. In this case the cultivator recognises that heavy fruit crops cannot be produced with mature fruit buds the same season. But after all, whilst vegetation so largely goes into an apparent state of rest in the autumn, whether natural, and of necessity, or whether enforced by low temperature, we see all evergreen vegetation not resting, because if no growth be apparent it is absolutely certain that all the forces of life are active. Leaves whilst existent and green must perform their respiratory functions. If these cease the leaves must soon fall. If leaves be active sap must be active, and rods must be active. This being so in the case of evergreens, where comes in that rest which is said to be thus indispensable? Has any plant physiologist ever yet given a lucid explanation of the causes which in one class of plants enforce evergreen leafage, and in another entire annual defoliation, and in the same climate, soil, and environment?

Do trees or shrubs that become defoliated in the winter really remain inactive? Does the lower atmospheric temperature congeal or harden the sap in the wood, causing it to contract or to expand, yet being absolutely torpid? and do the roots also get into the same condition? Surely whatever may be the case with the wood it is not so with the roots, for these are more or less active in winter, and we know that they exhibit in winter considerable absorbent powers. We also know that trees or shrubs apparently dormant, if lifted and replanted, will put forth fresh rootlets, evidencing activity. Even with respect to herbaceous plants that have no wood growth during winter, there is no proof that the roots are dormant or inactive. Now there is good reason to believe that, unseen, the roots are assisting to create crowns or shoots that shall produce the plant growths of the succeeding year.

The subject is an almost illimitable one, and needs to be approached with very open minds and an entire absence of egotism. Knowledge, based on generally received ideas, may after all be very far from exact. Probably there is nothing in gardening of greater interest than is found in plant physiology, not least for the reason that even yet there seems to be so much that remains unknown or unexplained.—A. D.

The Bondage of the N.C.S.

Is the National Chrysanthemum Society the slave of the Aquarium authorities? This is a pointed question, that every member of the N.C.S. should ask himself. "A. D." (page 503) hits in terse terms the keynote of the situation, and I have for some time past attempted to show in Committee that we are under the thraldom he indicates.

It would be well if every member would ask himself whether the Society, as now constituted, is holding its own in the furtherance of its objects, as the premier Chrysanthemum Society, against the rapid strides and successes gained by several provincial centres; also, whether the 700 or 800 members of the N.C.S., who are working so unselfishly and zealously for the cause of the Chrysanthemum, are reaping anything like the reward for their labours that they ought to receive, and which they would receive were they not fettered hand and foot by the present position of affairs. By usage and custom for several years past the Society seems to have parted with its original birthright – independence; in exchange for a mere cover, in which to display the productions of exhibitors.

After the many pointed remarks made at the Jubilee dinner (1896) at the Hotel Metropole, by several gentlemen who were present, and deeply interested in both the Society and the culture of the Chrysanthemum, several of the executive felt that it was time to face this matter boldly, and as a matter of duty. Mr. Bevan, the Chairman of the Floral Committee, and several others who were loyal to the object, proceeded to try and see if it was possible to make preparations for a change.

Printed circulars were sent to the thirty-six members constituting the General Committee, setting forth the objects of the proposed meeting. Most of the members of this Committee responded to the invitation, and a long and fair discussion ensued; but as soon as affairs were turning to a practical issue, and apparently going against the Aquarium Company, there was shown on the part of some of the higher officials a decided disinclination to further the objects of the meeting.

The Aquarium authorities were extolled for the good they were doing for the Society, and the members present were told that if the exhibition was taken away from its present home, the said officials would each of them withdraw their services from the Society.

It was also stated that if we left the Aquarium, the Directors of the Company would institute an exhibition of their own against us. The amount of subscription given to the Society by the Company was held out to us as a great blessing. The persuasive eloquence of a few exercised its influence over some others in opposition to the existing state of things. Two evenings were consequently spent in fruitless discussion, finally ending in a complete farce. Those who took a prominent part for the removal of the show felt that time and money had been wasted, and they are yet regarded by their opponents as cantankerous obstructionists to the progress of the Society, whereas they are as earnestly desirous of extending its influence and increasing its power as the most pronounced aquariumists can possibly be.

Let us look into matters fairly and dispassionately. Turning to the financial statement for 1896 I find that prizes and medals to the amount of £839 10s. were paid as follows:—

	£	s.	d.
September show	20	7	6
October	40	15	0
November 1st	464	13	6
November 2nd	155	10	0
December	54	13	6
Medals (all shows)	103	10	6
Total	£839	10	0

On the other side I find that the Royal Aquarium Company gave towards the working expenses—

	£	s.	d.
October show	75	0	0
November	175	0	0
December	50	0	0
Total	£300	0	0

It would appear from this that the Society received no support from

the Aquarium Company towards the September exhibition, though the gate money went to them as usual.

On the October meeting, with the exception of the medals awarded, the value of which I am unable to separately define, the Society appears to have been the gainer of £34 5s., the difference between the prizes paid and amount received from the Company towards that exhibition. But for the two November meetings (four days) the Society paid away £620 3s. 6d., or £445 3s. 6d. more than the amount received from the Aquarium Company. On the occasion of the December Show the Society paid in prizes £4 13s. 6d. more than was received. This refers only to prize money and not to the working expenses.

On the year's working as shown by the balance-sheet, there was a turnover of nearly £1650, while the Aquarium Company is only shown to have contributed £300 towards the work of administering that heavy amount, unless I am allowed to add what I find in the report that they "increased their special donation to the Jubilee fund from £75 to £100."

There is one thing done by the enterprising Company which, to my way of thinking, was not very commendable—namely, that when the Directors of the Aquarium Company discovered that the Society was compelled to give admission tickets in return for subscriptions received towards the special Jubilee fund, they demanded a commission on the amount collected, and £19 13s. 4d. stands in the balance-sheet as having been paid to them as a commission on Jubilee subscriptions. Fellow workers, think of this! Does it not rather take the gilt off the "special donation" referred to?

Three or four hundred pounds may appear a large sum on the face; but when this amount is granted the grantees have no further trouble or toil. They simply pocket the gate money, the amount of which must be very considerable.

As business men it is no doubt the duty of the Directors to earn the best dividends they can, and they very properly (from their point of view) make the best of the N.C.S., but in my opinion, and in the opinion of many others, our National Society should occupy a much higher *status* than that of a feeder, as in this case.

The N.C.S. does the work, pays for all labour, printing, stationary, clerical assistance, and everything else that is necessary for producing and maintaining the show, so that if the Aquarium authorities were to institute for themselves a series of exhibitions as held last year, instead of having to provide the amount quoted from the balance sheet above, they would find that it would cost them four or five times the amount as paid by the Society—viz., £1600.

Greater London contains a larger population than the whole of Scotland, but we read of some 40,000 persons attending the recent Edinburgh exhibition, and of the gate money amounting to £1000. Is the income of the N.C.S. from visitors to its shows increasing proportionately; if not, why not? if it is, where goes the money? After twenty years the Society has a reserve fund of only £101 18s. 2d.

Several other provincial towns take surprisingly large amounts as gate money, and it is not unreasonable to surmise from the crowds who visit the Aquarium on our exhibition days that the Company must realise a very large sum through the kind agency of the N.C.S., and by the efforts of those who toil on behalf of the Chrysanthemum, and who desire to see our "National" Society stand in a free and independent position worthy of its name.

No doubt a good deal might be endured if the Society were granted the convenience and accommodation desired, or even if the Company regarded it as worthy of the first consideration on their exhibition days. Instead of this we have to put up with any part of the building; bad light, no attempt made to separate the public from the judges while the awards are being made, and if refreshments are needed by the numerous members and friends, who are principally gardeners, many of whom have travelled a long distance, no distinction is made, but the fashionable West-End lounge prices are charged to all alike.

Remonstrance appears to be of no avail; as an instance, we were recently deprived of a portion of the ground floor for staging purposes. A protest from the Committee was sent to the Company. The answer that came back may be interpreted thus:—"We have the power to prevent you from using the body of the hall on this occasion, and we do not intend to let you have it for your next exhibition." So verily we are slaves to the Aquarium Company—a fact to which some of the principal officials leading the Society appear to be blind—and not infrequently use their persuasive eloquence in further fettering the Society to its present incongruous abode.—J. W. MOORMAN.

P.S.—Since writing to you on the subject of the N.C.S., the Journal is to hand, bringing a reply from "One of the Executive" to "A. D." I also have been one of the executive for a few years past, and am reluctantly obliged to write in an opposite strain to my colleague, whoever he may be.

He says the "public appreciation" of the November show is "demonstrated" by the thousands who visit the place. Nothing of the kind. It is rather the enthusiasm engendered amongst growers, showing the popularity of the flower, with the chance of meeting old friends. This has more to do with bringing them there than anything else.

His praise of the arrangements being both "desirable and appreciative," and his boldness, not to say audacity, in favourably comparing the show with the large Temple exhibition of the R.H.S., which is held under canvas, is ludicrous, for there can be no proper comparison.

The exhibits of the N.C.S. are from necessity so split up in various parts of the building that a crowd of persons go away without seeing half the show. Great credit is due to the superintendent, Mr. R. Dean, in making the best there is to be made of the space at his disposal, and were it not for his extended practical experience in matters of arrangement, I fear all would be confusion worse confounded.

The same number and quality of blooms staged in a suitable building would not deprive the "popular element" of its "annual display," but enhance its value in preserving the flowers and giving effect a thousandfold.

"One of the Executive," after his attempt in lauding the "advantages" obtained by holding the exhibition at the Royal Aquarium, confesses that "the members of the executive are fully aware of certain disadvantages." There are many disadvantages, and the only prominent so-called "advantage" is the contributions from the Directors in lieu of the gate money, which would otherwise go into the coffers of the Society instead of swelling the dividends of the Company.

As to "labour,' "difficulty," and "anxiety," we have plenty now. The Secretary told us as recently as the annual dinner that the "difficulties," "anxiety," and "amount of labour" were so great, that it became to him a most serious matter.

The printed balance-sheets are the best proof of the heavy expenses now annually incurred. Edinburgh this year realised £1000 for gate money alone on three days only. The Aquarium authorities had the privilege of thirteen days' takings at the doors last year, spread over four separate exhibitions, and yet this is regarded by "One of the Executive" to be to the advantage of the "National."—J. W. M.

THE N.C.S. AND THE ROYAL AQUARIUM.

To state as "A. D." does, that the National Chrysanthemum Society is the slave of the authorities of the Royal Aquarium, we may regard as a figure of speech. He neither knows nor can know anything of the arrangements made between the Society and the Royal Aquarium, and without this knowledge any statement he may make in reference thereto must savour of the romantic. He might just as well state that the Royal Horticultural Society is the slave of the London Scottish Rifle Volunteers or the Temple.

There are always two sides to a bargain of this kind, and the N.C.S. can be safely trusted to look after its own interests, which it does do. The co-operation of the Society with the Royal Aquarium has resulted in the Society prospering beyond the most sanguine expectations of its warmest friends. It is now far away the strongest, most influential and widely known of all the special floricultural societies, and every week witnesses accessions to its members.

It is enabled to hold four highly attractive exhibitions annually; to broaden the area of its practical work, especially in the direction of extending a knowledge of and the culture of the Chrysanthemum; it attracts to the Aquarium yearly thousands of persons to see the Chrysanthemum in its fullest glory and beauty during the last four months of the year; new interests in it are aroused, and new devotees worship at its shrine in consequence; the very centre of London has opportunities for witnessing magnificent displays of the golden flower provided by the Society, without the N.C.S. in any way trenching upon the work done on the circumference by the circle of metropolitan societies affiliated to it; it is enabled to prepare and publish editions of descriptive and classified catalogues, which are widely distributed and accepted as standard and authoritative works of reference in all parts of the world; it is able to pay its prize money promptly and fully and satisfy all demands made upon it; it can extend a helping hand to the many societies affiliated to it in all parts of the country and abroad, and to many who are not in close union with it; it is gradually building up a reserve fund; and all this while maintaining an entirely independent autonomy as the best administered special floricultural society.

The Society is able to do all this because of the co-operation and valuable assistance furnished by the Directors of the Royal Aquarium. I alone perhaps know the full extent of the valuable assistance, directly and indirectly contributed. I unhesitatingly assert that all this is largely due to the fact that the Royal Aquarium is the home of the exhibitions of the N.C.S. The arrangement is mutual, friendly, just, and honourable; and it has existed for a period of twenty-one years.

I have had experience of most of the large flower shows held in London during the past forty years. I know the enormous labour they entail; their overwhelming details; their appalling expenses; the anxieties and uncertainties inevitable to them; their load of responsibilities; and the disheartening dread of failure. I have seen some launched under apparently the most auspicious promise become financial wrecks. On no consideration could I be prevailed upon to assist in carrying out a large flower show in London if I had to bear a share of any financial responsibility. If "A. D." or anyone else could have placed in their hands the details of the actual cost of such an exhibition as that held at the Royal Aquarium on November 9th last, and see that all dependence for any return of the same was on the uncertain takings at the gates, they would then understand why I would decline entering upon any of the risks they appear to desire the N.C.S. should undertake.—RICHARD DEAN, *Secretary, National Chrysanthemum Society.*

[This and Mr. Moorman's letter above are two of the strongest communications from the respective standpoints of the writers which have yet appeared, and the excellent tone, with the convictions pervading them, undoubtedly adds weight to both. Let their supporters follow the examples

set of keeping personalities in the background, and discuss the subject on its merits, then will their letters be inserted. We do not wish to publish anything that will jeopardise personal friendship.]

SEEING that everyone knows who pens the signature "A. D.," just as well as if blazoned in full length, I can easily conceive how the individual who signs himself in last week's issue "One of the Executive" must have chuckled over the way in which he was girding at me, and yet keeping his own anonimity. It is such fun to sit behind a wall and in safety fling stones at known passers-by. However, let it pass, and the writer be as happy as he deserves.

I wrote on the subject of the Chrysanthemum Show and the Aquarium because of, first, what I have seen there, and secondly, what I have read of grand show successes elsewhere. When we read of what is done without the aid of variety shows and other "attractions," I ask, is it not a disgrace to the N.C.S. and London that it should be unable to run its shows in a building where the effect of all the splendid products sent cannot be fully seen and pleasingly enjoyed? Would any other Chrysanthemum society in the kingdom endure all the noise, hubbub, darkness, discord, and inconveniences that the N.C.S. has to endure? Certainly not one. When members of the executive bitterly complain as they have done, no wonder an evident advocate for the R.A. is nasty with me.

Did I feel alone, and write for myself, it would be of no consequence, but the sting of the matter lies in the fact that what I think everybody whose opinion is worth anything thinks the same. Will my critic tell your readers how much (first) the R.A. Directors contribute towards the November show, and then (second) tell them how many thousands during the three days the show is open go to the R.A. to see the Chrysanthemums solely? Is it not under the mark to put the number at from 12,000 to 15,000? And is not that relative to London but a small number compared with the attendance seen at Liverpool, Hull, Birmingham, Edinburgh, and other towns? Without doubt the November show brings some £600 to £800 into the R.A. treasury.

When we see cattle, dog, bicycle, and other specialist shows at the Agricultural Hall crowded and huge successes, why not a great Chrysanthemum show also, where a grand effect could be obtained? There is ample light, no noise; and the show would not be so much divided that half of the visitors never find the major portion of it.—A. D.

IF there are no better arguments to be adduced in favour of the Royal Aquarium as the place for the shows of the N.C.S. than those given in

Photo by Mr. A. Bilcliffe, Redhill.

FIG. 81.—CHRYSANTHEMUM JULIA SCARAMANGA.

the letter of "One of the Executive" (p. 531), then, surely, the verdict must go to "A. D."

"One of the Executive" tells us that "the public like the arrangement of the exhibits." Save upon the principle of the "Three Tailors of Tooley Street," I am at a loss to understand your correspondent's qualification for speaking for the public. My own experience is that the immense majority of people, exhibitors and the general public, strongly condemn an arrangement which deprives the show entirely of all general effect, and consigns the choicest exhibits to positions where want of sufficient light renders it impossible that the judging can take place under conditions fair to the exhibitor. How can "colour" and "freshness" be adequately measured in the dark dens of the Aquarium galleries?

And we have been going from bad to worse. A few years ago a major portion of the exhibition was arranged in the body of the hall, and something of a general effect was thereby secured. Now all this is changed, and permanent shows occupy the space once devoted to the flowers.

There has, in my opinion, been but one argument in favour of the Royal Aquarium, and that has been the difficulty of naming an alternative position, but if things go on in the future as they have recently gone on in the past, even this argument will cease to be sufficient; it will be merged in the general conclusion that if better cannot be done, it will be preferable that there should be no show at all.

On the other aspect of the Aquarium surroundings I will not enlarge. There will always be persons who like what others do not, so it must come back to the old *de gustibus non est disputandum;* but I must protest against any analogy being suggested between the "music and singing" permitted by provincial societies and the "music-hall assistance" furnished by the Royal Aquarium. I thank "A. D." for his "annual growl."—SIGMA.

IT is usual at this time of the year to find "A. D." spoiling paper over the shows of the N.C.S. Of course, they are not pleasing to himself; but all the same, it seems absurd for him and others to rail at the executive for holding the shows in the Aquarium without giving the slightest information or even a suggestion as to where they can be better accommodated. It is easy to grumble, and those who indulge in that ancient exercise should surely try to suggest remedies for what they assail. Do critics like easy ways? No great intellectual effort is displayed in naming such places as Hull, Edinburgh, and Birmingham; but where in London can "A. D." find such buildings available as in the places named?

Turning to "E. D. S.," if he were to obtain information about the financial situation of the N.C.S. he would probably find some reason for cutting up the exhibits, and arranging some on the ground floor and others elsewhere. He evidently does not know the exact position of the Society, but simply follows others in the easy old way of grumbling. As a Chrysanthemum lover he is deserving of attention; but as a helper out of what he conceives to be a wrong position lamentably fails.

We all know how the exhibits were cut up at the last show, and how bad the light was in certain portions of the building; what we want to know is how to remedy existing grievances. Give us some practical suggestions, or sensible criticisms tempered with feasible argument and sound advice; that is surely what most readers look for, not carping reflections, but so far look in vain under the signatures above cited.—AN IMPARTIAL OBSERVER.

[A very close "observer" too in the Chrysanthemum world, but evidently cannot see any way of evading the "grievances" which he admits. Others must try and solve the problem—a task, we suspect, by no means easy of accomplishment. Both sides shall have equal opportunities for fair discussion, devoid of unpleasant personal allusions. These are the greatest of hindrances to the attainment of the legitimate objects that controversalists have in view.]

HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY.

THE Committee of this Society met on 30th ult., and fixed Wednesday and Thursday, November 16th and 17th, as the dates of the 1898 show. It was resolved unanimously to invite Messrs. Geo. Gordon, E. Molyneux, J. W. Moorman, and J. Wright to be the judges. The amount awarded in prizes at the recent show, it was stated, was £34 more than in 1896, and general satisfaction was expressed at the excellence of the exhibits. The Treasurer's statement had not yet been made up, but it was not expected that any profit would be made; the Society, having a good reserve fund, prefers to increase the value of the prizes instead of adding to the funds. About £230 had been awarded in prizes, exclusive of challenge plates, value 40 guineas.

The Society is much handicapped for want of a sufficiently large building in which to hold the show, and in consequence of the dangerously crowded state of the hall in recent years the Committee decided to raise the price of admission on the concluding evening. Notwithstanding this drawback about 9000 persons visited the show, and the receipts were above the average.

YELLOW CHARLES DAVIS.

YOUR correspondent, "R. M." (page 532), states that he has a sport from Charles Davis of a soft yellow colour, and asks if anyone has seen anything similar to it. I have had several yellow Charles Davis this year, but I did not regard them as sports. Several of my gardening friends, on seeing the blooms, exclaimed, "What 'yellow' have you there?" The variety in question frequently comes yellow when the buds are taken too early. If "R. M." had selected a bud from the next growth I fancy there would not have been much yellow about it. I have also had pure white blooms of Viviand Morel.—J. FOLKARD, *Sand Hutton, York.*

IT may interest "R. M." to know that when Charles Davis received its first certificate it was for soft yellow blooms, and not the bronzy buff shade so much appreciated at the present time. It is quite easy to obtain blooms of the colour described by "R. M." of this variety; in fact, he makes known the *modus operandi* when he says the flower appeared on the plant not more than 3 feet high and from the first crown bud. I write this note for the benefit of "R. M.," that he may not be disappointed eventually after taking the trouble to fix the so-called sport and growing the plants afterwards.—E. M.

JULIA SCARAMANGA.

THOUGH this Chrysanthemum was seen once or twice in the season of 1897, it was not until this autumn that it attained to any peculiar prominence. At several shows it has had a place in the stands, and has made itself a very great favourite, eliciting much admiration from competent critics. It was shown at the Drill Hall on November 23rd by Mr. W. Wells, Earlswood, receiving an award of merit, and was also staged by the same grower at the N.C.S. on the 22nd ult., when a first-class certificate was given. By the courtesy of Mr. Wells, who placed a photograph at our disposal, we are able to give an illustration (fig. 81) of the variety, which was raised by Mr. Silsbury as a seedling from Viviand Morel, and is one of the best growers in cultivation. As may be seen, it builds up a fine flower, of which the long, narrow, curling, twisting, and intermingling florets are pale rosy bronze, inclining to terra-cotta in colour. If it maintains its promise it will become an extremely popular variety.

CHRYSANTHEMUMS AT TWERTON-ON-AVON.

AMONG the hosts of Chrysanthemums cultivated there are not many varieties, even at the present day, which suit the grower of cut flowers for market in every respect, and it is especially at Christmas time, when the demand is the greatest and the supply the least satisfactory.

As a rule, in this neighbourhood at least, all the best free-flowering varieties are over, and this year, owing to the continuance of remarkably mild weather, they are earlier than usual; but Mr. M. Coombe, Twerton-on-Avon, Bath, has managed by a little scheming to have a grand lot, which will just be in at the right time, and I have no doubt he will reap a rich harvest. His nursery is considerably elevated, and consequently comparatively cool for the locality. Besides this natural advantage, his houses have their sides and ends made up entirely with moveable boards, so that in a few minutes he can take down or put up a considerable portion of them, according to the state of wind and weather; and as we have had no frosts to hurt anything till a day or two ago the plants have been very much exposed to the elements, both by night and day, nearly all the time. The result is a batch of Niveus, not yet fully expanded, that is worth going some miles to see.

Nothing can beat Niveus for Christmas if you can keep it, and Mr. Coombe has evidently solved the problem. A good few W. H. Lincoln are grown, and a small quantity of Lord Brooke, but Niveus is there in thousands. Another thing I noticed, there is no leaf rust. I had begun to think Niveus and leaf rust were inseparable, but now I know it is not so.

I do not know how it is in other places, but in Bath if you have a dozen bunches to sell nine of them must be white and one or two yellow. Other colours are not wanted in quantity. You may sell an odd bunch of a good bronze, but as a rule you may keep the darker varieties and undecided shades for your own private use.—WM. TAYLOR.

STAGING CHRYSANTHEMUMS AT SHOWS.

"SADOC" (page 532) is quite right in supposing that I had not seen the report of the Edinburgh Show when I penned my previous article on this subject (page 503), but wrong in thinking a perusal of that report would have caused me to hesitate before writing it. I know that in previous years good prizes have been offered at Edinburgh and other places for flowers shown on long stems, and that those classes have been fairly well filled by growers from a distance.

Let me, however, point out that there is a wide difference between giving a very valuable prize in one class for flowers staged with long stems and stipulating that the flowers shown in all classes shall be set up in that way. Provided that sufficiently large prizes can be offered to compensate growers from a distance taking the large amount of extra trouble entailed, they will always be ready to put in an appearance; but few, if any, societies can afford to do this, and I have no hesitation in repeating, that if any society is bold enough to try the experiment, it will have to depend upon local exhibits, except in those classes in which they offer very substantial prizes.

At one important show two or three years ago I counted twenty-five lots of Japanese in one class—that for twenty-four distinct varieties. The first prize was £10. Now let me ask "Sadoc" if he honestly thinks as many fine exhibits would have been set up in that class if the schedule had required the flowers to be shown on long stems, the amount of prize money offered and the number of varieties required being the same? If he can answer yes, then his argument may be a strong one; if he cannot, then it falls to the ground. I confess that I like to see blooms staged with long stems, yet I think the drawbacks to the general adoption of that plan are too great to be overcome under present circumstances, without lowering the high standard of excellence at present maintained at the great shows.—OLD EXHIBITOR.

Naming Chrysanthemums at Shows.

It is time Chrysanthemum societies insisted upon having the names of the blooms printed or written clearly, and placed in such a manner that officials and visitors can see at a glance what the names are intended to represent. Too often the wrong name is placed against certain blooms, whether designedly or not I cannot say, but occasionally I am compelled to act upon the assumption tbat they are so misnamed to be misleading for an obvious purpose.

However, this latter is not the object for which I write this note, as in other ways I can deal witb wilful misrepresentation. Some societies stipulate that the names of cut blooms shall be written on labels supplied by the society. Such a plan renders the naming of the blooms a uniforu arrangement. Too often we see the names scratched on two half sheets of note paper in pencil, and very unintelligible, too, is the writing. These said sheets of paper are laid on the stand, and more often they are found on the floor than anywhere else. When such names are badly written, and only partly written—for instance, Alcester for Lord Alcester—it is most difficult for visitors to copy correctly the names for future guidance in forming a collection, especially if they are purely beginners.

No method of naming cut blooms on stands that I have seen is so good as that adopted by Mr. Fowler, Taunton. He has affixed to the front of his stand an arrangement of wire, which has space for three stout cards, on which the name of each bloom in the row above is plainly printed. Visitors and all concerned can see at a glance what each bloom is, and I have never seen one wrongly named on his stands. Surely what one man can do others migbt copy in some form, even if they do not to the extent of printing the names. Cards with the name plainly written would suffice. Small square envelopes, affixed to the stand by the adhesive flap, answer well, as abundance of space is available on each for the three names.

Committees of all societies, where the exhibitors are lax in naming, would be doing a public good if they strongly notified in their schedule that all blooms must be distinctly named. It is not only a distinct inconvenience to visitors on the show day that bad naming is reprehensible, but there it does not end. Visitors are charmed with certain blooms in a stand, take the naue there given, and order plants from some Chrysanthemum specialist, who naturally sends the variety named. After ten months labour and attention have been expended, the variety turns out to be something else. Of course the vendor is blamed for not sending the variety true to name. Thus wrong naming is a complete nuisance to all concerned. Some exhibitors do not even take the trouble to name their blooms at all. A remedy is easily found for such omissions.—E. M.

Chrysanthemum Notes.

Now that the exhibition season has run its course, growers must needs settle down to the preliminaries of another year—resolutions made respecting future action, selections for various purposes, solicitations for advice from specialists, exchange of cuttings from friends, as well as tbe yearly purchases in up-to-date novelties from the nurseries.

Among the amateur portion of the Journal readers, Mr. Molyneux's always welcome selections of the best exhibition sorts will be anticipated, and on their behalf might I be allowed to ask your able correspondent to give us his notes early, so that growers who rely on the selection so generously given during the past few seasons may be able to complete their list and order their new additions in good time? Mr. Molyneux has already shown by his notes on judging groups and plants that his interest in Chrysanthemums and growers does not abate. I fully endorse his remarks respecting the prominent feature groups convey in the exhibition hall, and agree with him that they add as much, if not more, to the general beauty of a show than all the cut blooms. This is a bold assertion to make before so vast a number of cut-bloom exhibitors; but it is, nevertheless, a fact, for what comparison would there be in an exhibition without groups, and one with the centre or sides of a hall fully occupied? I repeat that grouping, when artistically carried out, is a finer feature, though not so generally popular a one as the cut blooms.

With all the wealth of variety, both in old and new kinds, it seems strange that societies follow so strictly on orthodox lines, giving prizes for mixed collections, varying only in numbers. With such a really first-rate assortment of whites and yellows—in fact these colours are much more numerous than any others—how easy it would be to vary the display by having classes for, say, twelve white, in not less than six distinct sorts, and the same in yellow shades. At provincial shows, no doubt, there is a difficulty in instituting new classes such as this for want of funds, but such is not always the case. At some of the leading shows there are classes for the reflexed section, one that seldom finds good support, and is the least effective of any. Were these displaced by a similar number of yellow or white varieties, without any material difference made in the value of the prizes, a much more interesting contest would result. The classes for six of one sort are useful, but they would, I think, be more so were a larger selection of sorts allowed.

Single varieties obtain scant recognition from exhibitors or societies, and although their numbers are added to yearly by new seedlings, they are not receiving the attention from growers their merits deserve. Tbey find a place in some of the prizewinning groups, and lend a lightness and finish to the front, where in small pots they are so much needed. From among the large numbers of sorts the dainty Miss Rose seems the most popular at present, but even this is spoilt by being grown into large bushes.

Many of the leading varieties appearing on the show board are among the best for decorative purposes. That fine white, Mrs. H. Weeks, has been a particularly prominent one for cutting into sprays. Phœbus, another favourite of the year, too, is equally pleasing in bush form, as is also Golden Gate. In the incurved, Globe d'Or, Major Bonnaffon, and Bonnie Dundee give very fine cutting material. At the present time Cecil Wray, Niveus, Lady Lawrence, Mrs. Bruce Findlay, Florence Davis, and Amos Perry are making a good display. Plants intended for late flower are much influenced by the mild weather, Golden Gem and L. Canning with others being in a very forward state.—W. S., *Wilts.*

[Have our correspondent and Mr. Molyneux been in telepathic communication? When the former was penning his appeal the latter was probably at work on his selections. The first portion of these appears in this issue. Classes for whites, yellows, and crimson, much on the lines suggested in the third paragraph, have been instituted and were at the N.C.S. November show a distinct success; they were also particularly effective at Winchester.]

Treatment of Chrysanthemum Cuttings.

Cultivators differ in their treatment of Chrysanthemum cuttings after insertion. Some follow the generally recognised orthodox method of placing the pots containing the cuttings under hand-lights or in a frame, covering the latter with a light which can be removed entirely or opened to any extent. The same principle is followed when the cutting pots are placed in any portable box and covered with loose panes of glass. Tbe main object in these metbods is to exclude a too free circulation of air, which causes rapid evaporation from the leaves, thus preventing ready rooting. The soil, too, can be kept in a uniform condition of moisture, rendering the possibility of its becoming sour through frequent applications of water less likely to occur. When properly carried out, this is, I think, the best method to follow. It involves daily attention in wiping the glass dry, so that damping may not be caused by the accumulation of moisture upon the glass.

Another method of treatment is sometimes adopted with success. This is to place the cutting pots on the shelf of a greenhouse near the glass. I sbould hesitate to mention this method had I not seen it successfully carried out; but it was not in a large, dry, airy structure. The cuttings were lightly syringed frequently, thus preventing the atmosphere becoming unduly dry, and the leaves sbowing distress by wilting. I have tried rooting cuttings in a vinery, syringing or dewing them over every day; but though I was successful in rooting the majority, it was a rather slow process, and not equal to the more rational way of protection from free evaporation.

Short sturdy cuttings which have attained vigour by exposure to light and air are the most likely to succeed under this method, but weak or sappy cuttings may succumb. In any case there must be greater efforts made by the leaves to supply the needful circulation of sap, so that roots can be formed. Under very favourable conditions the plan is good, and when it can be carried out readily it is worthy of adoption.

Propagation by means of a little bottom heat is favoured by some. It requires considerable attention in preventing the deposition of moisture on the glass of the frame or box to such an extent as to drop into the hearts of the cuttings, causing rapid decay. When the first roots have been formed, too, the growth will rapidly extend and be weakened if air is not freely given.

Whatever method is employed it is essential that the details for carrying it out to the best advantage be studied and acted upon. Cuttings will probably root readily under the full exposure system as tbe sap becomes more active in spring, but as a rule a little confinement, so as to keep the leaves fresh, is the best incentive for quickly establishing the cuttings.—E. D. S.

Chrysanthemum Leaf Rust.

Mr. Briscoe-Ironside's interesting notes on this parasite (page 532) accord with species of Puccinia generally, the infection always ascending, the leaves first attacked not communicating the disease to those below, but above them. The lower leaves, therefore, show the most "rust," because the first and fullest developed, while on the younger leaves the specks are few, or appear so, for a time, being only less advanced. Evidently the first infested leaves were attacked when comparatively young, even the lower being blacked and destroyed before the disease was noticed. This occurs very commonly in the case of all "rusts," not a great number of disease spots appearing on the leaves in the early part of the season, hence some time must elapse before spores can be produced in such numbers as to insure general infestation.

As for the disease emanating from the roots, the idea is not by any means without precedent, for the late Mr. T. A. Knight found Pear leaf rust appear in the first leaves of seedling Pears, the parents of which had been infested, and the Rev. M. J. Berkeley also considered that Wheat might be infected with Uredo linearis by the roots. It may be possible for the pro-mycelium or first growth from the Puccinia or resting spore to enter as the rootstock sucker of the Chrysanthemum, and thus pass in the leaf into the atmosphere, there to develop the pustules, or at least one, and the spores from this seize on the other parts of the leaf and those forming above it. It is more likely, however, that the pro-mycelium produces its spores above the surface of the soil, and these infect the leaves immediately above the earth.

No doubt excessive root moisture would favour infection by inducing a softer condition of the leaf tissues, but as without eggs there are no chickens, so there cannot be any Chrysanthemum leaf rust without the pre-existence of germs. This continuation was first demonstrated or suggested by the eminent Italian naturalist, Spallanzani, in opposition to the absurd doctrine of spontaneous generation, and verified by Professor Tyndall.

The Chrysanthemum leaf rust, however, was not noticed until the spring of this year, and then on cuttings, which goes a long way to verify Mr. Briscoe-Ironside's statement of the disease coming from the soil; but no specimen of these plants was examined, and not until August, 1897, was the disease pronounced decisively in both the Old and New World. Why did not the parasite appear before if it were a widespread species?

Evolution in parasitism certainly attends the development of the "host," or rather over-cultivation. We raise, and to the highest possible degree cultivate, new varieties of particular species of plants—*e.g.*, Potatoes, Chrysanthemums, and parasites, apparently. Whatever in this may be due to cultural errors and mistakes, it is perfectly clear that the only cause of infection can come from some pre-existent germ evolved into form and possessing power capable of contending with the different circumstances, and the only way to grapple successfully with the enemy will consist in cultural selection, and striving for a race affording the largest measure of resistance. This and repression comprise the chief features of evading and preventing the spread of parasites.—G. ABBEY.

SELECT NEW CHRYSANTHEMUMS.

JAPANESE VARIETIES.

FOR the benefit of Journal readers generally, as a reminder of the good things that ought to be added to collections of the "up-to-date" cultivator, but more especially for those who have not the opportunity to judge for themselves, I present my annual list of what I term the sterling varieties of the year.

Having travelled at least 2000 miles during the first three weeks of November in visiting shows in one capacity or another, I have had favourable opportunities to see the new varieties under various conditions. The following notes were taken from personal observation, therefore should they differ somewhat from catalogue descriptions in the matter of colour, detail, and floret formation, it is because the blooms inspected did not come up to the published description of the vendors.

The complaint is fairly general this season that the number of really first-class novelties is fewer than usual. Perhaps this is accounted for by the high standard set up by critics appointed to discriminate upon the merits of the new varieties before they receive the hall mark of excellence. Unfavourable comments are frequently heard from disappointed exhibitors regarding the non-awarding of certificates for blooms thought by themselves deserving of recognition. Responsible members of committees have a public duty to perform, and generally speaking they do it fearlessly. I am distinctly in favour of withholding certificates where varieties are not an improvement upon existing ones.

I think, perhaps, if those responsible were to refuse certificates to so many of what I call mongrel-bred incurved varieties, instead of granting them, they would be upholding a desirable standard in this section. The inclusion of varieties that cannot truthfully be termed incurved is a step in the wrong direction, and one that cannot be the means of upholding a high standard in this section.

As the Japanese varieties are so much more favourably received by the public generally, I will place them first on the list.

Mrs. W. Mease.—When I say that this is a pale primrose sport from the much esteemed Madame Carnot, I need offer no apology for placing it first on the list. Last year, in the hands of Mr. Mease at Downside, it came as a root sport, and this year remained perfectly true. Those who saw the magnificent bloom in this grower's stand at the November show of the N.C.S. will not readily forget it. So good was it that it received the award as the premier Japanese bloom in the show in spite of the dozens of handsome specimens of its parent scattered over the Westminster Aquarium. The bloom in question measured 9 inches wide and 7½ inches deep. The colour is a soft shade of primrose, totally distinct from G. J. Warren, which is really a yellow-flowered variety.

Mary Molyneux.—This is from American seed and was raised by Mr. N. Molyneux, Rookesbury Park, Fareham, in 1896. It is safe to describe this variety as the finest Japanese incurved Chrysanthemum in cultivation. The florets are long, broad, and, what is important, they incurve loosely. The blooms are fully 9 inches in diameter. The colour is unique, a warm rosy peach, suffused with silver. The inside of the florets is flushed purple. As the growth is somewhat tall, and the wood brittle, when grown to produce exhibition blooms each branch must receive a separate stake as support. Almost every shoot produces a full sized bloom, whether the plants are topped or grown on the natural system.

Royal Sovereign.—Also belonging to the incurving section of Japanese, with loose florets, this makes a deep fine bloom. The orange-yellow colour is pleasing and distinct.

Ella Curtis.—The formation of the florets of this reminds one of Boule d'Or. The colour is rich golden yellow, shaded with chestnut and bronze. It is a promising variety.

Robert Powell.—An incurved Japanese, with broad florets. The colour is terra-cotta, shaded with bronze, lined and flushed with purple.

Lady Ridgway.—I became acquainted with this several years since, having received it from the raiser in the Isle of Man. It also belongs to the incurved type. The florets are broad, building up a massive flower, telling well on an exhibition stand when in good condition. The colour is somewhat difficult to describe. The base is amber, with a purple suffusion, each floret tipped with gold when young. The inside of the florets terra-cotta.

Madame Philippe Rivoire.—One may best describe this as a much magnified Souvenir de Petite Amie.

Madame G. Bruant.—Blush white, suffused purple, is the colour of this variety. The florets are of medium width, irregularly incurving. A flower was depicted on page 411 of the *Journal of Horticulture* for October 25th.

Royal Standard.—Perhaps the deepest of the crimson varieties. The florets are broad and flat. A little more depth would make this one of the most striking varieties in cultivation.

Werther.—This is an improvement on Lady Randolph Churchill, not only in colour, but in size.

George Foster.—An English-raised seedling of the incurved Japanese type. It is handsome, though the florets are somewhat irregular. The colour is pure yellow. (See illustration in issue of November 25th, page 507.)

President Nonin.—The colour of this, apricot yellow, should insure it careful attention. The florets have a long base, while the points widen out and incurve loosely.

Admiral Ito.—Very promising is this pure yellow variety. The florets are quite erect, fluted and twisted at the point.

Miss Hunter Little.—The narrow florets, twisted at the points, of this variety forcibly recall Criterion. The rich yellow colour is pleasing.

Lenaivee.—Although granted a first-class certificate by the N.C.S., this is, in my opinion, hardly up to the standard in point of quality. The type of bloom is moderate. An exhibitor would style this variety "too thin." The florets are narrow, incurving loosely. The colour, soft pink or peach, is pleasing.

Mdlle. Laurence Zédé.—This is a closely incurving Japanese with narrow florets. The colour, rosy plum, is distinct.

Surprise.—The carmine crimson colour of the flat florets, with the dwarf habit, should make this a desirable decorative variety.

Lovely.—Coming from America, this is an incurved Japanese variety of the palest yellow. The flower is deep and good.

Mrs. F. A. Bevan.—The colour of this American variety is flesh pink. The florets are of medium width, curling slightly at the tip. It is distinct and good.

Mrs. G. Carpenter.—In formation of floret this resembles Viviand Morel, but it is larger in all respects. The colour, rosy mauve with silver reverse, is distinct.

Master H. Tucker.—Young blooms of this incurve roughly, while later ones reflex. In the latter stage it is perhaps preferable, as the colour is more striking. The inner side of the petals is rich dark red, reverse bronze.

Georgina Pitcher.—This desirable variety has long, drooping, curling and winding florets, lemon in colour.

Mrs. John Ritson.—Viviand Morel is the parent of this variety. The colour is ivory white.

Moor Park.—A seedling from E. Molyneux, raised by Mr. Haggart, this belongs to the incurved section of Japanese. The colour is golden bronze on the reverse, and terra cotta on the inner side.

Madame Louise Remy.—A pure white sport from Mrs. C. H. Payne, and, like its parent, a monster.

The following varieties I noted last year are deserving of extended attention.

Australian Gold.—I have been disappointed with this, having seen only one perfect bloom. It was indeed charming, fully 8 inches in diameter, and 6 inches deep. It made as splendid a specimen of a Japanese Chrysanthemum as anyone could wish to see. The florets were semi-drooping, while the colour was of a pleasing rich golden yellow.

Mrs. H. Weeks.—This has well borne out the high opinion previously formed of it. It builds up a massive bloom of the finest quality

Mrs. J. Lewis.—About the end of October and early in November this has produced some enormous blooms. It is one of the best of white flowering varieties, and being dwarf in growth it is all the more desirable.

Australie.—The colour of this not having been consistent, the variety has been somewhat disappointing.

Mrs. C. Blick.—Instead of the dull white it possessed last year in colour, it is pure white, making up into a full massive bloom admired by all, and has improved on acquaintance.

Modesto.—Perhaps the stock was somewhat weakened by propagation, but certainly this has not maintained its promise. Amongst yellows it is pre-eminent.

Amiral Avellan.—Though unique in colouring, the short florets of this somewhat detract from its appearance. It was largely grown judging from the number of blooms met with at the shows.

Lady Hanham.—This has worthily won its way to the front. The colour, golden rosy cerise, is pleasing. As is well known, it is a sport from Charles Davis, itself a sport from Viviand Morel.

James Bidencope.—With its pleasing colour of rich rosy amaranth with silvery reverse, this makes itself distinctly seen where staged. —EDWIN MOLYNEUX.

(To be continued.)

ROYAL AQUARIUM SHOW.—DECEMBER 7TH AND 8TH.

THE last Show of the year of the National Chrysanthemum Society was held on the above dates. Naturally it was not very large, but quality made up for quantity throughout. As a matter of fact, it was one of the best late exhibitions we have seen. The arrangements, too, were highly creditable, and the plan of turning the visitors out during the judging is most commendable, and should be adopted permanently.

There were four entries in the class for twenty-four Japanese, Mr. W. Messenger, gardener to C. H. Berners, Esq., Woolverstone Park, Ipswich, taking the leading position with a capital stand. The varieties

represented were Madame Carnot, E. D. Smith, Golden Gate, Col. T. C. Bourne, Niveus, Beauty of Castlewood, C. W. Richardson, Graphic, Mutual Friend, Rose Wynne, Silver King, Mdlle. M. A. de Galbert, Miss M. Blenkiron, Simplicity, Etoile de Lyon, G. C. Schwabe, and Ialine. Mr. W. Slogrove, gardener to Mrs. Crawford, Gatton Cottage, Reigate, was a creditable second, and Mr. N. Davis, Framfield, third.

In the class for twelve incurved, Mr. W. Neville, gardener to F. W. Flight, Esq., Twyford, was a very decided first, his blooms being beautifully finished, and of fair average size. The varieties were Ma Perfection, Miss Dorothy Foster, Bonnie Dundee, The Egyptian, Major Bonnaffon, R. C. Kingston, and John Fulford. Mr. T. Robinson, gardener to W. Laurence, Esq., Hollingbourne, Kent, coming second; and Mr. A. Sturt, gardener to N. L. Cohen, Esq., Englefield Green, third. There were four exhibitors in the class, but the competition was not very keen. Messrs. R. Bassil, gardener to D. H. Evans, Esq., Pangbourne; W. Neville, and T. Robinson took the prizes in the order named for six incurved, distinct.

For twelve Japanese, distinct, Mr. W. Messenger went to the front with a very even stand of capital flowers. The varieties were practically the same as in this exhibitor's stand of twenty-four. Mr. R. Kenyon, gardener to A. F. Hills, Esq., Woodford, was second, and Mr. W. Slogrove third. For six Japanese, distinct, Mr. C. Cox, gardener to J. Trotter, Esq., Hertford, was first, Mr. R. Kenyon second, and Mr. A. Sturt third. Mr. F. Bush, gardener to W. T. Lister, Esq., Totteridge, secured the first prize, offered by C. W. Richardson, Esq., for twelve Japanese, distinct, and was the only exhibitor.

Bunches of both large and small flowered single Chrysanthemums were staged in a few classes, and several blooms of very good quality were observed. The prizewinners included Messrs. G. W. Forbes, gardener to Madame Nicols, Surbiton; A. Felgate, gardener to Elizabeth, Duchess of Wellington, Walton-on-Thames; W. C. Pagram, gardener to J. Courtenay, Esq., Weybridge; and A. Felgate, jun., Walton-on-Thames.

Of the four competitors who staged in the class for six bunches of Japanese, distinct varieties, Mr. N. Davis was placed first, Mr. W. Slogrove second, and Mr. R. Bassil third. Mr. W. Howe, gardener to H. Tate, Esq., Streatham, was first for twelve bunches of Japanese with a charming exhibit. The second position was accorded to Mr. N. Davis. The last named was the only exhibitor of twenty-four bunches of Japanese, and was adjudged the premier award.

Mr. A. Newell, gardener to Sir Edwin Saunders, Fairlawn, Wimbledon Common, received the first prize for a basket of autumn berries and foliage with a handsome arrangement. Miss C. B. Cole, Feltham, was second; and Mr. W. Taylor, gardener to C. Bayer, Esq., Forest Hill, third. So strong was this class that extra prizes were awarded to Miss Easterbrook, Fawkham; Mr. J. Mansey, Islington; and Miss R. Debenham, St. Albans. Mr. D. B. Crane, Highgate, was the only exhibitor of one large vase of Chrysanthemums, and took the first prize.

In addition to the classes for Chrysanthemums there were others for Cyclamens, Primulas, table of miscellaneous plants and floral decorations. In each of these there were one or more exhibits, and some fine specimens of culture were noticed here and there, Mr. W. Mease's double Primulas being magnificent.

The miscellaneous exhibits, shown "not for competition," were diversified, numerous, and of very good quality. Mr. W. Wells, Earlswood, had a large bank of Chrysanthemums, in the front of which was an arrangement of cork, with Ferns and water. Messrs. H. Cannell & Sons, Swanley, sent some magnificent vegetables, comprising Onions Cannell's Ailsa Craig, Cranston's Excelsior, and Reading Improved, with Cannell's Defiance Cabbage and splendid White Model Turnip, as well as Zonal Pelargoniums. Mr. J. R. Tranter, Henley-on-Thames, sent a dozen blooms of Chrysanthemum Mrs. J. R. Tranter.

Mr. R. Bassil exhibited a capital collection of salads, such as Lettuces, Tomatoes, Onions, Endive, Radishes, Celery, and others. Mr. W. Taylor sent a grand collection of Grapes, including handsome bunches of Lady Downe's, Muscat of Alexandria, Gros Colman, Alicante, and Trebbiano. Mr. W. J. Godfrey, Exmouth, staged an extensive collection of cut blooms, mainly consisting of varieties suitable for early December and Christmas cutting. Amongst the best may be named Queen of Pinks, Augustus, W. S. Davis, H. W. Reiman, Mrs. H. Robinson, Jeannie Falconer, and Georgina Pitcher.

Mr. W. Robinson sent a good collection of yellow varieties, while Mr. Neville exhibited some charming incurved in variety. Mr. J. R. Chard, Stoke Newington, sent a table of decorations in which Chrysanthemums were most conspicuous. Mr. H. J. Jones, Lewisham, made an imposing display with cut blooms on boards and in vases. Though the flowers were not large a charming effect was secured by careful arrangement. Mr. R. Owen, Maidenhead, was represented by a collection of cut blooms, amongst which were many seedlings of good promise, as well as several of the standard varieties.

LAYERING VINES.

A CORRESPONDENT having sought further information on the layering of Vines as practised by Mr. W. Miller, at Combe Abbey, and especially on the object of covering the layered parts with moss, we have pleasure in supplying it, on the best authority, as follows:—

The first time I adopted this "dodge" was in 1878 under a pressure of circumstances, which I need not here explain. To this end a young cane is grown the previous year. If it is in a vertical position it must be brought down and placed in a true horizontal position prior to layering. When about ready to layer the young shoots will have grown out from the parent cane, say about 6 inches. The pots are filled with soil, and as the rod cannot be buried to any depth in the pot it is necessary to heap some earth over the parent rod, which, of course, will also cover 2 inches or so of the young shoot. This done and a neat stake put to each shoot, a little fresh moss is put over the surface of each pot to prevent the sun and air drying the surface. This practically finishes the operation.

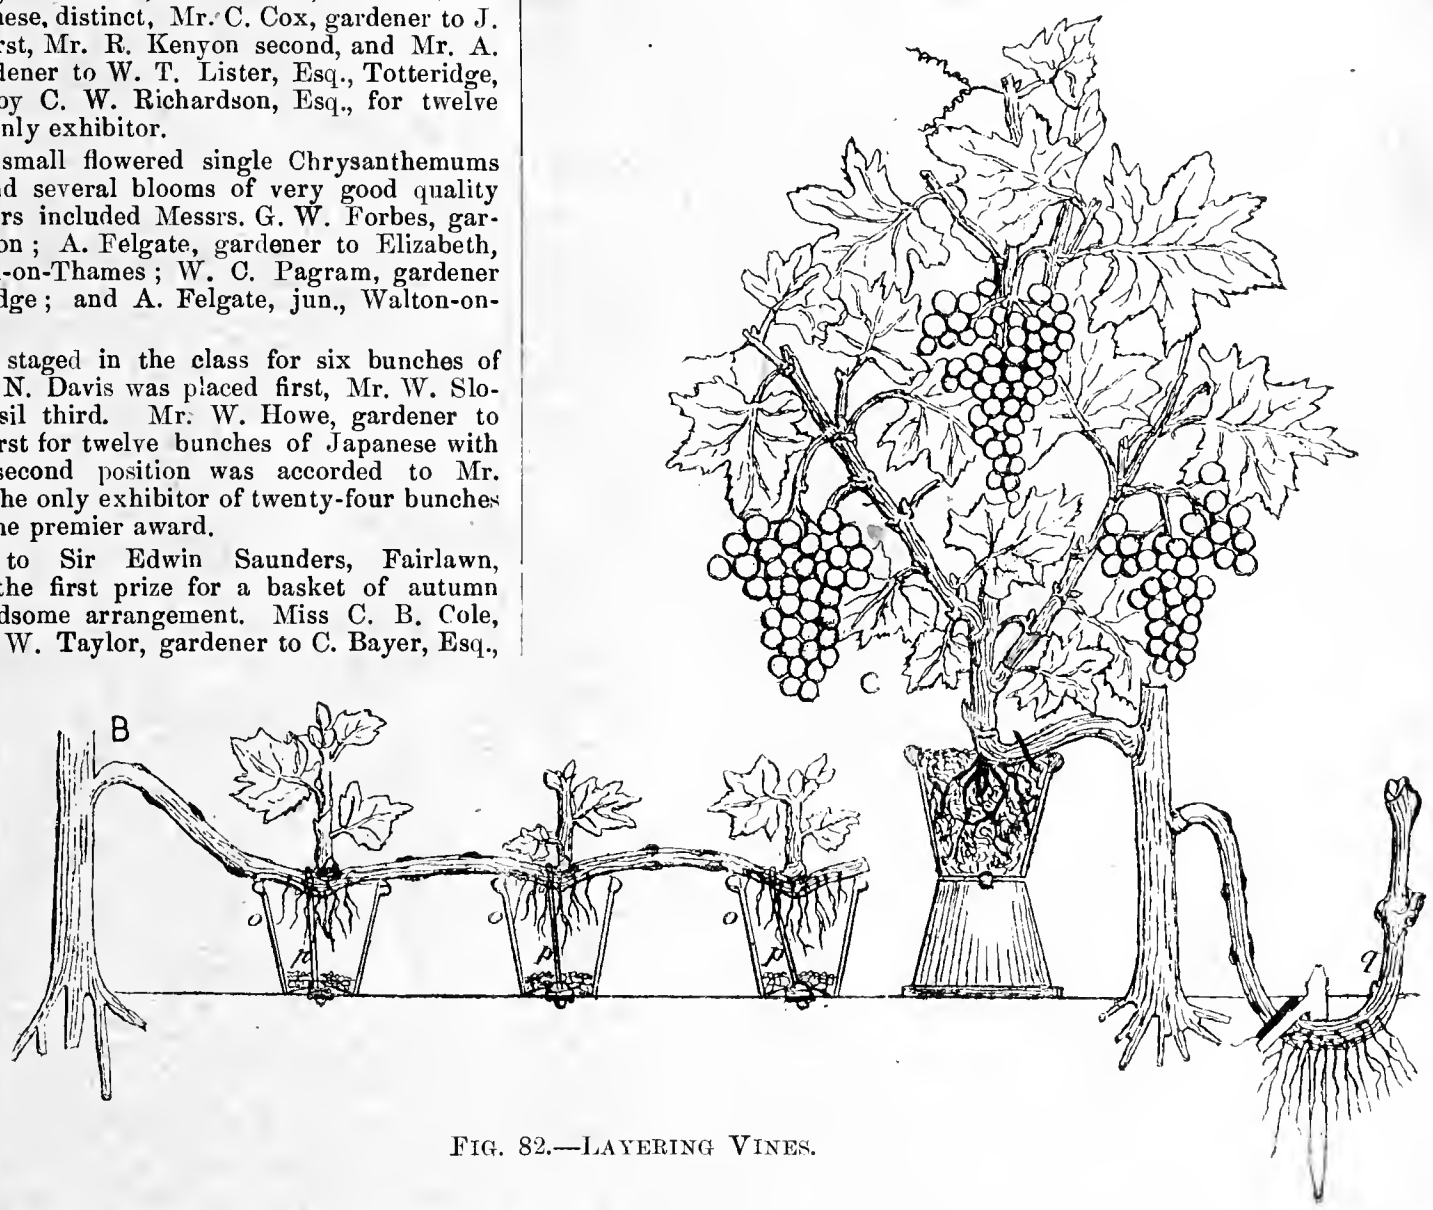

FIG. 82.—LAYERING VINES.

The moss is kept frequently moistened, but the moisture at this stage need only reach so far as the horizontal rod; this induces the emission of young roots, which generally appear in about eight days from the time the layering process has been performed. The roots issue the more freely from the upper side of the stem, and as they descend into the pots more water must be administered, following up with liquid manure as the roots grow stronger.

At this stage the young growths or upright shoots make rapid progress, for now, be it observed, they are fed from two sources—namely, from the parent Vine and from the freshly emitted roots. I cannot describe the growth of these Vines at this stage better than by saying it is "like magic.'

When first I experimented on Vines in this way, nineteen years ago, they were severed from the parent Vine exactly thirty days after the cane was layered. These young Vines were then planted in a well made border, and reached the top of the house the same season.

In the process of raising Vines in this way, it is quite unnecessary to make any incision on the rod with the idea of assisting the emission of roots. This I have tried, but I found it quite unnecessary; the roots seem to please themselves where they come out. I have been pursuing this practice more or less—and always successfully—ever since my first experiment in 1878.

The figure which accompanied Mr. Dunkin's notes in his very interesting description of Combe Abbey Gardens, which appeared in the *Journal of Horticulture*, October 21st (page 393), was a reproduction of the one which accompanied notes by Mr. James Smith, of Mentmore,

who was on a visit here in 1879, and he was the first to give publicity to my idea. Subsequently mention has been made of it approvingly in Barron's "Book of the Vine," and also in Wright's "Fruit Grower's Guide," two gentlemen whose opinions should, like that of John Gilpin, carry weight.—W. MILLER.

[The illustration (fig. 82) from the "Fruit Grower's Guide" clearly depicts Mr. Miller's procedure. It is a comparatively simple matter to get one or more bunches on a Vine by the system recommended.]

SWEET PEAS.

(*Concluded from page* 524.)

I HAVE said nothing about the fragrance of the Sweet Pea. In addition to its beautiful flowers of so many colours, its charming and graceful habit, its delightful perfume can be enjoyed by all, as it is within the reach of high and low. Some say it is honey scented, others the fragrance of the Orange blossom with a dainty touch of the Rose. Whatever its composition, we love it, and look upon it as one of the greatest and most refreshing pleasures of the garden.

The value of Sweet Peas for cut flower arrangements in rooms and for dinner table decorations is excelled by very few. In separate colours they are more striking than in mixture, and when lightly arranged with their own foliage and tendrils cannot fail to please. The fragrance is not too strong in rooms, as is the case with some sweet scented flowers. One of the prettiest dinner table arrangements I ever saw was done with a pink Sweet Pea.

I now come to the varieties. In dealing with them I shall fancy myself back on a July evening among the many little rows of our conveniently arranged collection. Drawn towards them, perhaps, by their more inviting fragrance, from the many other interesting studies of the garden, I soon get absorbed, but not so much so as not to notice and pull out here and there a rogue from where it has no business. We have selfs of all colours, striped of many colours, bicolors and versicolors.

Among the white varieties are Blanche Burpee, Emily Henderson, Queen of England, Mrs. Sankey, and White Eagle. The first named is the best, closely followed by Emily Henderson. In proportion to other colours, the whites should be more largely grown, as there is more demand for them. Those which nearest approach a yellow are Primrose and Mrs. Eckford, very nearly alike. This much-desired colour is more intense in the forward bud than in the expanded flower. It is still many shades removed from what we hope presently to get. Queen Victoria belongs to this section, and has much finer flowers, but is more of a cream colour.

We can revel in crimson and crimson scarlets. In Salopian, Mars, Firefly, Cardinal, and Ignea we have a splendid choice. Salopian is perhaps the best, and the others would not disappoint anyone. In the darker blues Madame Carnot, King of the Blues, Imperial Blue, and Blue King are good. In the more purple shades are Purple Prince, Indigo King, and the deepest of all, Shahzada, which I think dark enough for anybody. Madame Carnot is a favourite blue, but rather weakly in constitution. King of the Blues is also good, but with us a little inclined to sport. Captivation and Duke of Clarence are clear claret coloured; the latter is the darker, and I think the better.

Included in the deep bronzy maroon varieties Boreatton, Stanley, and Monarch are conspicuous. Boreatton is still our favourite, and one of the most distinct of Sweet Peas. The pale blue and kindred shades have many admirers—Countess of Radnor, Celestial, Princess May, Dorothy Tennant, Emily Eckford, New Countess, and Lady Nina Balfour include some very fascinating kinds. Among rose coloured varieties Lady Penzance, Princess Beatrice, Her Majesty, Adonis, Ovid, and Royal Rose are the best.

In pinks we have some really charming shades, Prima Donna, Mrs. Gladstone, Royal Robe, Peach Blossom, and several others. Venus is a very pretty varietyof a salmon buff, and Lady Beaconsfield is somewhat near it. Orange Prince, Meteor, and Countess of Powis are among the most beautiful Sweet Peas. Their orange salmon standards are exquisite, but unfortunately are liable to get touched by the sun. Countess of Powis is, I think, one of the best of the new varieties. These, and the pink colours, light up at night better than any others, and are consequently more effective for dinner-table and other indoor decorations.

The bicolor section must always be grown. The varieties include Duke of York, Blanche Ferry (perhaps the earliest of Sweet Peas), Little Dorrit, Apple Blossom, Empress of India, American Belle, and Painted Lady, which, besides being still a good variety, ought to be respected for its great antiquity. The striped section has become a large one, and is very distinct and popular. Queen of the Isles, Gaiety, Princess of Wales, Senator, Grey Friar, Mrs. Joseph Chamberlain, and Aurora are good. A rather peculiar class is shown in Vesuvius, Carmen Sylva, and Etna. They are variously coloured, shaded, and spotted, rather pretty, but small and little grown.

The various colours found in Sweet Peas run so near and into each other, that it is impossible to draw a line between them. I once tried, by request, to shade down the colours or grade them, beginning with the palest pink, gradually deepening into the darkest crimson, and the same with the lightest to the deepest blue, but it was not altogether a success.

I ought here, I think, to mention my experience of the dwarf Sweet Pea Cupid. It came over the Atlantic with a big reputation and a very florid description, which have not been verified in our climate. No one can say it is not a novelty. To stoop down to a Sweet Pea is not natural, so it may be said to be shorn of its elegance. We tried it in various ways the first season, but have not patronised it since. Then there is a pink Cupid, and if nice coloured varieties can be raised they may become useful.

I will now conclude by giving what I consider the best twelve and the best twenty-four varieties:—

BEST TWELVE VARIETIES.—Blanche Burpee, Salopian, Countess of Powis, Madame Carnot or King of the Blues, Lady Penzance, Prima Donna, Countess of Radnor, Queen of the Isles, Venus, Primrose, Duke of York, Boreatton, Butterfly, and Princess Beatrice. I have named fourteen to the dozen, but this, I think, is sometimes done.

BEST TWENTY-FOUR VARIETIES.—Blanche Burpee, Salopian, Countess of Powis, Madame Carnot or King of the Blues, Lady Penzance, Prima Donna or Mrs. Gladstone, Countess of Radnor, Queen of the Isles, Venus, Duke of York, Boreatton, Butterfly or Lottie Eckford, Apple Blossom Duke of Clarence, Princess Beatrice, Empress of India or Painted Lady, Queen Victoria, Firefly, Dorothy Tennant, Her Majesty, Lady Nina Balfour, Princess of Wales, Primrose and Mrs. Joseph Chamberlain or Aurora.—(*Paper read by* Mr. G. STANTON, *at a meeting of the Reading Gardeners' Association.*)

NOTES FROM DUBLIN.

ST. ANNE'S, CLONTARF.

ON page 206, vol. xxxiii, "Hardy Plantsman's" graphic pen depicts this fine estate as seen on a June day of last year whilst tripping through the Green Isle. Bent thitherwards on a winter's day, with a chill nor'-easter blowing, one feels a little handicapped as the memory of his smooth-flowing descriptive notes recur, for are not things now at their "worst?" Yet, where gardening is carried on in so spirited a manner as here, the "worst" (relative to interviewing Nature and Art on a winter's day) is good, and, somehow, the critical inspection of a fine place at its "best," in all its summer glory, with its *embarras des riches*, is trying to the pen. However, we (there are two of us) set forth from the city following the route taken by our accomplished singer of the praises of hardy plants, and flatter ourselves that no two hardier plantsmen could be found to face a nor'-easter stiff enough to delight a Kingsley.

On the other side of Dublin Bay the mountains loom through the hazy distance stern and white-capped. 'Tis the first touch of winter, and whilst the gale of wind and rain was recently sweeping the country, up there on the hill tops the ice king was silently spreading his mantle. My friend points out the features of what is to me a comparatively new country, though often viewed from afar, and bold and picturesque as is the Hill of Howth as we journey nearer to it, it is a relief to gain the shelter afforded by many Evergreen Oaks inside the demesne.

About the dignity of the stately mansion, or the satisfying *coup d'œil* it affords in its clear, classical outlines, wrought in polished Portland stone, we need not descant, or dwell upon the general features of the grounds immediately surrounding it; all of this has been detailed by the apostle of hardy plant culture previously alluded to. We are glad to escape from the chill nor'-easter and find the warmth of the plant houses decidedly grateful and comforting. On the roof of the first division of one of the several ranges Bomarea Williamsi, not now in bloom, is distinguished looking in its dark green glossy foliage, and fruits (seed pods) hang from it. This range discloses a glorious display of white Cyclamens of the gigantea type, in the culture of which our courteous guide, Mr. Campbell, the head gardener, is *facile princeps*.

Carnations are also, both indoors and outdoors, a feature of these gardens, amongst which Mrs. L. de Rothschild, Princess Alice of Monaco, and Winter Cheer are especial favourites. A seedling of Mr. Campbell's, bearing the name of Countess Ferrars, Lady Ardilaun's sister, is much esteemed for its general good qualities. It is but natural that two old mummers should thoroughly enjoy a superb group of the popular plants just in their prime, occupying the centre of a large house. Needless to say the display is of big blooms, although decorative plants of Pompons and singles adorn the side stages. These are pretty, the former superb; particularly noticeable being H. L. Sunderbruck, Souvenir de Petite Amie, Philadelphia, and Silver King; a few perfect balls of that inimitable incurved, C. H. Curtis, being conspicuous among their Japanese relations.

Entering a lofty house, of dimensions capacious enough to form a winter garden, formerly known as "The Orangery," and lately converted into a tropical house, are to be found some stately plants, and not a few, perhaps, seldom seen outside the Botanic Gardens. Giants of the Fern world are represented by a huge specimen of Angiopteris erecta, but the most satisfying objects, to me at least, are two grand clumps of Papyrus antiquorum. One could hardly overpraise this plant for tropical gardening (under glass) on a large scale. Among the lesser things is a striking South American species of Gloxinia (G. maculata), still bearing some of its quaint, hood-like, blue blossoms. Far up, depending from the roof, the winter sun gives a vivid tone of colour to bright bunches of Bignonia venusta. This plant as seen in bloom is charming. Arundo spicata, a slender Reed, has reached the roof, the chief point of interest about it being how it has managed to do so unsupported. The rich blue blossoms of bushy Dichorisandras have a cheerful influence on a winter's day.

In passing through other plant houses there are many promising collections of good things to come; 400 pots of Freesias are vigorous and sturdy. The choicest of Chinese Primulas in named varieties are coming on, and Mr. Campbell speaks highly of White Lady, a small,

single white, floriferous variety which—which we think somewhat weedy, but do not say so. Poinsettias in their two forms, P. pulcherrima and P. pulcherrima rosea, show well in a good batch of late spring-rooted plants with good heads of bracts over the average size. In the Orchid department Cattleyas and Lælias are clean and healthy, and amongst a good general collection we notice a fourteen-flowered spike of Vanda cœrulea, a variety of Odontoglossum Harryanum in bloom, with good flowers also of Cypripedium Charlesworthi, C. insignis montanum, among the type which are in strong force, C. Lawrenceanum, and a nice lot of Lycaste Skinneri.

A special house has lately been built and devoted to the requirements of the cool Odontoglossums, and here are some large specimens of the remarkable looking Streptocarpus Lelandi flourishing with the rightful occupants. Passing through the vineries, in which some serviceable bunches are still hanging, a large collection of Amaryllis are resting, and among them a number of seedlings of Mr. Campbell's own raising. These were interbred with a distant relative of that family, Griffinia hyacinthina, and he awaits results with some interest. That little gem, Saintpaulia ionantha, has been seen in various houses *en route*, and the results of Mr. Campbell's selection are to be seen in a remarkably fine type of this charming wee flowering plant.

Practically, my notes finish with the fine conservatory attached to the mansion, where a grand pair of Dicksonia antarctica, the pride of the noble master, Lord Ardilaun, are, perhaps, the principal feature, although the graceful pendulous growths of Grevillea Manglesi hanging from a cross rod are much admired. Lady Ardilaun's cultured taste is evident in a device employed on the side stages to minimise the stiffness of pot plants generally used. Pulham's famous rockwork in the grounds, the picturesque treatment of the water scene, the thousands of hardy plants, and the hundreds of others which are naturalised by thousands on the grass or in the glen—all of these have been noticed by my forerunner under more favourable conditions than a chill nor'-easter on a late November day.—K.

PALMS.

I KNOW of nothing so suitable for general decorative purposes as the beautiful and much-enduring Palms, which are coming into more notice every year. There is a peculiar interest about them, arising to a great extent from the associations connected with warm eastern and southern climes, which the very name of Palm seems to call up immediately before our minds. In almost all, or perhaps I might say in all, hot climates Palms of some sort form a conspicuous feature of the prevailing vegetation. In the midst of our own dark cheerless winter, when we are enduring bitter east winds and the early Snowdrops are shivering in the blast, we hear from our consumptive friends in their voluntary exile in Algeria or Mentone of the warm sunshine lighting up Palms and Citrons and Olives, and the ground being already bright with Hepaticas, Cyclamens, and wild Hyacinths, and we seem to be in a warm climate ourselves for a moment when we read of the many charms of the sunny south. Not that I for one would wish to change our English climate, capricious though it may be, for any other which I have met with or read of in other lands. We cannot have the warmth of their delicious winters, but neither have we the intolerable heat of their parching summers. If your business requires you to stay in one place all the year round, depend upon it there are few countries which can equal in climatic advantages our own sea-girt isle.

It is wonderful how long some of those Palms which do not require much heat will stand the dry air and the occasional draughts in drawing-rooms. I had a fine specimen of Phœnix dactylifera in the drawing-room the whole of last winter and far into the late spring, when it was sent out into the vinery to recruit. This plant, with many others, I raised from seed, which makes all the difference in point of interest. If seeds are sown in heat in a comparatively short time fine young plants, capable of bearing a good deal of cold and draught, and making a beautiful ornament for the drawing-room or the study, will be produced. The first two or three leaves are simply broad grass-like fronds, but even these are graceful; the divided fronds, which come afterwards, are really most charming in their effect, either separate or grouped with other Palms.

Seaforthia elegans is one of the most beautiful Palms where there is room for it. It requires space and generous treatment, and then few things can come up to the graceful beauty of a large plant of it with the older fronds bending down in a fine curve and the new fronds pushing straight up the centre. This is the Palm now generally used on Palm Sunday, and tied up in an ornamental fashion by the natives of Madeira and along the coast of the Mediterranean for that purpose. I should like to know how the fronds are made so beautifully white in their dried condition. They are frequently brought home and made use of as a room ornament hung upon the wall. I have tried the Seaforthia out of doors in summer, but it spoils the beauty of the plant, which is nothing once the green symmetry of the whole is injured.

For table decoration it is necessary to have kinds which grow in a smaller way, and of these, so far as my experience goes, Cocos Weddelliana is *facile princeps*. It is a beautiful light feathery-looking Palm with graceful arching fronds, which are minutely divided. It is one of the slow-growing Palms, and therefore it is necessary to be patient with it. But even in its babyhood it is beautiful. It makes an excellent plant for the dinner table whether small or large. In the small state five or six of them in small silver stands look exceedingly well; in a larger state of course they must take a more central position. Their great recommendation is, that in common with the whole tribe they will bear so much knocking about. Cocos Weddelliana is, however, a Palm which likes a warm house. Areca monostachya, or the Cabbage Palm, though not so beautiful as many, is a singular plant; the knotted stem is peculiar, and gives it the character of a small tree. Areca sapida is somewhat tender; its spiral mode of growth is pretty, and well grown it makes a fine specimen. I have found it too delicate to associate with Corypha australis.

It is by no means necessary to have even a cool greenhouse to grow the hardier Palms. With a little care and attention they will be found to accommodate themselves to the sitting-room. Those who have rooms large enough cannot introduce any ornament more graceful than a fine specimen of Latania borboniea or Corypha australis; and those who have less space in their rooms may rejoice in the more upright growth of the beautiful genus Phœnix, which includes several good species. The genus Chamærops is another of the more hardy race. They will stand out of doors well in the west country. It is wonderful how a Palm starts into growth as soon as it is taken out of its pot and put out with a depth of cool damp soil beneath it. I have no doubt with a little wrapping up Palms could be easily kept alive through our mildest winters; but I always think it is a pity to spoil the look of a winter garden for the sake of preserving a specimen which would do much better indoors. A mat against the wall is not so conspicuous, nor does it spoil the general appearance of other things, but even that is bad enough. On the whole, it is better to be satisfied with things which can really bear our climate, though attempts at acclimatisation are always interesting.—P. A.

THE YOUNG GARDENERS' DOMAIN.

PRIMULAS.

THIS genus is a very large one, including some of the most popular florists' flowers—namely, the Auricula, the Polyanthus, and the Primrose. It is of the greenhouse varieties, however, that I intend to write. The chief of these is Primula sinensis, of which the value is so well known to those who have to provide bloom for conservatory and table decorations when the flush of Chrysanthemums is over. At that season there are few plants in bloom, and the cheerful colours of the Primula brighten and lighten the conservatory wonderfully during the dull winter months.

To grow these plants well the seed should be sown at intervals from early in January until April, thereby having a long succession of flowers. Sow the seeds in pans containing light, rich soil, which has been previously damped, cover with a piece of glass, and place on a warm hotbed. When the seedlings are through and large enough prick out into boxes or pans, and when sufficiently rooted place in 2½-inch pots, and arrange them on a shelf near the glass to keep them sturdy. When the pots become full of roots transfer the plants to 5-inch pots, in which size they may flower. If, however, large plants are required, another shift will be found necessary. The best soil will be found in equal parts of fibrous turf and leaf soil, silver sand and charcoal added. Careful watering is necessary, as if the soil becomes in any way sour the plants soon present a sickly appearance.

During the summer months they may be grown in a cold frame, but shading will be necessary on hot days, and premature blooms must be pinched out. The same treatment is also applied in the culture of Primula obconica, a charming free-flowering species, which is also found useful during the winter. If used with the bright scarlet flowers of Raspail "Geranium," or Poinsettias, or flowers of any description used in table decoration, it is very lovely, while for conservatory and house decoration it is one of the best plants that can be grown.—E. J. B.

TOMATO CULTURE.

THE fruit of the Tomato is a universal favourite, and as such is used in many and various ways. Perhaps a few notes on the cultivation of the Tomato may prove interesting to readers of "The Domain." Plants may either be raised from seeds or by cuttings. In the latter case the plants commence fruiting earlier, but the constitution of the plant is not generally so robust as in those raised from seeds.

Seeds should be sown thinly in clean well drained 4 or 5-inch pots in a compost consisting of fine loam and leaf mould in equal proportions, adding coarse silver sand to keep the mixture open. The pots should be filled to within an inch of the top, and when the seeds are sown they must be just covered with a little of the compost. Place the pots in a temperature of 65° by night, and as soon as germination takes place raise the pots to quite near the glass. Seeds to produce plants for early fruiting must be sown at the beginning of December, making successions until about the last week in May.

As soon as the seedlings are large enough to handle, they should be pricked off singly into 3-inch pots, using a compost as before. Stand the pots on a shelf close to the glass in a growing atmosphere, being careful with water, as if given too freely the young plants will damp rapidly. When these pots are filled with roots, transfer to 6-inch, using as a compost fibrous loam, leaf mould, and a little old Mushroom bed refuse. Pot rather firmly, fastening the plant to a neat stick. As growth advances, the plants may be gradually hardened, but at all times it must be the aim of the cultivator to get a dwarf, sturdy growth. Remove all the side growths, leaving the flower spikes as they appear, and not stopping the leader.

Having filled the 6-inch pots with roots, the plants may either be placed in beds or in well-drained 11 or 12-inch pots. The compost for this operation should consist of four parts good loam, one part Mushroom bed refuse, half a part old mortar rubble, with a little soot added. In either case the soil must be made quite firm. Continue to grow as advised for the

6-inch pots, keeping the side growths continually disbudded, unless a space has to be covered.

If planted outside, as soon as danger from frost is over Tomatoes will succeed well, and will amply repay any trouble taken. If possible the plants should be put against walls facing the south. For winter fruiting, to insure a good set, the flowers must be artificially fertilised every day about noon. During the dark days of winter the Tomato will require little water, allowing the pots to ring before giving it, or seeing, by examination, the beds are dry. In the case of manures, I think, were less sheep or cow manure water used, trusting to some well-proved fertiliser, we should hear less of the dreaded disease. In the winter a temperature of from 48° to 53° will suit well, giving air on all favourable occasions. —SEMPER.

RASPBERRIES.

THE Raspberry is one of the commonest and most useful fruits we have, yet I fear it is often given a place in the garden where it can never receive proper attention; indeed, I have seen Raspberries so neglected that it has been difficult to perceive where the original canes were planted. For a good crop of fruit I would recommend the following mode of culture.

Select an open—though not necessarily exposed—piece of ground, and if in nature it be somewhat retentive, so much the better. If possible, trench the site 3 feet deep, adding a liberal quantity of farmyard manure. The best time for planting is the month of September, or as soon as the leaves turn yellow, though it may be done at any time from now until the end of February, provided the weather be open. Choose a good variety, such as Superlative, which has proved in every way an acquisition. It is robust in habit, without throwing up an unusual number of suckers; while the fruit is large, handsome, and freely produced. Plant in rows 5 feet apart, the canes or stools being 2 feet asunder, this will allow room for getting between the rows in inclement weather.

After planting, place iron uprights at equal distances along the rows, and to these attach four stout galvanised wires, the whole when finished being 5 feet high. To these wires tie the canes loosely to allow for a slight sinking of the ground. Some growers cut their young canes down to within a foot of the ground the first year, thus giving the stools time to gain strength and throw up three or four strong canes for next year's fruiting. This is to be recommended when the canes have been planted late, but if planted in September a light crop may safely be taken the first year. After the stools become established give copious waterings with liquid manure, as Raspberries are gross feeders, and soon exhaust the ground in which they are growing.

Remove the bearing wood immediately after fruiting, tying-in the young canes about 6 inches apart along the wires, which will give neatness to the quarter and expose the wood to the elements to get well matured. When the leaves fall, shorten the growths retained to the top wire, removing every one that is not required with a fork. Let this last item be thoroughly well done each year, as it is most important to maintain a neat and presentable appearance, while if allowed to remain the suckers will rob the ground of much useful food.

Hoe the surface lightly, giving a good mulching of decayed manure to remain over the winter. This mulching should be taken off from time to time, and renewed with fresh, as it is advisable not to dig between Raspberries at any time, their rootlets making quite a network immediately below the surface of the soil. In the case of light soils farmyard manure is by far the best to use, it helping to retain moisture. Should the soil, however, be retentive a dressing of fish manure may be used about thrice in the year, from which I have seen excellent results. Raspberries may remain from eight to ten years if properly fed, a new plantation being made in the meantime to take the place of the old.—T. P.

FRUIT FORCING.

Cucumbers.—Foggy, wet, and dull weather, alternating with windy and bright intervals, tax the plants severely, growth being very unsatisfactory. Keep the glass as clean as possible both outside and inside, for every ray of sunlight is of consequence. Use sweet warm soil, and not very wet, for earthing-up the roots, covering them lightly as showing at the sides of the ridges or hillocks. A few sweetened horse droppings with an occasional sprinkling of soot spread on the surface will attract the roots and afford nourishment to the plants when watered. This is preferable to liquid manure, unless the plants are growing in very small beds or confined to boxes or pots; then copious supplies will be necessary. Always apply it weak and tepid, and not too often. Sufficient moisture will be secured by damping the paths and walls in the morning and afternoon of fine days; but avoid an excess, and do not supply water to the roots till the soil is becoming dry, then afford a thorough supply. Look over the plants at least once a week for stopping, removing bad leaves, thinning as required, but neither stopping nor thinning will be much needed; yet these must not be neglected, as crowding is one of the greatest evils in the growth of winter Cucumbers.

Mildew is sometimes troublesome at this time of year. It may be combated by dusting the affected parts with flowers of sulphur, and the atmosphere should be kept drier. A light brushing over the hot-water pipes with a cream of sulphur and skim milk is useful against mildew, red spider, and white fly. Thrips and aphides are best destroyed by fumigation with tobacco paper or vapourisation with nicotine essence. Tobacco powder dusted on green and black fly or aphides destroys them, and fumigation on two or three consecutive evenings eradicates these pests.

Peaches and Nectarines.—*Earliest Forced Trees in Pots.*—To have fruit at the earliest possible time, and without overtaxing the trees by very hard forcing, they should be started without loss of time to ripen the fruit at the end of April. Only the very early varieties will do that, such as Alexander, Waterloo, Early Beatrice, Early Louise, and Early Leopold Peaches; Cardinal, Advance, and Early Rivers Nectarines. These embrace varieties with both large and small flowers, so that there is no difficulty in securing pollen for cross-fertilisation. The trees do admirably in a three-quarters span-roofed house facing south, quarter, half, and full standard trees being grown so as to have the heads near the glass. Tomatoes can be grown against the back wall for an early supply of fruit, and when the Peach and Nectarine trees go outside the house will be at liberty for plants in pots. The trees require the same treatment as trees in borders.

Earliest Forced Planted-out Trees.—Trees started in December, or at an early date in previous years, swell their buds promptly without incitement from artificial heat, but those forced for the first time are slower in starting into flower. To have fruit ripe in May, and the trees being of the second early or midseason varieties and not before early forced, the house must now be started. They must not be hurried, but given time to advance steadily and develop a strong flower, perfect in all its parts. The proper procedure is to admit a little air constantly at the top of the house, and above 50° it should be increased correspondingly with the temperature. Do not allow a decline below 50° in the daytime, sufficient artificial heat being employed for that purpose, and with sun heat an advance may be allowed to 65°, closing for the day before the heat has receded to below 55°. A temperature of 40° to 45° is ample at night, or in mild weather 50°.

When the flowers are advanced so as to show the anthers cease syringing, but afford a moderate amount of air moisture by damping the borders, paths, and walls in the morning and afternoon on fine days. Avoid a close moist atmosphere at any time, especially at night. Examine the inside border, making sure that there is no deficiency of moisture. If necessary afford a thorough supply of water or liquid manure to weakly trees. The surface soil is often deceptive, being kept moist by syringing, therefore supply enough to moisten the soil through to the drainage, for surface moistening does little good. Trees often have weakly blossoms, and fail to set in consequence of water being given to the tops of the trees instead of to their roots. Remember, a sodden soil is just as bad, or worse, than a dry one, therefore guard against extremes either way. If there is a superabundance of blossom buds, remove those on the under side of the trellis or shoots by drawing the hand the reverse way of the growth. This will materially assist the swelling of the remaining buds. If there be any trace of aphides fumigate the house on two or three consecutive evenings Protect the outside border with leaves and a little litter, but not so thick as to heat.

Second Forced House.—If the trees are very early varieties, such as Alexander, Waterloo, Early Beatrice, Early Louise, and Early Leopold Peaches, Cardinal and Advance Nectarines, fruit may be had early in May by starting at the new year; but if the trees are such as Hale's Early, Dr. Hogg, Early Alfred, Stirling Castle, Royal George, Dymond, or Grosse Mignonne Peaches, Early Rivers, Lord Napier, and Stanwick Elruge Nectarines, the fruit will not ripen until May is well advanced or early in June. This must be taken into consideration by growers. In either case the house must be closed at once. Fire heat must only be used to exclude frost, the trees being sprinkled occasionally, or on fine days in the morning and afternoon, allowing time for them to become fairly dry before night. Keeping the trees constantly dripping with moisture, especially at night, enfeebles the blossoms, and is provocative of wood bud rather than of blossom bud development. Do not allow the temperature to exceed 50° in the daytime without full ventilation. Supply water or liquid manure to inside borders, and protect outside with some leaves and a little litter over them.

Succession Houses.—Where the roof-lights are moveable it is much the best plan to remove them, and expose the trees to the elements for the winter, the wood being thoroughly ripe. This is inimical to many insects, especially brown scale, and the trees are insured rest and thorough moistening of the border. Even the latest and unheated houses are best treated in that way, often having the effect of causing trees to retain their buds, which cast them under fixed roofs, and the blossoms are generally finer on trees that are kept constantly evaporating from the young wood through the time they are at rest under fixed roofs, or when they are subjected to alternating rests and excitements where plants are grown in the house. The fogs and damp of winter, with the drenching rains and snow, suit Peaches and Nectarines in well-drained soil, the trees being invigorated and the soil enriched. If the houses have fixed roofs, ventilate to the fullest extent in all but very severe weather. Proceed with the pruning, bringing matters to a close in respect of cleansing the house and trees as soon as possible.

Pines.—*Young Stock.*—Spare no effort to keep growing plants from becoming drawn and weakly, by giving all the light possible, and not pinching for room. Maintain a night temperature of 55° to 60°, which, with 65° in the daytime, will keep all young stock gently growing,

admitting a little air at the top of the house at 65°, leaving it on all day, but do not let the temperature fall below that point, and when the temperature advances to 75° from sun heat, a free circulation of air must be allowed. The bottom heat should be kept steady at 80°. Avoid a damp atmosphere, an occasional damping of the paths will suffice. Water only when the plants become dry, then afford a proper supply of weak liquid manure.

Plants to Ripen the Fruit in May and June.—Where a supply is required at the time named, and plants are not showing fruit, it will be desirable to select from those started in March last, which have completed growth and are now in a state of rest, such as show a stout base—the best indication of starting into fruit when subjected to a higher temperature both at the roots and in the atmosphere. The plants are best placed in a structure to themselves. Where this cannot be afforded they must have a light position in the house where the fruiters are swelling. Maintain a night temperature of 65° in the fruiting department, 5° less in the morning of cold nights, and 70° to 75° by day, but in very severe weather a few degrees lower is preferable to extra sharp firing.

THE KITCHEN GARDEN.

Vacant Ground.—Advantage should be taken of the first hard frost to wheel on to the vacant plots decayed manure, vegetable refuse, leaf soil, old potting soil, mortar rubbish, ashes, sand, or anything that would improve the working and fertility of the soil. This should be done whether it is desirable to dig or trench the ground early in the winter or not, as nothing can be more injurious, to heavy soils especially, than wheeling and trampling on them when they are soft and damp.

Heavy Clayey Soils.—More than ordinary judgment ought to be exercised in the treatment of these. In some few cases digging and roughing up clayey soils early in the winter does not answer well. If after they are pulverised by frost and rain the clayey particles run together like so much birdlime, then digging had better be deferred till a few weeks prior to cropping, or only just long enough for the fining down of the lumps by the action of the weather to take place. In this case wheel on the manure in frosty weather, and cover the heaps with soil. The majority of heavy clayey soils, however, are best dug roughly either before midwinter or soon after. They would be still further improved in fertility and free working by a second digging in February or March, deferring cropping till the drying winds and sunshine, followed by some rain, have effectively broken down the lumps. In this way a good spit of finely divided soil is prepared. Strawy manure is best for heavy land, especially when it is dug in early in the winter. and peat moss litter manure is also suitable if not too freely applied. For ameliorating heavy soils a variety of materials are available and should be employed whenever possible. These include lime rubbish, sand, ashes, peat, leaf soil, and soft ballast, made by burning clayey soil and weeds. These ought to be spread over the surface in the spring, and well mixed with the top soil. Fresh lime should be similarly applied, but if gas lime is used spread this over the ground at the rate of one-half hundredweight to the square rod, and leave it exposed a month or six weeks before forking it in.

Medium and Light Soils.—Medium soils, or those moderately retentive of fertility and moisture, are fairly free working, give the least trouble, and generally prove the most desirable. In some instances these are improved by early digging. For these almost any kind of solid manure is suitable. Light sandy soils are, as a rule, best left alone till near the time for cropping. They are usually hot and dry during the summer, and for this and other reasons ought to be dressed with nearly decayed manure. Decayed garden refuse is also a most suitable manure for light soils, digging in green vegetables finding favour in some districts. Where Turnips, Rape, or Mustard have been sown thickly expressly for digging in no other manure will be required.

Trenching.—Ordinary trenching ought not to be undertaken lightly. If the subsoil is of a clayey, unkindly nature, and has not been previously greatly improved by bastard trenching and the addition of a variety of materials such as previously recommended for the surface of heavy land, then to bring that to the top and to deeply bury the fertile free working top spit is likely to prove a costly blunder. Where this mistake has been made the best way out of the difficulty is to re-trench the ground. By the time this is done the whole depth will become so mixed that it will be found more productive than ever before. Deposited or alluvial soils are frequently of considerable depth, and of much the same character two spits deep as they are on the surface. These may be safely and advantageously trenched every few years.

Bastard Trenching.—This is also known as double digging, and consists of breaking up the ground two spits deep without altering their relative positions. It has the effect of greatly improving the ground, rendering it warmer in the winter and more retentive of moisture in the summer than ordinarily dug ground. Trenching should be done early enough for the ground to have time to settle and solidify somewhat prior to cropping, and no manure need be added to the top spit unless it is very plentiful.

PLANT HOUSES.

Epacris.—Any plants that only made puny growth during the past season and are healthy, as well as those that have not ripened their shoots sufficiently to flower profusely, may be cut well back. If done at once such plants will start early, and invariably make vigorous growth next year. Keep plants subjected to this treatment in the greenhouse, and maintain a cool airy temperature.

Erica hyemalis.—Home-grown plants that are not going to flower profusely may have all the strong shoots cut nearly close back. Any young growths that are not more than 1 or 2 inches in length may be left as they are and allowed to extend. Plants treated in this way last year have flowering shoots upon them nearly 18 inches in length. Purchased plants generally do better the second year than the first after flowering. To flower the plants even satisfactorily the first year they must be potted as soon as they have started into growth.

Erica autumnalis (gracilis).—This is hardly worth retaining after it has flowered once. When grown with hyemalis we have never been very successful with it owing to it being so badly attacked by mildew. It can be grown fairly well, however, if given a place where the atmosphere is dry and abundance of air can be continuously maintained. A close atmosphere even for a few days means partial ruin to the plants. Be careful that none of these plants is allowed to become dry at the roots or it will be ruined.

Azalea indica.—One of the greatest evils these plants have to contend against is keeping them too dry at their roots during the winter months. At no season of their growth should they be allowed to become dry; once this occurs their silk-like roots quickly perish. Plants that are confined for years in their pots usually lose a very large percentage of the foliage owing to inactivity at the roots. Those that are repotted from time to time as they need more root room have darker and bolder foliage, which they retain well throughout the winter. Plants also that are potted in loam, leaf mould and sand, have better foliage, and make more vigorous growth than those potted in peat and sand. Destroy thrips directly these pests are observed. Syringe the plants well at least once a day when the weather is favourable. Complete the tying of the plants as early as possible.

Mignonette.—Plants in 5-inch pots must not be allowed to become crowded; thin them out to five or six in each pot. Keep the plants perfectly cool, and as close to the glass as possible. Do not allow them to suffer by an insufficient supply of water, or their foliage will soon turn brown. Trained plants that have their pots full of roots may have a little artificial manure applied to the surface of the soil at intervals of a fortnight.

Zonal Pelargoniums.—Plants that have been kept as cool as possible may be placed in a temperature of 60°, when they will quickly come into flower. Be careful not to overwater the plants, or they will start into soft growth instead of flowering freely. Damp must be expelled from the house by the admission of air whenever the weather is favourable. At this period of the year the plants do well standing on a moderately dry base with the atmosphere as dry as possible. Not only are the flowers liable to damp, but the foliage as well, if too much moisture is kept about the plants.

Acalyphas.—The leaves are falling from these where they have been kept in the conservatory, and only ordinary temperatures maintained. The plants may be cut back to within 2 inches of the soil, and if placed in a temperature of 60° and kept on the dry side they will soon break into growth. When about 1 inch of growth has been made the plants may be reduced and potted in the same size pots, or if they are only in small pots the drainage can be removed and the plants given a small shift. Cut-back plants with three or four shoots make excellent bushes.

THE BEE-KEEPER.

FOUL BROOD.

BEES are not liable to disease to any serious extent if they are carefully managed, except it be from foul brood. In some districts it is unknown, but in other localities this dread disease has increased rapidly of late years, and is much more prevalent in the South and West of England than in the North. In some country districts, where a quarter of a century ago I could easily have found a hundred colonies of bees, very few now remain, and one may drive for several miles without seeing a stock of bees, whole districts being devastated by this disease.

Foul brood being very contagious, strong measures should be taken to prevent the disease from spreading to healthy colonies, otherwise it will be difficult to eradicate. Unfortunately, if the disease is not suspected it is seldom discovered in its early stages. This was quite excusable when the majority of bees were kept in straw skeps, as it was then almost impossible to discover it except from the smell arising from the putrid mass, or from the weakness of the colonies. When in this condition the disease is in its last stage of development, and may contaminate all the bees within a radius of two miles.

The advent of the moveable frame hive offered facilities for examining the combs without injury or serious disturbance of the bees, but the ease by which the bees could be manipulated under the modern system of bee-keeping had its drawbacks. Hives were constantly opened, irrespective of the weather or outside temperature, the consequence being brood became chilled in the combs, and in too many instances I fear it has been the forerunner of foul brood. Chilled brood is quite different from foul brood; the latter is contagious, the former is not. The larva of chilled brood in the early stages is

grey, becoming nearly black as it decomposes, and if the colony is a strong one the bees will remove the dead larvæ from the cells.

In the early stages of foul brood the larva is white, changing to yellow, afterwards turning to a coffee-coloured brown. In some instances the larva is healthy to all appearance until the cells have been capped over, afterwards succumbing to the disease. When in this condition the cappings become perforated, many of them being slightly indented, and if the capping is removed the disease may be at once detected, owing to the unpleasant smell arising from it, by anyone who has not previously had experience with foul brood. The well-known whiteness of the brood in a healthy stock need never be confounded with either chilled or foul brood.

How Foul Brood is Spread.

One of the chief causes of the spread of foul brood is leaving hives in which the bees have died exposed on the stands, so that the bees from other colonies in the neighbourhood have access to the combs. This they readily take advantage of, and the first bright day that comes commence to clear out the stores that remain in the hive. Thus disease is carried from one to the other, and the whole district soon becomes a hotbed of foul brood. This is no imagination, as I know of several instances where this has happened, though fortunately not in the neighbourhood of my apiary.

Another common mistake is to use hives again without properly disinfecting them, also the combs and frames, which should have been destroyed. This is mismanagement, and may be easily remedied by using a little forethought. Carelessness in this respect may do a great amount of injury to bee-keepers who are unable to help themselves.

But if bee-keepers would only take the matter in hand foul brood and its ravages might soon be stamped out of the country. The chief difficulty is to get those bee-keepers who are either careless or ignorant to realise the harm that is being done in some districts owing to the improper handling of diseased stocks suffering from foul brood.

Treatment of Affected Bees.

It is well to remember that it is not necessary to destroy the hives in which diseased bees have been; but all frames, combs, quilts, and whatever has come in contact with the bees should be committed to the flames. The combs may be melted down for the wax if necessary; but it is better to be on the safe side and destroy all bodily, as the frames can now be bought at such a cheap rate (if they are not made at home) that it is unwise to run any risk.

If the bees are weak and few in number, which they in all probability will be, join several colonies together, and make an artificial swarm of them; place them in a clean straw skep, and allow them to remain for twenty-four hours without food. Many of the diseased bees will then have died, and the remainder may be shaken into another clean skep. The bees must now be fed with syrup made in the usual manner, to which has been added a small quantity of naphthol beta. They may be fed from a bottle feeder placed over the hole on the top of the skep.

Sixty hours afterwards the bees are placed in a frame hive on full sheets of foundation and fed as before, and in all probability the offspring from this colony will show no signs of disease. The reason the bees are not placed in the frame hive directly they are removed from the diseased stock, is owing to the fact that by placing them in quarantine in an empty straw skep they consume all the honey they brought in their sac before using the medicated syrup. The hives must be well washed with boiling water and soap, afterwards painting them inside with pure carbolic acid, working it carefully into all the crevices. The outside of the hive should have a couple of coats of white lead paint. It will then be ready for use again as soon as the smell arising from the use of the carbolic has passed away.

Hives after being treated in this manner should be exposed in the open air for a week or two, as the smell will pass away much more readily if the sun and wind have access to them.—An English Bee-keeper.

TO CORRESPONDENTS

All correspondence relating to editorial matters should, until further notice, be directed to "The Editor," **8, Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Pears on Quince Diseased (*Young Hand*).—Your specimen will be examined and reported on in an early number of the Journal.

Bone Ash as a Manure (*Constant Reader*).—Certainly you may use bone ash as a food of plants. It is a permanent manure—that is, it lasts longer than the year in which it is supplied, and is more calculated to promote a sturdy floriferous or fruitful habit and a fibrous root formation than free growth: but this can be induced by supplying nitrates of potash or soda, or sulphate of ammonia when the plants or trees are starting into growth, about one-fourth of one of these substances being sufficient to mix with the bone ash for plants in pots, also for Vines, Roses, or vegetables. Alone it should only be given at intervals during the growth of plants and crops.

Slugs (*W. S.*).—The specimen is the garden slug, Limax hortensis, said to be a hybrid between the field or milky slug (L. agrestis) and the black slug (L. afer), or, according to some, Arion ater. The hybrid rests on nothing but mere conjecture, and the habit to which yo allude shows you to be a careful observer. The garden slug varies extremely in colour, but this does not imply a hybridism, being sometimes brownish, yellowish, or even greenish, but commonly grey or black, often neither one nor the other, but some of both. It is rather longer than the field slug, and more tapering. The Fern is Asplenium caudatum, a form of A. falcatum.

Soluble Phenol (*Phenyle*).—Mr. Abbey says the article is not soluble phenyle, which is not of the "colour of weak tea," but a thick dark brown or nearly black syrupy liquid, and when placed in water forms a milk-like solution. This is the genuine article, having the formula, C_6H_5, and is a proprietary preparation, known as Little's Soluble Phenyle. The aqueous solution of phenol, with which you appear to have been supplied, has the formula C_6H_5OH, and hence not far removed from carbolic acid, sometimes called "phenol," the crude article in solution not being unlike "weak tea." It has the formula C_6H_6O, and has not been recommended for destroying mites or eelworms at the roots of plants.

Tar and Clay Mixture for Peach Trees (*H. G.*).—The mixture would hardly be suitable for dressing Peach trees infested with brown scale; but we have known it used without doing any injury, and in other cases almost kill the trees, likewise Vines, the gas tar sinking into the bark and causing it to become bark-bound—that is, dried. This may have been due to the mixing and the excessive application. We also have known neat's-foot oil applied pure for killing American blight, and also boiled linseed oil for destroying scale on Apple trees, and both with and without injury to the bark. We have not found paraffin dangerous in any case as a winter dressing at a strength of a wineglassful to a gallon of water; but it will not mix with water, so that some parts get all oil and others all water. If you put eight wineglassfuls of water into a pan and one wineglassful of softsoap, heat to boiling, and then add a wineglassful of paraffin oil immediately on removing from the fire to the solution, and stir briskly, the oil will mix with it and form an emulsion; then you can add boiling water to make up a gallon of solution, and use it at a temperature of 130° to 140° for dressing the trees, applying with a brush, taking care not to dislocate the buds. That is soluble petroleum, easily made and effective against most hybernating pests, whether in the egg or otherwise. Another plan, and certainly as good, if not better, is to dissolve 1 oz. each of caustic soda (98 per cent. purity) and 1 oz. commercial potash or pearlash in a gallon of hot water, and apply with a clean half-worn painter's sash tool carefully, suffice that every part be wetted. If the wood be sappy the mixture must be used weaker, diluting to 1½ gallon. We find water at 140° to 160° kills scale, even the eggs and all hybernating pests; but unless the wood be ripe there is danger of scalding. The trees in every case must be quite dormant.

Blood Manure (*Pytchley*).—The recipe given on page 540 is the correct and original one, and failures occur through the acid being too weak or the blood not kept long enough. It must be rancid and smell strongly, otherwise it will coagulate instead of fall into a powder; indeed, the breaking up by decay is an essential.

Tabernæmontanas (*Novice*).—The varieties of this useful plant produce their double white flowers nearly the whole year round. T. coronaria fl.-pl., is more adapted for spring and early summer flowering, while T. camassa produced its flowers in greatest abundance about August. This has been the character of large plants, and in order, if possible, to induce the first-named variety to flower during the winter cut it hard back, and after it had commenced growth it was pushed on rapidly, until a few weeks ago it was placed under a little cooler treatment. It is again in brisk heat, and has commenced showing a fair number of flower buds. Hard cutting back appears to suit them well, for our plants have made remarkable growth, and we subject them to the cutting-back system annually.

Culture of Tuberoses (*B. J.*).—Many thousands of these plants are grown by placing one medium-sized bulb in a 5-inch pot, and three in 6 or 7-inch pots. Very large bulbs are sometimes placed singly in 6-inch pots. The upper part of the bulbs are above the soil, which is similar to that in which Hyacinths are grown. They are usually buried in cocoa-nut fibre refuse under the stage of a warm greenhouse, where no drip falls from the plants. In that way the soil is kept moist without watering, and roots form freely. When top growth is visible light is essential, a shelf in a warm house being suitable. Many plants are grown on shelves and stages from the first, but great care is needed in watering. When flowers are wanted early the plants are grown in stoves or hothouses, and in this case it is advantageous if the pots can be plunged in a hotbed.

Half a Dozen Good Apples (*A Constant Reader*).—The following are likely to "give good crops, and, if well grown, command a good market price." Dessert: Devonshire Quarrenden, *Worcester Pearmain, *Cox's Orange Pippin, Brownlees' Russet, Gascoyne's Scarlet, and Baumann's Reinette. Kitchen: *Early Transparent, Lord Grosvenor, Cox's Pomona, *New Hawthornden, Bismarck, *Newton Wonder, or *Bramley's Seedling. You did not say whether you wanted dessert or culinary Apples, so we have given both. The list of good varieties is now so extensive that it is extremely difficult to make a small selection without leaving some first-rate varieties out, such as King of the Pippins, Ribston Pippin, and Sturmer Pippin in dessert, Potts' Seedling and Golden Noble in kitchen. If you only require six those marked with an asterisk are good. The trees would come into bearing in the third year, and become profitable more or less right away, attaining the full degree in about a dozen years, if dwarfs on English Paradise stocks, and about six years more on free stocks. Blenheim Pippin would do excellently in Somerset, but would not bear well until fifteen or twenty years old. We recommend standard trees for orchards, and low standards or bushes for plantations.

Names of Fruits.—*Notice.*—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*G. T.*).—1, Closely resembles an unusually well preserved specimen of Marie Louise d'Uccle; 2, The Brougham, raised by the late Mr. T. A. Knight. (*L. P.*).—1, New Hawthornden; 2, Yorkshire Greening; 3, Alfriston; 4, Tower of Glamis; 5, Wellington; 6, Blenheim Pippin. (*W. B.*).—1, Nec Plus Meuris; 2, Jersey Gratioli; 3, Josephine de Malines; 4, Catillac; 5, Chaumontel. (*H. J. L.*).—1, Golden Winter Pearmain; 2, Court Pendu Plât; 3, Calville Rouge d'Hiver; 4, Flower of Kent; 5, Beauty of Hants. (*R. C. S.*).—1, Hollandbury; 2, Gloucestershire Costard; 3, Golden Noble; 4, Queen Caroline; 5, Wellington (Dumelow's Seedling); 6, Cox's Orange Pippin. (*J. E.*).—2, An abnormal specimen, but bearing a general resemblance to Scarlet Leadington; 3, Bramley's Seedling; 4, Mank's Codlin, which frequently keeps until this time; 5, Annie Elizabeth.

Names of Plants.—We only undertake to name *species* of plants, not varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*V. M.*). 1, Kentia Fosteriana; 2, Lomaria gibba; 3, Phœnix reclinata; 4, Nephrolepis davallioides; 5, dead; 6, Onoclea sensibilis. (*W. F. P.*).—1, A poor variety of Odontoglossum crispum; 2, Masdevallia Lindeni; 3, Oncidium Forbesi. (*H. S.*).—1, Adiantum pubescens; 2, Selaginella Martensi; 3, S. cæsia.

A MODEL.

(*Continued from page* 518.)

Although the Mangolds and Carrots would all be drawn off the land, there should be enough metal left to grow a good crop of Barley. The seed must be put in early, say between March 1st and 15th, when the weather is dry. If there is any doubt as to the land being in good enough condition, or if the young Barley shows signs of turning yellow in May, a light dressing of nitrate of soda, say 80 to 100 lbs. per acre, would insure at any rate a crop of straw, and as there would be no young Clover plant to consider a little risk might be run of getting the crop a bit on the heavy side. It is not a bad fault to have too much.

The 7 acres of Turnips and Swedes would be something like equal acreage of each. The Swedes would do with about 10 loads of muck per acre if it could be spared; they would be drilled during fine warm weather between May 21st and June 10th, the land of course being cleaned in autumn if possible, otherwise in spring. Six cwt. of superphosphate with the manure would be enough top-dressing per acre

but without manure 3 cwt. superphosphate, 3 cwt. bonemeal, and half cwt. nitrate of soda ought to grow a good crop. As the Swedes would be drawn off, or at any rate most of them, we should advise the Monarch or Elephant type to be grown, as they would pay for storing by extra weight and quality.

Part of the Turnips would be taken off, part eaten by the ewes, so they had better not be sown until about June 10th. The same hand tillage as for Swedes without the manure or nitrate is advised. Fosterton Hybrid and Green Globe are excellent for growing on most soils. Both Turnips and Swedes to have a good chance must be drilled when the land is warm and dusty, and the soil cannot be too fine.

The next crop—Oats—will not take much labour or management. They had better be drilled as soon as the land is available after March 1st, and the weather suitable. Eight cwt. of basic slag harrowed in with the seed will benefit both this crop and the next; but the Oats would do with 1 cwt. or 1½ cwt. of nitrate of soda after they are well up.

After roots 14 pecks per acre would be as much seed as necessary, and a good drill would put 14 pecks of Oats on; but after seeds many people sow 16 or even 20 pecks. In such a case it is best to drill the seed twice, 10 pecks each way; the seed gets thus well distributed over the ground, a thing we like to see. But we hear someone say, "How about the hoeing?" If the land is in good cultivation and condition none should be required, for weeds ought to be few, and these few should have a very bad time amongst 20 pecks of vigorous Oats.

We have now come to the end of the course, and the next crop would be Potatoes 4 acres, Tares 3 acres, as dealt with before. Of course, circumstances may make alterations in the above treatment advisable. For instance, on very rich land the top-dressings for corn may be almost or quite unnecessary, whilst on very light soils they might with advantage be increased. The differences in soils and locality is so great that what may be right for one field may be wrong on the other side the fence, and we can only dogmatise as to what is generally advisable.

"Practice makes perfect" is a proverb especially applicable to farming, and special knowledge, only to be gained by experience, as to the peculiarities—we might say the eccentricities—of fields is so valuable to the cultivator that that proverb must at once make way, or at least find room, for another—viz., "A rolling stone gathers no moss." This is the chief reason why farmers are loth to leave the old holding for a new one.

Now we come to the live stock, and will take the horses first. Four draught horses would be kept; one pair to work regularly on the land, the other to do carting work for the Hall whilst filling up time on the farm, but always available for the land when urgently required.

Besides these four a brood mare of the Shire breed would be a useful item, and might be a profitable one. If one or two of the other four were mares, and attempts were to be made to breed from one of these in addition to the brood mare, there would be more certainty of a foal each year, and in this connection we would rather look upon the brood mare as an extra farm horse than as a brood mare pure and simple, and work her as the other horses when she is not in foal.

With two breeding mares one foal should at least be produced per annum; thus, with anything like good luck, the stock would be increased and an animal be spared occasionally to be sold at a fair price and help to pay for the horse corn. If a foal were reared every year, a horse should be spared every year, and, allowing for casualties, at any rate four years out of five. It is most profitable for the farmer to sell his horses at six or seven years old. If anything like sound they should realise £50 at that age, if no more. Thus, if the stock be kept up and £40 per annum be realised, there should be good reason for satisfaction.

Horse corn is an important matter. Oats are the natural food, but are rather expensive if cart horses are to be kept on them in good condition. We prefer equal portions of crushed Oats, ground Maize, and bran; 12 lbs. of this mixture per day, given with cut Barley or Oat straw, would make a good ration, but a little hay in the rack as well would be a valuable addition. It is an excellent plan to keep a water-tub always full in the stable. Into this water half a pound of linseed meal a horse per diem should be put, and if it is well stirred up and the animals watered from no other source, there will be little trouble from colic or gripes.

Foals must be well fed when young, particularly for six months after weaning. Crushed Oats and bran are good foods, but not Maize for young animals. Young horses are, except the weather be very severe, better kept out of doors as much as possible; and in snow time they will be as well out during the day, if the paddock be sheltered at all. Food is of more consequence than shelter for young horses, as long as they have a shed to fly to when so inclined. Grass in midwinter must not be counted as food, but the horses fed as if there were none. With good food and plenty of exercise, little anxiety need be felt as regards the weather.

WORK ON THE HOME FARM.

Martinmas, with its feastings and hirings, is a thing of the past. There has been no lack of servants wanting places. Strikes, serious in their own localities, tend to cheapen labour in other districts, but the supply of hands fully qualified by teaching and experience to carry out the work of the farm, never was more scanty.

With the farmer now it is not exactly "Hobson's choice," but a choice amongst a number of more or less useless hands, to find out, if possible, which is of any use at all. Farm servants who will be up to feed the horses at 4 A.M. are almost unattainable, and it looks very much as if the agricultural day would have to be shortened, for horses must have sufficient time to feed properly before going out to a day's work.

The want of proper qualification amongst the younger hands makes one naturally cling longer to the older ones, but we should like to utter a word of warning to farmers employing old or delicate men. Many employers have recently found themselves obliged, when engaging or re-engaging yearly hands, to make an express limitation to the period during which they shall be liable to pay the servant's wages whilst he may be kept by illness from his work.

We have and are ourselves suffering from a lack of caution in not having made any express stipulation. The law binds the employer to pay the wages of the servant during temporary illness, unless there be any over-riding agreement to the contrary; but the term "temporary illness" is a very elastic one, and it is much easier to guard oneself when making the engagement, than to prove permanent incapacity against a man, when it is so much to his interest to show that there is a probability of his coming back to work. Of course, in the case of an old servant, no employer worthy of the name would wish to turn him away if he could possibly see his way otherwise, but we are speaking of ordinary, not exceptional, cases, and having been bitten ourselves, would advise our readers to be shy.

The weather is very stormy and wet, and farm work is at a standstill. Tenting late sown Wheat against the ravages of larks is the serious work of the moment; as Professor Wrightson says, they are worse than the sparrow, as mischievous as mice, and as bold as brass. The worst of it is that these are not the birds which have sung to us during the summer, but are merely immigrants from abroad.

[We suspect if our practical and patriotic correspondent lived in the environs of London he would be an antagonist of Italian "hurdy-gurdies."]

METEOROLOGICAL OBSERVATIONS.

28th.—Damp morning, with rain at 10 a.m. Rain from 4.30 to 6.30 p.m., and almost cloudless after. Gale from about 3 p.m.
29th.—Strong gale early, and windy day; almost cloudless throughout.
30th.—Dull and showery early; fine day, with frequent faint sun and bright sun at times; smart showers in evening.
1st.—Bright sunshine from sunrise till about 3 p.m.; overcast after.
2nd.—A few melting snow crystals early, bright sun from 9 a.m. to noon, but cloudy at times after.
3rd.—Sunny almost all day; bright night.
4th.—Cold with fog all day, thick and dark in morning.
Rainfall still small in amount.—G. J. SYMONS.

Journal of Horticulture.
THURSDAY, DECEMBER 16, 1897.

THE JOURNAL OF HORTICULTURE *can be obtained from the Office*, 171, *Fleet St., London, post free for a Quarter*, 3/9. **Editorial communications must be addressed to 8, Rose Hill Rd., Wandsworth, S.W.**

FRUIT NOTES.

THOSE who have opportunities of judging cannot fail to notice how fruit is appreciated by all classes, and how largely it enters into the diet of those who are able to get a supply of good quality. Of this we have abundant evidence. The dessert is never taken out of our dining room, and still the guests after their preliminary look through the gardens, including the fruit room, often pay a daily visit to it afterwards, and I take it as a healthy sign for gardening that they put a few Apples and Pears in their pockets to eat later on.

For some years past we have been in the habit when large parties were being given for several nights in succession of turning the dining table into a miniature fruit show. The fruit is placed on the cloth (no dishes are used), a bunch of Muscats, 3 lbs. in weight, is placed at each end of the table, the Apples and Pears are shown on Vine leaves, five or six fruits of each, according to their size. The fruits are not crowded together, but space is left for a few small glasses and a little trailing material. Only fruit that is fit for table is used, and all varieties are labelled. Apples have appearance to recommend them if they are not of the Ribston and other well-known varieties. Pears are all in an edible condition. For trailing material a fortnight ago we used Ampelopsis Veitchi. A few pieces were laid on the cloth, and some well coloured sprays hung loosely from the candlesticks. The glasses were filled with canary coloured Chrysanthemums, and a few dark blooms (Wm. Seward) mixed. It may not have looked like a "scene from fairyland," but I know that several of the names were taken down, the position the trees grew in noted with other information, and the varieties have since been added to several collections. This has occurred for several seasons by people coming from different parts of the country and who move in the "highest circles."

We have a good collection of fruit trees, for which I must thank my predecessor. When I took charge (July, 1891) I found, in addition to the older trees, many young bush Apples purchased the previous season, and these had been temporarily planted a few feet apart. In the autumn we trenched a piece of ground and planted the

young trees 6 feet asunder each way, intending to take out every other row and every other tree later on. The piece of ground to be eventually covered is about an acre in extent. Each season since we have cropped with vegetables that are cleared off in time for the land to be trenched in the autumn. Of course, all could not be done the same season. That nearest the trees was worked first, trenching being repeated the three following seasons. This meant work, especially as the pick had to be used to break up all that was turned over after the first 15 inches had been shovelled off. All the ground that is planted has been worked at least 30 inches deep. We take part in whatever work is in hand, and enjoy being in the trench with the men. The pick often changes hands, but the work is done cheerfully. A basket of Apples is brought out when work of this description is going on, and those who use a spade and fork, and use it properly, know how refreshing one or two are occasionally through the day.

Two years since we commenced to thin out the trees, taking the largest first, and this season we have been at them again. The trees vary in size, but are from 10 to 12 feet high, and 6 to 10 feet through. We prune according to the strength of the growths. The stronger they are the longer they are left, and the weaker they are the harder they are cut. The strong shoots are left from 12 to 18 inches, and the weak from 6 to 9 inches. Our object is to have trees with branches strong enough to support the fruit. Since the trees were first planted they have given a full crop of fruit for their size, many trees requiring thinning, and this we account for by the condition of the land, for the depth of soil not only supports the present season's crop, but is able to retain sufficient moisture to feed or plump up the buds for the succeeding crop.

The blossom on our trees seems to stand a little frost, and the fruit drying winds; and whether this is the result of the liberal way we have treated them at the roots—for we used manure freely in breaking up the bottom soil—we cannot tell, but it seems to us that fruit trees want support to counteract the sun and drying winds in the spring if blossom and fruit are to hold on. We are supported in this view, for since we took some of the heavy soil from round our older trees, filling up with soil from the vegetable quarter mixed with charred refuse and mortar rubble, we have had no cause to lament an unfruitful season.

Four years ago we started to put a few on the market. They were only cwts., but they brought 16s. 8d. per cwt. The following season we sent them to a midland town (buyer paying carriage) at 14s. per cwt. dessert, 11s. culinary. Last year in our local market we received 8s. 4d. per cwt. This year we shall have a few cwts. to dispose of. We have only sold a few early Apples up to the present at 2d. per lb. Last week we were told if we kept them a little longer they would give 16s. 8d. per cwt.

We are convinced that fruit can be grown as well and profitably in Shropshire as in other counties which are supposed to be more favourable to fruit-growing. A few essential conditions are necessary—1, That the land be well drained, or where surface water does not hang about, this means fog, and fog means frost late in the spring and early in the autumn when there is none on higher and drained ground. 2, Shelter from rough winds, which usually come from the S.W. The earliest varieties should be planted in the most exposed places, as the fruit from these trees would probably be gathered before the gales which usually sweep over us in September. It is these that do so much damage to our late and most valuable crops of Apples and Pears. 3, Sufficient depth of soil for the trees to make continuous progress after it has settled down. Two feet is not too much for trees from which profitable crops are expected for a number of years.

To plant trees in 18 inches of comparatively loose soil, leaving the subsoil as hard as a turnpike road, must eventually lead to failure. Planting closely together at first has much to recommend it. Young trees have a tendency to make strong growth, which is checked by lifting. The strong roots are made fibrous, and other roots induced to multiply. The strong shoots then become studded with fruit buds, advantages from which the trees ever derive benefit.

Our collection was formed with a view to exhibition, and is composed of the best varieties for that purpose. We are satisfied with nearly all the sorts, very few but which give us a good crop. We notice that there is always a demand in our market for early Apples, Gladstone, Irish Peach, Lady Sudeley, Beauty of Bath, and September Beauty selling well. In the late autumn our market is glutted with windfalls and other Apples of poor quality, and those who have good samples find it advantageous to store until near Christmas.

A rack has been fitted in one of our rooms that was formerly used for other purposes. Two large windows face the south, and the sun shining on these raises the temperature of the room. This is detrimental to the late keeping of the fruit, but by careful handling and fitting the windows with straw-covered frames, we keep a supply until April. The room was heated by a gas stove, which two years since had to be removed. We have sometimes thought too much heat found its way into rooms where fruit was stored, and have been surprised during a severe frost to find how little the temperature of the room varied.

The space between the fruit trees that have been thinned is cropped with Broccoli, not too near the trees. The plants are dropped in holes made with an iron bar. The ground has settled down and become firm by treading, and this is the only place we have found where our Broccoli crop can be depended on to come through the winter with any degree of safety.—S. B. O.

[Our correspondent has favoured us with a small sample of fruits. One of the Apples measures 14 inches in circumference, and all are admirably grown.]

"FAIR DEVON."

"WEATHER," said a Devonian gentleman, "Oh! yes, we have some variation in the weather. For instance, we have the 'dry drizzle' and the 'wet drizzle,' as we say in Devonshire." "Then what do you call this?" I remarked, the aspect of the country from the railway carriage windows reminding one of the West of Scotland, dense mists and lowering clouds partly shrouding the distant hills, while a steady downfall of rain was of ominous portent to an autumn traveller. "This," answered my companion, with a glance which seemed to combine pity and grim delight, "this is only the dry drizzle, we shall get some rain later on." Such was my introduction to one of the fairest counties of England, and though I knew the rainfall was much above the average, yet I had not realised its full meaning. A few hours spent in travelling through the rich valleys, and amongst its verdure-clad hills, did more to show how greatly the climate and productions of a district depend upon its rainfall than a year of reading and theorising could have done.

So assured are the Devonians they have an exceptionally wet county that they have generally adopted a kind of parodied meteorological forecast, which runs as follows:—

"The west wind always brings wet weather,
The east wind wet and cold together.
The south wind surely brings us rain,
The north wind blows it back again."

They even carry their weather jokes farther than this, as the lines appended set forth:—

"If the sun in red should set,
The next day surely will be wet.
If the sun should set in gray,
The next will be a rainy day."

Though it is not quite so bad as the natives would have us believe, Devonshire is undoubtedly a moist portion of our island, as an examination of the returns given in Mr. G. J. Symons' "British Rainfall" will prove; but the same tables also show how great a range of variation there is in the county. Taking the four past years, we find that in 1893 the lowest amount registered was at Teignmouth, 23·79 inches; the highest at Princetown (Dartmoor), 67 55 inches. In 1894 the lowest was 34·78 inches at Exeter, the highest being 90·65 inches at Princetown; but at three places in that year over 70 inches were recorded, and at ten places over 60 inches. In 1895 the lowest was 30·05 inches at Budleigh-Salterton, and the highest 74 65 inches at Princetown; while in 1896 Exeter had again the lowest in the county—namely, 22·43 inches, an exceptionally low record; Princetown still being the highest with 63·15 inches. A study of the rainfall of Devonshire is extremely interesting, as it serves to illustrate some of the phenomena connected with great differences in climate and vegetation in other portions of Britain and the world. Where there are mountain ranges to intercept the moisture-laden currents of air, as in the Himalayas of India and the Andes of South America, the rainfall (and consequently climate, as it affects vegetation)

varies greatly, according as they are opposed to the prevalent winds or not, from 200 to 600 inches per annum down to 22 inches, or less. The cold heights of Dartmoor, some 1400 to 2000 feet above sea level, serve in a similar though minor degree to condense the moisture from the warm winds blowing off the Atlantic, and thus we get the extremes here noted.

The horticultural importance of the annual rainfall in any district is very great; in fact the two points which most closely concern the gardener in meteorological observations are the rainfall and the amount of sunshine, for upon these he is dependent to a very great extent for his success with outdoor productions. In the county under notice it is fortunate in one respect that a good portion of the soil is porous and naturally drained, for were it generally heavy it is difficult to know what the result would be, as many find 25 inches of rain on a heavy soil more than they like if it be not equally distributed over the year. At the same time such an amount of rain passing quickly through the soil must wash out (particularly in winter) a large quantity of soluble salts of importance to vegetation. The experiments at Rothamsted, in Hertfordshire, where the rainfall is not above the average, have proved what an enormous waste there is constantly taking place in this way, and the greater the rainfall the greater the loss. There is some compensation no doubt in the fact that the rain itself also brings certain fertilising agents to the soil, and to this must be partly attributed the vigorous growth of plants observable in the moist districts of our islands, notably in Ireland and the West of Scotland. Beyond this in rocky districts heavy rains hasten the decomposition of the stone, and thus help to keep up the supply of substances available for plants.

Upon the development of many trees an abundant rainfall has a most marked effect, especially when it is combined with a mild climate; thus it is that Devonshire is famed for its collections of handsome trees, particularly Conifers and evergreens, of which Bicton and Endsleigh possess some magnificent specimens. The county has also been famed for its orchards and Apples, and even now we find the official statistics giving the extent occupied with fruit trees at over 26,000 acres, thus sharing with Somersetshire, Herefordshire, and Kent the largest acreage in Great Britain devoted to fruit. But the "fame" which attached to the Devon orchards has been allowed to decay with the trees, of which thousands can now be seen in a condition fitting them more for consumption as fuel than for any other purpose. It is true there are bright spots where able cultivators are demonstrating what skill can accomplish when aided by advantages of soil and climate; but these constitute a very small proportion of the 26,000 acres.

It is contended by some that the climate is too moist for successful Apple culture, and the lichen-loaded branches of the old trees are pointed to as examples, but this does not afford the required explanation. A long period of general neglect is the undoubted cause of most of the bad results too plainly visible in every direction, and in conjunction with this must be taken the fact that almost all the old orchards are in grass, a condition which in such a wet district cannot be otherwise than unfavourable. The adverse influence of grass growing over the roots of young Apple trees has been fully demonstrated at the Woburn experimental fruit farm, as can be seen from the illustrations and description in the report for 1897 by the Duke of Bedford and Spencer Pickering, F.R.S. That this influence is exerted to the injury of older trees can also be proved by a comparison between orchards in the same district on grass and cultivated land. In the course of my travels I have seen such differences strongly marked in the conditions of the trees; indeed I have observed differences in favour of those orchards where the grass was kept close grazed as compared with others where the grass was allowed to become long and rank. It seems to me that the explanation of the unsatisfactory state of many orchards in grass, apart from the root competition, is to be found in the fact that the evaporation is so much greater from grass than from soil, and much of this moisture is condensed upon the stems and branches. At one of the North American experimental stations, the results of five years' observations showed that from turf 85 per cent. of the average annual rainfall was evaporated, from bare and undisturbed soil 70·7 per cent. evaporated, and from bare, but cultivated soil, the evaporation only amounted to 63·9 per cent. of the rainfall.

The effects of such a large evaporation on grass land must be proportionately increased where the rainfall is as heavy as it is in Devonshire, and it is not difficult to understand why lichens and mosses flourish on the stems of the trees where they are so abundantly and constantly supplied with moisture from above and below, no effort being made to keep the trees clean. With a cultivated, clean, well-drained soil around the trees a fairly heavy rainfall is not adverse to the Apple; indeed it is favourable to the development of all the large fruits and the varieties for cooking. Nor is it opposed to the production of colour and flavour, as might be supposed. I have had Apples in the wet districts of the United Kingdom, the West of Scotland, the South of Ireland, the West and South-West of England, equal in most respects, and superior in some, to examples of the same varieties from the drier eastern or midland regions. Though familiar with the eastern counties from Essex up to Northumberland, where the rainfall may average from 25 to 30 inches per annum, I do not remember remarking that the flavour of the choicer Apples is superior to that of the same varieties in the wetter counties; in fact, I am inclined to think that, other conditions being favourable, the Apple rather delights in an abundant rainfall, but it stands in the greater need of the cultivation which is far too frequently denied to it.—VIATOR.

NUT GROWING AND PRUNING.

(*Continued from page* 546.)

Now let us pass on to the pruning required during the following winter. The leading shoots will then need shortening to various lengths, according to their strength. Strong ones may be shortened one third of their length, those moderately strong one-half, and weak shoots ought to have two-thirds cut away, so as to cause them to break stronger the following year. In each instance the bud to which the shoot is shortened must be an outward one; the young shoot produced from it will then grow from instead of towards the centre of the tree. It is in this way that basin-shaped trees with open centres are formed. It is also important to remember that the terminal bud left should be a wood bud. This shortening of terminal shoots must go on in the same way each year, to cause spurs to be produced evenly throughout the entire length of the main branches, until the trees have reached the desired height, from 5 to 6 feet, then all leading growths ought to be cut back to two eyes each year. It is an easy matter with well-managed trees to keep them near the above height, as when necessary some of the old wood can be cut away back to a well-placed spur. This kind of pruning may be continued for fifty or 100 years, and the trees still remain well furnished with bearing wood from top to bottom.

Having now dealt with leading shoots, we will consider the treatment necessary for side growths, a matter of vital importance, because it is to such that we must look for the annual crop. The distinction between male and female blossoms must now be noted. The male is the well-known catkin, such as the common Hazel produces freely, the female is like a small pinkish coloured brush. The buds which produce these minute flowers can generally be distinguished from wood buds by reason of their larger size and plump appearance, as in the case of other fruit trees, but they do not flower till February, and as it is necessary to retain as many catkins as possible to insure fertilisation, pruning should be delayed till the end of February or March. In warm, still weather, it is a good plan to tap the branches to disperse the pollen the catkins carry. When such are not freely produced branches of the wild Hazel may with advantage be placed upon the upper parts of the cultivated trees.

Although the above may seem a somewhat lengthy introduction to the real work of pruning, it is nevertheless of importance that the points enumerated be fully understood, hence my excuse for indulging in a certain amount of perambulation. Being armed with a sharp knife and a short saw, the pruner must go over every main branch carefully. In a young and vigorous tree strong side shoots will be found throughout the entire length; some of these must be cut clean away where they appear in the least crowded, the others shortened to two or three buds. The basal buds will usually be wood buds, and often the second or third flower buds, with perhaps a catkin depending from the bud above. In such a case the extra bud should be left for a time to be cut away after the whole of the fruit is set. Near the tops of the branches catkins are produced the most freely, and the shoots may be left a little closer together there; still the aim of the pruner should be to have male flowers situated as evenly as possible over the whole surface of the tree. From the base of these closely pruned side shoots small twigs will be sent out the following year and it is from them that the principal portion of the crop is obtained If too numerous to admit of a free circulation of air some of these should be removed in July, very strong ones stopped or entirely removed.

After the side shoots have been pruned in closely for some years they begin to show signs of age; some of them should therefore be shortened each year, cutting them back to a young shoot or wood bud near to the main branch. It is by constant attention to this matter that the trees are kept well furnished with fruitful wood throughout their entire length. Sometimes a shoot carrying a large cluster of catkins may be left from 6 to 8 inches in length, as it is easy to remove it the following season, unless it happen to be then carrying several good bearing shoots.

Numbers of strong shoots are always produeed in the eentre of Nut trees; many of these should be removed in July or August. In Kent they are ealled wands, and are used for packing fruit. Fairly strong shoots will also appear in various parts of the tree; the points of these ought to be twisted off in July. This helps to equalise the sap, and plump up basal buds. In Nut growing a good deal of trouble is eaused by suckers whieh spring from the roots near the stem. These should be hoed off as they appear, but a more radical operation is neeessary to keep them thoroughly in eheek. The plan usually adopted is, in the autumn to remove the surfaee soil for a distance of 2 feet around the tree stem, pull up every sueker to be found, and if the tree is old lay on a eoating of manure, and eover with soil from the open spaees.

The ground between Nut trees should be forked over during autumn or early winter, but not deeply, only disturbing it to a sufficient depth to bury weeds, leaves, or any manure that may be applied. As the pruning—for reasons above given—is deferred till spring, this digging with many eultivators preeedes it. Shoddy and ehopped rags are often used as a manure for Nuts; but burnt refuse or farmyard manure is, of course, also suitable for the purpose—the latter in partieular where the soil is poor and shallow.

VARIETIES.

Kentish Cob produees the largest Nuts, and is the surest cropper. Red Filbert, White Filbert, True Kentish, and Duke of Edinbugrh are good flavoured Nuts, but somewhat tender when planted in exposed plaees. Cosford and Pearson's Prolific are sometimes planted at intervals amongst others, beeause they produce a large number of eatkins.—KENTISH MAN.

REST IN PLANT LIFE.

(*Concluded from page* 519.)

ALTHOUGH, generally speaking, the winter season is one of rest in the vegetable kingdom, we are aware that there is a great deal of unseen aetivity amongst a thousand things in their dark eold bed. Many kinds of bulbs, having enjoyed a good siesta after their spring or early summer labours, are awakening into life, and their feeders are ramifying under what is to them congenial eonditions. A number of the ehoieer varieties of these plants are doubtless benefited by annual lifting, this giving to them a more perfect rest and ripening than our ehangeable elimate often affords, besides the benefits conferred by replanting in fresh soil. A little attention in this direetion will often prevent disappointment with some at least of those bulbous plants which, being natives of a more pronouneed elimate than ours, seem unable to adapt themselves to the ehange without this annual aid.

Undue delay in planting is, however, dangerous, and many of the troubles experienced by cultivators of bulbs are partly attributable to this eause. Not wholly so is obvious, for some of the evils arise from an imperfect method of storage, in whieh unnatural exposure to light, to moisture, to paeking in bulk, possibly in a medium eonducive to heating—all favouring excitement, whieh is inimieal to the quiet eonditions of rest. In any ease the greatest care is unable to prolong the resting period beyond certain limits, for the ealls of Nature are distinetly heard and responded to by the subjeet, hei ee we may often see at the potting of Dutch bulbs when too long deferred, Hyaeinths and Tulips particularly, that growth has eommenced, and eommeneed at the wrong end; and it is not seldom the case when this oeeurs to find these misdireeted efforts continued, with little or no attempt at root action to support the embryo flower and foliage, which either perish or are impoverished by inanition. One thing may be remarked by the way, and that is—the eoal ashes usually employed as a medium for plunging newly potted bulbs is, I believe, the worst material that can be used for the purpose, so far at least as the covering portion is concerned. Any loose friable soil is infinitely preferable, and partly deeayed leaves, if free from slugs, ean hardly be excelled.

With all subjeets of the vegetable kingdom within the confines of our own insular experience frost alone is the agent whereby vitality is completely arrested, and with many things this appears to be distinctly advantageous. Where the elimatie influenees are totally at variance with our own, and the dry and rainy seasons eontrol the rest and growth of plants, similar results are obtained from a widely different cause. That there are apparently some exeeptions to the universal law of rest may to some extent be admitted, in considering the extraordinary and exeessive development of vegetation operating in eertain tropical regions—that of Sierra Leone, for instanee. Nature there appears to allow her subjects little or no rest, unless the sleep of plants, previously alluded to, is the *solatium dulce*. However that may be, the bulk of vegetation, where heat and moisture are so excessive and continuous, is of no less rapid growth than of quiek decay, and in the eontinual building up and pulling down of the same organic material seience would probably allow what ordinary observation might be loth to acknowledge.

During the present abnormal season, in which little or no cheek has been given to the growth of lesser things, we may traee the eause of some trouble whieh ensues in the spring, if not before. For example, amongst those two important members of the Brassica family, Cabbage and Broeeoli, destined for spring use, many vagaries are noticeable, and even the most reliable varieties distributed to growers by firms of high repute, are not regarded as Cæsar's wife, above suspieion. Even by some thoroughly eompetent market growers due allowanee is not always made for this abnormal elimatic influenee, and a case in point eame under notiee some few years since, where ten acres of Ellam's Early Spring Cabbage behaved so badly that complications ensued between seedsman and grower. This had, at least, one good result, leading, as it did, to a rather rigid investigation over a given loeal area, showing indubitably that the seed was blameless. It is, doubtless, a far cry from Crotons (previously mentioned in relation to this subjeet) and Cabbages, but eaeh are equally important, and equally benefited, too, in degree, by rest. The exeitement so mueh in evidenee at the present time amongst our winter green stuff presages from that quarter troubles to come.

Comparatively high temperature, with exeessive moisture, is not, in spite of some immediate advantages to our farming friends in the way of herbage the eattle are yet able to crop, an unmixed blessing. The proeess is exhausting. We are, doubtless, touching upon evils it were better, perhaps, to avoid where no remedies are apparent; yet it is pleasant to note, amongst the observations of a rural life, the anxiety evideneed by a few of our high-class farmers to keep their land well drained, and so return the superfluous water as quiekly as may be to the sea. It is at present, in fact, a daily operation on one farm of some 200 aeres at hand, where my neighbour not only sends his man round daily to see there is no obstruetion to the drain outlets or in the ditehes, which are also annually eleaned up, but keeps an eye upon it himself to see that it is done. Waterlogged land is eold eomfort to all vegetation, and must be ultra-pernicious to it during the season of rest.—INVICTA.

SOLUBLE PHENYLE.

THERE are two points that must be settled before the merits of soluble phenyle as a eure for eelworms can be profitably investigated or discussed. 1, What is soluble phenyle? 2, What is an eelworm?

1, For the information of the general publie it may be stated that "soluble phenyle" does not exist, and is not a recognised chemical material, but is merely a faney name given to a preparation of ereosote patented by Mr. Little in 1876, and sold by the firm of Morris and Little of Doneaster for use as a sheep dip. The ereosote obtained in the distillation of eoal tar eontains "earbolie aeid," eresol, naphthaline, and many other eompounds. It is not soluble in water, and Mr. Little devised a very ingenious method of rendering ordinary ereosote soluble in water. "Soluble ereosote" would have been a more fitting name for this preparation than the one by which it is known. Mr. Little effected the desired object by treating ereosote with resinsoap and a little softsoap.

The composition of Little's soluble phenyle is stated to be as follows:—

	Per cent.
Coal tar ereosote	59·1
Rosin oil...	29·6
Softsoap	5·9
Caustic soda solution	5·4
Total	100·

Messrs. Jeyes eagerly took up this idea, and in 1877 and 1878 took out two patents for a similar preparation, omitting the softsoap, but otherwise praetically the same as Little's. An analysis of Jeyes' disinfeetant gave the following results:—

Ereosote	60·4
Resin	29·6
Soda	2·4
Water	7·6
Total	100·0

Similar preparations have been placed on the market as "carbolised ereosote," and have found use as sheep-dips and general liquid disinfectants. A well-made sample should mix with water without the separation of any oily undissolved ereosote.

For use as a sheep dip these soluble ereosotes are diluted with about 100 times as mueh water, and are then effeetive in destroying the tieks.

Personally I have never tried any of these preparations as garden remedies, and can offer no experimental evidence to throw light on

Mr. Abbey's successful results or Mr. Dyke's decided failure. Mr. Abbey is quite right; Little's original soluble phenyle is of some theoretical manurial value, as it contains 1 per cent. of potash. This means that the application of as much potash as that in Mr. Dyke's dressing of kainit (12 ozs. per square yard) would require over 80 gallons of soluble phenyle liquid for each square yard! The manurial value of softsoap, as applied in washes, is not worth the consideration of any practical man. The potash in soap costs just five times as much as that in a potash manure.

It should be noted that Jeyes' disinfectant contains no potash, and therefore quite free from any pretensions as to manurial value.

The nitrogen in creosite is in the form of highly unsuitable material for plant nutrition, and is not only useless to plants but also capable of doing them serious harm if applied too liberally.

I believe Miss Ormerod was the first authority to recommend soluble phenyle for root eelworms, and that it is quite possible that it may be efficacious.

2, *What is an eelworm?* Many people talk lightly of "eelworms," and point them out as visible to the naked eye. These visible eelworms are not eelworms proper, but mostly the larvæ of small flies, and for *these*, I am told, the soluble phenyle may be sound treatment. The "eelworm" proper, or *nematode*, is only visible under a fairly high power of the microscope, and anyone who can free soil of this pest at small expense would be worth £50,000 to-morrow.

Meanwhile, experiment is open to all, and there is no reason why a reader of this Journal should not be the lucky man. Sugar Beets, Hops, Cucumbers, and Clover are all victims of nematodes. Kainit and lime are the only palliatives at present recognised by scientific experts as of any practical use and application.

Unfortunately, I have not access to diseased Tomato and Cucumber plants, and am at present unable to test "soluble phenyle" or other possible remedies. I would suggest that Mr. Dyke might find success with one of the following materials:—(1) Carbon bisulphide; (2) xanthate of soda; (3) antinonin (potassium nitro-cresylate). 1 and 2 obtainable from Harrington's, City Road, E.C.; 3 from Fuerst Bros., 17, Philpot Lane. 1 and 2 have cured the phylloxera pest of the Vine; 3, a new German remedy for caterpillars and other pests.—HALOGEN.

IN turning my back on eelworm a few months ago I had hoped that this evil pest, with its accompanying discouragement and disappointment, was for my part really finished and done with. However, let me in as few words as possible give the comments for which "W. D." has asked.

I used Little's soluble phenyle at varying strengths, as advised by "Phenyle Adviser" and Mr. Abbey in the Journal. I have kept no notes as to the exact per-centages, as the results of fair trials proved of so little value, but certainly the applications were stronger than those mentioned by "W. D." I have noticed on one or two occasions that after what I thought was a too heavy saturation of the soil in which the plants were growing, there was a slight flagging, such as one may see in Cucumbers when a sudden burst of sunshine follows a period of dull weather, but nothing serious; the leaves did not hang like "wet clothes.' With these exceptions I have not noticed phenyle take any effect on Cucumbers, nor, worse luck, on the eelworm, and I have done with it.—BY THE SEA.

LAST year Mr. W. Dyke recorded a failure with kainit in solution for destroying eelworms in Cucumbers, and on page 547 registers a success with the salt in conjunction with basic slag phosphate—two of the most economic substances, supplying potash and magnesia, phosphoric acid, lime, and iron, also manganese. The latter I, at one time, regarded as of considerable importance in the treatment of parasitic diseases as caused by animal and vegetable micro-organisms. Its value, however, was found to rest upon combination with other substances.

I am not going to enter on another discussion about eelworms, only I should like the Editor to publish an illustrated article I sent him some time ago on root-stem eelworm in Vines, and I do not criticise the article on page 547 further than to say that 4 ozs. of kainit per square yard suffices to kill any species of eelworm known in England, and a solution of it, 2 ozs. to a gallon of water, answers every useful purpose. I say nothing as to bad cases requiring sharp medicine, or deep-rooting plants necessitating more abundant dressings. Cultivators must exercise judgment in this as on all other matters of management in particular cases.

Your correspondent records a failure with soluble phenyle. I wonder if the grower alluded to by Mr. W. Dyke has used the genuine article, for I notice he omits the prefix "Little's," as have other correspondents, and an inquirer recently received a substance from a chemist to order of soluble phenyle labelled "Soluble phenol," and on the purchaser pointing out the divergence between the definition on the label and the order, the chemist said they were the same. Perhaps there were faults on both sides, the orderer not having written "Little's" soluble phenyle and the seller not knowing the difference; hence the mistake, and, if the wrong kind were used, that would account for the disaster.—G. ABBEY.

[The illustrations mentioned will shortly be published, and we think they will be interesting to many readers.]

ÆSCHYNANTHUSES.

GESNERACEOUS plants are some of the most brilliant ornaments of our stoves, the majority of them producing very gaily coloured flowers in abundance, and these seem even more attractive in comparison with the rich diversity of foliage which Palms, Crotons, Dracænas, Alocasias, and innumerable others present. Gesneras, Tydæas, Gloxinias, Achimenes, and Streptocarpus include many handsome plants of great value not only for the stove but for cooler houses also, though the majority are more at home in a rather high temperature.

The genus Æschynanthus, to which especial attention is now called, similarly comprises several species of much beauty, particularly as basket

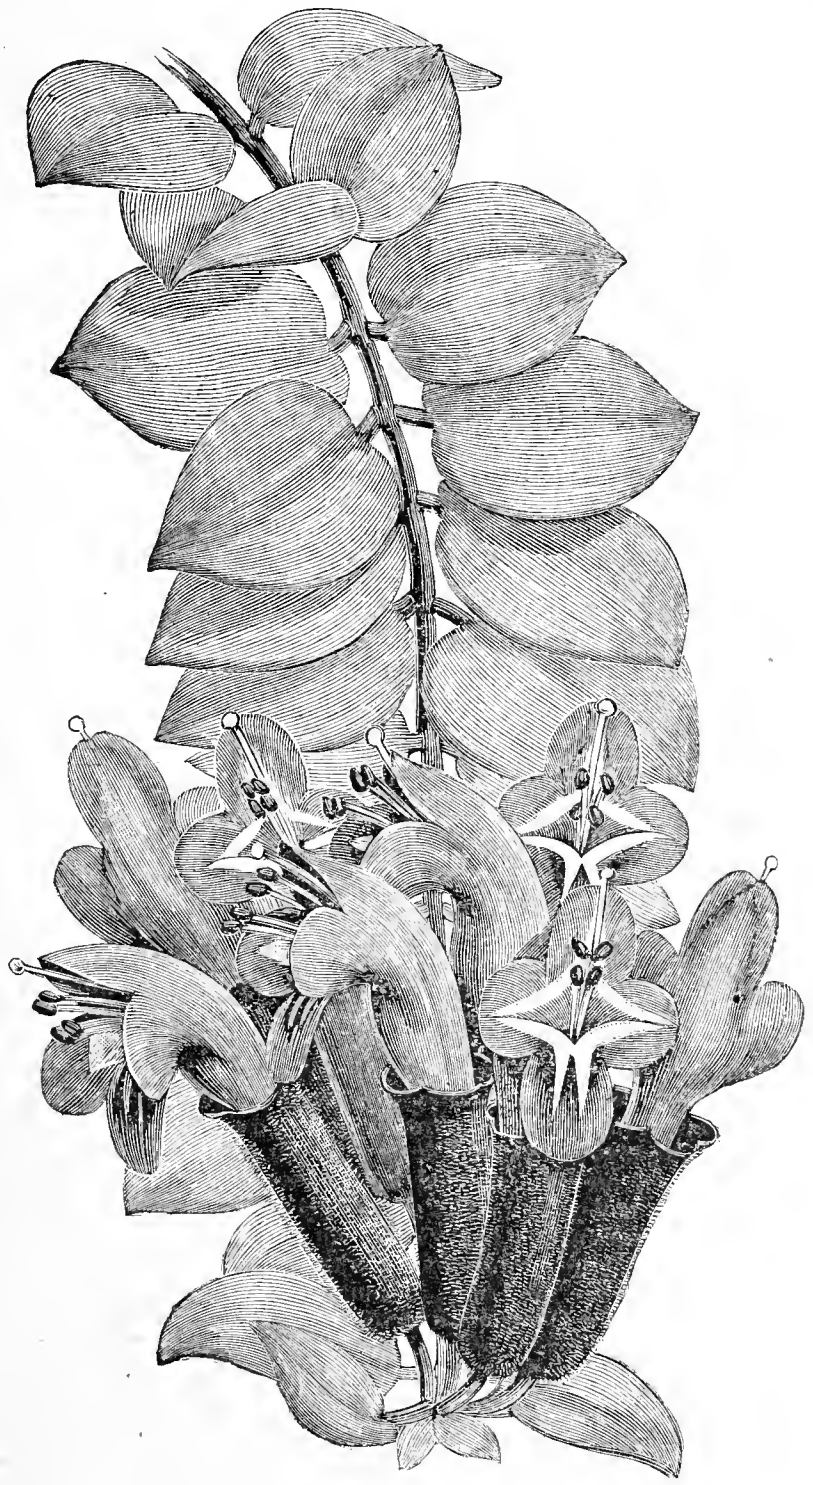

FIG. 83.—ÆSCHYNANTHUS TRICOLOR.

plants, for which their epiphytal and pendulous habit well fits them, and in gardens where they are carefully grown no better plants for that purpose could be desired. The rich scarlet and orange shades distinguishing their flowers are unrivalled, and the blooms, being produced in large trusses or clustered closely along the stems, have a very imposing appearance when pendulous from elegant baskets near the path of a stove. The plants are not more difficult of management than many other epiphytal plants; but it is no use attempting their culture in any house where a high and moist temperature cannot be maintained with regularity, and perhaps most of the failures that occur in the growth of these plants are due to a misapprehension of their requirements in this respect. The baskets should be prepared in the ordinary way with a layer of large potsherds and some pieces of charcoal, over which a layer of rough moss or peat can be placed, upon which the plant should rest, with good fibrous peat in lumps placed firmly round the roots. Water must be liberally but judiciously supplied; and if at any time the temperature becomes unduly reduced the amount of water given must be proportionately

limited, or the plants will soon become unhealthy, and when once they get into that state it is very difficult to insure their recovery.

A few of the species are adapted for culture in pots. Some cultivators prefer peat alone for the species under pot culture, with thorough drainage, but a little turfy loam incorporated with the peat is beneficial. But in that case sand should be also used unless the pot contains a large proportion. Both the baskets and pot plants must have a warm position in the stove, and then little difficulty will be experienced with them.

Æ. speciosus is one of the most handsome, its large scarlet and orange flowers being produced in trusses of sixteen to twenty, and with several of these on a plant of moderate size in a 5 or 6-inch pot the effect is most striking. Another valuable quality it possesses is the remarkable durabilty of the flowers, which last in good condition for some weeks. This plant was found by Mr. Thomas Lobb growing upon trees in damp woods on Mount Asapan in Java at an elevation of 2000 feet. Æ. fulgens was also collected by Mr. T. Lobb in Moulmein. It approaches the above in habit, but is more drooping. The leaves are large and ovate, the flowers being 3 inches or more long, scarlet streaked with yellow in front, and are borne in large heads.

Æ. cordifolius, obtained by the same collector, is a native of Borneo, with leaves and flowers of moderate size, the latter about 2 inches long, deep scarlet streaked with black in the throat, and produced in pairs or triplets in the axils of the leaves. This is well suited for a basket, as also is its near relative Æ. tricolor (fig. 83), both being of slender habit. The last-named is similarly a native of Borneo. It has small ovate leaves, the flower being about 1½ inch or 2 inches long, scarlet streaked with orange and black.

Æ. javanicus is a showy form, with deep scarlet flowers streaked with yellow, and borne in the axils of the leaves near the point of the stems; while Æ. Lobbianus ought to be included in every collection, its rich scarlet corollas contrasting so well with the deep purple calyx. All these succeed best in baskets. This plant is especially useful owing to its free growth and flowering, requiring rather less care than the others, and the flowers last for a great time.—C.

NOTES ON PEARS.

THE Pear crop of the past season will be remembered as an erratic one, some shy cropping varieties having carried full crops by the side of others that were complete failures, although, as a rule, reliable croppers.

Williams' Bon Chrêtien, than which for cropping we have no variety more reliable, especially as pyramids and bushes, was this year a complete failure, not from lack of bloom, but possibly from the fact of our having 9° of frost when the trees were in full flower. Yet by their side, also in blossom, Beurré Diel carried a full crop, which for size and finish was a record. A Marie Louise on a wall, with a west aspect, trained horizontally with geometrical precision, gave only a very light crop. The same variety as a pyramid, 15 feet high, bore a good crop of large fruits.

Duchesse d'Angoulême as pyramids carried scarcely a Pear, but on upright cordons in the open there was about half a crop of very fine fruit. Beurré d'Amanlis, a grand Pear to succeed Williams' Bon Chrêtien, either for market or private use, carried half a crop of large fruit, but did not finish so fine a colour as usual. As pyramids the delicious Doyenné du Comice never bears a very heavy crop, but this year it has been above the average. As oblique cordons on walls this variety gave a heavy crop of smaller fruit. Comte de Lamy, although a small fruit, is one of the best flavoured Pears for October we have, and it possesses the additional advantage of being a constant bearer. This year as bushes it has been below the average in quantity, but above the usual size.

Zéphirin Grégoire, a very reliable bearer, has this year given us a poor crop of small fruit. Intending planters, not altogether carried away with the modern craze for size, should not forget this variety, as for British gardens a richer flavoured variety does not exist. It is "rich and sugary," with a delicious aroma all its own. The crop of Winter Nelis, both as bushes and on walls, is much below the average, and the same remarks apply to Glou Morçeau. Louise Bonne of Jersey has borne good crops, both as pyramids in exposed situations and as cordons on walls.

Of the very useful late kinds Joséphine de Malines and Bergamotte Esperen head the list, both giving good crops, but of small size fruits. Beurré Rance on a wall with a west aspect was a very light crop, and Easter Beurré as bushes little better. The latter has generally to be used for stewing, as it very seldom ripens properly, and the same may be said of Knight's Monarch.

The following varieties have carried fairly good crops as oblique cordons:—Pitmaston Duchess, Marie Louise d'Uccle, Brown Beurré, Beurré Clairgeau, Souvenir du Congrès, and Madame Treyve. Very few fruits have been afforded by Clapp's Favourite, Passe Colmar, Beurré Bachelier, Passe Crasanne, and Nouvelle Fulvie.

Another peculiarity about the season in connection with Pears—at least, with us—is that they are all ripening at least a month earlier than usual and, what is worse, remaining a much shorter time in prime condition. All our efforts to keep them as cool as possible seem of little avail; but no doubt the close mild weather we have had the last few weeks has had something to do with this undesirable state of things.—J. H. W.

ABOUT DENDROBES.

THE majority of the species comprised in this genus are now at rest, but a few of the earlier flowering kinds are already giving us of their beautiful flowers. The well-known D. aureum, for instance, a modest looking flower, not nearly so showy as many others, yet remarkable in being one of the parents of many of the finest hybrids in existence. D. Ainsworthi, D. Leechianum, D. splendidissimum, and its variety grandiflorum to wit, to say nothing of the secondary hybrids D. chrysodiscus, D. euosmum of the older, and many new ones. These are choice and beautiful plants that owe their being partly to the fragrant and pretty species in question.

The plant is too well known to need any description, and its treatment just now is very simple. Plants in flower should be kept in a fairly dry and cool house, in order to prevent, if possible, the young growths starting out of season. Those advancing for flower are best in rather more heat, but not too much atmospheric moisture, this being apt to cause the production of growths instead of flower buds. Any later plants should be kept quite dry at the roots as soon as the growth is finished, and if convenient brought on for flowering in small batches of half a dozen plants or so; they will then keep up a long display. The plant is very widely distributed on the Khasia Hills, in Burmah, Madras, and other parts of the Old World.

Not far behind is the good old D. nobile, and this, too, in its many varieties, ranks as one of the most potent in hybridising. It is not strictly deciduous like the last mentioned, still it likes a good resting season, and may, for cultural purposes, be almost bracketed with it. Most of the cylindrical long-stemmed kinds, such as D. crassinode, D. Wardianum, D. Pierardi, D. superbum, D. Devonianum, D. Bensoniæ, and others have lost their foliage, and are best kept quite dry and cool until the new year. If wanted early in flower, they may, of course, be hastened a little by placing in a warm and moderately dry house; but the longer and more complete the rest, and the more gradually they are brought into flower, the better they all are without exception.

A similar plant in appearance, but one needing totally different treatment, is D. chrysanthum. In most cases this begins to grow just as other deciduous species are going to rest, and consequently, during the winter months, must be kept growing as freely as possible. If the stems can be kept dormant until the spring, all the better; but when once they commence growing, it is useless trying to stop them, and placing them in cool and dry quarters, with growths 2 inches or 3 inches in length, is ridiculous, though too often practised. Cultivators who do this sort of thing can have very slight powers of observation.

Two beautiful Dendrobes—abundantly distinct even when out of flower, yet sometimes mistaken the one for the other—are D. Dalhousianum and D. moschatum (calceolus). Both these require a long season of growth, and even now are often to be met with growing freely. If these flowered upon the previous season's wood only they would be difficult plants to bloom freely, but as the racemes of both are produced upon two, and even three-year-old stems, their late habits make little difference. But even so it is worth while being at a little trouble to get the growths well away in early spring, as they have then the dual advantage of the waning sun in autumn to ripen and the plentiful supplies of fresh air that may be safely afforded at that season.

The east coast of Australia has given us many fine Dendrobiums, and the culture of these for the most part resembles that recently noted as suitable for D. bigibbum. A well-known exception, however, is found in D. speciosum, this plant delighting in a long, cool, and dry rest all through the winter months, and exposure to the full sun nearly all the year round. The growths in fact often shrivel considerably if the resting is prolonged enough, but this has no ill effect upon the plant. The variety Hilli likes a similar régime, but the more delicate, and I think I may say the more beautiful, Bancroftianum, must not be quite so harshly treated. This is a very pretty plant, not common under cultivation, sent home by Dr. Bancroft from Brisbane about sixteen years ago, while the type was known in this country as far back as 1823.

The evergreen section, as represented by D. chrysotoxum, D. suavissimum, and D. thyrsiflorum of the larger habited kinds, and D. aggregatum, D. Jenkinsi of the smaller, are easily grown, useful, and handsome Orchids. Their treatment just now is to keep them on the dry side in an intermediate house, but they will not stand so much drying at the roots as the deciduous kinds, and must never be allowed

to shrivel. Any of the black haired (nigro-hirsute) section that chance to be at rest may be similarly treated, but most of these, like D. formosum, D. eburneum, and even D. infundibulum will probably be growing more or less, and must be treated accordingly.

Did space permit, there are other kinds that may be singled out for special treatment in some way or other, such as the beautiful D. taurinum or D. stratiotes, the tiny growing D. Loddigesi and D. Falconeri, but in the above cursory notes most of the sections in the genus have been touched on, and occasion will doubtless arise for going more fully into the details of their culture. Briefly, then, I may advise cultivators who wish for the best results to study the habit and liking of the individual species rather than give them all a collective mode of treatment which will suit some, but by no means all.—H. R. R.

RHEOLA.

HAVING many times heard the name of Rheola we were prompted on a recent occasion to direct our steps thither. But when the journey was commenced we little dreamt of the lovely scenery the Vale of Neath had in store for us. The lofty Cambrian mountains, with their tree and Fern-clad sides, were a glorious picture in their autumnal beauty. The graceful Larch, with its golden mantle, the silver trunks of the Birch, the golden brown of the Oak, the numberless dark twigs of the Alders, with here and there, towering above the rest, the silvery glaucous hue of the Fir, with the streamlets rushing down the mountain sides into the stony bed of the sometimes turbulent River Neath, formed a panorama of more than ordinary beauty.

The residence of J. E. Vaughan. Esq., soon comes into view. The pretty and well-kept lodge passed we found ourselves on a well-made and picturesque winding carriage drive, and were not long in reaching the mansion with its Old World air. Beneath the verandah, on the southern side, Myrtles were noticed—fine old warriors, too, that have withstood the test of many a severe winter. At times they have suffered, but with a vitality that seems inexhaustible their glossy shoots are again put forth, and these, with Jasmine, Roses, and others, tend to make up one of Nature's most charming pictures.

Leaving behind us huge mounds and towering bushes of Rhododendrons, we made our way to the garden, where the energetic gardener, Mr. J. Crofts, is soon found. Here let it be said this fine old gardener is no stranger, having served the late Mrs. Palmer, together with the present owner, for something like thirty-five years. Under his guidance we proceeded to the lawns and pleasure grounds, and the eye was attracted at once by the fine trees and Conifers. A fine old Ash was noted, while near by a Cedrus Libani, with its horizontal branches, was conspicuous. Lawson's Cupressus and several trees of Juniperus chinensis also claimed attention. Diverging to the left brought to our view some grand Abies excelsa, splendidly clothed specimens of Araucaria imbricata and Wellingtonia gigantea, Taxodium distichum, with numerous well coloured Golden, Silver, and other Hollies, all so disposed that light and sunshine can reach every branch. Here and there were some beds and clumps of Gynerium argenteum, with their silvery plumes glistening in the autumn sunlight. Fine Yuccas and Kniphofias luxuriate near a rushing stream. Retracing our steps we passed the mansion, noting by the way that the formal arrangement of flower beds alone had given way to that of perennials and other plants useful for decorating the drawing-room as well as the flower garden.

Coming to the conservatory—a spacious structure—we were impressed by the many ancient specimen Camellias which were planted some forty years ago. Fine Orange trees were also uncommonly attractive, their branches laden with fruit and myriads of starry flowers. The walls and pillars were clothed with suitable climbing plants, such as Rhyncospermum jasminoides, Tecomas, Heliotropes, Abutilons, Rose Boule de Niege, and the beautiful Noisette Ophirie were quite at home. These, with Ferns and Chrysanthemums, made a lovely display.

On re-entering the kitchen garden, where the other houses are situated, we passed through the greenhouse and stove, both of which were gay with the usual occupants of such structures, and on through the vineries, of which there are three. There is no modern air either about the Vines or the houses, which, with their numerous rafters and innumerable small panes of glass, have a decidedly ancient appearance; nevertheless, good Grapes are annually cut, notably Black Alicantes turning the scale at 3 lbs. from Vines planted, the imperishable label tells us, in 1859. Lady Downe's and Muscat of Alexandria, planted at the same time, also give good returns, and that from the original or first rod taken up, so that naturally the spurs have attained some length. The next house, a long lean-to, planted with Black Hamburgh, is filled by two old Vines that on the advent of the present gardener, some thirty-five years ago, were as large in circumference as an ordinary man's leg and are still very vigorous, producing hundreds of bunches annually. The Vines are planted outside in a border made against the back wall on high ground, and taken in through holes at the top, and trained originally along the back, with other rods taken from them down to the front; but no hard and fast rule has been adhered to, and the many rods or elongated spurs turn in all directions, furnishing good Grapes and healthy foliage to the satisfaction of all concerned. The Peach and Nectarine house is furnished with creditable trees of approved varieties that annually give good returns.

The kitchen garden is of considerable size and well cropped. Celery, Sprouts, Broccoli, Savoys, spring Cabbage, and Kales all showed excellent cultivation. Root crops of all kinds are also well grown, the soil appearing to favour the growth of these, Potatoes being specially fine. The garden is not surrounded by good walls, as are many places, but an orchard near by supplies plenty of fruit.

Our time soon passed, and we retraced our steps, after thanking Mr. Crofts for his very cordial reception.—EXILE.

NATIONAL ROSE SOCIETY.

ANNUAL MEETING.

THE annual general meeting of this Society was held in the Hotel Windsor, Victoria Street, S.W., on the afternoon of Thursday, 9th inst. Chas. E. Shea, Esq., occupied the chair, a fairly numerous audience being present, including most of the leading spirits of the Society. The circular convening the meeting was first read, followed by the minutes of the last general meeting. Scrutineers for the ballot nominating the officers and Committee to carry on the work of the Society for the year 1898 were next appointed. The choice of the meeting fell upon Mr. George Gordon and Mr. W. J. Jefferies, who duly accepted. The report of the Committee for 1897 and the balance-sheet was then presented by Mr. E. Mawley, one of the Hon. Secretaries of the Society. It ran as follows:—

REPORT OF THE COMMITTEE FOR THE YEAR 1897.

THE great event of the past year, the celebration of her Majesty's Diamond Jubilee, has, in one way or another, affected most of the institutions in this country—some beneficially, others the reverse. The National Rose Society has not escaped its influence. It materially affected our southern exhibition at Portsmouth, even to the altering of the date, which was originally fixed for the day after the Jubilee celebration. As it was felt impossible to hold the show under such circumstances, the fixture, at the request of the local Committee, was changed to the 18th of June. This is the earliest date on which a provincial show has ever been held by the Society. The exhibition proved an unusually small one, while the attendance of visitors, no doubt in some measure owing to the stormy weather during the afternoon, was also very limited. The fine display of garden Roses was a noteworthy feature of this exhibition. Everything that could be done under the depressing circumstances of the day was carried out by Captain Ramsay, our local Secretary, who not only gave his valuable services, but also a silver cup in the leading class for amateurs. The Committee are also greatly indebted to the kind hospitality of Mr. Alderman Evans, who kindly entertained the judges and principal exhibitors to a luncheon in the Town Hall.

The metropolitan show at the Crystal Palace was also affected, but not in the same way, by the Jubilee celebration, for the Palace Victorian exhibition occupied the whole of the nave. Consequently that of the National Rose Society had to be relegated to the central transept and the concert room, the latter a most unsuitable position for a Rose show, particularly on such a dull day as that on which the exhibition this year took place. It was the largest show that the Society has yet held, no fewer than 7200 blooms having been staged on that occasion in addition to the many beautiful stands of garden Roses.

The northern show, which was held at Norwich, in the grounds of Mr. J. J. Colman of Carrow Priory, was a most successful one, and attracted a larger number of visitors than any previous summer exhibition of the local Society. The arragements were, on the whole, excellent, and reflected great credit on the Committee of the Norfolk and Norwich Horticultural Society, and especially upon their energetic Secretary, Mr. J. E. T. Pollard.

Early in the year application was made to the different railway companies for a reduction in the rates charged for the carriage of Rose boxes, with the result that although no reduction was granted, there is now a uniform rate charged on nearly all lines throughout the country, which previously was far from being the case.

It is with much regret the Committee have to record the deaths of two of their oldest members—Dr. Robert Hogg, a Vice-President of the Society and one of its original founders, who for many years took a warm interest in its welfare, and frequently presided at the meetings; and the Rev. E. N. Pochin, who in the early days of the Society was not only a member of the Committee and a constant exhibitor, but also a leading authority on all matters connected with the Rose.

FINANCE.—The financial position of the Society must be regarded as satisfactory, considering how greatly most societies of the kind have suffered this year through the many demands upon their members' pockets owing to the celebration of her Majesty's Diamond Jubilee. The year was begun with a balance in hand of £76 12s. 3d., and now, after paying all outstanding expenses, including £495 in prize money, there remain £39 18s. 7d. in the Treasurer's hands.

The sale of publications realised £8, which is more than in any previous year.

ARRANGEMENTS FOR 1898.—Various suggestions have been made with a view to increase the efficiency of the Society, and these are now engaging the attention of the Committee. The engagements for the coming year are likely to prove unusually satisfactory, as the provincial

exhibitions will be held in places which the Society has already visited, and where large Rose shows are each year being held. The southern exhibition will take place at Bath, in conjunction with the Bath Floral Fête and Band Committee, on Thursday, June 23rd. The metropolitan show at the Crystal Palace on Saturday, July 2nd, when, we are informed, there is every prospect of the nave being once more placed at the disposal of the Society. The northern exhibition will be held at Halifax, under the auspices of the Salterhebble and District Rose Society, on Thursday, July 14th.

A Rose Conference will take place at each of the provincial exhibitions, when some subject of interest in connection with Rose culture will be discussed. A report of the Conferences will be afterwards published, and issued to the members later in the year.

MEMBERS' PRIVILEGES.—Members subscribing £1 will, as usual, be entitled to two private view and four transferable tickets, the latter admitting at the same time as the general public; while subscribers of 10s. are entitled to one private view and two transferable tickets. Each of these tickets is available for any one of the Society's exhibitions. Members joining the Society for the first time in 1898 will also receive copies of the following publications:—The official catalogue, the supplement to the catalogue, "Hints on Planting Roses," and the "Prize Essay on the Hybridisation of Roses," also the reports of the two Conferences as soon as issued. Members alone are entitled to compete at the Society's exhibitions.

The Committee, in conclusion, express their best thanks to their local secretaries, also to the donors of special prizes. Of the former Mr. H. P. Landon has distinguished himself by obtaining more new members for the Society during the last three years than any of his fellow secretaries. Among the leading donors of special prizes may be mentioned the Right Hon. Lord Penzance, the Mayor of Norwich, Dr. S. P. Budd, Mr. C. J. Grahame, Captain Ramsay, Mr. C. E. Shea, Mr. A. Tate, and the Trustees of the Prince Memorial Fund.

BALANCE-SHEET, YEAR ENDING 30TH NOVEMBER, 1897.

RECEIPTS.

(Signed) J. D. PAWLE, FRAS. TULLIE WOLLASTON } *Auditors.*

After reading the balance-sheet, Mr. Mawley explained that the Society stood in rather a more favourable position than would appear, for whereas the balance at the bankers was stated to be only £39 18s. 7d., it should really be £64 18s. 7d., for £10 had been paid in during November as special prizes for next year, whilst in the item of £81 10s. 9d. for printing another £15 had to be accounted for.

On rising to move the formal adoption of the report and balance-sheet the Chairman said that another milestone in the history of the Society had been successfully passed. He commented upon the apparently unfavourable appearance of the much shrunken balance at the bankers, but stated that Mr. Mawley had removed many of their trepidations by explaining that they really had a balance in hand analagous to £64 18s. 7d. The last year, continued Mr. Shea, had been a chequered one. It might have been better, and also might have been worse. The Jubilee had been got through fairly well—a great thing in itself. The show at Portsmouth did not turn out so well as they had hoped, but the Society was greatly indebted to Captain Ramsay's strenuous efforts for the measure of success that had fallen to them. The show at the Crystal Palace, on the other hand, had been the best ever held with regard to the number and quality of the blooms exhibited. Taking it altogether the National Rose Society had done as well as could be expected, both from a financial and a show point of view. He concluded a pithy address by saying that he did not doubt for the future of the noble flower when he looked around him and saw so many of its lovers and able cultivators; in such hands it could not suffer an abiding or a lasting retrogression. In a few words Mr. Geo. Bunyard seconded the motion proposed from the chair, and the meeting unanimously voted that the report and balance-sheet be formally adopted, printed, and circulated.

A vote of thanks to the officers and members of the Committee for their services during the year was then proposed. Mr. A. Munt seconded. The Rev. H. Honywood D'Ombrain, who was received with enthusiasm, replied, expressing on behalf of himself and his brother officers their thanks for the confidence placed in them.

The meeting then proceeded to the alterations of the rules, of which the necessary time notification had been previously given. The italics represent the alterations of, or additions to, the existing rules. On the motion of the Rev. H. A. Berners, seconded by Mr. O. G. Orpen, it was proposed that Bye-law 5 be altered to read:—"Notice of any proposed alteration of these bye-laws to be given in writing to one of the Secretaries at least two weeks before *a* general meeting, and no bye-law or regulation shall be altered except at a general meeting of the Society. *A special* general meeting may be called at any time," &c. This was carried without a dissentient voice. The Rev. A. Foster-Melliar proposed, and Mr. Cyril Cant seconded, that Bye-law 7 should be altered to read:—"That the Committee shall at its first meeting appoint . . . the General Purposes Committee . . . the functions of that Sub-committee shall endure until the next *annual* general meeting," &c. This was also carried.

Mr. Landon moved that Regulation 8 should be made to read:—"All Roses must be exhibited as cut from the plants. Artificial aid of any and every kind is strictly prohibited, with the exception of wire or other supports, which are only to be used to keep the blooms erect. *A bloom left tied will not be counted by the judges.* Dressing Roses so as to alter their form is prohibited. *A bloom so dressed will be counted as a bad bloom.* The insertion of any additional foliage *will disqualify the stand.* All Roses should be correctly named." There was a brisk discussion upon this rule, and the exact meaning of the word *counted*, which was finally defined as meaning *pointed.* The insertion of the latter word was proposed as an amendment by Mr. Langdon, supported by Mr. Mawley, the rule to read, "*shall not receive a point*," instead of "*shall not be counted*," and in the form of this amendment the motion was adopted, but not unanimously, since some of the members thought that a tied bloom should be directly penalised by being counted as a bad bloom.

The next item in the proceedings dealt with the size of exhibition stands. Mr. Geo. Paul moved that—"*Exhibition stands should be of the regulation size—viz.*, 4 *inches high in front, and* 18 *inches wide, and be set out with moss or other suitable material. They should be of a uniform length—viz.*, for twenty-four blooms, not less than 3 feet or more than 3 feet 6 inches; for twelve blooms, not less than 1 foot 6 inches and not more than 2 feet; for six or nine blooms, not less than 1 foot and not more than 1 foot 6 inches.' Dr. Shackleton seconded, and a lively discussion then ensued. The Rev. A. Foster-Melliar spoke of the need for a direct penalty for infringement of this rule, and he took exception to the very gentlemanly suggestion "should be.' He humorously pointed out that a man ought to be able to make a box within an inch, and yet when transgressors were shown that they had broken the law, they took the matter very quietly. The resolution was ultimately transferred from its old place in the "Authorised Rules" for judging at Rose shows to its new position among the Bye-laws.

Mr. Geo. Gordon then announced that the result of the ballot was that the list of officials proposed was unanimously adopted.

Passing to the consideration of the fixtures for 1899, Mr. Mawley read correspondence from the Secretary of the Salisbury Rose Society, which stated that a welcome awaited them at Salisbury in 1899, if the Society would elect to hold their provincial show there. An invitation from Horace G. Egerton Green, Esq., on behalf of the Colchester Rose Society, was also read, and Mr. Orpen then pointed out that Colchester had the prior claim to the visit of the National Society in 1899, since the invitation was decided upon at the April meeting of the Colchester Society. The Rev. Pemberton remarked upon the splendid way in which the Colchester people managed their shows, and upon the fact that they had plenty of room there. Mr. Landon corroborated, and spoke of the lead taken by Essex in the cultivation of the Rose. After due deliberation Colchester was chosen, upon the formal proposal of Mr. Bateman, seconded by the Rev. A. Foster-Melliar.

Mr. W. J. Grant then stated that he was authorised by the Helensburgh Society to invite the National Rose Society to Helensburgh in 1899. The people of Helensburgh would much appreciate a visit, and they were quite ready to accede to any terms that might be imposed, including the money guarantee of £80. The Rev. H. H. D'Ombrain had several reasons to give against going to Helensburgh, but Mr. W. J. Grant had a fitting answer for them all. Communications had been held during the year with Mr. P. Weathers, discussing Manchester as a northern meeting place for 1899, but no letter had reached the Hon. Secretaries for the last two months, and the matter was yet undecided. Mr. Grant moved, and the Rev. Pemberton seconded, that the rival claims of Helensburgh and Manchester be left to the Committee for decision. In this the meeting concurred. A vote of thanks to the Chairman for presiding, moved by the Rev. A. Foster-Melliar, was accorded unanimously, and the proceedings then terminated.

Notes & Gleanings

WEATHER IN LONDON.—A considerable amount of rain has fallen in the metropolis during the past seven days. Thursday was fine, but rain fell almost the whole of Friday. Saturday again was dry, while on Sunday it rained heavily until the evening, when it cleared, and the stars shone brightly. During the early hours of Monday morning rain recommenced to fall, and continued throughout the day. Tuesday morning also was wet, while during the early hours of Wednesday morning there was a thunderstorm accompanied by heavy rain. At the time of going to press it was fine.

—— WEATHER IN THE NORTH.—The weather of the past week has been of all sorts—fog, rain, sleet, snow, frost, and bright sunshine, but little of the last. Saturday was the best of the week; on Sunday there was frost of 6°, which continued till evening; Monday was very dull and drizzly; Tuesday morning, although dull, was more settled and pleasant. —B. D., *S. Perthshire.*

—— THE ANCIENT SOCIETY OF YORK FLORISTS.—The following quaint invitation is issued by Mr. John Lazenby, Secretary, 13, Feasegate, York:—"Brother,—You are desired to meet the Fraternity of the most Antient Art of Gardening at the annual Feast of the Royal Society of Gardiners and Lovers of a Garden, within the City and County of York, kept this year at Mr. Pearson's House in Marygate the 15th day of December to dine with them, at Six a Clock, where you will be earnestly expected and kindly received." Sir Jos. Terry, Kt., has promised to preside, and as the presence of the Right Hon. the Lord Mayor (E. Gray, Esq.), the City Sheriff (H. Copperthwaite, Esq.), and other influential gentlemen is assured, it is hoped there will be a good attendance of members on the occasion.

—— CLUMBER.—Much has been written from time to time about the noble establishment in the neighbourhood of Worksop. I am pleased to relate that the Duke of Newcastle has added to the Clumber gardens what has long been required, and that is a splendid lean-to range, erected by Messrs. James Gray, horticultural builders, Danvers Street, Chelsea, which is a model of horticultural skill. It is 175 yards long, and has a noble Palm house in the centre. This range is in various departments, and the greater part will be used for the cultivation of fruit. At the present time there is a fine display of Chrysanthemums of all the leading varieties splendidly arranged, many of the flowers being fit for any exhibition table. At the back of the range all the offices necessary will be erected upon the most modern and serviceable plan. The gardener's house, erected some time ago, is a splendid building, complete with all modern arrangements conducive to comfort, and the same may be said of the bothies. Gardening in all its branches is carried out on a most extensive scale. Everything useful is well represented both in fruit, cut flowers, and vegetables. Clumber is in the capable hands of Mr. C. Slade, whose previous experiences have well fitted him for the management of such an establishment.—ALFRED OUTRAM, F.R.H.S.

—— PANSIES.—I have just been enjoying the pleasure of planting a number of seedling Fancy Pansy plants. They are the product of a fine, blotched strain that gave numbers of grand richly coloured blooms last summer. The seed was sown in a large frame early in August, and as the soil was kept well watered, and some rough shading thrown over the glass, the germination was quick, and the plants appeared in thousands. When strong enough they were carefully lifted out from the drills and dibbled out 4 inches apart into a bed of well prepared soil, where they were, so long as needful, kept well watered, and now are very sturdy well rooted plants. Lifted with balls of soil they will bloom finely in the spring and early summer. Here in a few lines is summed up nearly all that need be said with respect to raising Pansies from seed, and their treatment in the autumn. I should have transplanted to their blooming border earlier, but the soil had become very dry and loose. The border had previously been well manured, and indeed trenched. Recently it was dug, and after the rain of the 7th and following days was in capital condition for planting. There are now in commerce such superb seed stock that a good store of plants may be easily and cheaply obtained from a packet of seed if of the right sort.—A. D.

—— GARDENING APPOINTMENT.—Mr. William Phillips, for the past six years foreman Effingham Hill Gardens, Dorking, has been appointed head gardener to J. H. Buxton, Esq., Hunsdon Bury, Ware Herts.

—— ORCHID-FLOWERING CANNAS.—Messrs. Dammann & Co., the well-known horticulturists of Naples, have forwarded to us a coloured plate of what are termed Orchid-flowering Cannas. If these fulfil the promise of the illustration it is quite certain that they will quickly become popular in this country. Twenty varieties are represented, all of which are distinct and very handsome.

—— CORRECTIONS.—Permit me to make two corrections of errors in some notes of mine last week. One is found in the reference to Grapes at Tilehurst, where I am made to say that the number of bunches per 15 feet run of rod was 30½. I wrote 38½, which makes a material difference. Then in the article on "Rest in Plant Life," in paragraph 6, rods in the twelfth line should read roots.—A. D.

—— WOLVERHAMPTON GARDENERS' ASSOCIATION.—A very interesting and instructive lecture was given before a large meeting of the members of this Society on the 7th inst. by Mr. C. R. Bick, gardener to Walter Chamberlain, Esq., Harborne Hall. The essay dealt with the cultivation of certain ornamental foliage and flowering shrubs, suitable for planting near large or manufacturing towns. Sprays and fruits of various shrubs and trees were used as illustrations. The Chairman (Mr. Simpson) and others complimented Mr. Bick on his comprehensive remarks.

—— OLIVE CULTURE IN AMERICA.—It is remarkable, says "Meehan's Monthly," what an immense stride forward has been taken by Olive culture in America during the last quarter of a century. It is scarcely fifty years ago that nothing at all was known of it; and the writer remembers well a distinguished French gentleman, although a citizen of Philadelphia, buying land in Texas, and importing plants from the Old World for the mere purpose of experimenting with them, in order to ascertain their fitness for culture in that region. None of these attempts succeeded. Even California, so ready at once to experiment in all horticultural lines, never seemed to think of what might be made of the Olive until Mr. E. Cooper, of Santa Barbara, commenced their cultivation some twenty years ago. At the present time 1000 acres are under Olive cultivation on the Pacific Coast, and it is regarded as one of the most profitable of California market horticultural productions.

—— BIRMINGHAM GARDENERS' ASSOCIATION.—At the fortnightly meeting of the members on the 6th inst. Mr. J. Deacon, gardener to the Right Hon. Joseph Chamberlain, Highbury, Moseley, gave an essay on "Late Flowering Chrysanthemums," and accompanied it with an assortment of cut blooms on long stems set up in bottles. The practical remarks were much appreciated, and were followed by an interesting discussion amongst several of the growers present. Mr. W. Gardiner took occasion to advert to the recent decease of Mr. James Bateman at Worthing, and of his fame as an enthusiastic horticulturist, special reference being made to his remarkable work, "The Orchidaceæ of Mexico and Guatemala," the coloured plates, each of which cost over £200, being mostly life size. The speaker also alluded to his own interesting visit to Biddulph Grange some thirty years ago, and still retains a lively recollection of the "Chinese Willow Pattern Plate" garden and the "Egyptian Court."

—— A GARDENER'S MISTAKE—CAN WE FORGET?—Of course, in all such cases as that of Thos. Harwood Crasp the natural inference is always against the person implicated; nor is it easy to obtain any proof that can exculpate him. I am generally particular in receiving money, wrapping it separately in paper with name and particulars; but as the Judge, in the case referred on page 551, expressed so decided an opinion on the impossibility of forgetting such, I venture to submit occurrences that have happened to myself. Unfortunately, perhaps, for certain parish schools, I was prevailed on to take the treasurership. The first year the overdrawn account at the bank at the end of the year was less by a few shillings than the overdrawn account as represented by the books of the Education Department. At the beginning of the following year I drew these out, and placed them as voluntary subscription to the credit of the school. A year or two after a similar incident occurred, only then the difference was a matter of £2 or £3, but of like character. Plainly, in both these cases I had paid accounts of the school and had forgotten to make a note of the same. By no manner of means am I an unselfish person, therefore it may be safely said that if a person can forget paying away money it is also quite possible to forget receiving it. Judges' opinions are not always gospel, or there would be fewer law suits.—Y. B. A. Z.

—— Bud Variation.—That Nature does not require external conditions in every case for inducing great changes in the forms and other characters of fruits and flowers is well known (says an American contemporary) to florists, who have numerous varieties produced by bud variation, or sports, as they term them. Some fruits originate in the same way. It is understood that the famous Canon Hall Muscat Grape is from a branch of the ordinary Muscat of Alexandria; and yellow Plums, appearing on trees normally producing purple ones are not uncommon.

—— Presentation to Mr. F. Q. Lane, J.P.—We learn that at the annual meeting of the Berkhamsted Chrysanthemum Society, of which Mr. F. Q. Lane is the Vice-President and Earl Brownlow President, Mr. Lane of The Nurseries, Berkhamsted, was presented with a silver cigar box, bearing the inscription, "Presented by the Committee of the Berkhamsted Chrysanthemum Society, 1886-1897" on one lid, and on the other "F. Q. L.' Mr. A. Prudames made the presentation. The recipient, who was taken by surprise, expressed his thanks for the kindness shown him, and was much pleased.

—— Hessle Gardeners' Improvement Society.—At a meeting of the above Society, held December 7th, Mr. D. Toyne of Hull read a very interesting paper on "Floriculture of the Present Reign." Mr. J. Barker, gardener to W. P. Birkenshaw, Esq., West Hill, showed some very good Cypripediums, including, amongst others, C. Arthurianum, C. nitens superbum, and C. nobile; also Dendrobium Phalænopsis Schröderianum. Mr. Wilson had some good blooms of Chrysanthemums Mrs. H. Weeks. Perle Dauphinoise, Bonnie Dundee, and W. Tunnington. There was a capital muster of members. A hearty vote of thanks to the essayist and Chairman terminated a very pleasant evening. —G. W. G.

—— Metropolitan Public Gardens Association.—At the monthly meeting of the Metropolitan Public Gardens Association, 83, Lancaster Gate, W., Lord Teynham, Deputy Chairman, presiding, on the motion of Sir William Vincent a resolution was unanimously passed expressing great regret at the death of the Vice-Chairman, Lord Dorchester, who had taken an active interest in the work from its commencement fourteen years ago. It was agreed to make some improvements in St. Nicholas's Churchyard, Deptford, with a view to its use by the public, and to prepare a plan for the further laying out of St. John's Churchyard, Hoxton, and to replant some trees and shrubs in Whitechapel Road, and in St. Stephen's Churchyard, Bow. Progress was reported in the laying out of the East Street Recreation Ground, Walworth, the disused burial ground in Kipling Street, and St. George-the-Martyr Churchyard; and it was decided to commence as soon as possible the laying out of Charles Square, Hoxton, and Albion Square, Dalston. It was announced that the Oval, City Road, had been completed and opened to the public by the St. Luke's Vestry, the Association having provided seven seats. A number of other schemes in connection with the acquisition and laying out of grounds in Camberwell, Blackfriars, Walworth, Ratcliff, New Kent Road, Putney, and other places occupied the attention of the meeting.—("Garden.")

—— The Assessment of Nurseries.—Mr. George May appealed against the assessment of the nurseries, Upper Teddington, on the ground that he was entitled to relief under the Agricultural Rating Act. The Clerk stated that the solicitors to the Gardeners' Association had instructions to make this a test case, and if need be to carry it to the House of Lords. It was a question whether the nurserymen were, or were not, to receive the benefits of the Agricultural Rating Act. When the lists were deposited nine months ago, the surveyors of taxes were invited to be present with the overseers, and to raise any objections they had to the supplemental lists. The overseers and surveyors had several interviews, and in the whole Union there were only three objections to deal with. Two months ago there were similar appeals from the Surbiton Nurseries and Wimbledon, and the Committee referred the matter to him (the Clerk), and he spent four hours one day with solicitors, witnesses, and experts. The surveyor of taxes for Wandsworth had seen the Commissioners at Somerset House, and they supported the view which he (the Clerk) advised the Committee to take—viz., that the relief of the Agricultural Rating Act did not extend to nurseries. But in a case at Worthing recently the appellant had successfully appealed against the rates, and his appeal had been confirmed by the Court of Appeal, but the case was now going to the House of Lords. The Judges did not agree, and therefore there was no final decision at present. He therefore advised the Committee to confirm Mr. May's assessment, but to record his formal objection on the minutes. Mr. May assented to this course, and the Committee confirmed the assessment accordingly.—("Surrey Comet.")

—— The Japan Umbrella Pine.—The curious Japanese tree, is named Umbrella Pine, from the effect given by the arrangement of the free leaves in an umbrella-like form at the ends of the branches. It is said to be comparatively rare on account of the difficulty of obtaining seeds from Japan, and because no way has been found to propagate it, except by seeds. It is true that cuttings will root after a long time, but the objection to this method is the length of time required. Besides, only a limited number of cuttings can be obtained from any one tree. It will be noted that the term "free leaves" is used in the above reference. The reason for this is that many limbs of plants of the coniferous family, especially in the true Pines, have the leaves all united together so as to form an outer covering to the bark. The outline of these leaves can be readily seen on examination. In a certain stage of growth these leaves are not united to the stem as later, and then the true leaves are apparent. The botanical name of the Umbrella Pine is Sciadopitys verticillata.—("Meehan's Monthly.")

—— Influence of Stock on Scion.—The Academy of Science, Paris, France, sends out a report of the effect of the stock on the scion in the case of two Pear trees, fifteen years old, which had grown side by side in a garden where they were apparently subject to the same conditions, with the exception of the stocks into which they were grafted. The variety was the Triomphe de Jodoigne, and one was grafted upon a seedling Pear, the other upon a Quince. Each tree bore about 300 fruits each year, and for three years the fruits when mature were collected, compared, and analysed. The colour of the fruits was very different, those upon the Pear stock being green, and those on the Quince stock golden yellow, with a decided rose blush on the side toward the sun. Ten fruits from the Quince stock averaged to weigh 406 grams, against 280 grams on the Pear stock. Both fruit and fruit juice of the Quince stock had greater density, and it also exceeded that on the Pear stock in acidity and in contents of sugar. The sugar was in the proportion of 11 kilogrammes on the Quince stock to 7 on the Pear stock. These observations, according to a transatlantic contemporary, were in the main confirmed by others made some years ago on Winter Doyenné scions on seedling Pear and Quince stock.

—— A Rare November.—There have been many records given of late in various periodicals regarding the extreme mildness of the autumn, or its consequent influence on vegetation. On page 502 "G. H. H." gives an accurate account of the abundant floral features of the month, of which we are so unaccustomed during November, as well as the extraordinary out-of-season crops in the kitchen garden. It would have been not at all difficult to produce a second crop of Potatoes outdoors this year, were it possible to predict the November weather actually experienced. Peas, Runner and French Beans were in very general use in November. I gathered the last dish here on the 25th of the month, and cut a nice dish of Globe Artichokes on the same day, while of Cauliflowers and early autumn Broccoli there has been no loss from frost or any other cause, and they have been abundant and good. Chrysanthemums have been fine everywhere outdoors, so much so that the indoor display has suffered in appreciation in private gardens, and proved a source of loss more or less to the market grower, but probably what may have been loss in one case has been gain in another.—W. S.

—— Liverpool Horticultural Association.—On Saturday evening the first lecture of the season was given in the Free Library, William Brown Street, the Chairman of the Association, Mr. Thomas White, presiding over a satisfactory attendance of members. The subject, "The Progress and Popularity of Orchid Growing," was given in a happy style by Mr. Weathers. Down through the long years, from the time when Linnæus first introduced dried flowers in 1763 up to the present, the many good things introduced were adequately dealt with. A warm tribute was paid the R.H.S. for the earlier efforts to popularise Orchids. He associated the name of Mr. Owen Thomas when mentioning Disa grandiflora, by reason of the splendid plants grown at Chatsworth, and also that of Mr. Smith, gardener to the late Y. de Barronda, Esq., for the gorgeous collection of Phalænopsis grown by him at Liverpool. He also gave interesting accounts of the increasing interest in their cultivation by many working-men amateurs. The lecturer considered Vanda Sanderiana the king of Orchids, though owing to the difficulty of importing it, was somewhat scarce. Hybridising was mentioned as of the greatest value, as although varieties might become scarce in their native habitat, we need not fear with the splendid varieties we had now to work upon. Orchid literature numbered at the present time some 150 standard and scientific works. The discussion which followed was of a most interesting character. A hearty vote of thanks to Mr. Weathers, proposed by Mr. Ranger, and seconded by Mr. Mason, and a similar vote to the Chairman, brought a most pleasant evening to a close.—R. P. R.

—— THE DEVELOPMENT OF THE FOREIGN FRUIT TRADE.—The foregoing was the title of a paper read by Mr. M. J. Garcia at the meeting of the Horticultural Club held at the Hotel Windsor on Tuesday evening last. There were present besides the Rev. H. H. D'Ombrain, the Secretary, M. Henri de Vilmorin of Paris, Rev. W. Wilks, Mr. Harry J. Veitch, Mr. J. H. Veitch, Mr. Arthur Sutton, and a large gathering of other members. The paper proved to be one of the most interesting and instructive given at these *réunions* for many a day, and gave rise to an animated discussion, in which Mr. George Monro, Mr. Assbee, Mr. George Bunyard, Mr. Walker, and M. de Vilmorin took part. The general purport of Mr. Garcia's remarks was to explain that vexed question, "Why is English fruit growing unprofitable?" Mr. Garcia, speaking from experience, accounted for the general failure of the English grower to keep pace with foreign and colonial competition to the fact that he grows too many varieties of fruit, and does not pack his consignments in cheap wooden barrels *not to be returned*. English buyers are conservative, and persist in asking for the same varieties of fruit year after year. English sellers will not consign their fruit in receptacles to be broken up when done with, like the American importers. The remedy, therefore, is for the English grower to limit the varieties and transmit the fruit to market scientifically packed in barrels of which he makes a gift to the consumer. Mr. Bunyard remarked that one difficulty English nurserymen had to contend with was the caprice of the buyers of fruit trees, the demand being very variable in respect of the varieties. In course of the discussion, Mr. Garcia and Mr. Monro stated that in spite of foreign competition the price of certain ordinary fruits, so far from sinking, had actually risen during the last forty years. In conclusion, Mr. Harry Veitch expressed a hope that at some future day Mr. Garcia would see fit to repeat his lecture at a meeting of a more public nature.

THE HERBACEOUS PÆONY.

THERE are fashions in flowers as in other things, and the favourite of to-day is too often the despised of to-morrow. We sometimes think it unfortunate that this is the case; that a flower seen everywhere for a time should drop into comparative obscurity. Yet it is doubtful if the gains are not greater than the losses which flow from this tide of fashion. It is impossible to doubt that the popularity of some flowers has done much to lead to their improvement, and has encouraged many to devote their attention to raising new varieties. However much we may seek to minimise the question of what is lucrative in flowers, it constantly arises and exercises an enormous influence. The raiser of new flowers, who has devoted much time and skill to his work, is as much entitled to a pecuniary reward as the successful man of science who reaps the benefit of his discoveries.

But for these fashions the professional raiser of new varieties would not receive a fair reward, and his time could not be applied to such a work as this. Many amateurs have enriched our gardens with new varieties of many flowers without either the desire for or the prospect of gain. For many other flowers we are, however, indebted to the man who makes it his business, and who expects his work to recompense him in the ordinary way. The subject of this article is one of the latter flowers, and we cannot but recognise the high value of the work of the raisers of the best varieties of this brilliant flower, the reinstatement of which in popular favour is likely to give much satisfaction to many.

There are some who call the Pæony coarse and gaudy; but it appears to the writer that they have not seen the beauty of the tinting and shading of the exquisite flowers of many of the blooms. It is not a little strange to hear some who go into ecstacies over a bed of scarlet Zonal Pelargoniums condemning as garish and gaudy the colouring of this flower. Used aright in the garden, its great flowers are toned down by and harmonise with the surrounding foliage; used for house decoration, its massive blooms are suited for large vases and similar receptacles. It cannot be judged from the same point of view as a flower for use in a buttonhole: yet there are some who appear to do so, and speak with disdain of its flowers as "lumpy" and "ungraceful." It is all a question of using properly. This much by way of introduction, and we must now turn to the history and cultivation of the flower.

The Pæonia has long been an inhabitant of our gardens. There is a little discrepancy in the statements about the time of its introduction; but so far as we can learn the year 1548 saw it introduced into this country. This is the date assigned to P. albiflora and P. officinalis, although some state that P. albiflora was not introduced until 1780. The former of these is the progenitor of what are, perhaps, the most beautiful of the varieties in cultivation. P. officinalis in its several varieties is the well-known common Pæony of cottage gardens, which, through good report and ill, has survived long years of both neglect and favour. It is a native of South Europe, while P. albiflora comes from Siberia and adjoining countries.

Much of the popularity of the herbaceous Pæonia at the present time is due to the magnificent exhibitions made by Messrs. Kelway and Son of Langport, who have had marked success as seedling raisers. Messrs. Barr & Son, Mr. T. S. Ware, and other prominent trade growers have also done much to bring the beauties of the flower to the notice of garden lovers. Continental growers, such as Messrs. Krelage & Son of Haarlem, who grow a very complete collection, have upheld the merits of the varieties of the Pæony when little interest was taken in the flower. From a very complete list of over 500 varieties published by this firm, it is shown to whom we were indebted for the florists' Pæony, until Messrs. Kelway & Son showed how well it can be raised in England. These continental raisers were the Prince of Salm-Dyck, Lémon, Guérin, Buyck, Parmentier, Verdier, Calot, Count de Cussy, Delache, Van Houtte, Gombault, Pelé Delacourt-Verhille, Donkelaer, Foulard, Miellez, Salter, Crousse and Méchin, and Dessert. Many of the finest standard varieties have been produced by these raisers, and it is well that their names should be remembered. In the literature of the flower Mr. J. G. Baker, Mr. George Paul, and Mr. George Anderson may be mentioned as having contributed valuable studies.

The herbaceous Pæonia is a very accommodating plant, and is so easily grown that it frequently suffers in beauty from the want of attention in the way of giving manure and a plentiful supply of water. It likes a good, rich, well-drained soil, which has been deeply dug and well enriched with thoroughly decayed animal manure. It should never be allowed to suffer from drought, and watering with liquid manure while the buds are forming will add to the size and beauty of the flowers. It may be grown in beds, borders, or shrubberies, and large beds massed together in grass are very striking when the plants are in full flower. In shrubberies they are very effective against the background presented by the shrubs. They can be planted at almost any season, but should, if possible, be obtained while at rest, as the young growth in spring is very brittle and liable to be injured. August is a good time for division of the plants, but they can be removed much later, and if planted before the middle of January may bloom the following summer. A portion of a plant with a crown will grow. New varieties are procured from seeds, which may be sown as soon as ripe, either under glass or in the open. These directions apply to all the Pæonias, including the varieties of P. albiflora, both single and double: those of P. officinalis and the numerous species.

The double varieties of P. albiflora are the most admired, their fine and massive flowers being much appreciated in June. The single varieties have of late received more attention than formerly, and many are very beautiful both in form and colour. The old P. officinalis has hardly any superior in richness of colour when in bloom in May, and its varieties give much to admire. The other species also give us many handsome plants and are comparatively little known. At the Cambridge and Glasnevin Botanic Gardens there are extensive collections of these species, and Mr. Peter Barr has made an exhaustive study of them in the nurseries of his firm.

The range of colouring in the herbaceous Pæonia is very wide, and this greatly increases the difficulty of making a selection. Selections of florists' flowers which have been long under improvement are notoriously difficult to compile, and in the case of the Pæony, where there are so many almost perfect flowers, it is even worse than usual to choose. Scores of equally good flowers must be omitted to keep the list within bounds. A garden might also be largely furnished with what are called the species with their varieties. In these a yellow less difficult to grow than the pale yellow P. Wittmanniana is a desideratum, and it is to be hoped that the new P. lutea from China, and now on trial in France, may prove more amenable to cultivation. In the selections of flowers given below only the principal colours are given.

For the benefit of those desiring to exhibit, quotations of the various points for judging may be made from the invaluable "Rules for Judging," issued by the Royal Horticultural Society. These are —"Size and fulness of bloom," 2; "regularity of guard petals," 1; "compactness and symmetry," 1; "clearness of colour and freshness," 1; "average evenness of blooms," 1.

SELECTION OF DOUBLE HERBACEOUS PÆONIES.

Varieties of P. albiflora.—Agnes Mary Kelway, rose and yellow; Candidissima, primrose; Comte de Gomer, deep crimson; Cyclops, purple crimson; Duchesse de Nemours, snow white; Festiva maxima, snow white; François Ortigat, purple; Lady Beresford, rose pink; Lady Leonara Bramwell, silvery rose; Madame Breon, peach blossom; Princess Christian, white; Sir Henry Irving, rose pink.

Single Varieties.—Autumnus, purple; Blucher, carmine; Duchess of Sutherland, pink; Emily, bright pink; Stanley, maroon crimson; The Bride, pure white.

SELECTION OF EUROPEAN AND OTHER SPECIES.

Anomala, rosy lilac; Arietina, crimson; decora elatior, crimson; officinalis alba fl. pl., white; Peregrina Exquisite, pink; tenuifolia fl. pl., crimson.—S. ARNOTT.

OUTDOOR TOMATOES.

To grow Tomatoes successfully out of doors a good sunny position should be chosen. The seeds may be sown by the middle of January, and the plants raised in a warm propagating pit or frame. As soon as they are large enough to handle they must be placed singly in 3-inch pots, using a mixture of good fibrous loam, leaf soil, and a little sharp sand previously warmed to about the same temperature as that in which the seedlings are growing. Cold soil chills the tender roots and gives the plants a check, from which they may be long in recovering. Sturdy plants should be the object of the cultivator, and these can easily be had if a good start has been made by giving the plants plenty of room, and keeping them as near the glass as possible. Short-jointed plants fruit much quicker when planted out than those that have been allowed to become drawn.

By the first week in April the plants will be in a condition to need more air than before, and a liberal amount, avoiding sharp currents, will be of great service in preparing them for planting outside. This may be done about the end of April or the first week in May; but great care must be taken in covering them every night till they are safe from frost.

The varieties which I have grown this year are Carter's Early, Chiswick Red, Viceroy, Polegate, and a seedling the result of a cross between the old Red and Polegate. Chiswick Red is a splendid cropper outside. Carter's Early is also good; but for an indoor Tomato the latter is the best I have grown.

There is yet one more feature in outside culture—namely, getting the fruit to ripen after it is grown. I often hear people say they can grow plenty of Tomatoes outside, but cannot get them to ripen. Let them cover the plants at night from about the middle of September, and they will find that most of the fruits will ripen well outside. This is not only much better when ripened on the plants, but it saves a good portion of the crop being spoilt through being picked green.

The enclosed photograph was taken on September the 27th. Now, October 27th, the whole of the crop has been gathered. Only the last set fruits failed to ripen. The length of wall is 40 feet, and this is the sixth year in succession that Tomatoes have been grown on the same ground with excellent results.—W. J. EMPSON, *The Gardens, Ampthill House, Ampthill, Beds.*

[It will be conceded on examination of the illustration that Mr. Empson's system of culture is an excellent one.]

RASPBERRY LEAF RUST.

THE leaves submitted to the Editor by Mr. Briscoe-Ironside, and mentioned on page 532, are infested with the Raspberry brand, or leaf rust, Phragmidium (Aregma) Rubi-Idæi (gracile), which infests both wild and cultivated Raspberries.

Your correspondent has sent both a young and a mature leaf of the infested Raspberry, but on both the fungus is in the matured condition. The parasite appears on all the green parts, commonly on the under side of the leaves, in the form of small spots, usually very numerous. In the early stages of attack the leaves exhibit no trace of infection on the upper surface, but as the disease advances yellowish specks appear, and ultimately the leaf becomes brown and dies, more or less, the leaflets or leaves sometimes falling prematurely, thus considerably weakening the canes and prejudicing another season's crop of fruit.

The fungus is one of those producing different spores at various seasons. The earliest or spring form, giving rise to orange yellow spots on the leaves, is composed of the so-called æcidiospores, and notable for not having any distinctive name. These spores are small spherical or, from being jammed, angular bodies, and being readily blown about by the wind cause the rapid spread of the disease.

The spores, however, of the next generation are of a brighter yellow colour, known as midsummer and uredospores. Lastly, black spots only are found late in the season—September and October in this country. The black spore differs from either of the preceding forms, being cylindrical, and rests over the winter, either attached to the leaf or on the ground, and may be regarded as frostproof and waterproof.

The spore germinates in the spring and produces several minute globose sporidia, which are wafted along and upward by the slightest currents of air, and catching on the under side of a Raspberry leaf amongst the down they, in presence of moisture (always evaporating from the earth and from the stomata), send out slender tubes, which enter the tissues of the leaf from below, either by a stoma or by directly piercing the cuticle. Once in the leaf, the tube divides or branches, forming a seat of mycelial hyphæ, and pustules are developed.

Coming to means of prevention, the first thing deserving of attention is to watch early in the season for the first pale lemon spots on the under side of the leaves, removing and burning them before they burst. That will end the parasite. The alternative plan is to spray the leaves on the under side with Bordeaux mixture or some powder preparation containing sulphate of copper; but Raspberry leaves are very easily injured, a quarter strength Bordeaux being quite strong enough, and, what is better, effective. Raking up and burning the affected leaves at the end of the season goes a long way in preventing the disease, and deep digging—that is, drawing the surface soil into the spaces between the plants and burying it well down, may prove effective.—G. ABBEY.

ROYAL HORTICULTURAL SOCIETY.

DRILL HALL, DECEMBER 14TH.

THE last meeting of the Royal Horticultural Society was held on Tuesday, and was, taken as a whole, very successful. The various exhibits were splendidly diversified, and examples of excellent culture were frequently observable. Mr. W. H. White's collection of Calanthes was a superb feature of the show. All sections were represented in greater or lesser numbers.

FRUIT COMMITTEE.—Present: P. Crowley, Esq. (in the chair); with Rev. W. Wilks, and Messrs. G. Bunyard, J. Cheal, J. H. Veitch, J. Willard, G. Reynolds, F. Q. Lane, T. Fife, H. Balderson, G. Wythes, J. H. Laing, G. Woodward, W. Bates, A. F. Barron, W. Pope, W. Farr, W. J. Empson, A. Dean, and J. Wright.

As will be seen there was a good attendance of members, as is usual at the last meeting of the year, also, as is usual, they were not overwhelmed with work.

A few examples of Celery were sent from Chiswick, but only one met with special approval; this was *Sutton's Solid White*, with very firm fleshy stalks and hearts, remarkable for great tenderness and sweetness. Award of merit was granted by nine against six votes.

Pear President Barabe was sent by Mr. W. Allan from Gunton Park. A medium size fruit of the shape of Fondante d'Automne, with a large open eye; very juicy, tender, and sweet. An award of merit was granted unanimously.

Prague Celeriac Géant de Prague.—Splendid bulb-like roots of this vegetable were sent by Sir Trevor Lawrence, Bart.; also fine samples of Couve Tronchuda. A cultural commendation was awarded.

Mr. Owen Thomas sent splendid samples of Frogmore All the Year Round Cucumber. Much approved, but, as previously stated, desired to be seen in February. The greater the test the greater the triumph when success is finally won.

Mr. S. Mortimer sent a dozen boxes of selected Conqueror Tomato; extremely bright, flat, but rather small, and fruits corrugated (silver Banksian medal).

Mr. H. Berwick sent from Sidmouth fifty-six dishes of Apples, some of them very fine, including Hormead Pearmain, Newton Wonder, and Striped Beefing (silver Knightian medal).

Twenty dishes of Apples were sent by Mr. J. Day, gardener to the Earl of Galloway, Galloway House, Wigtonshire; excellent fruit for the district (silver Banksian medal).

FRUIT FLAVOUR CLASSES.—The first prize for a dish of Apples was taken by Mr. C. Herrin, Dropmore, with Adam's Pearmain in good form; Mr. C. Ross being second with Cockle's Pippin. For Pears the first prize went to President Barabe, from Mr. W. Allan, Gunton Park; and the second to Mr. G. Wythes, Syon House, with Winter Nelis.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair); with Messrs. H. B. May, C. E. Pearson, R. Dean, J. H. Fitt, G. Stevens, J. Hudson, J. F. McLeod, T. Peed, J. Jennings, C. J. Salter, C. Jefferies, W. Bain, G. Gordon, C. E. Shea, H. J. Jones, H. J. Cutbush, E. Beckett, R. M. Hogg, J. Walker, E. Mawley, G. Paul, C. Blick, H. Turner, and the Rev. G. H. Engleheart.

A large group of Chrysanthemums came from J. W. Temple, Esq., Teyswood, Groombridge, but quality was not a very conspicuous feature (silver Flora medal). Mr. W. Farr, gardener to A. F. Pears, Esq., Spring Grove House, Isleworth, staged a collection of well-grown plants of Begonia Gloire de Sceaux. The plants were carrying good flowers above the metallic bronze foliage. A few green-foliaged plants were used to increase the effect. Mr. Farr also sent a group of Poinsettias composed of dwarf plants with richly coloured bracts of good size (silver Banksian medal). Mr. J. Bryson, Helensburgh, staged a number of seedling decorative Chrysanthemums in which quality was conspicuously absent.

Bunches of magnificent Zonal Pelargoniums were exhibited by Messrs. H. Cannell & Sons, Swanley, Kent. The richness and diversity of the colours made this one of the most effective exhibits in the show. Particularly conspicuous were Countess de Morella, Mrs. Simpson, T. W. Lawton, Owen Thomas, Duchess of Marlborough, St. Cecilia, Herrick, Mrs. W. Partridge, Wordsworth, Shelley, Niagara, Lord Reay, Lord Farrer, Soldier's Tunic, and Lady Tennyson (silver Banksian medal). Messrs. H. Low & Co., Upper Clapton, staged a collection of Cyclamens and Carnation Winter Scarlet. The plants of the Cyclamens were rather small, but were producing flowers of good quality and substance (bronze Banksian medal).

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, sent several pots of the hybrid Begonia Ensign, as well as plants of a new hybrid called Winter Cheer. This is very floriferous, the colour being rosy carmine. Messrs. W. Cutbush & Son, Highgate, sent a large collection of double Primulas. The varieties represented were Princess and Marchioness of Exeter. The plants were carrying large numbers of flowers of good shape (silver Banksian medal). Mr. G. Cragg, gardener to W. C. Walker, Esq., Winchmore Hill, sent flowering sprays of Cissus discolor, and Mr. J. R. Tranter, Henley-on-Thames, flowers of Chrysanthemum Mrs. J. R. Tranter.

Considering the time of the year, the Chrysanthemums staged by Mr. H. J. Jones, Ryecroft Nursery, Lewisham, were highly creditable. Some were slightly past their best, but that was only natural. Amongst the best were Mrs. W. H. Lees, Geo. Seward, Julia Scaramanga, Miss Phyllis Fowler, Golden Gate, Georgina Pitcher, Mons. Demay-Taillandier, Silver King, Simplicity, Mrs. H. Weeks, Wilfred Godfrey, and W. G. Newitt. Ferns were carefully interspersed amongst the flowers (silver Flora medal).

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair); with Messrs. J. O'Brien, De B. Crawshay, H. M. Pollett, H. Ballantine, W. H. White, H. J. Chapman, W. H. Young, F. J. Thorne, E. Hill, J. Douglas, T. W. Bond, T. Statter, C. Winn, S. Courtauld, and T. B. Haywood.

Messrs. F. Sander & Co., St. Albans, had a small collection of Orchids with Dracæna Godseffiana. Calanthes only were represented, and these comprised Bella, Bryan, Florence, Victoria Regina, and Phaio-Calanthe Arnoldiana superbum. Mr. W. H. White, Orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, staged a magnificent collection of Calanthes. The plants were splendidly grown, and carrying flower spikes of great length. The colours were particularly bright. We noted Veitchi splendens, Victoria Regina, Veitchi lactea, burfordiense, versicolor, Bella, revertens, nivea, sanguinaria, Bryan, and labrosior. Mr. White also sent Cirrhopetalum Medusæ, Cypripedium Leeanum superbum, Masdevallia corniculata, M. irrorata, Dendrobium cymbidioides, Lælia rubescens, and Cypripedium callo-bellum (silver-gilt Flora medal).

A small group of Orchids came from Messrs. J. Veitch & Sons, Ltd. The plants were not numerous, but with no exception they were of good quality. Lælio-Cattleya Pallas was in fine form, as were L.-C. Eunomia, Cattleyas leucoglossa, Miranda, and Mantini. Besides these there were Cypripediums Leeanum, Adrastus, Sallieri, Zeno, Prospero, Actæus, and Niobe (silver Flora medal). Messrs. Paul & Son, Old Nurseries, Cheshunt, staged ten round hampers of Cypripediums. All the plants were very healthy, and producing capital flowers. They comprised Spicerianum, Wallacei, Chantini, Harrisianum, grandiflorum, alba marginata, syletinse, Ashburtoniæ, guttulatum, and insigne aureum.

Messrs. H. Low & Co., Upper Clapton, staged a miscellaneous group of Orchids, amongst which were observed Cypripedium Bellona, C. Pitcherianum, Williamsi var., Calypso, Sallieri Hyeanum, insigne Laura Kimball, and others. In addition to the Orchids referred to there were numerous smaller exhibits sent by Mr. A. Wright, gardener to T. McMeekin, Esq., Lower Norwood; Mr. R. W. Richards, The Priory, Usk, Mon.; Mr. W. H. Young, Orchid grower to Sir F. Wigan, East Sheen; Mr. W. Cobb, Tunbridge Wells; Mr. J. Douglas, Bookham; Mr. T. Duck, Abbey Wood; Mr. G. Walker, gardener to H. Druce, Esq., St. John's Wood; Mr. W. Buckell, gardener to M. S. Cook, Esq., Kingston Hill; Admiral Sir Henry Fairfax, Melrose, N.B.; C. S. Lucas, Esq., Warnham Court, Horsham, and Mr. G. Cragg, gardener to W. C. Walker, Esq., Winchmore Hill.

CERTIFICATES AND AWARDS OF MERIT.

Begonia Winter Cheer (J. Veitch & Sons).—The parentage of this hybrid is B. socotrana and a tuberous-rooted variety. The plant is of an upright habit and very free flowering. The colour is a rich rosy carmine (award of merit).

Calanthe burfordiense (W. H. White).—Crimson is the colour of this charming Calanthe. The flowers are of medium size and good shape. The spikes are of fair size (award of merit).

Calanthe Harrisi (Downes).—A magnificent white form with occasional faint blush suffusions. The flower is of considerable size (first-class certificate).

Calanthe sanguinaria (W. H. White).—The varietal name of this Orchid tells the colour, save that it conveys no idea of the white tips of the sepals.

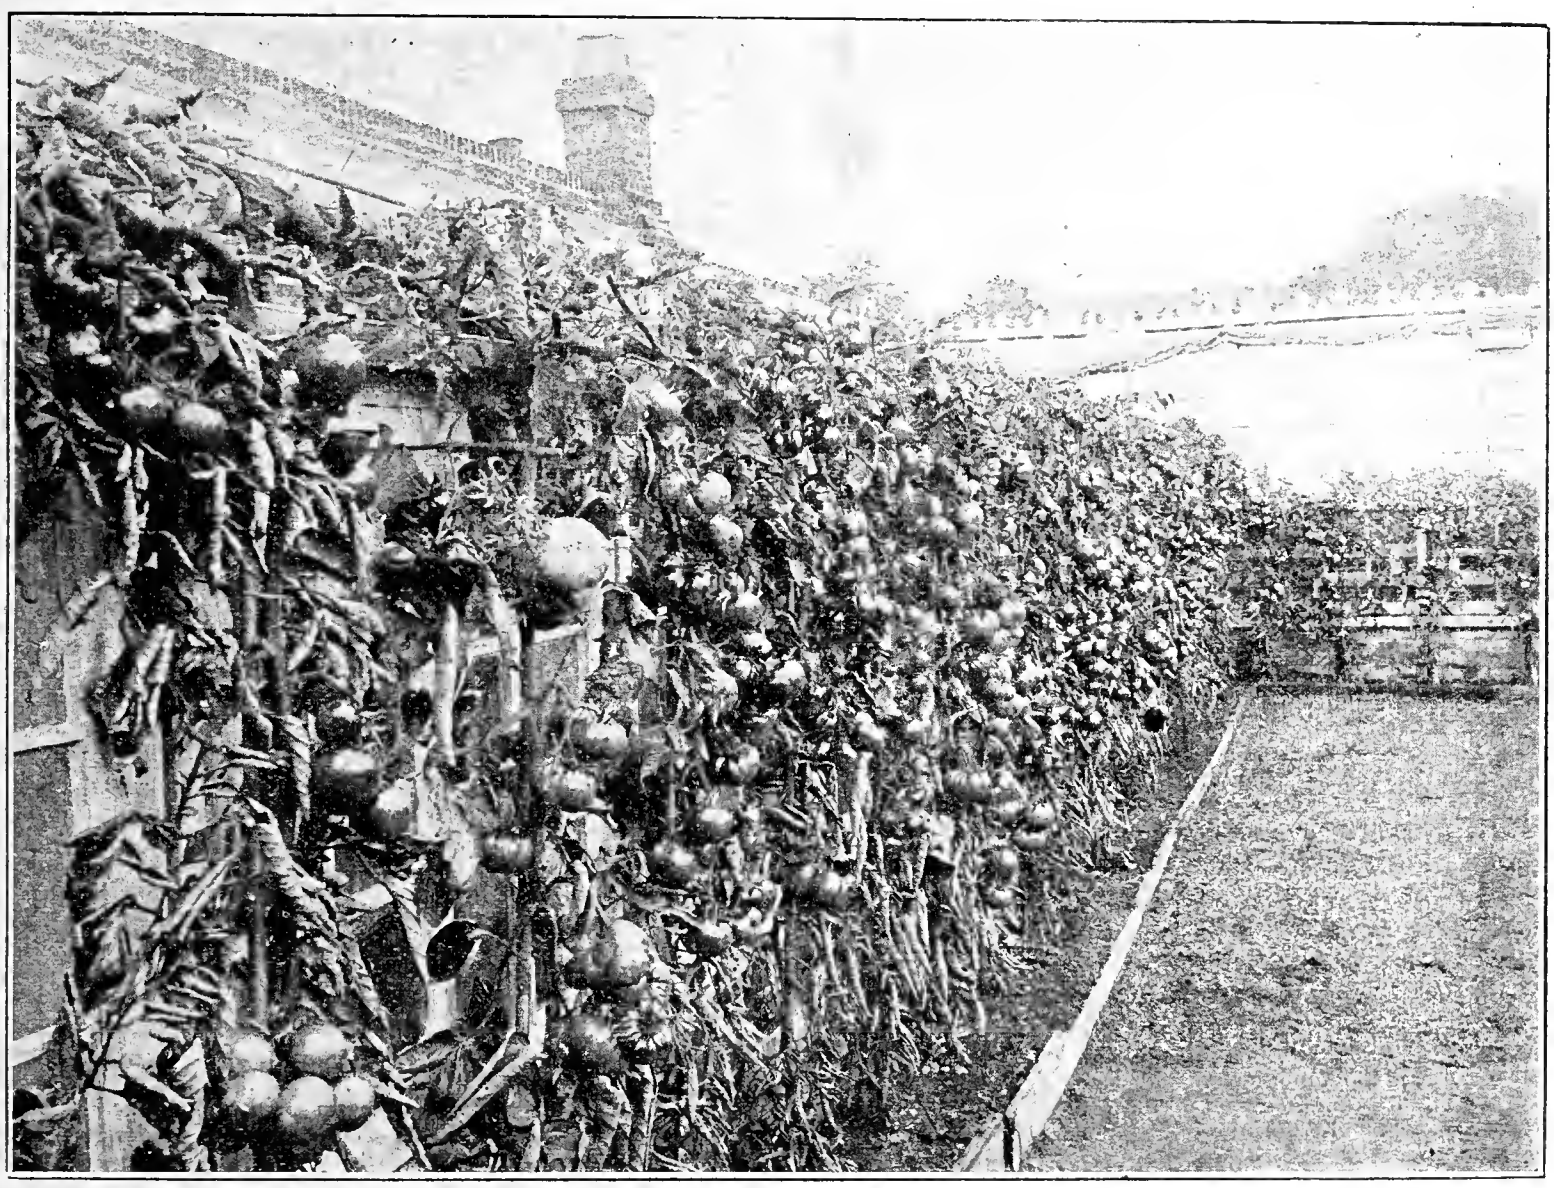

FIG. 84.—MR. EMPSON'S OUTDOOR TOMATOES.

Calanthe Veitchi splendens (W. H. White).—This is a variety of fine quality. The sprays are long and the flowers are borne very closely on them. The colour is very bright rose (award of merit).

Cypripedium Aeson giganteum (J. Veitch & Sons).—An enlarged and improved form of the type (award of merit).

Lælia anceps Mrs. de Barri Crawshay (de B. Crawshay).—A superb form of L. anceps. In all respects it is vastly superior to the type. The sepals and petals are rich purplish rose, while the lip is very deep velvety crimson. The throat is crimson veined on a pale primrose ground (award of merit).

Lælia Briseis (J. Douglas).—This is the result of a cross between L. harpophylla and L. purpurata, the former being by far the more conspicuous. The narrow sepals and petals are yellow, and the long narrow lip white with flushes of purple on the sides. The throat is pale yellow (award of merit).

Lælia Lindleyano-elegans (W. H. White).—The sepals and petals of this hybrid are pale sulphur in colour and very narrow. The small lip is rich crimson, and the throat white with a central crimson line (award of merit).

Lælia præstans superbum (R. W. Richards).—This is an excellent form of the type (award of merit).

Lælia rubescens (W. H. White and G. Cragg).—One of the most attractive Orchids in the show. The sepals, petals, and lip are all of a bright mauve colour (award of merit).

Tricopilia brevis (W. H. Young).—A charming Orchid that is comparatively well known. The short tubular-like lip is white on the outer margins and primrose yellow within. The sepals and petals are deep brown with yellow bars and tips (award of merit).

CYCLAMENS AND PRIMULAS AT READING.

THOUGH the name of Sutton had been to me as "a household word," it was not until a recent date that I was able to pay a personal visit to their establishment. Prior to this I had been in spirit, for my friends had spoken delightedly of what they had seen, and I had read from time to time of visits made by greater wanderers than I can ever hope to be. These served one purpose at least, they whetted my appetite, and caused me to make the most of an opportunity. Having been, and having seen, I will follow up my initial expedition into the town of Reading by a few notes of what I saw and admired.

Some persons may say "Why did you not wait for the summer and then go?" adding, perhaps, that there would be much more to see. To this I would reply that the man who does not seize an opportunity when it arises is—well, remiss, and further that the Primulas and Cyclamens were amply satisfying. More I might have seen so far as numbers are concerned, but a higher grade of quality would be impossible, at least such is my opinion. For upwards of a score of years I have been growing these two kinds of plants, but I have attained to no such excellence especially, perhaps, in the Cyclamens.

There were not half a dozen only, but hundreds, even thousands, of plants, filling house after house and presenting a lovely display. Here one would see a gorgeous mass of brilliant scarlet, there some scores of plants clothed with the purest white, yonder similar numbers of a warm crimson or a bright blue. And so one might go writing in general terms of what had been seen, but such is not the present intention. There was here evidently something to be learned from a cultural point of view, and my guide readily gave me all the information as to the methods of procedure that are adopted. Neither in respect of the Primulas nor the Cyclamens did it differ materially from the lines upon which I had worked, but the results were markedly superior. I shall continue to try my hand, and when I can produce plants superior to those of Messrs. Sutton & Sons I shall rest on my laurels in perfect contentment.

Of one thing I am assured, which is that cultivation alone could not possibly do everything. The best attention will do much, but it will not add every desirable attribute for which the florist looks to any plant. There must first be an inherent quality which high culture may accentuate and bad systems would almost suppress. In this fact lies the crux of the matter. The Reading strains of these two plants possess the best points that can be wished, and plants grown from them require skill and common-sense culture to bring these to the surface. With what the firm started many years ago I am not aware, but it is easy to see the advance that has been made even in the last half a dozen years. Then we should have said the summit is reached and no better can be produced. But Suttons recognise no zenith, and the work that was commenced in the long ago continues to-day with unabated vigour and surprising success. What the end will be none, I take it, will venture to say.

Looking for a moment at the Cyclamens, it will be conceded that it was not long ago considered a far cry from the persicum to the grandiflorum section, and yet since the inception of the latter both have made enormous strides. It is fortunate indeed that there is no confliction between these two strains—each can be grown to advantage in every collection. The former gives the grower small flowers in enormous numbers, and foliage so beautifully marbled that for it alone the plants would readily be cultivated; while the latter provides almost as many flowers of considerably larger size, but the leaves lack the handsomeness of the smaller and older section. It is therefore obvious that both must have a place in all establishments where Cyclamens are appreciated, and I for one would like to know where they are not. I shall not attempt a selection where all are so good, but must single out for special mention the deep-hued Vulcan and the delicate Salmon Rose. These are superb in all respects, but then so are the vast majority of the others.

Chinese Primulas for the embellishment of rooms, greenhouses, and conservatories in the winter are unsurpassed, and are probably only rivalled by the plants named in the preceding paragraph. The diversity of colour now to be found amongst the many varieties was not always a characteristic of Primula sinensis. At the present moment one may have any colour from pure white, through the shades of rose and red to the deepest crimson, with heliotropes and blues to swell the list. Again must the Reading firm be accorded its meed of praise and credit, for it is to its enterprise, persistency, and resource that we owe many of the most distinct varieties in cultivation. Ever since a commencement was made in the cross-fertilisation of varieties of Chinese Primulas the results have shown an advance. There have doubtless been failures of which the horticultural world has never known, but there has, on the whole, certainly been advance.

As the time of beauty amongst these, as with the Cyclamens, is but in its infancy for the present season, no selections will be made. Instead of this, everyone who can is counselled to go to Reading any time during the next two months, and behold the display for themselves. They will find many other plants besides the Cyclamens and the Primulas in which to take an interest. I have been once, but shall go again when I can, for the eye is pleased by the beauty of the flowers, while the mind is being enlightened out of the abundance of Messrs. Sutton's foreman's knowledge. —F. W. W.

A REJOINDER TO MR. J. W. MOORMAN.

IT is to be regretted that Mr. Moorman does not attempt to verify his figures before rashly rushing into print. Until very recently he was a member of the Committee, and if he did not know, the necessary knowledge could have been had for the asking.

The cash contributions of the Royal Aquarium to the N.C.S. during 1896, the year with which Mr. Moorman deals, were these :—

September Show	£50	0	0
October Show	75	0	0
November Show	275	0	0
December Show	50	0	0
Total...	£450	0	0

But there is something which does not strike a superficial observer like Mr. Moorman—*i.e.*, the cost of the four exhibitions to the Royal Aquarium Society. All the necessary staging, tables, and baize; the printing and posting of the bills announcing the shows; all the advertisements in the daily and weekly papers, with the exception of the few exclusively devoted to gardening, are provided for the N.C.S. without charge. The N.C.S. do not pay the costs of hiring the place for their shows, nor for attendants, police, lighting, music and moneytakers. They are free of the many charges incidental to hiring a hall; they are not worried by insurance agents and County Council officials. There is no demand in respect of damage or dilapidation. They are simply at the cost of the labour necessary to the staging arrangements, and the provision of the indispensable machinery of their own exhibitions.

Taking a low estimate, I put the cost of the four shows at the Royal Aquarium as something like the following :—

September Show	£75	0	0
October Show	75	0	0
November Show	150	0	0
December Show	75	0	0
	375	0	0
Add Cash	450	0	0
And the result is	£ 25	0	0

As against Mr. Moorman's £300!

I hold that I have placed the cost of each show at considerably less than that which would have to be borne by the N.C.S. did they have to defray the whole amount. Let Mr. Moorman and those who think with him ascertain the cost of hiring nearly 5000 superficial feet of tabling and baize (the quantity provided at the recent November show), and add to that the cost of labour in erecting it. The growlers are ignorant of the charges incidental to carrying out a large flower show in London as a financial speculation; it is this formidable amount, added to the labour, vexations and worries, which has led me to determine to have nothing to do with any project of the kind unless the entire cost were guaranteed beforehand.

If Mr. Moorman would only take the trouble to examine the last published schedules of prizes he would find it distinctly stated that the Royal Aquarium Company give £50 towards the Dahlia and Gladioli prizes at the September show; but as the Committee prefer to consider this particular exhibition as held by the Royal Aquarium Company and not by the N.C.S., the Society's funds is not credited with this £50; on the other hand, the amount of the Dahlia and Gladioli prizes, a proportion of the Superintendent's expenses, luncheon to the Judges, are not debited to the Society.

There are other points in Mr. Moorman's communication equally imperfect or erroneous, and misleading. At the special meeting of the General Committee to which he alludes in paragraph 4, page 553, he insinuates that the officials quashed the proceedings. Nothing of the kind. A sub-committee of three members was appointed to look for suitable places in which the exhibitions of the Society could be held, and report. They never once met or attempted to discharge the duties they undertook to perform. If I may presume to regard myself as one of the "higher officials," I admit I distinctly stated I should cease to be the Secretary of the Society if its shows were removed from the Royal Aquarium, and I said this in reply to a direct question, or I should not have given expression to this determination. I did not in any way oppose the appointment of the committee of inspection; I simply refused to add to the labour incidental to the secretaryship by acting upon it.—RICHARD DEAN, *Secretary National Chrysanthemum Society.*

FREEDOM FOR THE N.C.S.

WELL-WISHERS of the National Chrysanthemum Society must welcome the discussion which has arisen in the pages of the *Journal of Horticulture* concerning the Society's humiliating position in relation to the Royal Aquarium. The letter from Mr. Moorman last week reviews the subject in an impartial and comprehensive manner, and few men are so well qualified to deal with it as your correspondent. He has had long

experience in connection with shows as an exhibitor, as a judge, and as an active working member of committees, his energy and business aptitude having rendered his help valuable in many ways.

It cannot be possible that the officials are unaware of the inconveniences attending the shows at the Aquarium, nor can they be ignorant of the strong feeling there is throughout the country against holding exhibitions under such circumstances. It is notorious that some of the finest collections of cut blooms and plants ever brought together for competition in Great Britain have been practically ruined as exhibits by the inadequate space for arrangement. Visitors who appreciate the excellent work done by the Society, and who recognise that the N.C.S. officials do their utmost to make the best of such opportunities as they have at their disposal, cannot fail to be distressed at the results when they visit the Aquarium shows in the afternoon or evening.

How the Committee and members have endured the alliance under such conditions so long it is difficult to understand, and how a Society which takes the title of National can be content with such a policy of nervous dependence upon another institution is quite beyond general comprehension.

The great argument against a change is, that besides the contribution to the prize fund, which would be lost, the N.C.S. takes no risk. If the weather prove unfavourable and the attendance be small, the Aquarium Company are the losers and not the Society. But it is obvious there is another side to this argument, for what becomes of the profit when the visitors crowd every portion of the building, as they do at all the November shows? I have never seen the Aquarium so crowded, except at holiday times, as it is on the occasion of the N.C.S. principal exhibitions, and it is certain that it must give substantial results, or a body of business men would not contribute £200 or £300 for the sake merely of encouraging the cultivation of the Chrysanthemum. Probably they do not gain over the October or December shows, but they make it up in November, or they would not have continued the arrangement so long. The fact is the Aquarium Company manage to secure a very important addition to their attractions at much less outlay than many which they provide, and with not half the risk or trouble. Surely, however, the N.C.S. was not founded for aiding in the support of an institut on of this kind, and the profits derived from the immense amount of work performed by the members in producing such large numbers of excellent productions for exhibitions, should be applied entirely to the cause of the Chrysanthemum.

With the reputation the N.C.S. now has it could hold a show anywhere in the London district and insure a large attendance. If a permanent home could not be secured, why could not the shows be held in different metropolitan centres every year? It would be quite possible to find ample accommodation in different directions if it were really desired to do so, and many believe that the Society would receive more substantial support than it does now if such an independent and self-reliant policy were adopted. Unquestionably it would redound more to the credit of a society which has grown to be an horticultural power second to none devoted to a special object. The strength possessed in its long roll of membership, and its prestige, render it all the more pitiable that the Committee should rely so weakly upon an institution absolutely foreign to the purpose and intent of the National Chrysanthemum Society. —Ex-Official.

I SHOULD not have taken any farther part in the discussion which has arisen in your columns with respect to the N.C.S. shows at the Westminster Aquarium but for the receipt of an ordinary letter from a well-known gardener at Reading, who, at the close of his communication, referring to the November show, said "the crush was worse than ever, and there was no chance whatever of seeing the principal exhibits after the morning, except in St. Stephen's Hall, which is a fine room if only it was better lighted. Still few people seemed to find it. There being a cheap trip to London from here on the 10th, five of my men went up to see the show, but they all next day complained of being unable to see anything because of the crowd and the place was so full of smoke. It is really disgraceful that smoking should be allowed at all."

This is the testimony of no partisan or purist, but of a plain, practical gardener, and it is that of thousands of others who are not members of the executive or do not hold briefs for the place. That six persons from one garden only should have come over thirty miles to London expressly to see the show illustrates the undoubted fact that by far the greater portion of those who attended the show go expressly to see the Chrysanthemums and not the variety performances. Is it probable that they would go from an area of certainly fifty miles round London to hear a woman squeal through her nose, or see a man make an ass of himself, or the shouting and hullaballoo that makes the whole place so hard for a flower lover to endure? No one seems to think how many thousands of people keep away from the show which they cannot see and enjoy. Why is not that fine St. Stephen's Hall fully utilised for the purpose? Is it because it keeps the visitors too far away from the reserved seats? —A. D.

P.S.—Since writing the above I have read Mr. Moorman's letter to you. It is one of those documents that is at once convincing and unanswerable. It is specially satisfactory to obtain such information from one who is thus behind the scenes. Still farther does it show how strong is the objection to the R.A. as a place for the Society's shows, entertained by many members of the executive. The side lights thus thrown on the subject at issue are invaluable. I have often wondered why a Society calling itself "National" should not include in its executive any of those gentlemen who in various parts of the kingdom have shown deep interest in the cultivation of the Chrysanthemum. Is their absence due to the distance from the place of show? Very likely officials may feel in a friendly way bound to the R.A, but the N.C.S. does not exist, neither was it originated, to exploit a glorified music hall. —A. D.

I THINK responsible officials of the N.C.S. are very short-sighted in sticking to the Aquarium. They might have a distinguished, fashionable, and wealthy list of members and larger funds if a more suitable building could be found. I sent tickets to some friends this year. They met me at the Aquarium, and I was really ashamed to introduce them into such an atmosphere of smoke. I am a smoker myself, and would not be thin-skinned about allowing it in reason, even at a show, but I do not see how it can be avoided in volume at the Aquarium. It is objectionable to many, and prevents many from going, especially ladies. I am very sorry it is so, and not to observe any signs of improvement, but the reverse. More and better space was formerly placed at the Society's disposal, and the shows were decidedly better displayed and certainly more enjoyed than they are now. Such crushing, pushing, and huddling cannot, I think, continue without prejudice to the Society. – A Member of the N.C.S.

N.C.S. Floral Committee.

The last meeting for the present season of the Floral Committee was held on Monday, the 13th inst., Mr. Thomas Bevan in the chair. On this occasion there was not a single exhibit of Chrysanthemums, this experience being almost unique in the history of the Society. A flower-pot was submitted for adjudication, having a narrow and shallow channel running round the rim of it. The object of the channel is to prevent earwigs from getting on the plants. However, this was generally considered quite inadequate for the purpose, as during very hot weather the channel would have to be filled repeatedly, and also was too small for the purpose.

A resolution was moved altering the number of blooms to be submitted of any new variety to two only, instead of three as formerly. This was, however, lost. A vote of thanks to the Chairman for his services during the past season was unanimously carried.

In the evening the Floral Committee dined together as the guests of the General Committee at the Royal Aquarium Tavern, under the presidency of the Secretary, Mr. R. Dean. A goodly number were present, and an enjoyable evening spent.

Popular Varieties of Chrysanthemums.

A table showing the number of times certain varieties were exhibited at eighteen of the principal shows may be of interest and utility to many readers, as now is the time to purchase anything new to lay the foundation for a successful flowering season. There have been no less than 110 varieties exhibited. The table has been taken from the winning stands of twenty-four Japanese, and duplicate blooms are counted as one.

The following varieties were shown once:—G. J. Warren, Julia Scaramanga, Mons. Bernard, M. de la Rocheterie, J. Seward, Richard Dean, Mrs. Dr. Ward, C. W. Richardson, Lady Dorothy, Prefet Robert, W. Fyfe, La Colosse Grenobloise, Mons. Gruyer, M. Demay Taillandier, Mrs. H. Kloss, Mrs. E. Tate, General Roberts, L'Isère, Madame Rozain, Mrs. C. Orchard, M. Gerard, Elthorne Beauty, Queen of Buffs, Jno. Shrimpton, Beauty of Teignmouth, W. G. Newitt, Violetta, Robert Owen, Mons. Ed. André, H. H. Spencer, Madame Ad. Moulin, A. H. Fewkes, Rose Wynne, Ialene, Snowdon, Deuil de Jules Ferry, Sunstoue, Duchess of York, Mrs. F. A. Bevan, Waban, Golden Gate, Duchess of Wellington, Floreuce Davis, Stanstead White, Wm. Seward, Eda Prass, Louise, and Mephisto.

—A. E. Raisbeck, *The Gardens, Benton Hall, Newcastle-on-Tyne.*

Timing Chrysanthemums.

May I suggest, for the benefit of myself, and no doubt other readers of the Journal, that Mr. E. Molyneux, or some other experienced Chrysanthemum grower, give a list of, say, sixty of the best Japanese Chrysanthemums (old and new) to grow for exhibition cut blooms; also indicate any that require stopping and when, and which bud to retain?

It is very disappointing, after having grown plants for twelve months, to find the season's trouble and expense thrown away by not knowing the exact treatment of certain varieties. I have mismanaged old ones this year. For instance, I took some on the crown bud that I ought to have taken on the second crown; and, again, I have taken second crown buds where I ought to have taken crowns.

Only being a grower of 200 plants, and wishing to make the best of these, a little advice as to the selection, when to stop, and buds to select would be very acceptable, so as to have them all as near as possible in full bloom together by the middle of November in the West Riding of Yorkshire.—William Bowman.

Appointments of Judges.

May I be allowed to make a suggestion that I feel sure, if adopted, would be of great service to a large section of your readers who are interested in Chrysanthemum exhibitions? That is, to ask you to devote a space under the "Exhibition Notices," signifying what judges had been appointed to adjudicate at such exhibition. We know that, as a rule, as soon as the N.C.S. date is fixed for the principal November show, the leading provincial societies follow on in chronological order, avoiding each other if possible. But many are obliged to clash, not being able to sandwich themselves between others they would like to avoid.

After the date of the exhibition is fixed, the next important thing in most societies is to appoint judges, and it often occurs that the persons chosen by the committee have already been engaged by another society, and even the reserve man has been engaged also. This means much correspondence on behalf of secretaries and judges, and very often delay in publishing schedules; whereas if there were some authority they could refer to, it would save no end of inconvenience and time.

If it is practical I should suggest something in this order:—

Chrysanthemum Exhibitions.—Judges Engaged in 1898.

Hull, Nov. 16th and 17th.—Messrs. G. Gordon, Ed. Molyneux, J. W. Moorman, and J. Wright.

This would facilitate business, and be of immense service to those directly interested in making arrangements for the autumn exhibitions, and their names is now legion, so many springing up in every county. I feel sure secretaries and judges themselves would keep you posted up as soon as the engagements were fixed. I already have had to refuse engagements for next season on account of being engaged for the dates, as have no doubt some of my fellow judges.—C. Orchard, *Bembridge, I.W.*

[We can only publish such notifications as come to hand, as in the case of Hull. Our excellent correspondent and able chrysanthemumist omits his own appointments. Mr. Wright wishes it to be known that he does not desire fresh applications, though he will endeavour not to disappoint the few societies at whose shows he officiated this year if his services should be required.]

Naming Chrysanthemums at Shows—Prize Cards.

I was pleased to see "E. M." calling attention to the laxity of naming blooms (page 557). It is grievous to see the very slovenly way this is done at many excellent exhibitions. The wrong or imperfect naming of a variety does not end at that exhibition, but is very often perpetuated and carried on through others by young beginners taking the names down and feeling safe in being correct after passing the ordeal of the keen eyes of judges at an exhibition. I remember once having to disqualify a stand of blooms that should have been distinct for containing duplicates. It subsequently turned out to be that of a "young beginner," and he assured me that he had copied the names from a prize stand at an exhibition he had attended, and procured his cuttings from the same source, so he was more to be pitied than blamed. I certainly think it of very great importance for the Chrysanthemum world at large to have all the varieties legibly and correctly named.

There is another reform that I should like to see at some of our most excellent and leading societies, that more concerns the executive than the exhibitors. That is, the mode of displaying the prize cards. In the majority of cases the card is pushed in between the blooms, or under the board in front, or laid on the top of perhaps the finest bloom in the stand. If there should be a prize for the premier bloom in the show, the award card has either to be placed immediately on the top of the flower itself or laid on one near it, and the general public often wonders which it is intended for. Although in the majority of cases the premier bloom is elevated a little higher than the rest, the great B.P. does not know what the judges and the committee know, so constant inquiries are solicited, or mistakes are made, or people go away in ignorance.

The plan adopted in some societies and which we used to practise at Kingston-on-Thames was to have the card elevated on a wire support fixed to the back of each stand, so that the names could be very plainly seen. All cards were so displayed whether the blooms were prizewinners or not, so that it made it doubly interesting to the public to see, not only who were the winners but who were exhibiting. Many excellent stands of blooms in a strong competition contain flowers but very few points removed from the first prize lot, and of which the exhibitors not only need not be ashamed, but would like their friends to notice, though very often cannot because the card was out of sight, and they could not observe who was the exhibitor.

If executives could pay more attention to this matter by making the necessary arrangements for a person to fix and elevate all the cards by following after the judges, the show would be doubly interesting to the visitors who are immediately interested in the exhibits, and to the public at large, besides adding greatly to the effect of the exhibition as a whole.—C. Orchard.

Single Chrysanthemums.

A very extensive, as well as successful, grower of these pretty flowers is Mr. Forbes, gardener to Madame Nichols of Surbiton Park, near Kingston. Beyond growing all the best varieties in commerce, he has succeeded in raising a fine collection from seed. Last winter he found a plant of Purity carrying what promised to be a good cluster of seed, and knowing how long a time is required to enable seed to mature, placed the plant in a warmer house, and kept it there till the end of January. By that time the seed was plump and ripe. It was then gathered, and sown in a shallow box on sandy soil, and placed in heat. Very soon the seeds germinated, and growth was excellent. The seedlings were shifted singly into small pots, then into others rather larger, and in June were planted out into a solid block, rather close together, in a sheltered and warm part of the gardens. Here, when in the autumn they showed bloom, a rough cover was erected, over which mats could be thrown at night, and so cared for the plants bloomed capitally. Out of the several dozen seedlings at least twelve have been found so good and varied as to be specially propagated for a further trial. It is interesting to find that, although the seed parent Purity is a pure white, and there was no effort at intercrossing, several diverse hues of colour have resulted. Semi-doubles are not good singles, and these, it is hoped, will soon be removed from the lists. Such singles as Purity, Earlswood Beauty, Admiral Symonds, Captain Felgate, Miss Rose, and Duchess Elizabeth are of the most pleasing forms.—A. D.

Chrysanthemum Notes.

"W. S." (page 557) draws attention to the value of groups of Chrysanthemums for providing interest and beauty in an autumn exhibition. Those opinions I cordially endorse. Even at such a fine show as that recently held in Edinburgh, the remark of how some representative Chrysanthemum groups would have added to the interest and splendour of so good an exhibition were frequently heard. Of course there were groups of Chrysanthemums at that particular show, but not what might be expected. Grouping, no matter how well done, cannot be so popular among so many growers as cut blooms. The cost of transit is a serious item, and it is not every gardener who can provide the material at that season of the year. Groups of Chrysanthemums alone at Birmingham, Ascot, Winchester, Kingston, Windsor, Brighton, and York, have been so invariably of high quality for years, that if no other feature were presentable the fame of the groups alone would have made a reputation for the societies named. Equally so at Hull, Lincoln, Birmingham, York, and at the National Chrysanthemum Society's exhibitions have the combined groups of Chrysanthemums and foliage plants won for the societies a reputation.

Much as I sympathise with the exhibitor of cut blooms, it is idle to disguise the fact that the finest exhibit of cut blooms ever seen fails to make a display equal to that of one of the Hull groups. Visitors to the shows of the Chrysanthemum Society of Portsmouth, held in the huge Drill Hall, lamented the bareness of the walls created by the paucity of the groups, and instances might easily be doubled, if it were necessary, in favour of groups as a means of embellishing the exhibition buildings. It would certainly be advisable if some societies were to increase the value of their group prizes, even at the expense of reducing the number of classes of cut blooms. The continued repetition noticeable in the schedules of some societies of twelve and six Japanese blooms, only tends to satisfy the cravings of exhibitors without adding to the beauty or interest of a show. Committees would find, by a judicious cutting up of these useless classes, and a substitution of others, that greater interest would be taken in the show annually by the contributing visitor. For the benefit of the latter the executive ought to have some consideration.

It may be urged by those responsible that anything new in the way of Chrysanthemum classes is difficult to suggest. For the last two seasons the executive at Hull have embodied in their schedule a class that is quite new, and one that appears to be coming popular with exhibitors and visitors alike. I allude to the following class—"A drawing-room mirror, or panel, group of Chrysanthemum plants interspersed with foliage plants arranged for effect in a space of 9 square feet." The Society provided the mirrors, which were 3 feet wide and 7 feet high, and also stipulated that the decorations must in all respects be carried out as if in a drawing-room. As each of the seven competitors arranged their groups in a dissimilar manner much interest was created in this one class.

"W. S." also suggests special classes for blooms of one colour, but in variety. As the Editor remarks, these special classes, if I may so term them, were effectively represented at Winchester as well as at the N.C.S. November meeting. In Edinburgh not only do they have classes on similar lines, but also for special varieties, six of each. For instance, Charles Davis, E. Molyneux, Duchess of York, and Madame Carnot are specially catered for. At Exeter special colours are provided for and interesting results are obtained. Single varieties are referred to also by "W. S." As plants they are seldom seen at shows, but in a cut state their number is on the increase. At the show of the N.C.S. held

on the 6th inst. single-flowered varieties were quite prominent, although I cannot say they possessed very much merit. The excuse for this latter was no doubt the lateness of the season. At many provincial shows I have seen really interesting exhibits of this section, and found them most favourably spoken of by the general body of visitors.—E. MOLYNEUX.

CHRYSANTHEMUM NOTES FROM WALES.

WELSH Chrysanthemum growers must surely be a very modest class, at least judging by the small space they occupy in your weekly columns. It may be safely said, however, that if they do not scribble much themselves they benefit by the scribbling of others, for I find the Journal frequently within reach of the potting bench, where Mr. Expert's tip may be found as to the taking of a certain fickle variety's bud, or which of the up-to-date varieties are really promising and should be added to stock.

The Welsh grower is too far removed to watch and select for himself such new varieties as can only be exhibited at a very limited number of shows. Not that he is far behind either as an exhibitor, as many of our best judges will testify from their experiences at such annual exhibitions as Cardiff, Carnarvon, Wrexham, and others, to say nothing of the occasional friendly excursions made into English territory, notably Bristol, by such doughty champions as Mr. J. Dumble of Picton Castle, Mr. Mabbott of Dowlais, and Mr. Drake of Cardiff. Mr. Dumble is, by the way, a master hand at incurved, and his beautiful stands of these have on several occasions pulled him through with flying colours, where probably his Japs would have failed him. Mr. Dumble took the premier prize at Cardiff, winning for the second year, and thus finally, the challenge cup offered by the Society. This also is the second cup won in the same way by him at Cardiff.

Mr. Mabbott, whose name is already mentioned, works under great climatic difficulties at Dowlais, but has nevertheless done remarkably well. Such foliage as his plants carried I have seldom seen. I think the Editor saw these, for if my memory serve me rightly a note appeared in the Journal about them. Unfortunately Mr. Mabbott, like many more, has suffered from the terrible fogs and damp, but not before his plants had demonstrated fully that good foliage meant in his case good blooms too.

Mr. J. Howe is another enthusiastic Welsh grower who has done wonderfully well at Cardiff for a few years past, but was, unfortunately, unable to show this season, to his very great regret, his blooms being exceedingly good, and his mind being bent on some of the plums of the show. Doubtless had he been allowed to stage, several decisions of the Cardiff judges would have been different. He has of late been at Lanelay, and we have now to congratulate him on his appointment to Dulwich House, where he will no doubt have every encouragement to cultivate his favourite flower.

From Cardiff to Beaumaris is a far cry, but in this lovely corner of the Isle of Anglesey is Mr. Howard, who took all the leading prizes at Carnarvon Show, and might, with great advantage to himself, have ventured much further afield. His blooms, both incurved and Japanese, were of the highest order—large, but not coarse, his stands embracing all the leading sorts. Near at hand is another young but good grower, Mr. Wright, gardener to the Marquis of Anglesey, whose collection has been greatly admired this season.

Growers on the borders, such as Mr. West of Bettisfield Park, who has done so well at Manchester; Mr. Robinson of Brampton Bryan, who is a familiar figure at Hereford, Leominster, Cardiff and Wolverhampton; Mr. Spencer of Goodrich Court, Mr. Townsend of Aston Hall, Mr. Roberts of Halston, and a host of others, practically Welsh growers, are well enough known to your readers. Suffice to say then that their fame has not diminished, though in the case of the last named a bereavement in the family which he serves has unfortunately interfered with his exhibiting arrangements.

Among shows which have not been chronicled in the Journal, a promising one held in the Gymnasium at Newport, Mon., deserves notice. It is the offspring of an old and less pretentious parent at Maindee, and the evolution is a natural and desirable one, such an outlet being necessary among so large a gardening community as a good local show. Cut blooms, trained plants, and groups were really good, and among the successful exhibitors were Mr. J. Lockyer, Pontypool Park, who was also conspicuous at Monmouth, Hereford, and Cardiff; Mr. J. Grisdale, The Gaer, a young grower, who has had large experience as foreman among a noted collection of Chrysanthemums; and Mr. Allen, a successful amateur grower from Penarth. Effective groups were shown by Mr. Sharratt, Stow Park; Mr. Powell, Chesterholm; Mr. Steadman, Maindee, and others.

Another show capable of being, and likely to be, extended much in the future is Swansea, where most excellent examples were crowded into a building much too small. Here we notice the veteran grower Mr. Hawkins of Hendrefoilan and his young rival in the Chrysanthemum arena, Mr. Gilbert of Baglan Hall, late foreman to Mr. Lees at Barnet. Mr. Gilbert is fast making himself a name in South Wales as a first-rate grower and a genial neighbour. Mr. R. C. Williams of Crosswood, too, was conspicuous as usual. We have not had the good fortune to see Mr. J. Lambert's collection at Powis Castle this season. No doubt they were worth seeing, for Mr. Lambert has not cast aside his old love, nor has he lost his cunning.

The season has been exceptionably favourable to the outdoor plants, and both in quantity and quality (and colour especially) they have been a grand success, particularly so in cottagers' gardens in the more rural districts.—BRADWEN.

CHRYSANTHEMUMS—NATURAL-GROWN FOR EXHIBITION.

MANY will no doubt agree with me, that it is chiefly owing to the gigantic prizes given for large blooms at the various shows throughout the kingdom that such grand results have been attained.

Now this has been achieved, I think committees of Chrysanthemum shows would do much good if similar prizes were offered for naturally grown Chrysanthemums. I for one do not appreciate the ungainly looking specimens, trained as flat as a pancake, with about 100 sticks stuck in, for at the best such plants have a very unnatural appearance. Now, as we all know, at the present time there are grand dwarf varieties in the field, therefore I would like to suggest that societies give thoroughly good prizes for the best twelve plants in six varieties grown in 8-inch pots, such plants not to exceed 2 feet 6 inches from the bottom of the pot, and each to be carrying twelve blooms. I would leave it an open question whether such plants should be grown on the one-stem system or not.

It will require some taste and skill to grow twelve such plants with good foliage down to rim of pots, and growers of large flowers would have to leave the beaten track, and adopt another one. I feel certain such specimens would find many admirers, both at shows as well as at home.—A. J. LONG, *Wyford Gardens, Reading.*

POMPON CHRYSANTHEMUMS.

THE value and attractiveness of these lovely free flowering "gems" are each year becoming more apparent. To cut flower arrangements they give the necessary lightness and variety of form, when associated with blossoms of bolder type; and when really well grown plants are produced in pots they find a ready sale. It is useless to grow "leggy" plants with the object of selling them as pot plants, but the man who turns out bushy specimens in small pots, furnished with deep green leaves throughout the entire length of stem, can afford to laugh at the forebodings of pessimists.

I do not intend, however, to champion the good qualities of this section of Chrysanthemums in opposition to those which produce larger flowers when grown in the same way, or even to write disparagingly about the huge, grand flowers modern gardeners and exhibitions provide for both public and private enjoyment. Chrysanthemums of every form are to me "things of beauty," which spread brightness throughout the land at a season when above all others it is needed. The flowering season of Pompons is somewhat earlier than that of other types of Chrysanthemums—excepting, of course, those similar in style to Mdme. Desgranges—and during September and October gardens as a rule are none too well supplied with flowering plants in pots. When those two months come round, how often may gardeners be heard remarking (after seeing a collection of well grown Pompons), "Ah! I must grow a good batch next year." Yet, through some cause or other, the following season finds them in about the same position in regard to a supply of these dainty "midgets" of the Chrysanthemum world. The insertion of Chrysanthemum cuttings is now in progress throughout the country, and these notes are intended as a reminder to those who have made a mental note to grow Pompon, as well as to draw the attention of others to their great value.

As they are the most useful when grown in 5 or 6-inch pots, I find January is quite early enough to insert the cuttings. If large numbers are required they can be rooted quite easily in boxes, but I usually employ 5-inch pots for the purpose, placing the cuttings an inch apart round the edges of the pot, and from three to five in the centre. If room can be spared in a house in which a greenhouse temperature is maintained the cuttings will root quickly when placed under a hand-light and kept close. I have, however, for some years rooted the whole of my Chrysanthemum cuttings in cold pits, and I find by following that plan the plants are invariably very sturdy, and thick in the stem at the collar. I prepare the pits by placing in them leaves to a depth of 3 feet. These are trodden very firmly, and covered with a few inches of sawdust or cocoa-nut fibre for plunging the pots in.

After giving one good watering it is a long time before more is required, provided the pit is kept close, and shaded if a few bright days occur. In the event of a succession of foggy or wet ones it is sometimes necessary to tilt the light slightly to dry up moisture. The only covering I give in severe weather is a double thickness of mats, and although the soil in the pots is sometimes frozen hard, I scarcely lose a cutting, though of course in the event of a continuance of severe weather they are rather late in starting their growth; but I think it is better to have them in that condition than to force them on in houses and then coddle them in pits till they become "leggy," because the weather in April is too severe to place them in the open air.

When the cuttings are well rooted I place them in pots 3½ inches in diameter, and as soon as they are ready for potting, I like to put them into their flowering pots at once, pressing the soil firmly during the process. About the first week in June the pots are plunged in coal ashes, a sufficient distance apart to allow a clear space between the shoots when they are fully grown. If treated in this way and well attended to in the matter of watering, as well as feeding with artificial and liquid manures, well flowered, sturdy, and healthy little specimens will be the result. After the blooming period is over many of the old stools are planted in a warm position in the open air, where they supply quantities of flowers for cutting, as well as young plants for increasing the stock. In regard to varieties, the following selection will be found to include some of the very best.

Early Flowering.—Alice Butcher, red, shaded orange; Anastasio, light purple; Blushing Bride, rose-lilac; California, bright yellow; Flora,

golden yellow (grand in every way); J. B. Douvoir, white, shaded lilac rose; La Petite Marie, white; Martinmas, pink; Miss Davis, pink; Piercy's Seedling, bronzy yellow, one of the best; Précocité, yellow, and White St. Crout's.

Later Flowering Varieties.—Aurore Boreale, orange bronze; Black Douglas, dark crimson; Bob, crimson brown; Cedo Nulli, gold; Comte de Morny, bright purple; Florence Carr, bronze, gold tips, a pretty flower; Golden Mdlle. Marthe, fine; Kyrle, crimson and yellow; Mdlle. Elsie Dordan, rose pink; Maid of Kent, white; Miss Wheeler, carmine; Nellie Rainford, buff; Prince of Orange, orange amber; Snowdrop, a pretty white; Sœur Melaine, pure white; William Payne, bronzy orange, fine; and St. Michael, rich golden yellow.—CHRYSANTHA.

CARDIFF CHRYSANTHEMUM SOCIETY.

"ON Wednesday last between forty and fifty members and friends met to celebrate their annual festive gathering, the chair being taken by Mr. F. G. Treseder, who was supported by Councillor Gerhold, Hon. Treasurer; and Mr. H. Gillett, Secretary. The usual toasts were given, and the Chairman, in responding for "The Society," stated the late show, although not quite so extensive in exhibits, was never surpassed for quality. Councillor Gerhold also responded, and added a few seasonable words of encouragement to the Committee and exhibitors. The Secretary gave a few statistics, and said there would be a small available balance. During the year the Committee have had twelve meetings, and the average attendance of members had been twenty. The town unfortunately lacks a suitable hall for holding the annual show, and besides they have to pay a heavy rental for the two days, which makes a serious inroad on their receipts.

IMPROVING DISEASED PEAR TREES.

OF the specimens submitted by "Young Hand" some are infested by two and others one species of parasitic pests. The twigs are infested in this and last year's wood by brown rot fungus (Sclerotinia fructigena) in the mycelial hyphæ condition. This permeates the cambium (formative layer between the inner bark and outer wood) and alburnum (outer layers of young wood), ruptures the cortex (bark), and produces the first fructifying stage of the parasite — namely, conidia or spores. These spores go forth, and alighting on fruit germinate under favouring conditions of air moisture, and push the germinal tube into the tissues, giving rise ultimately to brown rot—that is, the affected fruits become brown, and afterwards dense downy tufts appear on the surface, often growing in circles, white at first, then dingy red. In this stage the fungus is known as Monilia fructigena, and has spoiled Pears by the bushel.

Some of the shoots have the current year's growth destroyed, and in others the base of this year's wood is swollen to twice its normal size, and in this, in the cambium and adjacent young wood, is seated the mycelium. This spreads, until it girdles the shoot or branch, causing its collapse, the bark having a scarified appearance, but never exposing the wood as in ordinary canker. There is also some scale on the twigs—the mussel scale, Mytilaspis pomorum, now in the egg state. This, however, has nothing to do with the canker.

The roots are for the most part dead, as might easily have been ascertained by slicing off the bark here and there. They are Quince roots, and it is not uncommon for these to die in heavy soil, unless it contains a large amount of gravel.

What can be done to improve the trees? It may be that the soil is unsuitable for the Quince. Many soils have to be improved, and the way to make a strong loam fertile is to first of all drain it, get the water out and air in to a depth of not less than 3 feet, having the drains about 5 yards apart; then remove the ameliorated surface soil down to the clay, and either take this away or burn it, mixing one-third with the soil removed, and put the rest back as ballast for drainage, keeping the ameliorated soil on the top as before with the finer of the burnt clay mixed with it as stated. If the clay is not burnt, which is strongly advised, put in a foot in depth of brick rubbish from an old building for drainage. It is best screened through a half-inch screen, using the rough for drainage and the screenings for mixing in the soil, one-third not being too much, and 15 to 18 inches depth of soil over the drainage is deep enough for Pears on the Quince. Make sure that the border is not a pit for holding water, having a drain to carry it away. In the absence of old building rubbish, loose gravel (not binding) will be found serviceable.

The trees will have to be lifted and laid in whilst the border is made ready. It need not be more than 4 feet wide, or if a high wall, 6 feet. Cut away all the shoots or branches which are cankered all round to sound wood, making clean cuts, and dress every part with a wash formed of caustic soda (98 per cent. purity) and commercial potash, 1 oz. each to 1½ gallon of water, applying with a clean half-worn painter's sash brush, wetting every part, and working gently into the cracks as a painter does into rough parts of woodwork. When convenient the solution is applied at a temperature of 130° to 140°, but it has been found effective when cold.

The roots if matted must be thinned, dead parts removed, and the long healthy roots shortened. Replant carefully, adding wood ashes and a little well decayed manure, for the Quince enjoys humus, and mulch with farmyard manure, about an inch thick. Secure the branches to the wall, and the trees may be expected to prosper.

Another plan we have seen tried in the open and against walls with Pears on the Quince on a stubborn clay was lifting the trees, removing the good soil, providing a foot of drainage, and planting the trees over it with a third of opening material mixed with the top soil. The trees were thus on mounds, and they did well assisted by summer mulchings. On the flat the trees, especially Louise Bonne of Jersey, cankered in stem and fruits. On the mounds the mulching, watering, and feeding enabled them to produce fine fruit, while the sound, healthy growth of the trees did not seem favourable for the attacks of their enemies.—G. ABBEY.

RASPBERRY CULTURE.

IN many gardens, both large and small, it is a frequent thing to find the Raspberry bed in some out-of-the-way corner. This was more commonly the case some years back than it is now, but still I think this luscious fruit scarcely gets its due. The canes, often too numerous, are twisted closely together, many fruiting buds being thus rubbed off or crushed, also no light let into the canes, and the worst of all the grower diligently once a year digs the ground deeply and brings to the surface and removes to the refuse heap great quantities of roots. By this pernicious system the old stools are left standing high up like islands, with no roots save those immediately under them.

In preparation for Raspberries choose a fairly good piece of ground; if under the shade of trees never mind, for our humble friend the Raspberry naturally takes shelter under some growth more imposing than itself. Clear the ground, manure it, and be sure no Raspberries have been ever planted there before, because they in time "grow sick of the same soil." Draw a straight line for a row. At the one end put a stout post (3 feet 3 inches above the ground), a similar one at the other end, and one or two, according to the length of the row, of slighter dimensions between. Run along a piece of galvanised wire, such as is used for hanging clothes on, about 1 foot from the ground, and another about half a foot from the top of the posts; then plant single canes a foot apart all along one side of the wire, passing each cane in and out of the wires for support. You may have as many rows as you require by simply repeating this system. I do not think there should be less than 4 feet between the rows. This is the best plan for growing this fruit, and all others are very second-rate. Each bud has a fair chance; light, sun, and air are admitted. Birds have not so good an opportunity of hiding as if the canes were straggling about, and old ones have a habit of hiding instead of flying out when the boy or man shouts to clear the garden. Then they cannot perch on them as readily as when bent into arches. The whole, too, looks neat and tidy, and above all the fruit can be gathered readily and no canes trodden upon.

I have seen an enlargement of this plan as follows:—A row of Raspberries planted as I recommend, then some rows of Currant bushes, also Strawberries, then another row of Raspberries; the posts, instead of 3 feet 3, being 6 feet high, and a light framework passed from post to post, the whole covered at the fruit season with fish netting. The owner of the garden told me he more than paid his expenses the first year, for he had a choice lot of Currants hanging very late, and all Raspberries, Strawberries, and Currants free from bird or boy depredations. The height of the whole enabled a grown person to go inside without stooping and gather the fruit comfortably.

The Raspberry delights in rich and damp soil, and no Raspberries I have ever seen equalled those grown in the fens; not, indeed, on peaty soil, but on those gardens in the fen towns and villages which were naturally built on the islands in the fens to which the waters never or only partially extended, and where the subsoil is often, but not always, gravel; but whatever the subsoil, the soil above is deep, damp, and rich, partaking something of the fenny nature of the district around.—GROWER.

THANKSGIVING DAY IN NEW YORK.—For Thanksgiving Day trade tempting arrays of fruits were made in the markets and stores. California Grapes were offered in large variety and of excellent quality, and, handsome with their rich bloom, these looked as fresh and crisp as when taken from the Vines several weeks ago. New York State Grapes, of remarkable freshness for this season, were also displayed in variety, and included good Niagaras and Delawares. Lady Apples, some red Bananas, Strawberries from California, Cocoanuts, Pineapples, Italian and French Chestnuts and Cranberries were all in special demand. Other favourite fruits were Florida Oranges and Grape fruits, choice varieties of Pears, as Winter Seckle and Comice, and showy Apples. During one week 37,633 barrels of the latter fruit were received in this city for the local trade, besides 18,861 barrels for export. Other receipts of fruits were two cargoes of Cocoanuts from Colon and Trinidad, which comprised nearly 250,000 of these fruits, and four steamers brought 60,000 bunches of Bananas from Jamaica and Central America. One cargo from Kingston, Jamaica, consisted of 10,613 barrels of Oranges and 665 boxes, besides other shipments of Oranges from the same island. There are now on the way from the Mediterranean to this port 6200 barrels of Almeria Grapes, 3000 boxes of Oranges, and 60,700 boxes of Lemons. Fruits are still coming from the Pacific Coast, and twenty-one carloads were sold in one week, of which nineteen were Grapes. Other western fruits received were Winter Nelis Pears from Oregon, Easter Beurré and other late varieties of Pears from California, a carload of new crop Navel Oranges from the southern part of the same State, and attractive Lemons of excellent quality.—("Garden and Forest.")

GENTIANA BAVARICA.

THE Gentians are impatient of stagnant moisture, especially in winter, and they suffer from full exposure to the midday sun during the hottest months of the year; it is probable that inattention to these points is the chief cause of failure in their cultivation, and of their consequent rarity in our gardens.

With regard to soil they are by no means so particular as is commonly supposed. They will thrive in peat; in a mixture of peat and loam; and also in friable loam containing a little sand. Rich highly manured soil is objectionable, and in wet adhesive loams they will live but a short time; in either case it will only be necessary to supply a small quantity of the compost of peat and sandy loam, with drainage beneath it, in order to place the plants in the condition requisite to insure success.

The plants should be screened from the sun during the hottest part of the day, only the morning and evening rays being allowed to reach them, especially in dry arid soils; but the situation should be as light and airy as possible—they will neither bear to be smothered by other plants, nor endure the drip of trees. During long-continued rains in autumn and winter it will be a good plan to cover the clumps with a large pot, as they are more impatient of wet than cold; but they should not be kept covered longer than is necessary. The species figured is one of the most attractive of the genus, the flowers being rich dark blue in colour. - W. T.

THE YOUNG GARDENERS' DOMAIN.

EUPHORBIA JACQUINIÆFLORA.

THIS species of Euphorbia far surpasses any other in usefulness and floriferousness. The plants are of easy cultivation, and may be grown with great success in a stove where the temperature does not fall below 60° at night. It generally blooms in November or December, but, growing in three successions, abundance of flowers may be had for several months. At this time of the year its intense scarlet flowers and wreath-like shoots with green healthy foliage, add a charming and even a magnificent display. The flowers last well either on the plant or when cut and placed in glasses of water for decorative purposes. Early plants will give flowers from the second growths which are made after the first shoots have been cut.

Cuttings should be selected from young growths in spring with a heel of the old wood when about 3 or 4 inches in length. Have a quantity of powdered charcoal at hand, into which plunge the cuttings to prevent bleeding and flagging. Insert four cuttings close to the edges of 3-inch pots, filled firmly with loam, peat, leaf soil and silver sand in equal parts, allowing a thin surfacing of dry sand on each pot. Make the hole just deep enough for the cutting, and be careful that it rests on a firm base. Plunge the pots to the rims in a propagating pit, where the temperature does not fall below 70°, with a brisk bottom heat of about 75°, wiping all moisture from the glass daily. The cuttings should be kept close until root action has commenced, when air may be given.

As soon as the plants are well established transfer them to large pots, maintaining a ball of soil with the roots. As a compost for this potting use good loam and peat in equal parts, with one-quarter leaf soil and silver sand. The pots must be well drained, and watering be carefully done. Keep the plants close until root action has recommenced, when air can be admitted. A temperature of 65° by night, and about 5° to 10° higher in the day, will be found suitable at this stage of growth. The plant has naturally an erect habit, so that when bushy specimens are required the growths have to be stopped or bent down; the latter, in my opinion, being preferable, as it induces more eyes to break into growth. This operation must not be done until the plants are fairly advanced.

A good method of obtaining specimen plants is to place about six or eight cuttings into a 4-inch pot and shift as required. I believe, however, the plants are more useful when flowered on single stems grown in various sized pots. Plants which are in 60's may be repotted as soon as they have filled the pots with roots. Use a compost as previously advised, with the addition of a little decayed manure. Pots of different sizes may be used, but the strongest plants should be transferred to the 6-inch size, in which they would flower.

Cuttings which are rooted late in the spring may be successfully flowered in large 60's with the help of some approved chemical manure. This is also beneficial to larger plants, and should be applied carefully after the pots are well filled with roots, while an occasional application of clear soot water and liquid manure is appreciated. The plants will require a thin shade during the hottest part of the day; but they must be given as much light as possible, or their naturally straggling habit would be increased. If this method of treatment is followed it will impart both colour and substance to the flowers. As the season advances the temperature ought to be reduced to 60° by night, with an advance of 5° in the day. Ventilation must at all times be given very thoughtfully, using the greatest possible care to avoid cold draughts, which are very injurious.

As soon as the flowering season is over the plants may be kept considerably drier at the roots, giving just enough water to prevent shrivelling until they have made several inches of new growth, which can be used for cuttings if more plants are required. This Euphorbia is less subject to insects than most of our stove plants, although scale, thrips, and red spider will sometimes attack the plants. Syringing with the XL liquid insecticide or fumigating the plants I have found the most satisfactory means of destruction.—J. F. D., *Yorks.*

CARNATIONS IN POTS.

THE Carnation, next to the Rose, is the most beautiful and fashionable flower of the present day, for besides being useful and effective in borders, the plants are especially adapted for pot culture. What can be more effective than these plants when in bloom arranged in the conservatory, Maidenhair Ferns being arranged among the pots? Their many shades may be so mixed that no discord of colour harmony is present. These plants require great attention during their various stages of growth.

The first operation is the layering, which ought to be done about the beginning of July, so that we have good sized and well-rooted plants before the winter frosts set in. The method of layering is—only strong and healthy grass should be taken, the lower leaves stripped off, and a slit made for about a quarter of an inch upwards. The slit should not be too far down the stem, or the plants raised will be spindly. The layer is then pegged down into prepared soil, consisting of equal parts of leaf mould and sharp sand; a part of peat is also a great help to early rooting. If the soil be dry it is as well to give it a watering with the hose the night before commencing to layer. The knife used should be very thin in the blade and sharp, so as to make a clean cut. The next articles necessary are pegs. Some growers use stones in preference to pegs, as they save labour, but they do not keep the layers so steady. Bracken makes excellent pegs, while young shoots of the Snowberry are also used. There are wire pegs made specially for the purpose, these

FIG. 85.—GENTIANA BAVARICA.

of course being good in all respects. The prepared soil, already mentioned, should be forked lightly into that, round the parent plant, care being taken not to disturb the roots more than can be avoided.

Layers made the first week in July should be ready for potting in about five or six weeks. I may mention that the layers should be severed from the old plant about a fortnight before lifting. In lifting the young plants care should be taken to retain as good a ball of soil about the roots as possible. A good compost for the potting is turfy loam, sand, and peat; to every barrowload of loam add a quarter barrowload of sand and a smaller quantity of peat. The pots, before being used, must be thoroughly cleaned and have good drainage, as nothing is more harmful to the success of these charming plants than water-logged soil. The plants should be potted firmly.

The young plants may be placed outside on a gravel walk till the month of October, when they should be placed in the Carnation house. After potting no water ought to be given for a day or two, and when applied it must only be in a sufficient quantity to moisten the soil. After being taken inside they are best kept on the dry side, as too much water causes the leaves to turn yellow and bring on disease. If potted in the early weeks of August the plants will be ready for shifting into their flowering pots by the first week of January. The best size to use for this potting is 6-inch, the plants in these being of a bushy habit and throw up a profusion of flower spikes by the months of June and July. The compost used for the final potting must be a little stronger than the first, consisting of lumpy turfy loam, sand, peat, and charcoal taken from burned prunings of the shrubberies, with a dash of soot. It is the custom of some to add Mushroom bed refuse; but this is unnecessary, as Carnations are better without any manurial agency than that which is contained in the already-mentioned preparation; but it is beneficial that the plants get a top-dressing of sulphate of iron twice in

their growing season. It is a preventive of rust, keeping the foliage green and healthy.

The plants after being placed in their flowering pots should have very little water until the end of March when they begin to grow, but great care must still be taken in the watering of them after this month. Air ought to be abundant on bright days through the winter months. Heat should only be used in the Carnation house in the case of frost or excessively damp weather. As soon as the plants begin to grow they must have stakes affixed, and the young shoots tied loosely to these to prevent breakage. All withered and diseased leaves should be removed, as this not only gives the plants a clean appearance but keeps them healthy, for if these leaves are allowed to remain the healthy ones soon become affected.

During the flowering season bees do much damage to the flowers, and to prevent them tiffany should be placed over the ventilators. From the above culture Carnations are seen at their best, the plants being healthy and the blooms all that could be desired.—EAST LOTHIAN.

NOTES ON CUCUMBERS.

IF an early supply of Cucumbers is wanted a start should now be made. It is to be regretted that one rarely sees a good house of this delicious vegetable with wood, foliage, and fruit in first-rate condition and health, so a few notes as to their successful management will, I hope, benefit readers of the "Domain." For early use it is not advisable to begin before the middle of December. Seeds should then be sown singly in clean thumb pots in a mixture of loam and leaf soil in equal parts. This must be in a moderately moist condition, as no water ought to be given until after germination has taken place. The pots should be filled with the compost, and a slight rap on the bench is sufficient to make it firm enough. Cover the seeds slightly, and plunge the pots in brisk bottom heat, covering them with a sheet of glass to prevent rapid evaporation.

When the seedlings appear through the soil remove the glass, and place the pots on a shelf near the roof in the same house or pit. With the advent of the first rough leaf place the young plants in 3½-inch pots, using a compost consisting of one part good loam and one part old Mushroom manure. This should be previously placed in the house they are to occupy, in shallow boxes, so that it will be thoroughly warmed to the temperature of the house. The pots must be clean and properly crocked, as it is by observing these small details that success is obtained. Provided the soil is moderately moist, as well as the balls of roots, no water will be needed for a day or two. If the young plants have become drawn curl them down in the pots, so that the seed leaves are just above the surface. Continue to keep them near the glass, and if the weather is bright shade lightly until they will bear the sun without flagging. A dew over with the syringe is beneficial to them, but great care must be taken at this time of the year or they will damp off, especially in dull weather. Avoid sudden depressions in the temperature and cold draughts, particularly if the plants occupy a shelf near the ventilators of the house.

Under the foregoing treatment they will be ready to plant out in their fruiting quarters by the end of February. Thoroughly cleanse the house they are to occupy, as this both of structure and plants is the main point in Cucumber growing. The compost for the beds should consist of two parts fresh fibrous loam, one part of horse droppings, and a good addition of soot and artificial manure. Turn it all over a few times to insure all being properly mixed, and wheel it into the house several days before planting, so that it will be well warmed. If the house is span-roofed, say 20 feet by 12 feet, five plants on each side will be ample. The young plants should be carefully turned out and planted firmly, placing a stick to each reaching to the first wire. Care must be taken in watering until they are growing freely, when copious supplies will be required. Syringe on clear days in the afternoon only, and maintain a moist atmosphere by damping surfaces as they become dry. Morning syringing is often the cause of injury to the foliage and should not be resorted to except it can be done very early.

Cucumbers delight in a high temperature and plenty of light. Close early, to raise the temperature of the house to 90° or 100° from sun heat after syringing, and admit a little air before nightfall as a safeguard against condensed moisture, increasing it the next morning at 75°. Never allow the plants to receive a check, either from want of nourishment or by admitting air to cause a draught, and lower the temperature. I find the best way of training is to stop them at the first wire, taking three shoots to each plant, thus giving plenty of room and light for leaf development. The side laterals of these three main shoots will produce fruit in abundance. Regular sprinklings of artificial manure, or diluted stable liquid, will greatly benefit the plants when they are swelling their fruit, also top-dressings of good loam as the roots appear on the surface. Of varieties, perhaps the least said the better, as most gardeners have their favourites, but for handsome fruits and good cropping I find Lockie's Perfection one of the best.—NIL DESPERANDUM.

SUNLIGHT YEAR BOOK.—With the advent of the 1898 edition, this publication enters its fourth year. The range of subjects dealt with is wider than has been the case before, and as most of the information is conveyed in a clear and concise manner, its value will be materially enhanced as a book of everyday reference. Comprising nearly 500 pages, the book is bound in cloth covers, and sold for the price of 3d. by Messrs. Lever Bros., Port Sunlight. In recommending this *vade mecum*, we may mention that it contains an admirably written story by Conan Doyle, entitled "Burger's Secret."

HARDY FRUIT GARDEN.

Winter Pruning Fruit Trees.—Advantage ought to be taken of every favourable opportunity to proceed with the winter pruning of fruit trees in the open quarters, on walls and espalier fences. Exception may be made in the case of Apricots, Peaches, and Nectarines on walls as regards the final pruning at the present time, these trees being best left until closer upon the period when the buds commence swelling. Although, however, the pruning and nailing or tying is best deferred at present, yet in cases where the old bearing wood of the past fruit season has not been removed that work may be carried out at once. It is desirable, also, when the trees are trained on walls to detach the branches and shoots. Secure them in bundles away from the wall, thus preventing the premature swelling of the buds until the time for final pruning arrives.

Pyramid and Bush Trees.—The first important step to take in the winter pruning of these is to look over them for crowded and ill-placed branches. Saw all such out as cleanly as possible close to the point from which they originate. The distance between the main bearing branches of pyramid and bush trees should not be less than a foot. Pare the edges of large cuts quite smoothly with a sharp knife. Branches having very crowded spurs must have some removed or shortened. Those left are much benefited by the process. The summer growths require to be pruned back to one or two buds on the best ripened shoots. Very sappy or green shoots may be cut out entirely, also spray issuing from the old wood in any part of the trees. The leading shoot of each branch, if required to make further extension, should be shortened to one-third its length, so that the buds on the part left may develop into fruit buds, or throw out side shoots, which can be induced by restrictive pruning to do so. The upper bud must of course be a wood bud, in order that the desired extension of the branch may be originated next season.

Wall and Espalier Trees.—Horizontal training is the usual form for Apples and Pears on walls and trellises. When high walls have to be covered Pears, Plums, and Cherries are frequently grown fan-shaped, main branches covering the space, and allowed to extend as far as possible. The branches should not meet at the points nearer than 1 foot. Fruitful trees cannot be obtained when crowding is allowed. The pruning of espalier branches consists in shortening the summer shoots to well-ripened buds at the base, reducing elongated, and thinning out rank spurs. Dead wood must be carefully cut out wherever met. The spurs on the upper espalier branches, particularly on walls, ought to be kept within bounds; for to allow them to project to an undue extent over the branches below is to cause the latter to suffer from a limited amount of light. Neglect in this respect is frequently the cause of trees becoming fruitless, and the proper balance between roots and branches destroyed.

Fan-shaped trees being furnished with a number of main branches may have the foreright shoots shortened and thinned out to form fruit buds. Should any vacancies occur by decay or removals that cannot be filled up by regulating the permanent branches, new shoots originating from suitable positions may be laid in. This can be very frequently carried out with Plums and sweet Cherries, as these fruits are subject to the wearing out or loss of branches, and the system of laying in young shoots affords a ready means of renewal.

Cordon Trees.—The branches of these when the trees are in a flourishing and fruitful condition usually bristle with fruit buds, and the summer growths extending from among the spurs are not, as a rule, numerous. The branches of cordons are trained at the proper distance apart from the first, and each branch receives its due share of light and air. With cordons due attention must be paid to shortening the summer shoots in July, to encourage the formation of fruit buds,

The shoots thus dealt with in summer may now be finally pruned back to the basal buds, leaving two or three, according to circumstances, for increasing the number of fruit buds. When the groups of spurs become elongated so that they extend too far from the main branch they should be gradually shortened back to some of the lower placed buds. Thinning the spurs may also be necessary, in fact essential, where they have become crowded.

The best treatment for cordons is to give all the necessary pruning at the proper time annually from the first formation of the branches and spurs, thus necessitating less drastic treatment than is demanded by neglecting the trees for long periods. Ill-placed spur growths and those behind the branches, also sappy shoots breaking from the old wood, are best removed entirely.

Standard Trees.—The principle of winter pruning free-growing standard trees is that of thinning and regulating the growths to allow the entrance of light through the trees when the foliage is present. The best course to follow is to cut out entirely all interlacing branches, those growing too closely together, and any that spoil the outline of the tree. It is indispensable that dead or exhausted wood and rank sappy spray should be cut out. Standard Apples, Pears, Plums, and Cherries may all be treated on these lines. Though the simplest of all methods of pruning it invariably brings good results, provided the trees have a sufficient amount of space to do their best.

FRUIT FORCING.

Cherries.—The house to be employed for supplying ripe Cherries from the middle of April onwards must now be closed. Be sparing of fire heat at the commencement, not employing it unless absolutely necessary to maintain the temperature at from 35° to 40° at night, and 40° to 45° by day, ventilating when the temperature is about 50° to 55°. Close the house at 50°. Syringe the trees early on fine afternoons, so as to admit of the buds becoming fairly dry before dark. The house will also need damping in the morning and afternoon of fine days, occasionally only in dull weather. The border will be sufficiently moist for some time through the removal of the roof-lights, if not, it must have water to bring it into a thoroughly moist state. Trees in pots, if at all dry, will require repeated supplies of water to secure the thorough moistening of the soil down to the base of the pots.

Strawberries in Pots.—When the crowns commence swelling and the trusses appear, the temperature may be advanced a few degrees by day, but 50° to 55° is sufficiently high at night. Syringe the plants lightly in the early part of fine afternoons. Examine them daily, and supply water to all that require it. Keep a sharp look out for aphides. They cluster on the swelling crowns, and if any appear, vaporise with nicotine, or fumigate with tobacco paper on two or three consecutive evenings. It is very important that the plants be perfectly clean, and fumigation must not be practised when they are in flower.

Another batch of plants should be placed in a house from which frost is excluded, removing the decayed leaves, loosening the surface soil, and, after removing the loose material, supplying a top-dressing of rich compost with a little steamed bonemeal added to it. Attend to the drainage; if defective rectify it, and wash the pots. The plants may be introduced during the next three weeks to shelves in a Peach house started at the next year, or into a Strawberry house. La Grossé Sucrée, Vicomtesse Hericart de Thury, Noble, and Royal Sovereign are suitable varieties, also Keen's Seedling and Sir Harry, when true.

Plants for starting later will be quite safe in their quarters outdoors plunged in ashes to the rims of the pots, and a light covering of dry fern or litter may be given in severe weather, allowing to remain until the plants are thawed after being hard frozen, otherwise remove in mild weather. If the plants are placed in frames the lights should be drawn off in mild weather, but in this and wet tilt the lights at the back of the frames so as to throw off the rains, yet let the plants have plenty of air. They cannot be kept too cool, and none should be allowed to suffer through want of water.

Vines.—*Earliest Forced in Pots.*—When the buds break the temperature will need to be increased to 60° at night in mild weather, and 55° when severe, gradually increasing it so as to have it 60° at night when the Vines are in leaf, and from 65° to 75° by day, with moderate ventilation. Sprinkle the floors and surfaces of borders or beds twice or thrice a day in clear weather, avoiding too damp or too dry an atmosphere. Afford liquid manure whenever moisture is required at the roots, always supplying it at the mean temperature of the house or that of the fermenting material about the pots. Disbudding must not be practised until the bunches show in the points of the shoots, as any extra growth goes towards increasing the activity of the roots.

House to Afford Ripe Fruit in May.—The structure for this purpose should be started without delay. A bed of leaves and litter in a state of fermentation placed on the floor of the house, turning a portion of it daily so as to supply ammonia to the atmosphere, saves fuel, and conduces to a good break by constantly giving off moisture and warmth. Outside borders should have the needful protection from cold rains and snow; a few inches thickness of dry leaves, and a little litter over them, answer where the Vines are planted inside, but where the border is all outside a covering of warm litter is preferable, two-thirds of leaves and one of stable litter affording a less violent heat than manure alone, also more lasting, adding fresh material as necessary. The inside border must be made thoroughly moist by applying water, or, in the case of weakly Vines, liquid manure, and never less than the mean temperature of the house. Avoid, however, making the soil very wet, for that hinders root formation, and tends to a soft growth. Start with a night temperature of 50° in severe weather, 55° in mild weather, and 65° by day, except the weather is cold, when 55° will be more suitable. This slow work is better than a high forcing heat, which induces a weak growth, and we do not advise these temperatures to be exceeded until the growth commences. Depress young canes to the horizontal line, or lower, to insure the regular breaking of the buds. Maintain a moist atmosphere by syringing occasionally, but avoid excessive moisture and keeping the rods dripping wet, which excites the production of aërial roots from the rods.

Midseason Houses.—The Vines should be pruned and at rest. If this has yet to be done lose no time in pruning, cleansing the house, dressing the Vines, removing the loose soil from the border, and supplying a top-dressing of fresh compost. Where the Grapes are partially cut the remainder may be removed with a good portion of wood attached, and if the stems are inserted in bottles of water the bunches will keep admirably in a dry room from which frost is excluded. Thus the Vines will be liberated for pruning and the house for cleansing, repairs, and painting. A long and complete rest invigorates Vines, and early pruning effects that better than anything else.

Late Houses.—Vines that have the foliage all off will only require fire heat to exclude frost, but there must not be anything like a moist, stagnant atmosphere, or the Grapes will speedily damp and decay. Leaky roofs are a chief cause of Grapes keeping badly, and wide laps are not much better, as the wind drives the water from them all over the upper side of the berries, causing them to spot and rot. Grapes cannot be kept under such circumstances, and the sooner they are cut and bottled the better. A temperature of 40° to 50° suffices for the thick-skinned Grapes. Muscats require a mean temperature of 50°. The air must be kept in motion by a gentle warmth in the pipes, and ventilation given whenever there is a chance of securing a change of air without danger of letting in more moisture than expelled.

Figs.—*Earliest Forced in Pots.*—To force Figs successfully the trees must be brought on gradually and not subjected to too much heat in the early stages. This is apt to occur with bottom heat, the heat above the pots exceeding 70°; then the trees and embryo fruit come on too rapidly, and often fall instead of setting. Until the leaves are unfolded the heat at the roots should not exceed 70° at the base of the pots, then it may be increased to 70° or 80°, giving an atmospheric temperature of 70° to 75°. The temperature of the house started at the beginning of the month should be increased gradually to 60° at night, 65° by day by artificial means, and 70° to 75° with sun and moderate ventilation, closing at 75°. In mild weather a "chink" of air should be admitted early in the day, or between 60° and 65°, always at the top of the house, so as to allow the pent-up moisture to escape and insure a change of air, to insure a circulation in the house. In cold weather the heat from the hot-water pipes will keep the atmosphere in motion and the moisture will be condensed on the glass, therefore ventilation is not then required. Be careful, however, not to bring on the growth too rapidly, especially in dull weather, as foliage produced under such conditions is not of stout texture, but large and thin, possessing little elaborating power, and very susceptible of external changes, often scorching and becoming infested with red spider. Afford water whenever necessary, always equal in temperature to the mean of the house or that of the fermenting material about the pots. Syringe the trees in the morning and early afternoon so as to have the foliage dry before nightfall, but avoid excessive moisture, damping the house only in dull weather and only when the paths and walls become dry.

THE FLOWER GARDEN.

Herbaceous Plants.—When the ground is fairly dry, and the weather mild, advantage may well be taken of a favourable time to lift, divide, and replant many of the stronger growing hardy occupants of the mixed or herbaceous borders as may need it. All in time become either too large for the site, or present a less healthy appearance, owing to having exhausted the stock of food contained in the soil. The first to become crowded and exhaust the soil are Phloxes, Delphiniums, Spiræas, Campanulas, Potentillas, Hemerocallis, Asters (Michaelmas Daisies), Pyrethrums, notably P. uliginosum, Heleniums, Chrysanthemums, Helianthuses (Sunflowers), and Anemone japonica. About every third year these pay well for lifting, dividing, and as many as are required replanted, either in their old stations, after some fresh soil and manure have been added, or, better still, in fresh quarters. When crowded and starved, the flowering season is frequently of short duration, especially if they have to pass through a hot dry summer; whereas, when freely divided and replanted in fresh rich soil, they are much less affected by drought, and in any case the quality of the flowers is superior. Plunging forks, and in some cases ordinary digging forks, are much the best for dividing strong clumps, and when replanting the divisions take good care to well bury and firmly fix the soil about the roots, without, however, unduly lowering the hearts of the plants. Less vigorous plants, and which are too numerous to name here, may well remain undisturbed for a much longer period, or say double the time of the strong growers, and these require to be more carefully handled.

Re-arranging Herbaceous Plants.—Not unfrequently old, and, it may be, somewhat neglected mixed borders, would be greatly improved by being re-arranged, and on the whole the present time is, weather permitting, as suitable as any for this important work. It is true they are more often taken in hand in the spring, but in most gardens there is then usually much other work to be attended to, and besides this also greatly interferes with the display made by early-flowering bulbous plants. Old clumps of the latter are in many instances now rooting freely, and at this stage of growth may be lifted, divided, and replanted without detriment to their flowering either during the next or following spring.

Supposing it is decided to re-model a border, the first proceeding should be to well scrape back the loose gravel on the walk near at hand (and such are very general), and on this set the clumps of plants and bulbs, according as these are carefully searched for and forked out of the ground. If the nights are somewhat frosty, or the weather unsettled, too great a length of border should not be broken up at one time, or not more than can be trenched and replanted in one day. In most cases double digging or bastard trenching only ought to be resorted to, abundance of half-decayed manure being mixed principally with the top spit. There is no necessity or wisdom in returning the plants to the borders in formal lines, the better plan being to plant them somewhat irregularly, due regard being paid to the respective heights of the species and varieties, care also being taken to well mix them so that the early flowering kinds may alternate with those much later in coming into flower. Nor is it advisable to plant very thickly, there being a considerable number of half-hardy plants that room should be found for in herbaceous or mixed borders. All, whether bulbous or otherwise, to be correctly labelled, the simplest and best kind of label being made from 1 foot lengths of sound Hazel rods, these being pointed at one end, and faced and painted white at the other. Mulch with manure or leaf soil after the border is planted.

Manuring and Mulching Borders.—The least that can be done to an herbaceous border is to thoroughly clean and mulch it at this time of

year. All tender plants, whether dead or not, ought to be removed, and the dead tops of the hardy occupants trimmed off, and these, with any weeds there may be, consigned to the rubbish heap for burning. The surface of the border may then be very lightly and carefully forked up, the greatest care being necessary where many bulbs are grown, after which a liberal dressing of partially decayed manure, with loam added if it can be spared, and also charred rubbish, or the contents of a "smother" generally should be applied. Old Mushroom-bed manure is good for the purpose, and so also is a heap of leaves and manure that may previously have done duty as a hotbed or Vegetable Marrow heap. This mulching will answer the double purpose of enriching the border, and also to a certain extent as a protector of the roots from severe frosts. Bulbous-rooted plants, if planted sufficiently deep, are, as a rule, quite hardy, but if within 2 inches of the surface they may well be protected with a mound of either ashes, cocoa-nut fibre refuse, or leaf soil.

A Selection of Hardy Flowering Plants.—There is an almost unlimited number of species and varieties of serviceable and beautiful plants suitable for filling mixed borders, and which may be purchased and planted at the present time, the only exception being where the pieces are too tiny to be trusted to the tender mercies of slugs and other enemies, including a careless gardener's feet. The following, arranged much in their order of flowering, would be found very satisfactory:—Leucoium vernum, Snowdrops, Crocuses, Chionodoxa Luciliæ, Narcissi and Daffodils in great variety, German Irises, Anemones appenina, sylvestris, and fulgens, Cheiranthus alpina, Polemonium Richardsoni, Ibericus gibraltarica, Alpine Auriculas, Primulas Sieboldi and vulgaris in variety, Dodecatheon Jeffreyanum and meadia, Gentiana acaulis, Aquilegia, hybrids of cœrulea, californica, and glandulosa, Anthericum liliago and liliastrum, Dielytra spectabilis, Campanulas glomerata and dahurica, double Pyrethrums, Centaureas montana and alba, Erigeron aurantiacus, Hemerocallis flava, Lupinus nootkaensis and polyphyllus, Ornithogalum umbellatum, Papaver bracteatum, Solomon's Seal, Trollius asiaticus, Verbascum phœniceum, Tradescantias virginica and alba, double Potentillas, double white Rocket, Geraniums armenum and ibericum, Erigerons speciosus and macranthus, Dianthus barbatus magnificus, hybrid Delphiniums, Asphodelus luteus and ramosus, Pæonies in variety, Spanish and English Irises, Veronica spicata, Spiræas aruncus, filipendula plena and venusta, Pentstemon barbatum, Œnothera speciosa, and Galega officinalis.

THE BEE-KEEPER.

Protection of Straw Skeps.

Bees invariably winter well in straw skeps if provided with abundance of stores, and precaution is taken in the autumn before they become saturated with moisture to provide protection from the weather. Although the moveable frame hive has made considerable headway in the provinces, there are still numerous bee-keepers throughout the country who keep their bees at all seasons in the homely straw skep.

In this district (South Yorkshire) one bee-keeper annually winters upwards of forty stocks in skeps. These in a favourable season increase at a rapid rate, but as the majority of them are in skeps about 18 inches in diameter on which crates of sections are worked, they do not swarm so often as those in the small skeps usually seen. The skeps are placed on a bee stand with a roof, but quite open at the front. They face due south, and the hives are placed on shelves one above the other. Bees situated as above do not require any further protection, as the hives are perfectly dry, and to my knowledge the bees in that apiary come out strong and healthy in the spring.

With straw skeps placed on stands in the open air some protection is necessary, otherwise the bees will suffer. How often one may observe a solitary skep in a cottage garden with only a piece of sacking on the top of the skep, with a tile or broken pot to throw off the moisture, and prevent the wind from blowing it away. I need not say that success cannot be expected from bees treated in this manner.

The best plan that has come under my notice is to make a hood with Wheat straw. This is done by taking sufficient straw to cover the skep, placing the ears evenly together, and holding them firmly with one hand whilst the short straws are combed out with the other. Fasten the straw tightly together with string or fine wire just beneath the ears, or about 6 inches from the top of the straws. The remainder of the operation is very simple. Open the bundle of straw in the middle and place it on the skep, so that the straw hangs evenly round it; place a hoop of iron or wood round the whole, so that it fits tightly round the middle of the hive, and the cover is complete. The ends of the straw hood should be neatly cut, so that they hang a few inches below the floor-board with the exception of the entrance to the hive, where a few straws may be removed so as not to cause an obstruction to the bees; the remaining straws should be drawn on each side of the alighting board so as to allow the moisture to escape. Hives treated in this manner have a very neat appearance, and have the advantage, when thatched with straw, of being warm and thoroughly rain proof.

Straw Skeps for Increase.

The advantage of keeping a few stocks of bees in straw skeps is acknowledged by the majority of bee-keepers who obtain the whole of their surplus from the modern system of bar-frame hives, these being usually worked on the swarming system, and during a favourable season they provide numerous swarms, which are utilised in a variety of ways by the bee keeper. Owing partly to the warmth of the straw hive, and being small in comparison with the moveable frame hive, the bees swarm much earlier. I have closely observed this fact for many years, with always the same result. Some seasons the difference is very marked. Last spring there was nearly a fortnight between the first swarm reported from a straw skep and the one from a frame hive.

Observant bee keepers usually take time by the forelock and provide extra space for the bees when required. Still there are many who leave their bees very much to chance, and so they are on the same level as regards early swarms as those in other hives. Bees when kept in straw skeps only for the swarms they produce are not often robbed of their natural stores, consequently they go into winter quarters with plenty of food in the best possible condition, and being in a warm straw skep they start with an advantage over those in a frame hive, which have been robbed and not supplied with a substitute until late in the autumn.

When feeding is left until late in the autumn, probably several weeks have elapsed since the surplus from the honey flow was taken from them. During that time breeding has been at a standstill, so they commence the winter severely handicapped in comparison with the bees in straw skeps.—An English Bee-keeper.

TRADE CATALOGUES RECEIVED.

Hogg & Wood, Coldstream.—*Nursery Stock.*
J. Peed & Sons, West Norwood.—*Seed Catalogue.*
Sutton & Sons, Reading.—*Amateur's Guide to Horticulture.*

TO CORRESPONDENTS

All correspondence relating to editorial matters should, until further notice, be directed to "The Editor," **8. Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Chrysanthemum Madame Carnot Sporting (*Henri*).—We already have a primrose coloured Madame Carnot (Mrs. W. Mease), and a yellow one (G. J. Warren or Yellow Madame Carnot), both of which are excellent. As your sport shows no particular merit, we do not consider it worth saving.

Bleaching Pampas Grass (*J. C. R.*).—Cut the plumes with a good length of stem when quite dry and before the plumes are quite clear of the sheaths, placing them in a greenhouse or other place where they will be dry, in a similar position as grown, or upright. In ten days or a fortnight they should have the leaves or grass removed and given a gentle shake; they will then open out, and have the beautiful feathery appearance for which they are so much admired. Plumes dried in this manner retain their beauty for at least twelve months, indeed we have had them attractive still longer. When the sheaths are removed as soon as they show signs of splitting, the plumes are whiter than when left to force off their covering in a natural manner.

Scale on Peach Trees (*A B.*).—The proper strength at which to apply Gishurst compound is given with the preparation, it being important that the instructions be carefully followed in all cases, and the responsibility for the application rest with the vendor and user. The recipe given to "H. G." in last week's issue of the Journal answers for destroying brown scale, but you must dilute to 1 gallon, which you omit in the quotation.

Plants for Windows (*W. B.*).—For an ordinary window few plants do better than the different varieties of Show, Zonal, and other Pelargoniums, with Fuchsias, Petunias, Heliotropes, Mimuluses, and other flowering plants the grower may prefer. Indeed, no one can give any definite selection unless aware of your taste in the matter, it being usual for the individual to express this, or, better, make selections at a nursery or florists'.

Cutting Down Raspberry Canes (*E. B., Dorset*).—If the newly planted canes were short jointed and well rooted, we do not apprehend they will suffer through having been cut down now; but large, hollow canes, which are the worst for planting, might be injured if severe frost followed a term of wet weather. Leaflets, giving the life history and means of combating various insects, are issued gratuitously by the Secretary of the Agricultural Department, Board of Trade, Whitehall, S.W. The cost of binding half-yearly volumes of the *Journal of Horticulture* is 3s. 6d. each.

Gas Tar on Hot-water Pipes (*Coal Tar*).—The only effectual remedy is to remove the pipes and burn the gas tar off them over a red hot wood or other fire. Some good might be done by wrapping cloths dipped in caustic potash about the pipes, and when the tar has softened scrape and remove with hot water. You may try it by dissolving pearlash in water and, mixing with lime, using the clear liquid by means of cloths. It will do some good, if not sufficient, but the better plan would be to remove the pipes and burn off the tar.

Photographing Leaves (*M. R. B.*).—Extremely pretty representations of Fern fronds, and all finely divided leaves, may be obtained in white on a blue ground by means of red prussiate of potash in the following way:—Make a fairly strong solution and paint it on white paper. When dry this paper is ready for use, and on exposure to light it turns blue. A change is effected by light, which produces a permanent blue; but the potash, unaffected by light, is still soluble, and is easily washed off the paper. From the above it will be easily seen how the representations may be produced. Take first a few sheets of paper to form a bed, then lay on the prepared paper, next the specimen, and last of all a sheet of glass to press the whole flat, and through which the light may shine. Sunlight is best, and in that case an exposure of ten minutes or a quarter of an hour is quite sufficient. All parts of the paper not covered by the specimen are now blue, and it remains only to wash out the potash from the paper where it is still unchanged from the protection of the specimen. The prepared paper must of course be kept in the dark before use. This is an easy process by which the outline of Fern fronds may be taken with the greatest precision. Many leaves do extremely well, such as those of Ouvirandra and Jatropha multifida. It is much the best if the specimens are dried before use. Red prussiate of potash, being poisonous, should be used with caution.

Names of Fruits.—*Notice.*—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*D. W.*).—1, Newton Wonder; 2, Golden Noble; 3, Alfriston; 4, Unknown and worthless; 5, Beauty of Bath; 6, Court Pendu Plat. (*T. S.*).—1, Beurré Diel; 2, Pitmaston Duchess; 3, Easter Beurré. (*O. A. R.*).—1, D'Arcy Spice; 2, Flower of Kent; 3, Bramley's Seedling. (*B. M.*).—1, Josephine de Malines; 2, Comte de Lamy; 3, Bergamotte Esperen; 4, Braddick's Nonpareil; 5, Northern Greening. (*H. D.*).—The larger Pear is Winter Bon Chrêtien, the smaller one Winter Nelis; the Apple is probably a local seedling, and is not worth growing.

Names of Plants.—We only undertake to name *species* of plants, not varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*A. F. D.*).—The Caladiums that you sent are all florists' varieties, which can only be named by comparison. If you read the rules to correspondents you will find we undertake to name species only. (*A. W. P.*).—1, Woodwardia radicans; 2, Gymnogramma sulphurea; 3, Davallia canariensis. (*C. G. M.*).—1, A very poor form of Cypripedium insigne; 2, Epidendrum fragrans; 3, dead. (*B. J.*).—1, Luculia gratissima; 2, Eucharis grandiflora; 3, Todea intermedia; 4, Pteris longifolia. (*N. W.*).—Through being in the post over Sunday your specimens were quite dead on arrival here. Send fresh ones, and we will endeavour to assist you. (*W. F. M.*).—The specimen is either the typical Iris fœtidissima or a form of it. (*R. C. W.*).—All the specimens are varieties of Cattleya labiata, which can only be named by comparison in a large collection such as Veitch's.

NOT WHAT THEY SEEM.

How easily is the sentence written, how wide is the application, and how true it is. How is it that so many of us have two sides? A fair pleasant side to the world; a fretful, anxious, capricious one in the family circle. And if we find this variation in ourselves, how much more we find it in many commercial transactions.

Mind, do not mistake us, there are many excellent men engaged in commerce who would scorn to defraud by word or deed. It is only, we hope, of the few we now speak; but alas! as evil deeds are always more prominent than good, these things of darkness come to the fore and throw shame, not only on their perpetrators, but on whole classes and communities.

One body of men have borne reproach from time immemorial,

possibly in many cases deserved, in many others not at all. It has been said that let an honest man try his hand at horse dealing he inevitably swerves from the path of rectitude. Ever since Moses Primrose went with the family horse to the fair there have been both sharpers and dupes—the one the result of the other. Every man thinks he can carve, poke a fire, and drive a gig, and most men talk very knowingly about a horse. Depend upon it these very knowing men make knaves. Who can resist to "do" a conceited would-be horsey man? You cannot be both seller and buyer too, and the opportunity is too fine to be lost. So much for poor human nature.

If a would-be buyer could only be persuaded to place himself in the hands of a respectable man who really knows the points of a horse, horse dealing would cease to bear the reproach of roguery, because the rogue would have no chance against an honest man who knew his business. So many amateurs like to do a deal. They get their fingers bitten, and then, like the prophet of old, declare "all men are liars." We prefer to say that all men are not what they seem.

Horse dealing, with its snares, affects the few rather than the many. It is with everyday matters that we would deal. We have a free breakfast table, but on that breakfast table things are often far from what they seem, and it appears to us that the British trader is beset with foes before and behind. We suppress names, but these facts are taken from a London daily paper, and they speak for themselves.

At one of the suburban courts four tradesmen, late in this last September, were summoned for selling as English, Canadian and American hams. One case appears to us very bad, where an American ham was labelled "Bath" simply because it had been imported by a person living in that town. If that were not with an intent to defraud, we are sadly mistaken. Then again, it appears that American hams are usually cut quite differently from English or Scotch, but in this case these hams had been fashioned on the English model—perhaps unintentionally; who knows?

It appears there is a society called the Bacon Curers' Association of Great Britain and Ireland, and it was at the instance of this society these prosecutions were made. A substantial fine was inflicted, and the case appeared at full in the London dailies, possibly this being the greater punishment of the two. Do we always get fresh country butter even when we pay the fresh butter price? It is very much to be feared that other fats rather than that of milk figure in our pretty butter dishes. If we can only afford margarine, well and good; but if our purses allow of a little more expenditure it is as well to see we get the genuine article. And, indeed, we may have butter fresh from the farm in a far from pure state. Only this week did we meet with such. Nice to look at, but on close acquaintance revealing a quantity of buttermilk, which ought to have been entirely removed. In these days of dairy classes this is an unpardonable offence.

Then, too, although butter may be quite free from buttermilk, there may be a much larger per-centage of water than is desirable. Butter should be perfectly dry, and this is quite attainable with proper management. Butter-workers (we are alluding to the small ones worked by hand) are so reasonable that no dairy should be without one. They are kept in all sizes, to suit all purses.

There has been much said about the adulteration of milk, and great discussions as to what should be taken as the standard value—*i.e.*, the per-centages of fatty matter and solids. Now there is a difficulty here; cows vary in their milk value in many ways. Some breeds are infinitely more valuable as milk producers in quantity; others again produce the quality.

An old cow, or a cow that has been calved some time, gives, as a rule, poorer milk than a young freshly calved one. Then, again, both will vary accordingly as they are fed; and some owners understand the art of feeding far better than others.

The time has come, however, when some sort of a general rule must be laid down, and men well up in the subject suggest that 12 per cent. of total solids and 3 per cent. of fatty matter would be a fair thing for both seller and buyer. Milk certainly is not adulterated to the extent it was some years ago—that is, adulterated with extraneous matter; but there is still great room for improvement of what we may call natural milk. If people really prefer frozen New Zealand mutton to well-fed Southdown, we say let them have it; but at any rate they should know what they are buying, or they might be buying English, and how the imported meat is to be recognised easily by the average housewife is still an open question.

The Earl of Londesborough has spoken strongly on the necessity of branding imported horses. We see "Made in Germany" on many of our dry goods; why not carry out the same idea with regard to live stock? On the question of feeding stuffs and manures we have written before. We have safeguards now of which our fathers knew nothing. It is simply our own fault if we allow our cattle to be poisoned, or our fields and pockets impoverished by purchasing harmful cakes or meal or manures, whose only property is their fearful smell.

[Our correspondent has not come to eggs; when he does he will perhaps give a gentle intimation of the advantage to some of the "Continentals" of a trip into the country—going out at 24 a shilling, and coming back to London as "fresh laid" at 2d. a-piece. "It's a queer world, my masters, and things *are* not always what they seem."]

WORK ON THE HOME FARM.

We are now enjoying the first slack time since harvest, and can attend to the numerous little odds and ends of work that may, without loss, have been deferred to this more convenient season.

Autumn fallow, after receiving a good cleaning, has been waiting for the plough; meanwhile the mild autumn has encouraged the growth of weeds, which will now be destroyed and buried by the plough to enrich the land rather than impoverish it.

The recent heavy rains have been very welcome, not only to reinforce the failing springs, but for their consolidating influence on the young Wheat. For this latter we have fears, and not without reason. Never has the wireworm been noticed in such numbers as this autumn, and already we see complaints of its ravages recorded in the agricultural papers. Rape dust to act as food for the grubs in place of the young Wheat or thorough consolidation by rolling and weather are the only antidotes of which we know.

Farmers who took full advantage of the dry autumn to thoroughly cleanse their watercourses must look now with great satisfaction on the excellent outlet afforded for each rushing stream, and we have ground for hope that the numerous small outbreaks of diphtheria and typhoid fever which have created such alarm in almost every country-side will cease now that the village streams and becks have had such a thorough flushing.

With more rain and freshened springs, wet spots requiring drainage will bring themselves into notice by their glassy appearance and boggy nature when we walk across them. Where land has already been well drained, this often only means the blocking up of some particular branch. This should be attended to at once, as a block at one place may soon cause a breach higher up, and consequently a fresh blockage. The original break may have been caused by the drain having been laid too near the surface. In loose soils this may be easily done, and the drains should be put well out of the reach of pressure. On very strong land, however, if the drains are put very deep they may be of little use, as the surface water could not find its way to them.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

5th. Overcast all day, and damp at times.

6th.—Drizzle early; frequent rain from about 8 a.m. to 3 p.m.; fair evening.

7th. Fine, with faint sun at times till 2 p.m; then rainy, and steady rain from 5 p.m. and gale at night.

8th.—Steady rain till 6 a.m and showers till 8 a.m.; sunny almost throughout, but a smart hail shower lasting fifteen minutes from 1.5 p.m.; clear night.

9th.—Bright sunshine most of the day, but cloudy at times in afternoon; clear night.

10th.—Dull early; almost continuous rain from 10.30 a.m. to 3.30 p.m., frequently bright after.

11th.—Bright sunshine till 1 30 p m.; dull afternoon; bright night.

Temperature near the average, rainfall at last above it.—G. J. SYMONS.

FOR GARDENING LAND AND GARDENERS

Journal of Horticulture.

THURSDAY, DECEMBER 23, 1897.

THE JOURNAL OF HORTICULTURE *can be obtained from the Office,* 171, *Fleet St., London, post free for a Quarter,* 3/9. **Editorial communications must be addressed to 8, Rose Hill Rd., Wandsworth, S.W.**

CHRISTMAS THOUGHTS AND WISHES.

WHEN these lines appear in print the grand old season of Christmas will be close upon us—a time when old and young alike shake off, as best they can, the cares of daily life, and join each other in such mirth as inclination or surrounding circumstances allow. Friends and relatives from far and near will gather once more around the festive board to enjoy the good things of the world, to crack their jokes, to talk of days that are gone, of plans and prospects for the future, and in some cases to note with sadness the "vacant chair," which will ne'er again be filled with the old familiar face and form.

Gardeners are a social class, and enjoy as well as any the pleasures we all look for at Christmastide, and when a few "choice spirits"—who practise the "gentle art"—happen to meet in a promiscuous way, for hearty greetings and harmless joviality, I would fearlessly pit them against the "best" that any other calling can produce. Gardeners in responsible positions are not as a rule given to wandering far for the sake of mere pleasure; their work may in a sense be said to occupy their whole life, inasmuch as their thoughts are seldom separated from it for any length of time. We all know it has become a proverb that a gardener's idea of a holiday is to go and see the garden of some brother of the craft—as long as it entails a fair amount of travelling. In truth, there are many reasons why a gardener should never be happier than when in a garden; at the same time it is good for all to sometimes have a change, if only to help them to appreciate more fully the pleasures of their home life when they return to it.

The competition of modern times has been felt by gardeners as much as by any class, and there can be no doubt that it becomes each year more and more a matter of the "survival of the fittest," which shows the absolute necessity of being well equipped with a sound technical as well as practical knowledge. The great facilities for obtaining such knowledge at the present time are so pronounced, that no one can be excused for not taking advantage of them. The various horticultural journals each week supply a mass of information, which deals

with both the practical and scientific part of gardening. If these are carefully read, and their teachings acted upon by all who read them, the sum total of improved results must be inealculable. We have in addition, however, a splendid reserve of literature to draw upon, as numerous works dealing with every phase of gardening—as well as the sciences which bear upon it—can be obtained at a marvellously cheap rate. Towns, both large and small, and even villages, have their institutes, in which popular lectures are given during the winter evenings by scientists of varying degrees of eminence, who are each striving, in their own sphere, to help forward the grand progress of the Anglo-Saxon race. Although we may have allowed continental nations to obtain a good start in the matter of technical education, there are signs on every hand which show the "British Lion" is at last aroused, and is working in earnest. A knowledge that such is the case—that we are on the right road—ought to enable us all to enter with zest into the "joys of Christmastide."

Young men who are on the threshold of a life which may become prosperous or otherwise, in proportion as they utilise or neglect their opportunities, should sometimes ask themselves the significant question, Are we doing our very best under present circumstanees? It is necessary for us all to sometimes bestir ourselves to renewed action, for at times there comes to all human beings a great inclination to "take things easy," though fortunately this is combated in the average Briton by a spirit of restless energy. Gardeners as a body can, I think, lay claim to possessing this latter element in a large degree, and the amount of work the "smart young men" will accomplish in a single day during the busiest seasons is sometimes quite as marvellous in its way as some of the much-vaunted athletic feats. I doubt not that many young gardeners who read these lines will remember instances of rivalry in which the "bothyites" have each been doing their utmost to surpass the others in the accomplishment of some great task, and when this spirit of rivalry is conducted in the right way it expedites the progress of work and makes it a real pleasure.

Gardeners, both old and young—especially the young—will, however, at this festive season be looking forward to pleasures of other kinds, those which spring from the meetings of friends and relatives as they meet in the social circle. Holidays cannot be showered very plentifully among the workers in gardens, because of the nature of their work; but Christmas is perhaps one season, when by combined effort and management some may receive short holidays to visit the homes and join in the general reunion, which is looked forward to with so much zest by friends and relatives who throughout the year are scattered abroad in the land. In many places, again, Christmas is one of the busiest seasons of the year, as house parties, with their attendant gaieties, are the order of the day. There is little chance in such for the young gardeners to pack up their traps and "hie" for home; they must instead be content to work both early and late in attending to the duties connected with large establishments, so as to have the houses and gardens in good condition for the visitors to admire, and in carrying out the necessary plant and floral decorations.

Notwithstanding these drawbacks, young gardeners have a very happy knack of catching as much enjoyment as circumstanees permit; they can adapt themselves to varying conditions. I retain a vivid recollection of many joyous Christmas days spent far from home, when the "bothyites" were not allowed to wear out the time in lonely solitude, but, according to a good old custom, invited to spend their evening at the "Castle." The unfortunate one "on duty" in such cases often received a visit from one or other of his comrades during the course of the evening, to prevent him from feeling unbearably lonely; but the turn of duty on Christmas Day was usually borne with philosophical fortitude, and I actually knew one who quite gloried in having the place "all to himself" for once.

To gardeners old and young, at home or abroad, let the cheery words be recorded in the Journal once more—

A Happy Christmas.

—Onward.

SHOWING AND JUDGING GRAPES.

Perhaps I may be allowed to contribute a short letter on the subject of fruit showing and judging, particularly Grapes. Of all garden produce I think these at autumn shows are the most unsatisfactory fruits to deal with according to present schedule arrangements, both for exhibitors and judges. Take, for instance, the usual wording of the smaller classes—"Four bunches of Grapes, two white and two black allowed"—what is there here in this assertion to guide the exhibitor? He does not know whether to enter for flavour or appearance. Neither can the judges obtain any assistance from the words above cited to guide them in their action, and very often their decisions are unsatisfactory to the public and to themselves. If handsome bunches, irrespective of flavour, are awarded first honours, uncomplimentary words have to be heard by the judges from some Grape connoisseur who may be criticising their awards.

If perchance the awards are given in favour of flavour, what an outcry is sometimes heard from the public, and general disatisfaction seems to permeate the whole place. Very few judges dare ignore size and appearance in a bunch of Grapes. I think all this perplexity and discontent might be avoided if schedule makers would be more explicit in the wording of the classes.

For example and argument's sake we will say a class reads thus:—"A collection of ripe dessert fruit, eight distinct kinds, two varieties of Grapes allowed, three black and three white." This is explicit as far as it goes, but would it not be infinitely more satisfactory and more to the point if some qualifying sentence were added? something like the following:—"The judges, in making their awards, are to be guided by the most perfect examples of well finished fruits." By some such wording the exhibitor would know he must produce his best looking bunches of Grapes and the finest of his other kinds, irrespective of flavour, and the judges would know they had to give their decisions from appearances only. And might not all collections of fruit be similarly dealt with?

We will now take another class exclusively for Grapes. It reads thus:—"Six bunches of Grapes, two bunches each of three varieties. To be judged by flavour, combined with perfect examples of their respective varieties." By "perfect" examples I mean that the bunches should be of average, or rather above average, size, also of good shape, well set with full sized evenly thinned berries, good colour, and a dense bloom, according to the variety. By some such wording as the above it would be shown that flavour must have the first consideration. Similar wording could be applied to a four-bunch and a two bunch class.

No Grapes equal the Frontignans in flavour, and one of my reasons for advocating flavour classes is to give those varieties a chance in competition, as this might perhaps be the means of bringing them into prominence, so that they might again find their rightful place on the tables of the wealthy. I am fully persuaded there are many owners of gardens who are wholly unacquainted with those varieties, and it is to be regretted that those gardeners who are allowed to select the varieties of fruit for their employers' tables do not introduce a few of those high-class Grapes where suitable structures exist for their growth. I know that some of the best flavoured Grapes are not easy to produce in high-class condition, but I believe the difficulties are not insurmountable, as witness Madresfield Court.

I have not one word to say against those noble looking Grapes we are so familiar with at autumn shows; they are indispensable for late supplies, and after the turn of the year their flavour becomes quite first-class, also their good keeping qualities so prolong the supply that very early forcing is not now so necessary as formerly; but my contention is that "flavour" should be the first consideration in dessert fruits, and for autumn supplies highly flavoured Grapes should be more extensively grown. I would like to hear what others have to say on this subject.—J. Easter, *Nostell Gardens.*

[We have seen many classes in which Grapes were judged by "flavour" alone, "culture" not being mentioned as a point of merit. Generally the prizewinning exhibits have been so poor in appearance as to impress those visitors who might be unacquainted with the varieties with the idea that such miserable looking Grapes had better be left severely alone. Mr. Easter is aware of this, and wishes to provide against it. His suggested class might perhaps read better in some such form as this:—"To be judged by flavour combined with distinct cultural merit of the respective varieties." There are no degrees in perfection. It will be advantageous to hear "what others say" on the whole question.]

BRUSSELS SPROUTS.

Few vegetables excel Brussels Sprouts in delicious flavour and tenderness at this season of the year. The solid, ball-like sprouts are freely produced on well-grown plants. The larger the plants, as a rule, the finer the sprouts, and the longer the season during which the crop is available.

No kitchen garden crop pays better for superior culture, but the plants must have a long season of growth. Therefore, when plants are raised early and good culture follows in a suitable position the crop will be abundant and satisfactory.

The majority of those who cultivate Brussels Sprouts give their best attention to raising and cultivating this vegetable, so as to afford a supply of fine, solid sprouts, from November to April. This is the time when they are most in demand, though up to Christmas the autumn Cauliflowers and Broccolis compete with the Brussels Sprout, but that is no great disadvantage. Brussels Sprouts are very hardy, and keep well on the plants.

February is a suitable period for commencing operations in sowing and raising. If a frame cannot be spared sow in boxes placed in gentle heat. More sturdy plants, however, can be obtained from sowing on a bed of light soil formed near the glass in a cold frame. Introduce old potting soil, having it of a moist character, and make it firm and smooth on the surface. Give a gentle watering with a fine-rosed can, then sow the seeds thinly. It is better to take time in doing this than to have to draw out the small seedlings after germination, the operation often damaging those left. Cover the seeds one-eighth of an inch with fine soil, pressing it flat and firm. The bed may be darkened until the seeds germinate and the young plumule pushes its way through the soil to the light which they must then have free access to. The advantage of plenty of room for each seedling will now be apparent. Air must be freely admitted on every favourable occasion. Weakening the seedlings by confined treatment is as bad as thick sowing. As they advance and become stronger there will be brief periods when full exposure may be ventured upon. When the seedlings reach the stage of rough leaves they may be transplanted into a bed of rich soil formed in a sheltered but open situation. Place them 4 to 6 inches apart in a careful manner, seeing that the roots are not huddled together and are placed rather lower than previously.

From this time the plants will have every opportunity of strengthening their tissues and forming abundant fibrous roots, so that when the final planting period arrives they may be lifted and planted without any fear of severe checks.

While the plants are accumulating strength the ground intended for their reception must be prepared. The position should be an open one, and the soil of medium texture. A light sandy soil does not possess the requisite firmness, and is likely to be deficient in moisture at a period when the plants need it. Such soil must be freely manured with well-decayed farmyard manure, so as to add to the humic matter in the soil and assist in conserving moisture. Medium fertile soils also need a liberal manuring, and to be cultivated to a depth of 2 feet. The nature of the subsoil must determine whether a portion of it may or may not be mixed with the surface soil. When the former is very poor it is better to break it up well and liberally manure it in its original position rather than bring it to the surface. Heavy clayey soil can be brought into good condition by trenching, liming, and leaving the surface rough for frost to act upon. Such soil should be prepared at once and again before planting. It may not be possible, however, to bring it to the most desirable condition in a few months' treatment, but it will be much improved.

Planting may take place in May, or not later than the first week in June. Many growers are very anxious to plant when the soil is moist, and will risk the dirt and discomfort of tramping about on wet ground in order to plant. In my opinion this is a mistake. It is much more comfortable to plant in dry weather, and better for the soil. Draw a garden line across the plot to be planted, and with a spade take out a trench, place the plants at the required distance apart, cover the roots with a little soil, firm it, and apply water; then fill in with dry soil. This method takes up a little more time, but it serves to effectually establish the plants, for very seldom is more water applied artificially required. The plants do not flag, or at least not seriously, and they are ready to take advantage of the first showers.

The rows should be 2½ to 3 feet apart, and the plants 2 feet asunder. There is room then for the cultural operations, which include hoeing for destroying weeds and keeping the surface open to promote growth and prevent evaporation of moisture from the soil in dry weather. During growth two dressings of nitrate of soda may be applied at the rate of 1 lb. per rod each dressing. Scatter it evenly on the surface and hoe it in.

One of the best varieties of Brussels Sprouts is undoubtedly Sutton's Matchless. They can be easily grown 3 to 4 feet high, furnished with compact sprouts from top to bottom. The variety Aigburth also produces very large sprouts, and is well worthy of cultivation.—E. D. S.

EARLY STRUGGLES FOR KNOWLEDGE.

Education is so absolutely essential to every man at the present time, whatever his station in life may be, that strenuous efforts should be made to acquire it at any cost. For this reason the following account of a worker's struggles to gain knowledge in the face of many difficulties, and without the aid of friends, station, or means, may serve as an encouragement to persevering young men who are striving to improve themselves. The writer cannot be accused of egotism, or seeking for the applause of readers, because, except to the Editor of the Journal, his identity will be known to very few, but it would be idle to pretend that the record is not a source of self-satisfaction. Work of all kinds thoughfully undertaken, carefully, thoroughly, and perseveringly carried out, always yields this inward gratification. For the inclination for study I can take no credit, as this and other qualities were inherited; but mental capacity is improved by sustained application, and the development of the mind is an ample return for all labour in that direction.

Circumstances, which need not be entered upon here, compelled me at the age of twelve to commence working in a garden when a very brief period at school had merely furnished the rudiments of knowledge. It was enough, however, to indicate how much there was to learn if I wished to obtain and hold with credit an ordinary station in life. Beyond this I felt an insatiable desire to understand somewhat of the world and the life it supports, and to learn something of what the skill of man had accomplished in the past, or was performing in the current work of the age. Being left entirely to myself in the choice of my studies, these covered a much wider range of subjects than would probably have been selected for me, nor would I advise others to follow precisely in the same steps; each must choose for himself. What a lad or a man takes a deep interest in he will learn readily, but forced studies of any kind are useless, and troublesome alike to the learner and teacher.

It is wise to confine one's efforts to one or a few channels, and it has been well said that a man should know "something of everything, and everything of something." There should be a special subject to be exhaustively studied, but besides that every man requires a general knowledge, and it is surprising at times how usefully some things learnt in youth may be applied in after life. Certainly on three great occasions in my experience, totally different in their nature and requirements, special knowledge which I gained in my early days has enabled me to perform important duties, to the satisfaction of employers and the credit of their servant.

Perhaps I was ambitious as a lad. I did not then think of devoting my life to horticulture; I hoped to fit myself for a post as assistant to a scientific gentleman, or as a librarian, and for a considerable time this object was steadily kept in view, but further experience gradually developed a love of horticulture in all its departments, which effectually determined my path in life.

The first consideration in the commencement of my studies was the purchase of books, and here I was confronted by a great difficulty; my weekly pay was very small, and with the most rigorous economy I could only afford a few pence every week for anything outside the necessities of life. Being situated within three or four miles of a large city, however, conferred one advantage, and that was, it enabled me to visit the secondhand bookstalls, and thus frequently pick up useful books at a nominal price. For some years I made it an invariable rule to visit these stalls one evening a week, and sometimes twice; and in that way I bought nearly every book used in my studies, and besides acquired a familiarity with general literature. Though I was such a poor customer, some of the stallkeepers would let me search their whole stores, both in the shops and out, and many an hour have I thus spent on wet evenings. I have been a book lover and buyer ever since, and have spent pounds with dealers with whom my weekly expenditure in the early days did not exceed 2d. or 3d. It would be difficult to convey an idea of the pleasure experienced when some valued or long-sought-for treasure was thus obtained, and how eager I was to dive into its pages on my return home. Occasionally I have been weeks, or even months, searching for a particular book, and when this was needed to remove some difficulty which impeded my progress in any special subject, one of the troubles an unaided student with a slender purse has to encounter is revealed.

Second in order was the method adopted in my studies, with the time allotted to them. In regard to the hours at my disposal I had no advantages other than those of ordinary garden lads. We had a good master, a man of long experience, who thoroughly understood his business in every department; but energetic, active, and industrious himself, he expected the full complement of work from everyone under him. The working hours were 6 A.M. to 6 P.M. in the summer, and 7 to 5 in the winter, with occasional time in the evening to attend to ventilation or fires. By rising at 5 A.M., as I could easily do, I was enabled to have an hour before work in the summer, and two hours in the winter. On an average my dinner rarely occupied more than a

quarter of an hour each day, thus leaving three-quarters for my studies; and in the evenings I could always manage at least three hours on four days each week. With the addition of such time as I could devote to reading on Sundays this represents the portion of each week which was regularly devoted to learning for a period of seven years.

Recognising the prime importance of a thorough knowledge of my own language, I commenced with Lindley Murray's English Grammar and English Exercises, upon which I worked diligently for a considerable time. Then Dr. David Irving's Elements of English Composition and Dr. R. G. Lathom's History and Etymology of the English Language were obtained and studied carefully, both proving most useful aids, especially the former. Several interesting works by Dr. R. C. Trench on the Origin of Words were obtained, and that entitled The Study of Words was especially helpful. At this time also I procured an edition of Dr. Johnson's Dictionary, and taking 100 words or more each day to write out and study, I ultimately worked through the whole book. Finding, however, the necessity for some acquaintance with Latin and Greek for the due understanding of a large portion of the words in our language, I procured Dr. Peithman's Practical Latin Grammar, and following that, an interlinear literal translation of Virgil's Æneid, and to these, with some other classical works, I applied myself in translation and re-translation until I was familiar both with words and composition. Monteith's First Greek Course was next attacked, and with the aid of a lexicon and a Greek New Testament, I made some progress in that language as regards mastering words and their variations. Then came a study of French, Hamel's Universal French Grammar being the first book I had; but this was succeeded by several others and a series of Readers, as I was determined to acquire a knowledge that might be useful of a language to which I became much attached. I remember, in one of my bookstall hunts, picking up a quaint old work to practise on in translation—namely, Pitton de Tournefort's "Relation d'un Voyage du Levant," which contained many curious illustrations of plants, places, and people. The study of French was prolonged much later in my life, and has always afforded me a good deal of pleasure.—A Working Student.

(To be continued.)

HARMFUL AND HARMLESS GARDEN MOTHS—13.

Probably it is necessary to introduce the pug moths by name to most gardeners, because a knowledge of insects and their doings can exist without any acquaintance which tends to recognition of either genus or species. The moths themselves may not be very familiar, but one or other of the caterpillars is certain to make its presence manifest in all gardens containing a variety of plants and shrubs. Small creatures are not always pacific, the ants, for instance; but the pugs of the moth tribe have no pugnacity about them, and the point of the name would scarcely show itself to us when merely inspecting the moths alive or dead. A strong family likeness prevails amongst them, which makes the Eupithecia group very perplexing to the naturalist in identifying species, though the genus is soon ascertained. The moths are on the wing at dusk, seldom during the day, when they sit on fences or trunks of trees, the wings expanded and pressed closely to the object on which they rest. We have our attention drawn to some of the pugs by a conspicuous collar or belt, white, it may be red, but the general colour is some shade of brown. Mostly the four wings are ornamented with bars and lines forming a sort of pattern extending over all of them, only the markings on the hind wings are paler and less distinct.

Arriving at the caterpillars we find a clue to the name, which seems to have been suggested by the short, stumpy aspect of many, but they vary both in form and colour. Though of diminutive size, they are, as a family, certainly to be ranked amongst tree and plant disfigurers. Of course some are not found in gardens, or they are harmless, and the troublesome ones seldom occur numerously. Leaves suit the appetite of only a few; most either revel on flowers, devouring petals, stamens and pistils, while partially concealed, or they pierce into capsules and pods, subsisting upon the seeds. Being, then, entirely hidden, they are difficult to discover; sometimes they form cocoons within the fruit in which they have fed up. But the majority of them come down to the earth when ready to change, and it is curious to see how very skilful they are in weaving fragments with silk, so that the cocoon, lying on the surface, looks like a small lump of soil. Hence they frequently escape enemies, not only birds and mice, but beetles and other insects, which regard the chrysalis of a pug as a choice morsel. Many of these chrysalids, small as they are, show bright and varied colours.

Now, since the useful is generally considered to be more important than the ornamental, I may speak first of the Eupithecias that, while caterpillars, reside in the flowers of Apples, Pears, and other fruit trees at times. Guence, who paid much attention to continental species which had the repute of being mischievous, afterwards came rather to the opinion of our great entomologist, Newman, that these caterpillars might not be very harmful in the usual way. Emerson somewhere tells us that Nature makes fifty poor Melons to one that is good, and Leigh Hunt, in verse, has dwelt upon her great prodigality:—

> "Too much grass and too much tree,
> Too much air and land and sea;
> Too much seed of fruit and flower,
> And fish, an unimagined dower."

Everyone who knows anything about vegetable life is well aware that of the profusion of flowers which cover our fruit trees in a favourable spring, the greater part seems to vanish somehow. Even of the fruits that are actually formed, a percentage has to drop, the vitality of the tree is not sufficient to mature them. Therefore such insects as the caterpillar of the green pug, the grub of the Apple weevil, and other flower-eating species may even act a useful part in thinning out the redundancy of blossoms. But there are certain birds, which Nature provides as a check upon the too rapid increase of such caterpillars, and our French cousins, so Guence thought, had been unwise in slaughtering these without discrimination, and rather cruelly too.

This brings us to notice, next, the above green pug, as Newman calls it (Eupithecia rectangulata); though in fact the moth is of several colours, specimens occasionally turn up which are dark brown or black. The Latin name is scarcely correct, for a mark upon the wings is indeed angular, but is not a *right* angle. We have in these islands but one annual brood, the caterpillars feeding part of April and May, the moth flying in June. This caterpillar is decidedly puggy, pale yellowish green, with a line down the back of a darker colour, and also a few short hairs; the whole body is transparent. It is an abundant species throughout Britain. Rarer and local is the pinion-spotted pug, E. consignata, which is on the wing earlier, and though found in Sussex, chiefly occurs in the Apple orchards of the Midlands. Sitting by day upon the trunks rather high up it escapes notice, being just the colour of the bark. It has been recommended to hunt these moths at the egg-laying, but catching them is a tedious operation. Killing the caterpillars when young has its difficulties too; various washes have been applied for this purpose, amongst them the poisonous ones made from Paris green and London purple, to which I have always considered there were objections. But there is no question about their destroying these and other insects, if it is worth while running certain risks which ensue.

Very common in gardens throughout England, Scotland, and Ireland is the lime speck, E. centaureata, which has, however, no connection with the Lime tree that I am aware of. We see them from May to August, resting on walls or fences, especially at early morning. Probably these moths emerge in succession. The caterpillar is also noticeable during two or three months towards autumn. It is slender, a little wrinkled, and varies much in colouring. The food is flowers, principally of the Composite order, that have compact heads; but they live also upon some Campanulas and Saxifragas. The common pug, E. vulgata, merits its name. Its abundance is quite accounted for by the plentifulness of its food plants, the Whitethorn and the White Willow, upon which it feeds in July. The moth flies in May. It is brownish, barred with black and white, the hind wings pale brown, and is sometimes seen hovering about flowers at dusk, or reposing during daylight. Gardens show us now and then specimens of the brindled pug, E. abbreviata, a spring species, for it comes forth in March or April; small as it is (like most of the pugs, the wings only expand about an inch), the ornamentation of them, which is expressed by the English name, reminds us of a colouring to be seen upon some cows and dogs, but which seems now to be uncommon. The caterpillar has been taken on Oak and other trees, feeding upon the leaves; it is yellowish red, faintly spotted.

The netted pug, or Eupithecia venosata, has the wings, which are grey, crossed by numerous black lines. It is one of the larger species, and occurs about gardens in May or June. Later, we find the stumpy, grey and white caterpillar, hidden within the capsules of Silene and Lychnis species, devouring the seeds. A beautiful, and rather smaller pug, is E. pulchellata. The caterpillars live in the flowers of the wild Foxglove and the garden varieties. They are yellowish or green, with a few white hairs, and during July they draw threads over the mouth of the corolla, and thus protected, eat the stamens and unripe seeds, finishing off upon the capsule, when they descend to form an earthen cell, where the chrysalis remains till May. Some caterpillars of the pug tribe feed upon all sorts of flowers, as, for example, that of the dull-hued grey pug, E. castigata, not uncommon in August and September, a slender caterpillar brown and tubercled, with a purple line on the back.

From a peculiar mark upon the wings, the V. pug, also E. coronata has its familiar name; there are two broods each season; the caterpillar is partial to the flowers of Clematis and Golden Rod. The latter plant has its special pug, E. virgaureata, which feeds in September. The chrysalis, if examined by a glass, shows a skull-like device, surrounded by a sort of border.—Entomologist.

A HAPPY FAMILY.

It would be difficult to imagine any assemblage more fully entitled to the above familiar designation than that of Mr. Sherwood and his merry men at the famous Holborn Restaurant last Saturday evening. A wonderful place would this centre of social and ceremonial festivities be regarded by some, even many, of our readers who live laborious, though happy, lives in the quiet solitudes of rural Nature. Let them fancy a crowd of people ascending massive marble staireases, flanked with glistening balustrades, then galleries leading to the right and left, and on each side of these galleries noble rooms. Let them imagine just one of those rooms, with its eight pendent "chandeliers," each with at least thirty "globes," through which shines with subdued brilliancy the electric light; and as if these were not enough for the dissipation of darkness, let them further imagine rows of branched candle "sticks," each with its seven illuminants, along the tables, and then let them again imagine at the least twenty of such rooms, with as many "parties" of not less than a hundred, and thus 2000 diners at the least entertained at one and the same time, and they will in some sense be able to appreciate the difference between a cottar's Saturday night in lonely happy Arcadia and social "life in London."

There is indeed a difference, but each gathering, of few or many, may be, and is, in instances innumerable, equally, purely and harmoniously enjoyable. It is a question of numbers. In this particular London room a table runs near one side and the whole of its length; some forty guests, with the Chairman, Mr. N. N. Sherwood, one of the finest commercial men in London in every way, in the centre. Cross tables extend to near the other side, with twenty rows of his merry men—some, even many, grown grey during their long, loyal, and honourable service in the great wholesale seed firm of Messrs. Hurst & Son; others of varied age, down to the boys just "starting life" from school. See Mr. Sherwood (fig. 86), the embodiment of this great firm, greet his respected guests, shake hands with every boy and every man when his hand can reach them, accompanied with a cheery word for each, and then you feel and know that the gathering is indeed a "happy family."

See, on the side of the room opposite the Chairman, a raised platform with its pianoforte, and note on the conclusion of the repast vocalists and instrumentalists rise from the crowd at the Chairman's call and discourse sweet music in joyous strains; then must you be assured that among this great band of workers are not a few who have, most worthily and well, cultivated with success the delightful art of making others feel that labour is not an irksome task to all, and does not deaden the susceptibilities of those whose services are appreciated.

Note the warmth of the reception that is accorded the founder of the feast as he rises to give to all a hearty welcome, and with innate courtesy thanks all who have honoured him with their presence. Observe the warm acceptance of the loyal toasts. Listen to the several speeches earnest, eloquent, humorous—in fact, all kinds but those which depress, that were elicited in carrying out the programme. From this—a full one—nothing appropriate seemed to have been forgotten, and everything that was said seemed to meet with enthusiastic response; but the two speeches that went home the most directly were those of the veteran, Mr. Hugh Aiton, in proposing the "Chairman," and Mr. Sherwood's in response. The former described his having watched the growth and wonderful expansion of not only the "House," with which he had been so long and pleasantly connected, but he had enjoyed the privilege of also watching with admiration the progress of its honoured head from youth to manhood—his attention to details till he "knew the ropes," his diligence, thoughtfulness, and charming disposition; and whose sons were also following, in all those respects, in the footsteps of their much-loved father and friend of all whom he had welcomed on the present festive occasion.

Then came the great ovation—ringing and prolonged cheers from many more than a hundred throats—while Mr. Cox was bravely striving to get a hearing from his grand pianoforte—bravely but vainly, till the vocal music waned, and then soon all became still—as "still as mice"—for the master. There was no mistake about his speech. It emphasised the gratifying fact that there *is* unity in spirit between workers of all grades and directors. It is so, we are happy to know, in many establishments of a similar character, and never was it signalised more clearly than on this occasion. In a speech of gratitude and hope, Mr. Sherwood expressed his obligations to all—men and boys—who served him so loyally, faithfully, and well. Some had grown from boyhood to manhood in the work of his "House," and he read with pride the names of many who had served continuously for from nearly twenty to nearly forty years. He hoped other boys present might do the same. His business could not have been raised to its present dimensions without such an able staff and worthy, willing workers as he rejoiced in. He knew the work, and what men could do, and warmly appreciated what his friends had done, were doing, and would do; and they might depend upon it that so long as they did their duty to him he should not be lacking in endeavour to do his duty to them; and while the best of feeling existed and mutual trust prevailed, all would be stimulated to do what was just and right, and then as they were satisfied with, and thankful for, the past and the present, they might look with confidence to a prosperous future, when his sons would be as faithfully served as he himself had been.

Such is, in brief, the substance of a speech that made many hearts, old and young, leap with joy. It is not given to all to do what Mr. Sherwood has done in the institution of these banquets. They commenced in connection with some special event, or the event was seized as an excuse for friendly meetings, which seem to have become established

Fig. 86.—Mr. N. N. Sherwood.

features to be looked forward to annually by those who have come to believe that such gatherings are good for all who attend them.

But if not in this particular way and at this particular time, yet in other substantial ways and at other times, are pleasant gatherings promoted and good deeds done by the proprietors of other firms which occupy leading positions in the great industry of horticulture.

There are still other modes, and a time never out of season for bringing them into operation, which go to the making of "happy families"—little personal acts of kindness and of grace which will pass to and fro before many days are over, and are, in fact, on the way. If each and every person would seek to make one human being happier in a thoughtful way the sum total of happiness would be great. The time almost by universal consent for doing this is now, and if it were done we should be nearer the realisation of the ancient wish that will shortly fall from a million tongues and pens as naturally as it slips from the pen of the writer; it is a Catholic pen for the moment, and inscribes for all of every creed, rank, class or party the wish for

A Merry Christmas.

GLADIOLUS GANDAVENSIS.

The position which this splendid autumn-flowering plant at present holds, at least in London and its neighbourhood, is a very remarkable one. Well fitted to attract admiration by the bright and delicate colouring of its flowers of all shades, from pure white to the most brilliant scarlet, it may well be asked why it is not more popular: by popular I mean in the sense of its being more generally cultivated and exhibited. Whenever Gladioli are exhibited, people stand before them admiring their extreme beauty; but they go no further than this, and if you ask them they will probably shrug their shoulders and say, "I have tried them, and have utterly failed to keep them." I have asked many why, and the reply has been, as one leading nurseryman said to me, "I spent £50 on them, and have not one left."

I can look back upon twenty-five years of exhibiting, and the number

of exhibitors at any one show has never exceeded half a dozen, and I do not at present know of one amateur who cares to take the trouble of bringing his flowers to the show ; indeed, there is now very little encouragement for him to do so. The Crystal Palace Show, that was held early in September, always used to bring a certain number of exhibits, but that is now abandoned, and gives place to the great fruit show that is held at the end of the month. There are prizes offered by the National Chrysanthemum Society at the Aquarium, but from this amateurs are excluded—not avowedly, but the prizes offered are for collections, not for any specified number, and a collection which takes the prize consists of about 150 spikes, and an amateur's small number would look very out of place in competition with such an exhibit.

There is no regular competition at the exhibition held at the Drill Hall, so here again it is the nurseryman who comes to the front. In August Messrs. Kelway & Son always stage some magnificent collections, and Mr. Burrell of Cambridge comes out later on. This is one reason, I think, why the flower is not so popular as it ought to be, for disguise it as you may, it is, I think, a fact beyond dispute, that when a flower does not attract exhibitors it falls into the background.

But there are other causes tending to the same end. I have already alluded to the fact of the difficulty of keeping up a stock ; this can be done with pains and care, but it needs both. The corms which you plant this year may last for three or four, though in truth they are not the same, for the old one dies and the new one is formed on it. For all practical purposes, however, it is the same, and therefore those who said that they degenerated were in one sense correct ; at the same time the variety does not degenerate. I saw, for instance, this year, a bloom of Orphée with sixteen flowers expanded on it, and yet this sort has been in commerce for more than thirty years. This apparent contradiction is reconciled by the fact that each variety throws out more or less a number of cormlets which growers call spawn ; these when taken off and carefully planted, will grow in a couple of years into a flowering size, and thus, although the bulbs from which these have been taken have perished, the small ones produced do not seem to inherit any delicacy of constitution.

I have said more or less, for in truth the difference between varieties in this respect is amazing. I have mentioned Orphée, from which I recollect taking from one bulb in one season more than a hundred small ones, while there are other sorts which hardly ever throw out a cormlet. There is a remarkably fine variety raised by Mr. Burrell called Snowdon ; it is the purest white, with flowers of a large size, forming a grand spike containing eighteen to twenty expanded blooms ; but it is utterly valueless to the raiser, for it hardly ever produces a small bulb, and this explains the fact that many sorts do not drop in price like others. There are those which came out in the same year, of which one can be had for a few pence, while the others are still priced at a few shillings, and so I would say that those who wish to keep up a collection must depend for a continuance of their stock on these small corms.

There is also another cause why this flower is so sparsely exhibited—it involves a great deal of trouble in bringing it to the place of exhibition. Various have been "the dodges" to which growers have resorted for this purpose, for it must be remembered that you cannot bring them in the stand in which they are to be shown. I myself used to try this, but was ultimately obliged to abandon it. They are mostly taken now in frames covered with canvas and securely fastened, and anyone who knows the remarkable agility which railway porters always manifest wherever flowers are concerned, will readily imagine that it requires a somewhat watchful eye and a liberal expenditure of "tips" to get them safely through. Then when you have your flowers at the table for exhibition you have to take them out and arrange them in the show stand. Compare this with what an exhibitor of Chrysanthemums, Dahlias, Asters, and other autumn flowers has to do, and the difference will be at once seen. Their flowers are already arranged on the show stand, and all the exhibitor has to do is to draw them out of the case in which they have been brought to the place of exhibition. He may have, it is true, a desire to fiddle about with them, but that is the way of florists ; they always think they can make their flowers look a little better, and so as at our Rose and Dahlia shows it is very difficult to get exhibitors away from their boxes to make room for the judges.

These difficulties have prevented our amateur growers from continuing to exhibit Gladioli. I used to be a constant exhibitor at the Crystal Palace, but when that show was given up I had no place at which to stage ; in the same way, two very ardent and successful cultivators, Mr. Herbert Fowler of Taunton, and Mr. Lindsell of Hitchin, contributed some grand stands, but they too became tired of it, and although they both exhibited once or twice at the Aquarium, they afterwards abandoned it.

Other varieties besides those of Gandavensis have been exhibited at the Drill Hall, such as those of the Lemoinei and Nancianus section, and some also raised in America by Mr. Childs, but I do not think any of them can ever hold the place in the estimation of the true florist that the Gandavensis varieties have obtained.

The following new varieties have obtained the award at the shows of the R.H.S. in the Drill Hall, and came from Messrs. Kelway & Son of Langport :—Carlton, a large and well-formed flower of rich rose purple colour ; J. C. Clarke, a soft rosy purple, the flower is large and the spike good, but it is not of a colour that everybody would admire ; Countess Amy, a very beautiful flower of large size and good substance, colour a bright rosy purple with white throat ; Mike Lambourne, a rich deep velvety crimson, the form is excellent and the substance of the flowers good and firm ; and Countess of Leicester, a large flower, the ground white with rose and purple markings.

There was a very beautiful stand exhibited by Messrs. Burrell on September 21st, but as the raiser was very much occupied with some seedling Cactus Dahlias that were of such merit that out of the four set out for certificates three of them obtained awards of merit, that he had no time to set up his Gladioli, evidently impressed with the idea that in a commercial point of view the Dahlia surpassed the Gladiolus.

The following new varieties from the Continent have been grown in my garden :—Actéon, salmon, pink striped ; Duguesclin, described by the raiser as a brilliant scarlet, with a large white centre and a good deal of slaty marking in it, but it did not strike me as being anything remarkable ; Hébé, white, striped rather heavily with deep purplish crimson ; Hellé, a very pretty pale flower, with cream ground and blotch, and slight lilac pink markings ; Le Cid, a grand deep scarlet lined with white, the blooms very large and the spike good ; Marie Caroline, rose colour, large flowers ; Marquis de Mores, a large well-opened flower of bright cherry red colour, lined and blotched with pure white ; Menelik, a novel and unique colour, flowers not very large ; Toison d'Or, a pretty flower, pale yellow, with slight pink striping, a remarkable combination of colour ; Tristan, a fine flower, red, with stripes of darker red ; Almée, clear yellow, slightly tinted with pink at the edges ; and Sablé, a curious combination of colours, deep orange scarlet, blotched, lined, and spotted with bright yellow.—D., *Deal*.

ROYAL HORTICULTURAL SOCIETY.

DECEMBER 14TH.

SCIENTIFIC COMMITTEE.—Present : Dr. M. T. Masters (in the chair) : Mr. Michael, Rev. W. Wilks, Mr. Sutton, Prof. Church, and Rev. G. Henslow (Hon. Sec.).

Cypripedium, Monstrous.—With reference to the specimen sent to the last meeting by Mr. Veitch, Dr. Masters reports that the lip was wanting, but the dorsal and ventral sepals as well as the lateral petals were normal; both stamens were present, but only two carpels, standing in an antero-posterior position.

Tuberous Growths on Vines.—Mr. S. T. Wright sent some gall-like structures taken from Vines in the large vinery at Chiswick. He observes that "many of the old and young rods are similarly malformed at their base. It does not appear to affect the health and vigour of the rods. In all the malformations grubs or maggots are present ; but neither moths nor weevils have been seen in the house." Mr. Michael pronounced the grubs to be coleopterous, but they were not likely to have been the cause. Prof. Church undertook to examine them chemically. There was no apparent structure in them beyond a mass of cellular tissue with a corky exterior surface.

Hellebores Diseased.—Some badly diseased plants were received from Mr. F. W. Burbidge, Botanic Gardens, Dublin. They were submitted to Kew for examination. The report was as follows :—"*Phoma effusa*, Desm., is the name of the fungus attacking the Hellebores. The diseased portions should be removed and burned, as at this season the fungus is producing myriads of spores, which live as saprophytes on humus in the soil for some time before they are capable of acting as parasites. The Hellebore shoots of next year will be infected by these spores. The above alternation from a parasitic to a saprophytic mode of life enables the fungus possessing one form of fruit only, as in the present instance, to tide over the period during which its host plant is not actively growing. Spraying with a solution of potassium sulphide (1 oz. to 3 gallons of water) when the leaves first appear next season would to some extent prevent the chances of inoculation from floating spores."

Holly with Red and Yellow Berries.—Mr. Ch. Turner, Slough, sent some sprays, on which he remarks, "They are cut from a large tree which retains its berries for two years. The berries are yellow in the first year, but change to red in the second year.' As no seasonal break was distinguishable between the group of yellow and that of the red berries below it on the same stem, some doubt was expressed, and some further information desired. This Mr. Turner has kindly promised to furnish.

SOLUBLE PHENYLE.

ALLOW me to thank your correspondent "Halogen" for his clear remarks about soluble phenyle and its composition (page 579), and also for the three remedies he has given us for the destruction of eelworm. It seems, from what he says, that there is practi ally no plant food in soluble phenyle. I thought there could not be any, hence my remark on page 547, viz., "I have yet to learn what soluble phenyle contains to make its application valuable to crops as food." If it contains no plant food, why are such statements made as we find on May 6th (page 400), and July 1st (page 140) ? On the former date we are told that "soluble phenyle will give value for outlay as a manure,' and on the latter date, "it acts as a fertiliser.' Surely there is something wrong somewhere.

So, "By the Sea" has turned his back on soluble phenyle. All I can say is, he is not the only one who has done so. Perhaps I may suggest to him a practical way of getting rid of the eelworm in his Cucumber house. Procure some quicklime fresh from the kiln. Slake it in a tub with boiling water, adding enough of the latter to make the lime just workable. After clearing out all the old soil, put the thick limewash on the walls with an ordinary whitewash brush, being careful to fill up every crevice. After finishing the walls, put a quarter of an inch of the thick wash all over the ground inside the houses, and allow it to remain until the houses are required. The heaps of soil for planting the Cucumbers in may be

placed upon the dried limewash. The turf should be cut and stacked at the same time interlacing with good fresh horse manure, and in addition a good quantity of basic slag and kainit. Before the soil is used, saturate with boiling water to kill any eelworm living.

Yes, Mr. G. Abbey, last year I reported a failure with kainit when 1 oz. in a gallon of water was used. On page 547 I was able to report a success because the medicine was used about twelve times stronger, and in conjunction with basic slag. Like Mr. Abbey, I do not wish to enter on another discussion about eelworm, for these notes finish all I now have to say upon the subject; but I would like to ask your correspondent if he be sure that 4 ozs. of kainit per square yard is sufficient to kill any species of eelworm in England, why he cannot advise one of your numerous readers to rush off for that £50,000 named by "Halogen" in last week's issue? Four ounces per square yard is only about 10 cwt. per acre; cost 25s. What would anyone have cheaper?

With regard to the substance used so disastrously on Cucumber plants, as reported on page 547, I wish to inform Mr. G. Abbey (1) that Little's soluble phenyle was the liquid used; (2) it was obtained direct from their works at Doncaster; and (3) it had the formulæ C_6H_5 upon the bottle.—W. DYKE.

THE AWARDING OF EQUAL PRIZES.

THE disposition of judges to award prizes of equal merit to exhibits at autumn shows seems to be on the increase. This is a proceeding of which I much doubt the necessity or the advisability. Prizes are offered for various exhibits—it may be a collection of fruit, one of vegetables, a group of Chrysanthemums, a collection of stove and greenhouse plants, or possibly two dozen cut blooms. The duty of the judges is to find the best, and in all such classes I maintain there is a difference, and that distinction ought to be made between the competing exhibits. As Mr. J. Douglas once said (or was credited with saying), the awarding of equal first prizes is an easy way out of a difficulty for the judges.

Personally I do not think it is possible for two exhibits of a similar nature to those noted above to be so arranged that the merits of each are absolutely equal. Take, for example, twenty-four Japanese or incurved Chrysanthemums; it is not to be expected that two competing collections can be so arranged that they contain exactly similar varieties. Surely, then, the placing of two stands on an equal basis of merit cannot be in accordance with the individual merit of each variety. Where two stands of blooms run each other so closely that the difference between the two cannot be determined by comparison, resort is usually had to judging them by the allocation of points. I have frequently had instances of two competing stands totalling up the same number of points. The arrangement of colours and the "setting up" of the blooms is then generally sufficient to give the casting vote.

In a group of Chrysanthemums, interspersed with foliage plants, there would appear to be more points for consideration, and consequently more opportunities of finding weak spots in the same way, that there is greater scope for merit. Apart from the quality of the Chrysanthemum blooms, there is the question of their foliage and the disposition of the plants themselves as to whether due regard is paid to harmony of colour, or otherwise, with the quality and placing of suitable foliage. All these points, combined with a pleasing margin to complete the group, not forgetting the hiding or the exposure of the pots containing any of the plants, must be considered.

From the newspaper reports we learn that a unique occurrence took place at the autumn show at York. The regular judges could not agree as to the merits of a group of Chrysanthemums and foliage plants, two others were called in, and they also were unable to settle the point of supremacy. A third couple were deputed, and, strange to say, they also disagreed. Here we have six persons failing to agree over the awarding of the first prizes, and this may be taken as a strong argument for the advocates of equality in prizewinning. Eventually at the show named equal first prizes were granted. From such a conclusion there seems reasonable grounds in this class that substantial justice was done. Still it is difficult indeed to imagine two large groups of plants even in every point of quality, and the reverse. At the Ipswich show a similar decision was arrived at over a collection of fruit in six dishes. In that particular class a faulty dish of Doyenné du Comice Pears gave an equal award to the competing collection.

The only legitimate ground that I have ever seen for the awarding of "equal" was where prizes were offered for one bunch of Grapes, irrespective of variety. Handsome specimens of Black Hamburgh, in every respect, competed against faultless ones of Madresfield Court. Here, then, was a really a difficulty. The question of deciding which was the superior bunch was really a matter of personal taste, liking or disliking one variety as against the other. Black Hamburgh, in superb condition, is hard to excel by any other variety, while the difficulty of "finishing" Madresfield Court is recognised as demanding more skill, and this, coupled with the fine flavour possessed by the variety, give it an equal position as a Grape.—SADOC.

[If a silver cup had been offered for the best group at York it would seem that it could not have been awarded. As to Grapes, if the Black Hamburgh and the Madresfield Court bunches were equal in merit as to size, shape, uniformity, and finish of berries, ought not the "more skill" required in producing the latter to have been the determining point? Were equal prizes ever awarded in the cast of the "premier" bloom in a Chrysanthemum show?]

EELWORM ON YOUNG VINE ROOT-STEMS.

THE young Vine submitted by "Cross" to the Editor on the eve of the Chrysanthemum season well represents the attack of root-stem eelworm (Tylenchus obtusus, *Bastian*), hence a representation of the attacked part (fig. 87, *A*) may be interesting to some readers of the *Journal of Horticulture*.

The Vine in question was planted in March, 1897, evidently a cane from an eye of the previous year, and had not been deeply planted; indeed, there was only 2 inches from the setting-on of the roots (*a*) and the surface of the soil (*b*). The cane had been cut back to two buds, and the wound thus made had healed over (*c*). It had made abundance of roots, a complete "mat" of fibres, which, when cut off, weighed 1¼ lb., and the extending roots, one of which is shown at *d*, were quite clean, perfectly free from vegetable or animal parasites. The growth of the Vine had been excellent, as shown by the canes (*e*), and these also were quite clean and healthy. They are reduced one-half of the natural size, and do credit to the grower, being short-jointed, stout in bark, hard in wood, and small in pith.

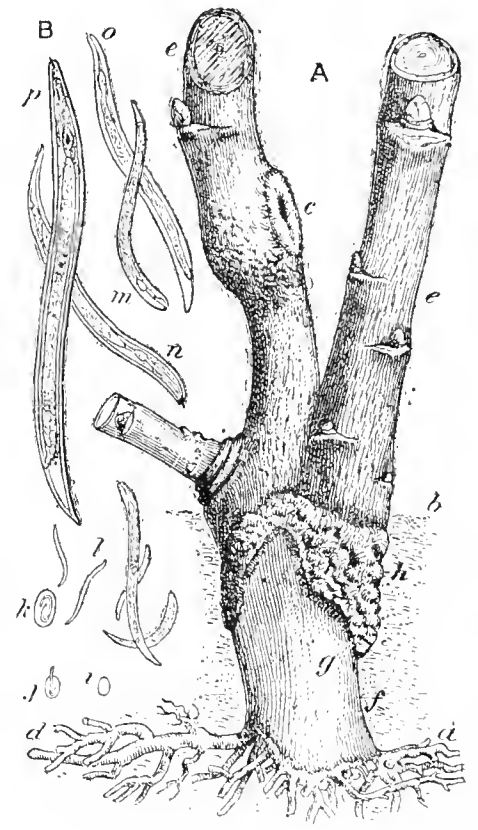

FIG. 87.—ROOT-STEM EELWORM (TYLENCHUS OBTUSUS, *Bastian*) ATTACK ON YOUNG VINE.

References.—*A*, part of Vine (half natural size) showing: *a*, setting-on of root-system; *b*, surface of soil; *c*, point of pruning or cutting back of cane in previous season; *d*, healthy root, free from eelworm; *e*, canes; *f*, barkless stem, arresting (partly) ascent of sap and descent (wholly) of assimilated matter; *g*, exposed stem; *h*, excrescence—"canker"—caused by eelworm. *B*, root-stem eelworm, enlarged (130 diameters); *i*, egg; *h*, eelworm emerging from egg; *k*, cyst-eelworm coiled inside; *l*, young found in part of excrescence; *m*, growing male; *n*, developing female; adults—*o*, male; *p*, female.

There was nothing to indicate disease except a decay of the bark at what is called the "collar," and some of this had fallen off, as represented at *f*, leaving the wood exposed (*g*). Above this, on the root-stem, appeared an excrescence (*h*), commonly called root-stem "canker," and in this a white mould was seen with a pocket lens. Its hyphæ did not pass into the living tissues, therefore, was considered a saprophyte which it is. I happen to know it well, but it can also break down living cells by contact of ferment or extruded juices, though that only happens under certain conditions not in this instance present.

Taking a small bit of the excrescence, and placing it in a drop of aniline, I got the animals, shown under *B*, as "still as mice." They were all forms of the blunt eelworm (Tylenchus obtusus), the root-stem pest of various herbaceous plants—weeds in Britain—and about as common as ditch water. I do not know what they do not live on, but they seem to delight in exotics, such as Cucumbers, Melons, Tomatoes, Chrysanthemums, Gardenias, and Ixoras.

The pest is not uncommon on Vine stems—that is, the root-stem, but somehow gets stopped in its work, and all goes well. Occasionally, however, it happens otherwise, and "Cross's" case is one to the point. Four Vines planted in March last with many others, have gone like the one represented, and that by root-stem eelworm, which never attacks any part of the plant but the root-stem; by so doing it makes sure of a supply of nourishment in abundance, the roots catering for it, and the descending current supplying bounteous assimilated matter, forming an excrescence—growth of cellular tissue.

The eggs were many; one is shown at *i*. One more venturesome inmate than the rest must come into this great world of things, but the animal only gets partly out of the shell (*j*). There were cysts, one represented at *k*, and several small fry, some before and others after encysting (*l*). There were males, one shown at *m*, and females, one represented at *n*, staid adults—Tylenchus obtusus—*o*, male; *p*, female. In "Cross's" specimen, everything appertaining to root-stem eelworm was there that is to be seen.

The eelworm leads a very simple life, lives on organic vegetable substances in a state of decay, and performs a very useful office in the great work of Nature—the reduction of organic material into inorganic—the food of plants. The larvæ, so called, emerge from the eggs, sport about in the decaying matter the parent has shed them in, then they encyst in the less decayed parts of the vegetable matter, or even in living, always soft cellular tissue, and after a time come out very active creatures, feed, grow and pair, the female gives forth some 200 eggs, and like her preceding consort, dies when her life work is done, the whole thing in summertime lasting four to six weeks. In winter, outdoors at least, breeding ceases, but under glass proceeds more or less the year round.

I know no more about this eelworm, and have put the matter in the

simplest way I am capable of, therefore need not proceed further, only "Cross" hit the nail on the head. "Soil may be rank, as the top (6 inches) is old Cucumber soil, the bottom virgin soil." The whole thing is there in a nut-shell. "Rank"—food for eelworms.—G. ABBEY.

THE NATIONAL ROSE SOCIETY.

ONLY the other day a correspondent was asking why the Rose should enjoy the appellation of the Queen of Flowers. Until the Chrysanthemum came no one thought of disputing the propriety of that title. So great are the claims of the Chrysanthemum, however, for regal honours in the floral world, that for some time she has been dubbed the "Autumn Queen," and as by the time her beauty shines most richly that of the Rose is on the wane; hence there is hardly after all a case of rival queens, for both are superlatively lovely in their seasons.

Reading over the report of the recent meeting of the National Rose Society I could but remark how different is the class of courtiers which thus annually meet to do honour to the summer queen to what are found in the court of the autumn queen. Not but what all are mortal and human, and therefore tainted with the feelings that pertain to humanity, and especially to those who are exhibitors. Still, the Rose does have a much more refined body of courtiers than the Chrysanthemum seems to have.

I have wondered whether the N.R.S. would care to meet or to hold its shows where the N.C.S. does; but surely I need not wonder, because it seems impossible it could be so. Association with the Rose, whether growing only, or both growing and exhibiting, evidently does refine. It could hardly be otherwise.

A floral society, to be worthy of the distinction of "National," should have a most important section of the community adequately represented on its Council—namely, amateurs, who occupy positions distinct from that of working gardeners, however honourable this occupation may be and high-minded the conduct and character of many of those who are engaged in it. It is the affluent after all who to the largest extent provide the means for the acquisition of new plants and the requirements of their cultivation.

It is most desirable to enlist the personal sympathy of this influential class with floral and horticultural associations, and this cannot be done, or done so well, otherwise than by according them a share in their government. It is not, however, by any means for their wealth alone that their official connection with societies is desirable, for there are many gentlemen who live and move in the same plane who are not wealthy, though ardent lovers of flowers, who can and do exert an influence which cannot, in the very nature of things, be exercised in the same direction by gardeners alone.

Moreover, gentlemen of high standing and education who may be engaged in large and successful business undertakings, or distinguished by their ability in the learned professions, possess great administrative capacity, and take broader views of things than any body of men can do who have had no such training. In a word, they give character and permanency to a society that must add to its strength.

I do not belong to class of which I write, and am a little more closely associated with Chrysanthemums than Roses; but I could not help observing, on reading the report, a source of strength possessed by the N.R.S. that seems to be unfortunately lacking in the sister society of the autumn queen.—MODESTO.

BUD VARIATION.

IT is odd that in the paragraph you inserted on page 576 under this heading, and quoted from an American paper, both the fruit sports referred to should be of English origin. The well-known Canon Hall Muscat Grape is there said to be product of a sport from the ordinary Muscat of Alexandria. There is no proof that such was the case. Mr. Barron, in his Vine book, refers to it as a probable seedling. No doubt the American writer has got a little mixed over recent mention of the sport at Chiswick, which resembles Canon Hall Muscat on the Muscat of Alexandria. As to the yellow Plums on a purple Plum tree, the only case that I ever read of or saw of this nature was in the late Dr. Stewart's garden at Alton, Hants, where a standard Plum, I think Angelina Burdett, for several years had produced yellow Plums on one branch. —A. D.

THE paragraph on bud variation brought to my mind a singular freak which occurred during my practice in Grape growing; that is, in a bunch of white Frontignan Grapes there appeared a perfectly black, naturally coloured, berry, rather larger than the normal white ones. This being on the side of the bunch facing the walk in the vinery, it excited some little interest at the time. I think such an occurrence is unusual. I cannot say that I ever heard of a similar freak.—J. EASTER.

YOUNG GARDENERS' EXPERIENCE OF CANADA.

IT may be of interest to readers of the *Journal of Horticulture* to give a few extracts from letters received during the past five years from three young gardeners who left the land of their birth for Canada in March, 1892. They were led to take this step after visiting the Royal Agricultural Show at Doncaster, where specimens of corn and fruit grown in that country were on view. They went out strangers in a strange land, having no friends there nor letters of introduction to assist them in obtaining employment. I was much interested in the success of their undertaking, as two of them had been employed under me for four years, and the other one for upwards of two years, as journeymen; all were good workers and of excellent moral character.

Knowing that I was interested in the commercial part of gardening they at various times mentioned the prices obtained for flowers and fruit in their adopted country, which compare favourably with the low prices prevailing in this country for several years past; but in making a comparison one must take into consideration the extreme cold and cost of production.

"A." writes: "I have now been here (Ontario) three months. I reached my destination at three o'clock in the morning after a cold and unpleasant journey. I would not advise anyone to come out steerage, as the majority of the passengers are foreigners, and the sleeping accommodation is not good. After leaving the steamer I was nearly three days in the train, which was enjoyable after seeing so much water and the rough life on board. 'B.' and 'C.' stayed at Montreal. I was extremely fortunate in securing employment in a private garden on the first day of my arrival, the wages being equivalent in English money to 31s. 3d. per week. There are few private places in this country, but anyone coming here and expecting to see nothing but log shanties will be much surprised, as there are some of the finest buildings I have ever seen. Electricity plays a prominent part even in the small towns. The electric light and electric cars are common, and nearly all the houses are connected by telephone. One can count as many as 100 wires in one street.

"The gardens are not kept in such good order as in the old country, as everything is done on a rough scale. It is very hot in the summer, the thermometer ranging from 90° to 96° in the shade, and all the lawns have to be watered, or the grass would soon be scorched up; but as we are near Lake Ontario water is plentiful."

After a year's experience the writer says, "This is called the Garden of Canada, and right well it deserves its name. This place is thirty miles from Toronto, the whole district being planted with Vines, Peaches, Apples, and Strawberries. One may go for several miles and see nothing else. Strawberries are soon over, and are of poor quality, the price being 1s. per punnet, Bananas 5d. per dozen, and Pines 6d. to 1s. each. Apples, of which there are great numbers grown, sell for 7d. per peck. Grapes are extensively grown and very cheap, the price being 1d. per pound; the bloom on them is perfect. Honey is abundant and good, the price being 5d. per pound.

"Chrysanthemums do not succeed well in the open air, owing to the dry atmosphere and the liability to be damaged by a bug which eats the centre out of the shoots. They, however, do well under glass if rooted in May or June and flowered in 5-inch or 6-inch pots. Plants treated in this manner will grow about 2 feet 6 inches in height, and produce from twenty to thirty small blooms. Odontoglossums, Cœlogynes, and Poinsettias are grown in the open air during the summer months. The latter do remarkably well, the bracts being larger than any I have seen in the old country. Orchids under glass are not shaded as much as at home, and they appear to do well and bloom as freely. Although it is very hot during the summer months one rarely sees the Vines scorched when grown under glass.

"Owing to the severe frosts, Cabbage if planted in the autumn would soon succumb, so plants are raised on hotbeds in the spring and planted out. In the autumn they are placed in large heaps and buried, the same as Potatoes are done in England, and they turn out all right in the spring.

"We have a few familiar trees to remind us of home; the Lilac and Philadelphus are to be seen growing and flowering freely, but of the common Hawthorn I have only seen one specimen. I am also much struck by the scarcity of wild flowers and song birds, which are so plentiful in the old country, but there are few here. The cold is not so severe in Ontario as it is in the North-West, where the thermometer often registers 40° below zero. The severest frost here has been 13° below zero, which is quite cold enough, as the ground was frozen to the depth of 3 feet, and ice on Lake Ontario was 2 feet 6 inches in thickness. It is not often we have more than 2 feet of snow, which, by the way, is different from what I have before seen, being like fine dust."

"B." found employment in a market nursery the second day after his arrival in the suburbs of Montreal, and after he had spent a year there he wrote: "I am in a commercial establishment, and receive 7½ dollars per week. There are many market growers in the neighbourhood of Montreal, and it is an easy matter to find employment so long as one can do the work; that is all they want. Roses, Carnations, Violets, Cyclamens, and Chrysanthemums are what we chiefly grow for winter. The flowers are gathered every morning and sent to the stores in the city, where there is a great demand for them. The retail prices during the last two months of the year have been—Roses, 10s. per dozen; Carnations, 3s. per dozen; and Violets, 1s. per dozen. Only six varieties of Roses are grown—namely, The Bride, Catherine Mermet, Souvenir de Wooten, Perle des Jardins, Sunset, and Madame Hoste. With us Carnations Daybreak, W. Scott, Silver Spray, McGowan, Portia, and Garfield are

most popular, and invariably flower well throughout the winter months. Of Violets, Marie Louise is the only variety grown. One house contains over 6000 plants, from which great quantities are gathered daily, which find a ready sale at the above price.

"Chrysanthemums are grown in 6-inch pots, and average eight to twenty blooms to a plant, one flower to each stem. The majority of the plants made from 50 to 75 cents each. Cyclamens are well grown in this country. We had grand plants, well flowered in 6-inch pots; they were two-year-old corms. The retail price of these was from 3s. to 5s. per plant. They are grown on a different system from what I was used to in the old country. We never allow the old corms to dry off at all, but keep them moist and growing throughout the season. My experience of Cyclamens treated in this manner is that they are much better than if kept on the dry side and allowed to rest. It may not be all in the treatment they receive, the different climate probably having something to do with it.

"The houses are all heated by steam; 30,000 feet of 1-inch piping is all heated by one boiler. Another little boiler is used for pumping and watering purposes. All the watering is done with the hose. There is a great saving in labour, the water is always warm. I like this country and the commercial business, but there is a great deal of competition. It is very hot in summer and cold in winter. February is the coldest month; 24° below zero is the most severe frost we have registered."

"C." wrote, after he had been in Canada nine months, "I am getting on well in this country. I obtained a situation in a commercial garden at Montreal the first day of my arrival. I am getting 7 dollars per week, and do not doubt but that I shall be able to command more wages next year. The chief things grown are Roses, Carnations, plants for decoration, and bedding plants in the spring. There is a great demand for flowers in this part, which command good prices. Roses are grown to perfection, and are managed so as to begin blooming the first week in September right on to the end of May, when they are replaced by young plants that are rooted from cuttings of the flowering shoots and grown in pots until the end of June. They are then planted out in the beds, which are 4 feet wide by 4 inches in depth, and run the entire length of the house. Cow manure is extensively used for growing Roses, and the temperature of the houses is maintained as near 60° as possible, which keeps them growing and blooming freely the whole of the time. As each bloom opens the shoot with the bud is cut back to the second bud, as might be the case with pruning Vines. Every shoot that breaks never fails to bring good blooms. That is what they call pruning.

"This place is on the banks of the river St. Lawrence, and about four miles from the city. The scenery is grand. Although we have the two extremes in heat and cold the atmosphere is dry and clear."

Since the above letters were written I have had further communication with the writers as to the advisability of young gardeners going to Canada, and the reply is nearly the same in each instance. "There is plenty of employment for young men in market establishments, and wages are an advance on the old country. There are few private gardens in which young gardeners are employed. Clothes and boots are similar in price to what they are at home, but rent and fuel is dear, and owing to the excessive cold a fire has to be kept burning throughout the night."

In answer to my query as to their future prospects I find they are not very good unless they can save sufficient money to commence business on their own account. They do not advise others to follow their example, although they own they would not like to come back to this country and work under the old conditions. They are loud in their praises of their adopted country. In the States, they observe, better wages may be obtained, but the hours of labour are longer, as Sunday is very much the same as other days of the week. They therefore remain loyal to the British Flag.—S., *Yorks.*

GRAPES AT TILEHURST.

I SEE on page 552 that "A. D." does not credit my statement as regards the vinery at the Tilehurst Nurseries. I advise him to read the paragraph again more carefully than he did before, ere he makes another calculation, for in my *Journal*, at page 521, the statement reads thus:—"The Vines are planted 5 feet apart at the back of the pipes, each Vine consisting of two fruiting rods, and one-rod Vines were planted in front of the pipes to get a crop of Grapes at the top of the house." These Vines have not been removed, but are still in the position in which they were planted, just 2 feet in front of the back Vines, and had Grapes on them this season.

Now if Mr. "A. D." will add fifty-eight rods more to his calculations he will then be able to see that it is not so very wonderful that a house of Grapes, grown for market, should have that number of bunches, representing, as they do, 3 tons or more of Grapes.

I suppose Mr. "A. D." noticed the Editor's remark. If your correspondent cannot see the photograph that was sent with the sample of Grapes I will send him one by return of post if he will send 2s. worth of stamps; if he cannot see his way to do that, if he will let me have his address, I will send him one gratis.

If he would take a trip down the Lee valley in Middlesex and Herts, he may see many such vineries, also in other districts; but it is rather late for that now, as the weather has been too warm for keeping Grapes back. We could not keep the houses cool enough for Grapes that were ripe at the beginning of September.

If I am spared till another September, and Mr. "A. D." is willing to pay me a visit, I may be able to let him see another good show of Grapes. If we do not get all the bunches to average 1½ lb., we can always find a corner in the basket for a smaller bunch that will just make the weight right and the basket full. I did not say that 1 lb. was the average weight, but "not less than 1 lb."

I thank "A. D." for the compliment he pays me of being a Grape producer. This is exactly what I want to be—namely, able to supply the masses with Grapes.—JOHN BRADLEY, *Tilehurst Nurseries.*

[The facts of the case would have been clearer if the sentence had read, "One-rod Vines were *also* planted in front of the pipes." Mr. "A. D." shall see the photo, and he may just be able to discern a row of Vines between the pipes and two side walls of the span-roof, also another row on the opposite side of the pipes, or between them and the central path, but, of course, near the pipes, seeing there is only a distance of 2 feet between the two rows of Vines. Such a dense, dark mass, with Mr. Bradley and his men, about the same colour as the Black Alicantes, could not be reproduced with justice to either the Grapes or the men, and we should be sorry to spoil either one or the other.]

REST IN PLANT LIFE.

"A. D." in his note on page 553 has, we may hope, set many cultivators thinking, for his subject is a very wide one. It is quite true, as he says, that rest is a relative term, but he appears to have overlooked the fact that it is also a variable quantity. Because the tropical vegetation he speaks of rests in a different way from that of cooler climes, is "A. D," right in saying that "There is in the case of all this tropical vegetation absolutely no proof that what is empirically termed rest is necessary?" As a matter of fact some at least of the plants he mentions take a decided period of rest, both in their habitats and also under cultivation, without the temperature being reduced beyond natural requirements.

During the natural period of apparent inactivity that may be noticed in almost every plant known, Nature is still alive, and the forces of the plant are fulfilling their proper functions, and I have no hesitation in saying that to keep any of these in a continual state of growth, were it possible, would eventually weaken and ultimately kill the plant. It would take longer with some than others, no doubt, but the end would be the same in all.

I cannot think "A. D." in earnest when he asks if deciduous trees really remain inactive above and below ground. If he is he may easily satisfy himself by keeping, say, a Peach tree, absolutely dry from the time the leaf falls until the proper time for it to start growing naturally. If he find at the end of it that no harm has been done to the tree, then it will be sufficiently demonstrated that the roots and branches pass into a comatose condition, have nothing to do, and do it. But of course "A. D." knows perfectly well that it is not so, and he also knows, I take it, that what we call rest is "an indispensable part of the great plan," just as much as growth is, but that absolute "rest" comes to plants as to animals only when they cease to exist.—H. R. R.

I VENTURED to allow the brief article upon this subject to be concluded ere replying to "A. D.'s" criticisms (page 553) upon it—a reply which common courtesy not only demands, but from the apparent interest taken by my able critic in the matter, with his pertinent questions still unanswered, judgment would go by default, and I am guilty of setting "an empirical theory" upon a foundation of "egotism" rather than that of observation.

Firstly, the conclusion of the article has, perhaps, in some measure shown the broad view taken by me—the writer of it. Perhaps not. In either case the fact remains, and no endeavour shall be made to ignore it, that either an assertion has been made, "an unquestionable dictum" constituted, or an "empirical theory" set up, and this is the crux of the critique. Whilst wishing "A. D.' to know that it was no hastily penned paper, being indeed the endeavour to express such knowledge as the observation of a lifetime in the great garden of Nature affords, with the benefits generally conferred by the labours of our great leaders in the botanical field of research, I must confess that his critical pen has led me to review the subject, and this has strengthened (in my own mind) the original assertion, dictum, or theory. This, I am aware, is rather self-comforting than critic-convincing; and, however one may wish to eliminate all bias from a broad question, our subject being too broad to admit of narrowing down into a matter of personal opinion, I, at least, while sticking to my guns, would rather hear a little independent firing settle the matter *pro tem.* This advisedly, having not a shadow of doubt but what in a century hence (and probably long before) the now contentious dictum—it is an indispensable part of the great plan that all life should have rest—will be duly recognised and fully established.

Obviously rest in plant life does not necessarily insist upon a total suspension of the functions of life any more than in the animal kingdom; frost alone, to repeat what has been already advanced, being the sole agent whereby vitality is completely arrested. Upon the similarity existing between life of the vegetable and of the animal kingdom sufficient evidence exists, from the observations of some of our most eminent men, to warrant the thought that it is worthy of another paper, which, with permission, will be given. All of such evidence as can be adduced is, at least, interesting, some of it has a distinct bearing upon our practical work, and in one particular instance the similarity is startling.—INVICTA.

Notes & Gleanings

Weather in London.—It cannot be said we are having what is generally acknowledged as typical weather for the Christmas season. Last Thursday, Friday, and Saturday were mild, the latter being very foggy, while on Sunday it was damp. Monday and Tuesday were fine, a cold wind prevailing over both days. At the time of going to press on Wednesday there was a very sharp frost.

—— Royal Horticultural Society and Victoria Medal.—At a meeting of Council held on December 14th it was decided to issue a diploma to all the recipients of the Victoria medal of honour. It was also unanimously resolved, "That in the event of any recipient violating the conditions on which the Victoria medal of honour was bestowed by using it for advertising, or for the promotion of trade interests in any other way, the name of such offender shall be struck off the list."

—— Ancient Society of York Florists.—On the 15th inst. the members of this Society met to partake of the annual dinner, under the presidency of Sir Joseph Terry, J.P., who was supported by several influential local gentlemen. The well-known Secretary, Mr. J. Lazenby, occupied the vice-chair. The company numbered between seventy and eighty, and from the tone of the several speeches it was easy to gather how excellent was the status of the Society, and how harmoniously everyone seemed to work for its good. The evening was in every respect a great success.

—— Apple Bramley's Seedling.—The value of this excellent Apple is becoming more recognised every year. For the Christmas season it is surpassed by none, and only equalled by a few, such as Newton Wonder and Wellington. It is now becoming well known on the markets, and buyers are ready to take good samples at high prices. An instance of this is furnished in a letter from a friend in Yorkshire. He writes: "I am selling my Bramley's at 20s. per cwt., and wish I had had a few tons of them." In all probability many growers will fervently re-echo the wish embodied in this brief sentence.—D. R.

—— National Dahlia Society.—The annual general meeting of this flourishing Society was held on Tuesday, the 14th inst., at the Hotel Windsor, under the presidency of Mr. T. W. Girdlestone. The company was a capital one, growers being in evidence from all quarters. From the annual report read by the Secretary, Mr. J. F. Hudson, it was easily gathered that the season of 1897 had been a successful one, and that the determined efforts of the leading spirits of the Society were not passing unrewarded. References were made to the climatic conditions during the growing period, and also to a few of the several classes. The financial aspect of the Society was placed before the meeting by Mr. E. Mawley, and it is pleasant to record that things are in a very satisfactory state, the balance in hand being just over £21. Routine business and votes of thanks occupied the remainder of the meeting, which was a most harmonious one. The work done by the Society is praiseworthy, and we wish it every success.

—— A Mild Season in Ireland.—The season so far here has been remarkably mild. It is certainly unusual a few days before Christmas to have the open air temperature, as it was recently, 60° Fahr. in the open air; while the night temperature did not fall below 45° Fahr., and with, up to the present, practically no frost. I am still gathering bunches of Chrysanthemums in my town garden, not merely hardy Pompons, but fine blooms of Col. Smith, G. C. Schwabe, Viviand Morel, and secondary terminals of Etoile de Lyon. Madame Berard, the most floriferous and persistent bloomer of all the Tea Roses, has several blooms still opening, while Marie Baumann and Mrs. R. Sharman Crawford gave me fine blooms the present week. A new supply of Teas in the open air, planted a month since, are now unfortunately expanding their growth buds, which, unless a climatic miracle takes place, must be badly burnt back by-and-by. We have often had second crop Strawberries and second crop Apples, but until this week I never saw second crop Gooseberries. There have been continuous rain downpours, with southerly and westerly gales, which accounts for the mild season; but northerly winds and night frosts may later on be expected to supervene.—W. J. Murphy, *Clonmel.*

—— Appointment.—Mr. John McLean, late gardener and manager to Sir William Pearce, Chilton Lodge, Berks, has been appointed and taken up the duties of steward and general manager to the Right Hon. Lord Annaly, Luttrellstown, Clonsilla, co. Dublin.

—— Devon and Exeter Horticultural Society.—The Committee of this Society has decided upon the dates on which to hold the two annual exhibitions. The summer show will be on August 19th, and the fruit and Chrysanthemum show on November 3rd and 4th. The Hon. Secretary is Mr. G. D. Cann, 16, Queen Street, Exeter. Schedules of the exhibitions may be had from Messrs. R. Veitch & Son, Exeter.

—— Avery Hill, Eltham.—We are informed that the family of the late Colonel North have decided on relinquishing this Kentish residence as a home. The plants are to be sold, and the capable gardener, Mr. George Abbey (son of the veteran whose name is familiar to readers of the *Journal of Horticulture*) is only to remain in charge of the establishment till he obtains an appointment of a similar nature elsewhere. His excellent work at Avery Hill has been described in our columns.

—— Birmingham Horticultural Society.—The annual dinner of the Birmingham and Midland Counties Chrysanthemum, Fruit, and Floricultural Society was held on the 15th inst. Mr. W. B. Latham presided. The Chairman proposed the loyal toast, which was followed by that of "The Society," given by Mr. A. Coombes. He remarked that they had every reason to be proud of the Society, because it was one of the best—if not the best—of its kind in the country. The show held at Bingley Hall was undoubtedly the finest ever held, not only in Birmingham, but anywhere in England. The Chairman and Mr. Pope responded. The health of the exhibitors was drunk on the proposition of Mr. W. Jones, who presented a financial statment which showed receipts amounting to £834 12s. 6½d. It was also estimated that they had yet to receive about £265 7s. 5½d., which would raise the total to £1100. The expenditure so far had been £656 3s. 10d., but it was estimated that bills outstanding would amount to £293, which would bring the total expenditure to £950. There would, therefore, be a balance of about £150 on this year's show. The names of Messrs. J. H. Goodacre and J. Crook were associated with the toast. The health of the non-competing exhibitors and donors of special prizes was submitted by Mr. W. H. Dyer, and drunk with enthusiasm. Mr. W. Jones's name was associated with the toast of "The Officers," which was given by Mr. W. Spinks. The health of "The Visitors," submitted by Mr. J. Child, and replied to by Messrs. Fellows and Twyford, and the "Chairman and Vice-Chairman" were also drunk. During the evening the cups and medals gained at the exhibition were distributed.

—— Conifer Seeds.—A great difference exists in the germination of Conifer seeds from different localities. The seeds of all the Conifers hardy in the Eastern States of America come up (says Mr. T. H. Douglas in "Garden and Forest') at the same time, or nearly so. Norway Spruce, White Spruce, Scotch, Austrian, and Mountain Pines, the Colorado Conifers, Picea pungens and P. Engelmanni, Douglas Spruce, Abies concolor, and other common Conifers can all be uncovered at one time. But few seedlings come up ten days after the first ones appear, while Conifer seeds from a warmer climate are very irregular in germinating. I raised a large quantity in California in 1889 and 1890. Those already named were sown in beds adjacent to the more tender kinds. Pinus Jeffreyi, P. ponderosa, and P. tuberculata started from two to four weeks before the others came up. Abies magnifica, A. grandis, and A. amabilis came very scatteringly. The first of these appeared in April and the last in September, and they required careful attention. The various Cupressus varied as much as the Abies. Douglas Spruce, Abies concolor, and Pinus ponderosa, from Colorado, came up much more regularly than the same species from seed collected in California, but the seedlings from California seed made much larger plants at the end of two years. Most of the seed from the Orient acted as those of our native and European species do, being very regular in germinating. The exceptions are Picea Morinda and P. Ajanensis, but as I had very little seed of the latter, and that apparently two or more years old, I may be mistaken in this particular. The seeds of Sciadopitys verticillata, Cedrus Deodara and C. Libani are also irregular in time of germinating. Cedrus atlantica may also be added to the list, but it comes up more evenly than the seeds of other Cedars. The seeds of our native White Pine are the most uneven in germinating of those of the hardy Conifers; but although they sometimes come up irregularly, this tree can hardly be classed with the species which are irregular in germinating. Thuia gigantea and Libocedrus decurrens are irregular.

—— Death of Mr. James Casey.—It is with sincere regret that we learn of the sudden death of Mr. James Casey, which occurred on the 8th inst., from the result of a chill contracted the previous week. The deceased, whose age was fifty-one, had been with Messrs. H. Low and Co. about thirty-four years, and latterly has represented this well-known firm as a traveller in England, Scotland, and Ireland, where he was thoroughly well known and respected.

—— Flowers in the Scilly Islands.—According to a daily contemporary the flower crops on the Scilly Islands are not so forward as they were last year, which was a record one, and the general opinion among the farmers is that the early blooms will not be so prolific as last season. Various reasons are given for this, one being that the bulbs are somewhat exhausted after the exceptionally heavy crops they produced last year. It is to be hoped that good prices will compensate for any deficiency in quantity. Much has been done recently by the Great Western and the North-Western Railways to develop this delicate industry. New markets in the North have been opened up by a quick and improved service of fast trains, particularly the new night express from Bristol by the Severn Tunnel route, in direct connection with the up night mail from Penzance. Consignments leaving the islands in the forenoon are in the Liverpool and Manchester markets as early as six the next morning, at Edinburgh and Glasgow by midday, and at such a distant station as Aberdeen at six o'clock on the evening of the following day.

—— Royal Meteorological Society.—The monthly meeting of this Society was held on Wednesday evening, the 15th inst., at the Institution of Civil Engineers; Mr. E. Mawley, F.R.H.S., President, in the chair. Mr. W. Marriott read a paper on "The Rainfall of Seathwaite, Cumberland." This place has long been noted for its heavy rainfall, being in fact one of the wettest spots in the British Isles. The average yearly amount is 137 inches. The spring months of April, May, and June are the driest, so they not only have the least rainfall, but also the least number of rainy days. August, the month when the Lake District is thronged with visitors, has the greatest number of rainy days. The heavy nature of the rainfall may be gathered from the fact that 21 per cent. of the falls are above 1 inch, 2 per cent. being above 3 inches. The greatest fall in one day was 8·03 inches, on November 12th, 1897. The author has investigated the atmospheric conditions under which the heavy rainfalls occurred at Seathwaite, and he finds that these heavy falls are due to the direction and force of the wiud. When the wind is blowing strongly from the south-east or south-west, it will be concentrated in the valleys on the windward of Seafell, and rush up them with considerable force, the air current consequently being projected to a considerable altitude beyond Seafell. Owing to the reduction of temperature with elevation the air parts with a great deal of its moisture, which falls as rain. With such a process going on continuously for a whole day, the heavy rainfall at Seathwaite is fully accounted for. Mr. R. C. Mossman, F.R.S.E., also read a paper on "The Daily Values of Non-instrumental Meteorological Phenomena in London from 1763 to 1896."

—— The Rating of Nurseries.—One of the unfortunate results of the Agricultural Rating Act was that in granting relief to all land classed as agricultural the burthen of recompense is thrown upon the taxpayer at large, and thus the agricultural interest, which denounces sugar bounties in other countries, readily accepts a bounty in the shape of relief of rates from the Government. It will seem to the unfortunate and over-burdened taxpayer grave aggravation of his burthens if, as was recently claimed at Teddington, nurseries of glass houses on building land in populous districts should claim exception from local burthens, on the ground that the land so occupied is agricultural. As well say that every piece of land occupied by a factory or workshops of any description is agricultural also. Surely it was never intended by Parliament that other than land purely agricultural should be so exempted from a burthen of rate which everybody else has to make good in taxes. When we see wealthy florists and nurserymen claiming exemptions we are naturally led to infer that they have scant consideration for the pockets of their neighbours. It is too much of a joke to assume that the nursery or market growing industries are "distressed." Already, indeed, we see that the purely agricultural interest is rapidly becoming more prosperous, and the gross injustice of the Rating Act is thus rendered all the greater. Naturally the decision of the House of Lords is awaited with exceeding interest. It is hoped that the law will be so clear on the matter that there shall be no division of opinion, as was seen in a recent case. It is too much to hope that the House will denounce the Rating Act as grossly unjust, but at least it may, by its decision, protect the pockets of taxpayers from outrageous demands.—Taxed.

—— Tree Planting in the Isle of Man.—We learn from a contemporary that a movement, at the head of which is Lord Henniker, has been initiated in the Isle of Man for extensively planting the island with trees, and thus making its arboreal charms more attractive to visitors. At a meeting held at Douglas reports favourable to the project were received from various parts of the island, and a resolution was adopted for the formation of a tree-planting society, and an influential committee appointed to draw up a constitution and code of rules for the management and development of the same.

—— Schizostylis coccinea.—This, I venture to assert, is one of those plants not cultivated nearly as much as its merits claim. This applies more especially to the southern and West of England counties. For the last six years I have annually seen some fine clumps of this Kaffir Lily, producing many spikes of the graceful scarlet flowers with their effective yellow anthers, and very useful they have been found when arranged in vases. Flowering naturally out of doors in October there are then usually a good quantity of Anemone japonica alba in flower, and the two growing and flowering side by side in the garden, or arranged together for decorative purposes, enhance the beauty of each other in a most desirable way.—Exile.

THE MILDNESS OF THE SEASON.

There are too few records published of the condition of the Arctic ice north of Europe to dogmatise about and to predict general outlook as to the severity of the coming winter. It would be of the greatest value to know more. The annually increasing movement of vessels in those regions, however, will remedy this defect somewhat, and it is consistent with the repeated reports received thence as to the unusual retreat this year of the Arctic ice-masses to point to the actual mildness as a possible consequence of that retreat, and the continuation of which might allow us to look for a generally mild winter. Furthermore, the reduced rainfall we find so prevalent this year would mean, if over larger areas and further north, reduced snowfall, and tend in the same direction towards mildness.

A meteorological station at Spitzbergen—nay, at Franz Joseph's Land and elsewhere—with submarine cables, should be the natural outcome of this age of science and exploration. Even the homely question of the Christmas meat market might not inappreciably direct its attention to early information as to the useful limits thereby counselled to the production of Christmas cheer, and a more general influence on agriculture might be exercised by future regular news from those northern regions.—H. H. R., *Forest Hill.*

OLD PARK, VENTNOR.

This, the residence of Mrs. Spindler, is beautifully situated on the Undercliffe of the Garden Isle. Extensive beltings and plantations have been formed from time to time to afford shelter and privacy. The horticultural department, in the capable hands of Mr. Geo. Abbott, comprises many good points. The erection of four houses, consisting of three Orchid houses and a show house, each about 20 feet by 25 feet, with tanks for rain water, and cellars underneath, proves the interest taken in horticulture by Mrs. Spindler. The lean-to vineries contain some healthy canes of Black Hamburgh, Foster's Seedling, and Buckland Sweetwater, which have yielded abundant crops this season. Two large greenhouses were well stocked with a miscellaneous collection of plants, Calla æthiopica being exceptionally fine. The Chrysanthemums were gradually getting over, with the exception of L. Canning (which is considered to be indispensable for late work) and Mrs. H. Weeks.

There is not much to see in the kitchen garden at this time of the year, though we noticed some fine Celery, autumn-sown Onions, and a healthy collection of winter vegetables. The fruit department is excellently arranged. There are two gardens, each comprising an area of about 900 square yards enclosed with a wall 10 feet high, securely netted overhead so as to exclude the birds, which are innumerable in the fruit season. Wall trees are grown in quantity, consisting of well trained Pears, Plums, Cherrics, and Peaches; whilst in the open quarters are bush Apple trees, Gooseberries, Currants, Strawberries, and Raspberries. In the cultivation of Strawberries Mr. Abbott finds that they fruit well for four or five years, and pay him better than making a new bed every second or third year; and also that digging amongst them in autumn or winter is productive of good, and not harm. I need not say that only the best varieties of fruits are grown.

On a south wall Roses are cut nearly all through the winter. The grounds surrounding the mansion are very picturesque and charming in the extreme. On the edge of a large lake were fine plants of Calla æthiopica, which bloom profusely. The aquatics include Nuphar lutea and Nymphæa alba. The extensive lawn is relieved by large plants of Eucalyptus globulus, Yucca aloifolia variegata, Chamærops Fortunei, Aralia Sieboldi (over 18 feet in circumference), Magnolia grandiflora, Choisya ternata, Picea pinsapo, Picea nobilis, and other magnificent specimen plants.

The estate is one of the largest and best in the Garden Isle, and well worth a visit from anyone interested in gardening. It is one mile from St. Lawrence Station, and three miles from Ventnor, on the road to the world-famed St. Catherine's Lighthouse and Black Gang Chine.—S. H.

CATTLEYA OLIVIA.

IT is probable that no section of the great Orchid family is more generally popular than that which embraces the Cattleyas. Amongst them may be found flowers of all colours, from white, through all the tones of rose, to the deepest red, with many of beautiful yellow shades. Notwithstanding the already enormous number of species, hybrids, and varieties, a new one, if distinct, and a marked advance on those existing, is sure to be received with favour. One of the most attractive that has recently been exhibited is Cattleya Olivia, of which we give an illustration (fig. 88). This was staged by Messrs. J. Veitch and Sons, Ltd., Chelsea, at a meeting of the Royal Horticultural Society held on October 26th of this year, and the Orchid Committee recommended an award of merit being given to it. It is a hybrid resulting from a cross between C. intermedia and C. Trianæ, the flower being of great beauty. The colour of the sepals and petals is delicate blush, the outer portion of the lip being rose, and the inner part cream. The flower is of excellent form and substance.

SOPHRONITIS.

WHEN Dr. Lindley founded this genus upon the typical S. cernua he doubtless hit upon a good name for it—viz., the Greek word meaning modest. Nothing could have been more applicable to it, for, as is well known, it is a small unassuming-looking little plant, growing so close and dwarf as almost to appear to be trying to hide itself from view. But when this was done the splendid showy kind with which we are all now so familiar—S. grandiflora—was unknown, and to this species Lindley's name seems out of place. But it is euphonious and also easily remembered, and as not one orchidist in a dozen troubles much about the derivation of their names, it is a matter of small importance to many.

To the botanist explorer Gardner the credit of introducing the Sophronitis in quantity to this country is due, though at least two out of the three species were known to science beforehand. Their culture is not difficult if due care is exercised, but being small-growing plants they are more subject to checks than their grosser growing congeners, the Lælias and Cattleyas. To compare a Lælia of the purpurata type, say, with a Sophronitis seems to the uninitiated a curious proceeding, but the fact of their so freely crossing the one with the other proves the near relationship. To grow them well and cause them to flower freely a house rather higher than the Odontoglossum house, but cooler than the compartment where Cattleyas are grown, is necessary.

Instances of successful culture in the coolest house are on record, but there can be no doubt that they like a few degrees more heat than the Peruvian and New Granadan species herein grown. S. cernua is a plant that seems to delight in clinging close to its support, whether it be wood, cork, or compost; and this evidence of a true epiphytic habit must be kept in mind when providing a root-hold for it. If pans are used these should be nearly filled with clean crocks, only about half an inch being left for compost. This may have a slight rise to the centre, and the plants wired so firmly on this that they are not likely to be moved in the least when the pans are taken down for watering or examination.

Sound fibry peat and sphagnum suit it well for compost, and though in the resting season it must have a sensible reduction in the amount of water given, yet a very dry régime is to be avoided. About three of the charming little flowers are produced on each peduncle, which only rises a little above the squat little bulb and foliage, and they are a delightful combination of cinnabar red and yellow, the latter colour occurring principally upon the lip. Although so small, the flowers last a very long time in good condition, and brighten up many a house during the dull days preceding Christmas. Its habitat is Rio de Janeiro, whence it was sent to Mr. Harrison of Liverpool many years ago by a relative in Brazil.

Much more showy, and a plant quite indispensable at this season, is S. grandiflora, the best in the genus, and a remarkably fine Orchid. So free flowering is it that from twenty-five to thirty flowers are produced on only medium-sized plants, and what is most surprising is the fact that these beautiful blossoms, some 2½ to 3 inches across, are produced and maintained for six weeks or more by tiny pseudo-bulbs scarcely above an inch in length. Such a glowing scarlet mass of flower is not produced by any other Orchid of its size, so one ceases to wonder at its great popularity.

As far as my experience goes, it is not possible to determine the varieties of this species by their habit, but, as a rule, it may be taken that the rich crimson flowers are generally produced on long, thinnish, bulbed plants, those of the crimson purple type usually occurring on the more obese bulbed plants. Their culture is, of course, the same, and does not, in fact, differ materially from that noted for S. cernua. If any difference is made, S. grandiflora, being the stronger growing of the two, may have a little more compost than the other, and rather wider receptacles to grow in. It first flowered in this country in 1841 with Messrs. Loddiges of Hackney, to whom it was sent by the collector named above. It must be a very abundant species in its native habitat—the Organ Mountains in Brazil—when we consider the enormous number of plants of it that have been imported since then.

Perhaps the least known of all is S. violacea, though it is a very pretty little plant. In habit it differs from the others in that the pseudo-bulbs occur on a creeping rhizome at some little distance apart instead of clustering. The bulbs are about an inch high, fusiform and fluted, and the leaves are about 3 inches in length. The scapes bear one or two flowers of a pretty rosy magenta hue, paler in the centre than on the outer segment. This, too, flowers in the winter months, and is rather more difficult to cultivate than the other species.

Owing to the rambling habit mentioned it is not suited for growing in pans, but does much better when it is allowed perfect liberty. I know of no better holding for the roots than pieces of Tree Fern stems cut into suitable lengths. If the plants are firmly wired to these they will take no harm afterwards, each little bulb and portion of rhizome pushing its own quota of roots into the soft bark of the Fern. No compost is necessary, the roughness peculiar to these stems being ample for their needs. Some growers use blocks of cork or wood more or less lightly dressed with sphagnum moss, and I have seen nice specimens grown this way. In either case the chief points to be observed are room for the full extension of the rhizomes and available support for the roots. This, coupled with a regular and constantly moist atmosphere and freedom from insects, will enable anyone who has had a little experience with Orchids to grow it well.—H. R. R.

HERBS AND AROMATIC PLANTS.

IT is often a matter for surprise, to me at least, that so little attention is paid to the culture of these plants in many gardens which in other respects leave little or no opening for adverse criticism. This, in allusion to herbs or, more correctly speaking, pot-herbs—a designation which, if not always pointed in application, has at least the merit of being an old-fashioned name for rather a large family. It may be that modern cookery on the one hand demands less from the herb border than in days of yore, and on the other we are too "up-to-date" to retain faith in but a tithe of the virtues ascribed to the "herbes and simples" by our grand-dams. However that may be, no garden can be considered complete if unable to furnish such things under this head as may be occasionally called for by the *chef de cuisine;* or is our renascent love for old-fashioned plants sincere without some recognition of those whose aromatic qualities endeared them to our ancestors. The latter are, indeed, pregnant with tender associations of the past; they are indelibly printed in the earlier history of gardening, and no later attempt to delineate a modern edition of this good old-fashioned work can afford to miss so important a page of it.

With few exceptions the culture of these simple plants requires only the most ordinary attention—but this they do require, and probably the majority will admit they are worthy of it; and their demands in the way of either space, soil, or situation are so limited that no excuse is provided for their exclusion. These remarks spring from two sources; the one is in repeatedly observing in really good gardens how poor an apology for a herb border is the meagre patch of impoverished plants bearing that title; the other is in having, long since truly, been called upon by a very arbitrary *chef* for some special thing on particular occasions, and found wanting. This led to some attention being given to the matter, by devoting a border to their culture, and forming a collection sufficiently comprehensive to meet all the real or imaginary wants of the most exacting of *chefs*.

The advantages of devoting a special plot or border to the cultivation of herbs, to be known as "the herb bed" or "border," are sufficiently important to be noticed, for when the many species and varieties are so gathered together and legibly and permanently labelled no margin is left for mistakes in obtaining what is required, mistakes which may have unpleasant, if not serious, consequences to him who is responsible for those who by ignorance or carelessness make them. It is here proposed to give a brief list of such plants which are either essential to or are worthy of being included in a general collection, with some simple directions for culture, to be followed by some notice of those aromatic plants which, whilst yet adorning some old-fashioned gardens, are too often conspicuous by their absence from more pretentious ones.

For the convenience of attention in the way of weeding and

replanting when necessary the formation of beds 3 or 4 feet wide at right angles of the walk, supposing a border to be devoted to the purpose, with narrow alleys between, is probably the best method; and whether the whole space be much or little, a thorough preparation by cleaning and enriching it will eventually give the best results, and save trouble among those perennials requiring no disturbance for several seasons. Our list may well include such herbs as are thought worthy of being found in a first-class garden, although the virtues of some are purely medicinal. *Apropos* of this, I recollect with pleasure an episode which occurred when my herb border, previously mentioned, was flourishing. This was an application made by an old dame, who had trudged some miles across country for a few sprigs of certain herbs now rarely met with, but dear to the heart of old-fashioned people. "If they were to be had anywhere I should have them;" and I had, to our mutual satisfaction.

The choice of position may be given to any border fronting a wall with a south, south-west, or south-east aspect. Commencing our list in the order of merit, such merit being merely a matter of what is in most demand—Mint may be first mentioned. Both Spearmint and Peppermint, being of such vigorous habit of growth, it is perhaps surprising that any difficulty is encountered in their culture, yet there are instances of such being the case, this proceeding from a want of replanting in fresh soil when deterioration is in evidence. To increase the stock, root pieces or cuttings taken in early spring and inserted under glass protection will give good plants for the Mint bed a little later, and some old potting soil or Mushroom bed refuse worked into the soil will insure success for two years at least, after which replanting or a good top-dressing, if exhaustion is imminent, will maintain the supply.

Sage is so freely produced from seed that no better method can be employed if the stock is worn out. Although the green-leaved variety is mostly in demand for culinary purposes, a few roots of red Sage must not be overlooked, an infusion of this being still in high repute as a gargle.

Common Thyme and Lemon Thyme, seeds of both of which will produce a more vigorous stock than from cuttings or division, may, with most herbs of perennial habit, be sown in their permanent position, to be subsequently thinned out; and it may here be remarked that the most satisfactory way of establishing a herb border is to obtain a collection of seeds from any good seedsman, which will generally prove to be as reliable as they are cheap. The same may be said of aromatic plants, and any difficulty which some experience in establishing plants of either is removed by the power of seedlings to adapt themselves to a change of soil or position.

Tarragon, which holds a rather prominent place among pot herbs, and where the necessary stock cannot be obtained by division, will give the best results by raising seedlings under glass early in the season, deferring planting outside until the plants are fairly strong and the weather genial. Marjoram under its two perennial forms, commonly known as Pot Marjoram and Sweet Marjoram, is of easy propagation by division; the more tender variety known as Knotted Marjoram may be included in our spring sowings of those herbs which are either annuals or treated as such.

Basil plays rather an important part in high-class cookery, and the two varieties in general use being annuals, it is not easy to supply the sweet variety, this being in most demand through the winter in a green state. The seed, whilst germinating freely, has a trick of disappointing the grower during the dark days of winter, and I have known the time when more hopes and fears were concentrated in a pan of Basil than in the whole catering of supplies at this season. However, a couple of pans or shallow boxes thinly sown and very carefully tended, especially in watering, will usually meet all requirements, although in respect to its "miffy" character it is as well to have two strings to one's bow by placing one sowing in a cool

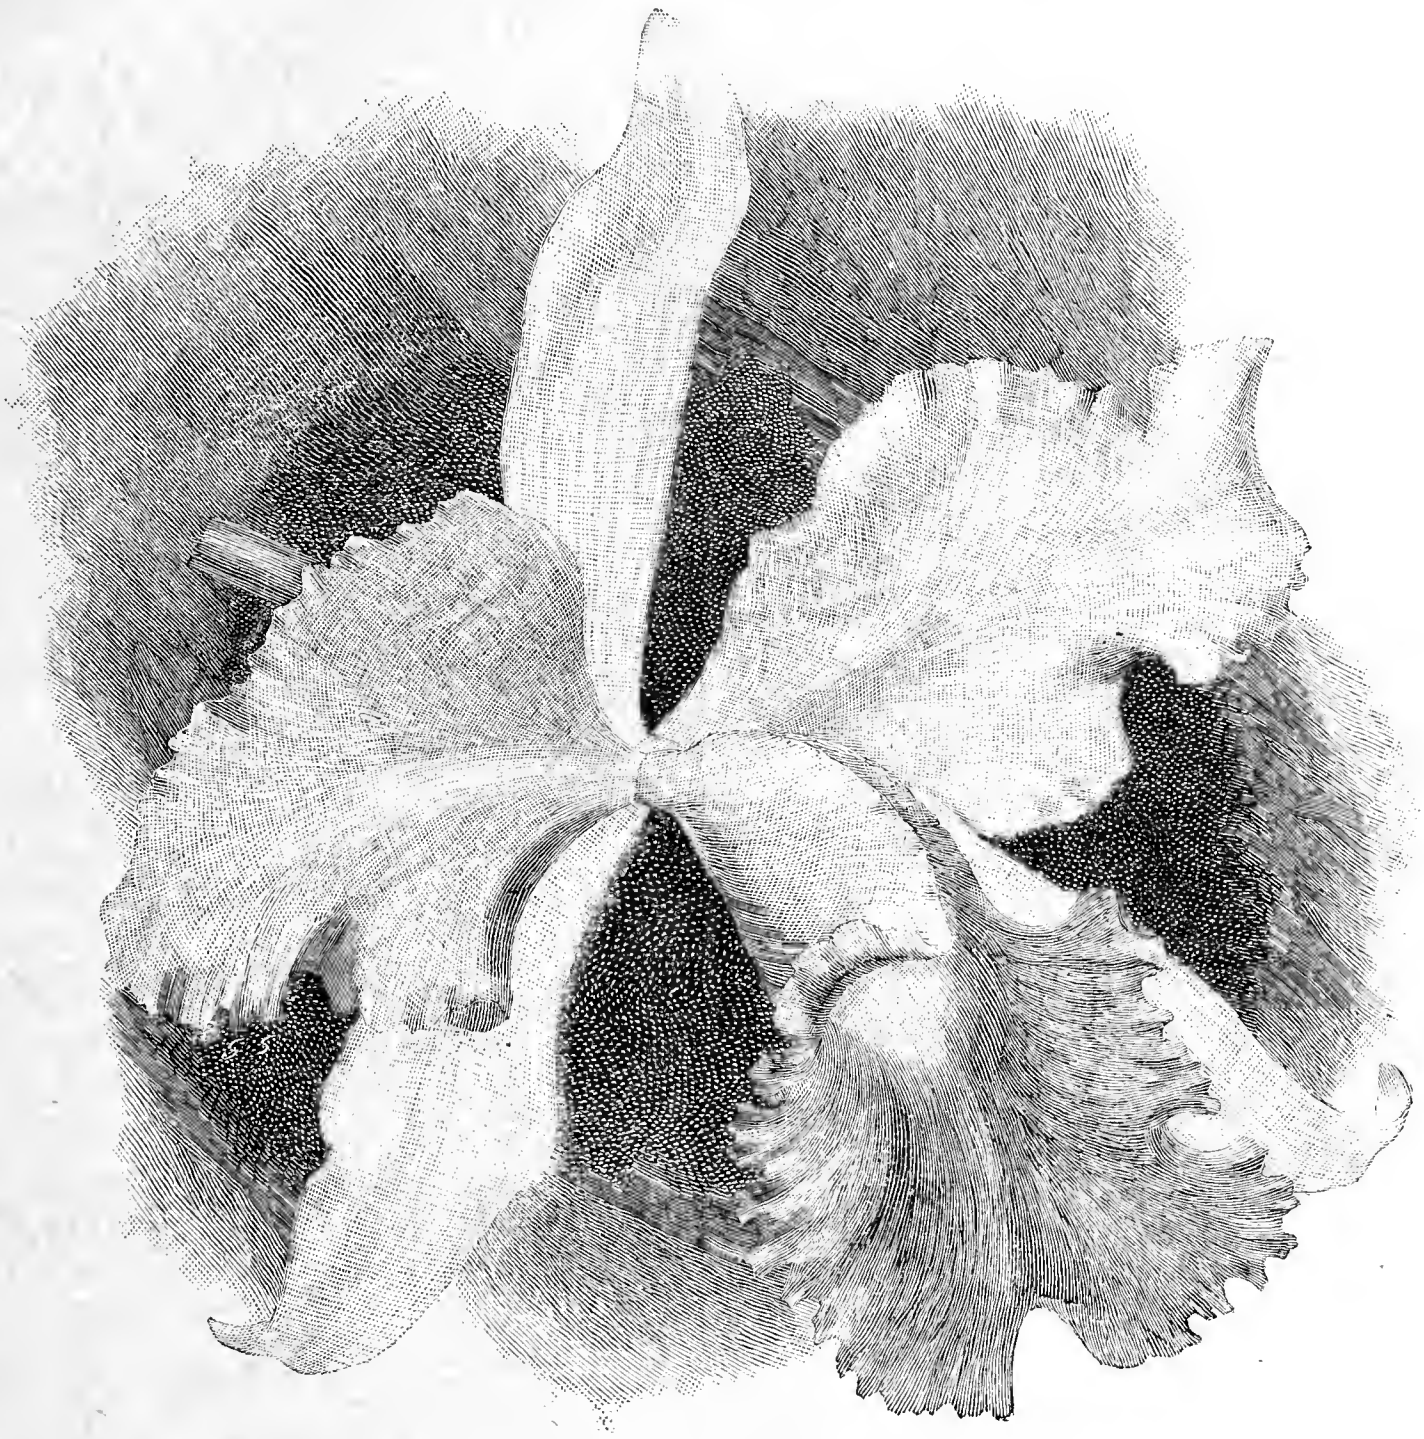

FIG. 88.—CATTLEYA OLIVIA.

house, and the other in a warm one, both fully exposed to the light in an airy position. Summer and Winter Savory, the former an annual, are of easy culture, and call for no special remark beyond that they, particularly the latter, must be regarded as essentials.—HERBALIST.

(To be concluded.)

CHEMISTRY IN THE GARDEN.

(*Continued from page* 522.)

WE saw by Bousingault's experiments that Sunflowers could be grown successfully in pure sand in which a small quantity of plants' ashes were mixed, the same being watered with weak solutions of nitrate of potash. Seeing that these substances contain all the elements of plant food, it would be interesting to inquire of what they are composed, for this ought to teach us what ingredients plants take from the soil as food. Bousingault obtained the plants' ashes he used in his experiments by burning hay. We have before us the composition of the ashes of hay; but before giving them to our readers we wish to draw their attention to the following facts. The plants experimented with grew as well in the sand, plants' ashes, and nitrate of potash as they would have done had they been growing in ordinary fertile soil. This being so, the latter ought to contain the same ingredients as the former. We apply farmyard manure to soils to maintain or increase their fertility, or, in other words, to supply those substances which are removed by growing crops. If the plants' ashes and nitrate of potash contain all the constituents which are needed for the growth and development of plants we shall expect to find the same ingredients in a fertile soil, and also in farmyard manure. If we do this we ought to be satisfied as to the nature of the food of crops.

We will now give the chemical analysis of nitrate of potash, plants' ashes, a fertile soil, and farmyard manure.

100 LBS. OF EACH SUBSTANCE TAKEN.

Constituents.	Nitrate of potash.	Plants' ashes.	Fertile soil.	Farmyard manure.
Nitrogen	13½ lbs.	none	4 ozs.	8 ozs.
Potash	45 lbs.	31½ lbs.	6 ozs.	10 ozs.
Soda...	—	3 lbs.	4½ ozs.	1 oz.
Lime	—	10½ lbs.	4½ lbs.	12 ozs.
Magnesia	—	7 lbs.	2½ ozs.	2 ozs.
Phosphoric acid ...	—	11 lbs.	2 ozs.	5 ozs.
Sulphuric acid ...	—	3 lbs.	3 ozs.	1 oz.
Chlorine	—	7 lbs.	2 ozs.	1 oz.
Silica...	—	27 lbs.	68 lbs.	4 ozs.
Iron	—	traces.	5 lbs.	traces.
Oxygen	41½ lbs.	—	—	—
Carbonaceous matter	—	—	6 lbs.	17¼ lbs.
Silicates of alumina	—	—	15 lbs.	—
Water	—	—	—	80 lbs.
	100 lbs.	100 lbs.	100 lbs.	100 lbs.

Looking carefully at the above analyses we note many things of importance. First of all we find that nitrate of potash contains only nitrogen, potash, and oxygen. When the plants growing in sand were watered with a solution of this substance, it only supplied them with the three ingredients just named. The reason they failed to grow, therefore, was because they had not all the food they required applied to them. The analysis of plants' ashes shows that they contain many of the elements of plant food, but no nitrogen. We know from what has already been said that the plants in the sand and plants' ashes refused to grow only when watered with nitrate of potash. Here, then, we have the whole case clearly explained to us, and are now able to see the names of all the substances needed by crops as food.

Further consideration of the above tables shows us that the very same substances are present in the fertile soil as supplied by nitrate of potash and plants' ashes; but you will also note the small amount of plant food in the former case as compared with the latter. In 100 lbs. of fertile soil we find 68 lbs. of silica and 15 lbs. of silicates of alumina. These substances are present to dilute, as it were, the plant food present in the soil. We know how useless it would be to try to grow plants in wood ashes or nitrate of potash. Bousingault knew the same thing, and therefore diluted his plant food with sand, thereby making it in all respects like a fertile soil, the only difference being he had control (?) of the plant food. Farmyard manure is very similar in composition in many respects to a fertile soil, but here again we find the food constituents diluted with water and carbonaceous matter. The latter, however, by its decay gives off many acids, which renders the medium *per se* undesirable for plants' roots; nevertheless, we all know, as practical gardeners, that good farmyard manure is the best, cheapest, and safest of all the substances we can apply to soils to make them fertile.—W. DYKE.

(To be continued.)

NATIONAL CHRYSANTHEMUM SOCIETY.

ON Monday evening last the General Committee of this Society held a meeting at Anderton's Hotel, Fleet Street, Mr. T. W. Sanders occupying the chair. After the usual preliminaries had been disposed of it was resolved that the proposed meetings of the Floral Committee for next season, which had been fixed for November 28th and December 12th, should not be held.

Letters were read from Mr. G. S. Addison and Mr. J. W. Moorman resigning their positions on the Committees of which they were members; the former, on account of pressure of local municipal work, was accepted, but the latter was requested to reconsider the matter.

The report of the Schedule Sub-Committee was then presented, a class being proposed for twelve vases of specimen blooms Japanese, distinct, with five blooms each, each bloom standing 1 foot above the top of the vase. The prizes proposed are £20, £15, £10, and £5. There was much discussion on this innovation both *pro* and *con*, the principal speakers being Messrs. E. Beckett, Gleeson, Waterer, Bevan, Mease, Lyne and Lees. It was also announced that the Royal Aquarium Co., in commemoration of next year's show being the twenty-first held by the N.C.S. at the Aquarium, had decided to offer a special sum of £30 for prizes in the class for twenty-four Japs, distinct—viz., £8 and a gold medal for the first, £6 for the second, £5 third, £4 fourth, and £2 fifth.

The election of judges then followed. For the September show they are Messrs. W. Higgs and W. Wells; October, Messrs. Langdon and Cutbush; November show—plants, Messrs. Prickett and Reeve; incurved blooms, Messrs. Geo. Gordon and C. Orchard; Japanese, Messrs. E. Beckett, E. Molyneux, T. Bevan, and C. Gibson; table decorations, Mr. J. Hudson and Miss Pemberton; fruit, Messrs. Owen Thomas and J. Roberts; vegetables, Messrs. J. Willard and W. Fife. Those appointed for the December show were Messrs. R. Kenyon and P. Waterer. New members were elected, and the Dundee Chrysanthemum Society admitted into affiliation. The Secretary stated that since the 1st January the following additions to the list of membership had been made:—Fourteen Fellows, 114 ordinary members, and eleven societies. The meeting was a busy one, and broke up somewhat later than usual.

THE BONDAGE OF THE N.C.S.

THE Secretary of the N.C.S. warmly accuses me (page 580) of "rashly rushing into print." I am certainly no more precipitate in this instance than himself, for our first letters on the subject appeared simultaneously in your issue for December 9th, and in the last issue a second letter from him appears, so that at the present time he has written two letters to my one.

Quotations from the Society's audited balance sheet (which is the property of every subscriber) should require no "verifying," and I challenge Mr. Dean to disprove by actual printed facts that I have been guilty of any "imperfect" or "erroneous" statement. The quotations I gave are the exact amounts appearing in the printed balance sheet for the past year, and Mr. Dean's figures are nowhere to be found in that balance sheet.

Mr. Dean admits that the £50 he places in his letter to the credit of the N.C.S. for the September show "is not credited to the Society's funds." That being so, what right has Mr. Dean to infer that my statement is wrong, and to himself add as an asset an amount which is not given to or allowed to benefit the N.C.S.? The N.C.S. has nothing to do with an arrangement made for the benefit of any other organisation by its directorate as between themselves and an acrobat, or the owner of a performing donkey. My bump of "observation" may indeed be but "superficial." Nevertheless I can assure Mr. Dean that I am not without some knowledge and trained experience of the many little details and necessary incidental expenses attending the holding of an exhibition of some magnitude.

But in whatever light my observations may appear to the Secretary, I have still the boldness to question the unreliableness of the amount given by him in his "low estimate" as indicating the indirect advantages rendered by the Royal Aquarium towards the N.C.S. Anyone can add a rough system of figures together so as to make a balance appear on either side as may be desired.

Has Mr. Dean no precise data to work upon in order to determine the amount which he puts as the "cost of the four exhibitions to the Royal Aquarium Society?" His letter suggests that he has not, or surely we should have had the facts. An argument founded on an "estimate," and this estimate, for all he has shown, based on an inference, cannot rest on a very firm foundation, and yet he says that "he has placed the cost of each show at considerably less than that which would have to be borne by the N.C.S., did they have to defray the whole amount." To say that it costs the Aquarium authorities £75 for management expenses for each September exhibition, beyond what is charged to and paid by the N.C.S. to award only £20 7s. 6d. in prizes for Chrysanthemums, is beyond my comprehension.

The fact is, the Committee know little or nothing of the workings of

this meeting, and the only argument I have heard in favour of it is that it induces the Dahlia enthusiasts to remain subscribers to the N.C.S.

Again I ask, Can anyone credit that the prettily arranged and snug little December show, held about three weeks since in the eastern gallery, could have cost the Aquarium management £75, in addition to what is charged and paid by the N.C.S.? If Mr. Dean will persist in upholding this statement, every unbiased person must characterise his opinion as obviously absurd. Did it cost the management a tenth part of what he now states? Great stress is also placed on the cost of hire of tabling and baize. Tables for this purpose are commonly made from floor boards, which cost a few shillings per square, and everybody can calculate how far each square of 100 feet will extend. It is unreasonable to suppose that any established organisation would hire them on every occasion, any more than ourselves would think of hiring our necessary garments, instead of buying them first hand. Even the cost for staging may be further curtailed if trade exhibits were not so much sought for, and the charges now made for space allotted would mainly be forthcoming as extended subscription to the Society in another form.

But assuming, for the purpose of this letter, that he is correct, and that the amount stated by him—viz., £375—actually represents the necessary and therefore legitimate expenses that must be incurred annually by the N.C.S. in order to carry out the details of a series of exhibitions (if the Society were dependent on its own resources only), what then? Surely that £375 must be added to the heavy expenditure already incurred! and again, what then? Would not the Society find itself in the unenvious position of having not only spent all its balance and reserve fund, but in debt to the tune of £259 11s. 2d.?

Is this the position that Mr. Dean wishes the subscribers of the N.C.S. to feel the Society would be placed in were it not for the indirect timely assistance of the R.A. Company? If this is to be our position, then the sooner the Society is put upon a safer and surer footing the better for all concerned, and a great number of your readers must think with me that it was but a mere "figure of speech," flavoured with self praise, that led Mr. Dean to say that the N.C.S. was "maintaining an entirely independent autonomy as the best administered floricultural Society."

It seems to me that instead of proving the independence of our National Society the evidence that he now adduces proves more clearly than I had hitherto thought could be proved so well—its "bondage."

In the same letter this not "rash and superficial" Secretary tells us that he "alone perhaps knew the full extent of the valuable assistance directly and indirectly contributed by the R.A. to the N.C.S." Mr. Dean in penning those lines was, I presume, writing on behalf of himself, not on behalf of his Committee, and certainly not with their sanction, for to have obtained this it would have been his duty, as Secretary, to have imparted his knowledge at their meetings.

Then not he "alone" would possess it. Surely the committee of any society is entitled to the knowledge of its secretary on matters affecting its policy and management. It is clear that the members of the N.C.S. Committee do not know everything about its affairs, or Mr. Dean's words have no meaning.

Does Mr. Dean know what the R.A. gains yearly by the gate money? He asserts "that it attracts to the Aquarium yearly thousands of persons to see the Chrysanthemums." All other writers agree with him. If any fixed and reliable number can be given, then both committeemen and subscribers to the N.C.S. will be able to judge for themselves, not as to the arrangement being "mutual, friendly, just and honourable," for that is not the question, but whether it is equitable. Reports tell us that the Birmingham November Show was visited by 32,000 persons, Edinburgh by 40,000, and that the Aquarium was crowded to excess and inconvenience. If 40,000 persons visited *one* show in Edinburgh might not an equal number be expected to visit *four* N.C.S. shows in London?—J. W. MOORMAN.

I AM disappointed. When I read Mr. J. W. Moorman's letter I was agreeably surprised, and thought, "Well, after all, there is hope for the N.C.S., and a few more with the spirit and sturdy independence of Mr. Moorman, the Society may have a greater claim to be considered national;" but, alas! my hope was a vain one, for, from the Secretary's letter, I now learn that Mr. M. has ceased to be a member of the Committee of the N.C.S.* I am afraid the real loss to the N.C.S. is considerable and irreparable.

It has already been pointed out in the columns of the *Journal of Horticulture* that the Secretary of the N.C.S. does not intend to allow the exhibition to be held in any other building than the Aquarium, for more reasons than one about the worst place for a Chrysanthemum show, and unfortunately with the Secretary there are enough of the Committee, who are his willing slaves, who dare not go against his wishes. What a gain to some of the trade exhibitors if the shows could be held in any other building than the Aquarium, for it is beyond dispute that the upper classes will not honour the shows there with their presence.

We are told that if the N.C.S. left the Aquarium the Directors of the Company would institute an exhibition of their own. Well, let them—and if they make it a success it would say very little for the management of the N.C.S. Should such a thing take place will Mr. Dean inform us where the balance of about £1300 is to come from?

Further, if it would pay the Aquarium Directors to run a Chrysanthemum Society on their own account, and of course finding their own prize money, it certainly proves that they are making a good thing out of present arrangements, when advertising, stationery, judges' fees, Secretary's salary, and others, to the tune of something near £1000, is paid for them. Mr. Dean wishes us to believe that he could not bear a share of the financial responsibility which a shift to another building would entail, adding, "that if anyone could have placed in their hands the details of the actual cost of such an exhibition as that held at the Royal Aquarium in November last, and see that all dependence for any return of the same was on the uncertain taking at the gates, they would then understand why I would decline entering upon any of the risks they appear to desire the N.C.S. should undertake."

Will Mr. Dean kindly inform us how other shows manage and have a good balance in hand? and he certainly does not ask us to believe that the Aquarium, by paying the N.C.S. the paltry sum of £500 for the three shows, and taking all the gate money, removes any portion of the great responsibility which rests on the N.C.S. at the present time. In referring to the great assistance given by the R.A. Mr. Dean says:—"I alone, perhaps, know the full extent of the valuable assistance directly and indirectly contributed." In reply to this I would like to ask, "In what way, Mr. Secretary?"—A. B. C.

* See report of N.C.S. General Committee on page 604.

THE OBJECT AND OBSTACLES OF THE N.C.S.

THE object of the National Chrysanthemum Society, as stated in its rules, is *to promote the cultivation of the Chrysanthemum*, but it would appear from the correspondence in your Journal that the principal care of the executive is to hold Chrysanthemum shows at the Aquarium at Westminster. I am led to this conclusion by observing that the letters of the Secretary and members of the executive ignore the repeated expressions of opinion as to the disadvantages of holding the shows there, but are profuse in their expressions of laudation of the benefits which the Society enjoys through its connection with the place. On reading their letters those who look below the surface will perhaps be of opinion that the words of the immortal bard, "Methinks the lady doth protest too much," may not inappropriately be applied to them.

I have visited our Society's shows for years past, and conversed with many of the members and also the executive. I find there are very few who do not find the place objectionable. Why, then, do violence to the general judgment by describing in such glowing colours the admirable adaptation of the Aquarium for the purpose? Viewed in the light of the almost universal opinion to the contrary, the grandiloquent letter of the Secretary, appearing in your issue of the 9th inst., borders on the grotesque.

The only really good reason I have yet heard advanced in favour of the Aquarium is the difficulty of finding another suitable building; but it appears from Mr. Moorman's letter that no genuine effort has been made to find one. Better far let the executive concentrate their efforts by honestly grappling with this question than alienate the friends of the Society by arguing against the general opinion. A society which annually draws from its members and the affiliated societies over £400 can afford to take higher ground than to be dragged at the tail of the Aquarium authorities.

The Secretary's letter appearing in your issue of 16th inst. lays great stress upon the vexations and worries and incidental charges inseparable from carrying out a large flower show. With his great experience I have no doubt the management of the show has by this time been reduced almost to an exact science, and vexations and worries have become a minimum quantity. I do not write as a superficial observer, but as one who has very closely observed the management of shows, both large and small, and I am convinced that these vexations and worries do not depend upon the size of the show, but are present in proportion to the absence, or otherwise, of a proper system of management; and as to whether a proper system can be best carried out in a place like the Aquarium, hampered by the presence of strangers, or in a place all our own for the time being, I leave the members of the N.C.S. to judge.

As to the cost of 5000 superficial feet of tabling, which our worthy Secretary essays to frighten us with, I find that this works out to nearly one-third of a mile of tabling 3 feet wide! After allowing 300 lineal feet for the decorative single and Pompon classes, there is sufficient space left to exhibit 8000 blooms on the orthodox boards. Was there half this number shown at the last November exhibition? The vegetable and miscellaneous classes are a source of attraction to some; but to return to my text. "*The cultivation of the Chrysanthemum*" is the object of the exhibition, and if extraneous exhibits stand in the way it is a fair subject for discussion whether they should be continued in such numbers as heretofore.—MEMBER OF THE N.C.S.

[A member, too, who has done yeoman's work in promoting the cultivation of the flower he loves.]

THE FETTERED N.C.S.—A HORTICULTURAL HALL.

ALL the controversy respecting the N.C.S. and the Royal Aquarium is tending to show what an ill-adapted and unpleasant place it is in which to hold horticultural exhibitions, and the disappointing amount of money the Directors offer the Society, compared with what is actually received at the turnstiles. This has been forcibly debated in the *Journal of Horticulture* recently, and in my opinion the discussion is most desirable, for it emphasises the humiliating fact that there is at present no suitable central place in London for horticultural exhibitions. It seems to me the only real remedy for existing grievances and for insuring future success is to set to in earnest, find a site, and erect a building, temporary or otherwise, over which horticulturists may have full control.

The scheme for a horticultural hall (similar to what is in existence in many cities in America and on the Continent), which I suggested several years ago, was most favourably received by the President, Council,

and also the Committee of the Royal Horticultural Society. Thousands of pounds were promised, and I sincerely hope those promises still stand good. If I am not mistaken, one gentleman offered to give £5000 if a similar sum was subscribed by a certain time, but unfortunately just then matters in the financial world were unfavourable, and great depression in business existed. It seems to me that a most opportune moment has arrived for the revival and carrying out of that or a similar scheme.

If a powerful and influential committee were selected from the National Chrysanthemum Society, and if our highly esteemed President, Sir E. Saunders, could be induced to act as spokesman, offering our cordial support to the President and Council of the Royal Horticultural Society, the whole matter could be discussed, and the feeling of kindred societies and the public generally be ascertained. The Rose, Carnation and Picotee, Auricula, Narcissus, and Cacti Societies continue to hold their shows at the Drill Hall, and I feel sure the National Chrysanthemum Society would be received with open arms by the R.H.S. if the building were large enough, as of course it is not, without that chartered body wishing to exercise any control whatever over internal arrangements of the N.C.S.

I am both willing and anxious to co-operate in assisting to bring something of the kind prominently before the public. Unity is strength, and it seems to me if the united strength of all the kindred societies now existing in London could be secured, and pay proportionate sums, on an equitable basis, towards the interest on borrowed capital (if such a course were deemed necessary), there is no reason why we should not have a home of our own, and not remain in lodgings for ever. I think we might reasonably count on something like the following income, each society, of course, taking its own gate money :—

Royal Horticultural Society	£400 per annum.
National Chrysanthemum Society	200 ,,
National Rose Society	100 ,,
National Dahlia Society	100 ,,
Carnation and Picotee Society	50 ,,
Auricula Society	25 ,,
Cacti Society	10 ,,
Letting the hall for horticultural business committee meetings	100 ,,
Letting for other approved purposes ...	1000 ,,
Total	£1985 ,,

This, at 4 per cent., gives a borrowing power of nearly £50,000.

If the Council of the R.H.S. would favourably reconsider the suggestion, and all kindred societies cordially support such, or a similar scheme, it seems to me we can well picture phœnix rising boldly out of its own ashes, and British horticulture going on in rapid and harmonious strides. It certainly is an undisputed reproach that horticulturists do not possess in the City of London a building large enough to hold even an ordinary flower show ; and, in my opinion, it is now quite time we did. I ask one and all if the time has not arrived when this hall should be begun.—H. Cannell.

After the perusal of several contributions on the affairs of the N.C.S. and the R.A. Co., I cannot come to any other conclusion than that the Secretary's remarks are laboured and put out of court by the temperate statement of facts and figures from Mr. J. W. Moorman. I observe that a section of the N.C.S. have dared to threaten a split with the view to have shows under the management of the R.A. Co. if the shows of the N.C.S. were transferred elsewhere. The futility of this threat becomes ludicrously apparent through the total of the expenses incurred in 1896 by the N.C.S., which the R.A. Co. would have to be responsible for should the said section of the N.C.S. subordinate its independence to the dictates of the latter as the result of a schism. If this is not slavery with a vengeance as correctly designated by "A. D." and others, I should like to know what is.

The threat alluded to does not seem to be dictated by consideration for the N.C.S., but from motives of separate interests unconnected with the continuation of a victorious career of this Society, for which all its members are supposed to strive. If prosperity of the N.C.S., to which the Secretary refers, be a potential power, certainly the examples of the successes of provincial societies would positively prove that separation from the R.A. Co. and its "attractions" would induce the general public of our huge metropolis to assemble in their thousands for the main and only true enjoyment intended, represented by the fostering of the spirit of horticulture, and as a superior aim to the distractions that disturb this result.

The evils of darkness attaching to the locality chosen for these shows I will not further discuss, and I must add my belief that those members of the Society who know of no better reason than that the show has been held there for twenty-one years in order to continue so are not its true friends.

However, to consider the other side of the question - practical suggestions for amelioration. The idea of "A. D." of transferring the shows to the Royal Agricultural Hall deserves all the praise of something better, if the best, a central site, be unobtainable. It would be considerably better than a lesser evil, and ample attendance would soon dispel the notions of any adversaries of this scheme.

But why stop here? Let us admit the unimportance as to the locality of the shows for a year or two while a "Temple of Horticulture" be created, befitting the richest city in the world, in a central site, and be enthusiastically supported by the N.C.S., occupying the most influential place among special floricultural societies. The Royal Horticultural Society will be certain in its strong aid and power growing annually in an accelerated ratio as the general love of horticulture expands, and trust should be placed in such evidences. If practically and properly attempted many purses will lend their aid, and more readily now in consequence of the outspoken condemnations of the accommodations actually existing.

What will posterity say of the niggardly spirit of this city towards a truly elevating object on the threshold of the twentieth century, to have wasted its opportunity and missed to secure a central and worthy site for the Temple of Horticulture before the rapidly decreasing areas for such a purpose be otherwise appropriated? Is it even too late to begin resuscitation of the project, twice before attempted and dropped? The very vastness of our metropolis renders a central site alone acceptable, and certainly the fitness and felicity of choosing this moment, one—the few remaining ones—of this the Queen's Jubilee, should accelerate action. It can be only a matter of time as to the creation of a true temple, and the opportunity seems good with the scrupulous care by the rules of all nations to leave the peace of the world undisturbed, and commerce adding vast riches to our nation's pockets quite on a par with the colossal edifice of the Empire. Are the pockets of those blessed with riches only capable of appreciation of the handicraft of mere man in their creation of temples for picture gatherings and their contents, leaving the handicraft of the Almighty, His sublime creation of flowers that no human art can attain, to shift for themselves?

Flowers appeal to sympathy and sentiment, and their "practical" aspect is only half the battle. Let the true and existing sympathy be appealed to in such forms as experience may suggest, and let us see whether we cannot create a "Temple of Horticulture," where also could be shown to, and seen by all, our transmarine cousins when arriving in their shoals to have a look at the old country, the gathering from the horticultural world of the empire, emblematic of its extent, as is done through collections in other branches made independently.

In view of such a development, I should like in reference to Chrysanthemums to see the tendency arrested towards ever larger and larger blooms, running the risk of bordering on the coarse. The public taste is thus diverted from real beauty into a mischievous direction, and the craving for sensational sizes must soon pass the limits beyond which all claim to beauty is forfeited.

Two attempts at creating a central hall have failed, let us have faith in the mystic symbol "three" as of good omen.—H. H. R., *Forest Hill.*

P.S.—A portion of this letter was sent five weeks ago to another paper, and now I see printed at this belated hour with one from Mr. Cannell.

[Mr. Cannell's letter appears above. It arrived too late for insertion last week.]

Late-flowering Japanese Chrysanthemums.

At the recent winter exhibition of the N.C.S., which was most interesting, I made note of the following varieties which were represented by good blooms ; as a guide to those who require large blooms at so late a period of the year the selection may prove useful :—Golden Gate, bronze yellow, belongs to the section known as reflexed Japanese ; General Roberts has petals of the type of Mrs. F. Jameson, red, shaded carmine ; Duchess of York, rich yellow in colour ; George Seward, buff and bronze with a suffusion of red ; Mutual Friend, ordinarily white, but so late exhibiting a tinge of pink at the base, a remark applicable to Mrs. W. H. Lees, which has more curly florets, and shorter than when earlier developed ; Mons. Chenon de Lecbé appears to have been a great success this season, whether early or late ; Louise, fresh and neat ; Bellem, ordinarily is a bright pink in colour, is now nearly white, the narrow florets building up a large bloom of much substance ; Elmer D. Smith, rich cardinal red ; Madame Carnot, apparently as good for winter use as for early November ; Julia Scaramanga (depicted on page 555), bidding fair to become a leading variety ; Rose Wynne, faintly flushed pink ; Edith Tabor, rich yellow ; Mrs. C. Blick, pure white ; and Beauty of Castlewood.

Chrysanthemum the Queen.

Cultivators of Chrysanthemums are generally glad of information respecting any good variety suitable for early or late flowering. When one especially valuable for providing blooms in quantity during the latter half of December is found the joy is the greater. After a two years' trial with the variety here named I am pleased to say it is one of the best for the latter purpose. Cultivated in the ordinary way to produce exhibition blooms, three on a plant, it would be classed as a Japanese incurved, white, with just a tinge of colour suffusing the lower florets. Grown to produce blooms in quantity the colour is pure white, the petals erect, or nearly so, with perhaps a leaning to the reflexed type of bloom. Where so many varieties fail as decorative sorts is in the weakness of their peduncles. If blooms do not stand erect without artificial support they lose much in value. Especially strong in this respect is the Queen, and therefore the more valuable.

Cuttings inserted early in January, the plants allowed to grow uninterruptedly without interference with the shoots, will produce numerous clusters of bloom of from four to six each. How I purpose to manage this variety next season is to plant out the old stools in April in some open position in the garden, top the shoots once, afterwards allow them to grow at will, repot at the end of September, and bring the plants on in a cool house as desired.—E. Molyneux.

Timing Chrysanthemums.

Please allow me to correct an error on page 582. The sentence reads, "I have mismanaged old ones this year," which should have read, "I have mismanaged *odd* ones this year." W. Bowman.

Chrysanthemum Mrs. Caterer.

This is a pure white Anemone-flowered variety, valuable for decoration on account of its freedom in flowering and purity. In clusters it is very useful; the peduncles are stout, supporting the blooms quite stiffly.—E. M.

Chrysanthemum (Red) L. Canning.

At the recent show of the N.C.S. this late flowering variety was represented by a full box of blooms in clusters. It is said to be a seedling from the well-known L. Canning, one of the best of white flowered varieties for cutting during December, January, and February. It is a counterpart of its parent in all but colour. This is a rich dark red, especially bright under artificial light, and one that should become immensely popular on account of its colour alone.—E. M.

Yellow Charles Davis.

I must thank your correspondents, Mr. J. Folkard and "E. M.," for their information *re* "Sport from Charles Davis" (page 556). I am quite aware that both Viviand Morel and Charles Davis will come very light coloured on the crown bud, having grown them so myself, but I have never seen a pure white Viviand or a yellow Charles Davis. In saying this I do not in the least doubt the truth of your respected correspondents' assertions. Another year will decide the question, as I am rooting cuttings of it, and will grow flowers from terminal buds, also crowns, and if it comes yellow on the terminal it will be a decided acquisition to the family.—R. M.

Staging Chrysanthemums at Shows.

One would assume, from the remarks of an "Old Exhibitor," that there is a danger of societies substituting the tall stem classes entirely for the stand method of staging cut blooms. Such is not the case by any means. My contention is that if committees provided classes for vases, as well as for the ordinary method of cups and tubes on stands, they would create increased interest. I do not think twenty-five exhibits could be found in a class for twenty-four Japanese blooms, distinct, if they were to be set up on long stems in vases. It is not reasonable to expect so many merely for the sake of gaining a point in an argument. I know sufficiently well the difference in transit occasioned by the two methods to attempt to say the long stem principle could produce as many. I should be much surprised, also, to find that all of the twenty-five exhibits in that particular class were creditable. Generally, where so many compete, there are some little removed from the mediocre status. I repeat again, the wish to compel all exhibits to be on the long stem principle is far from my conception. Let us, however, have as much variety as possible, some of which is provided by staging blooms on stems in vases.—Sadoc.

A Select Twenty-four Japanese Chrysanthemums.

I have no doubt but that everyone interested in Chrysanthemums have their favourites, and where such is the case there is necessarily some bias. Perhaps I am no more free from such bias than others, but I try to have none, and am not a grower. I rather have made my selection from flowers I have seen in the best collections growing, and in the exhibition stands at shows. Deductions from mere numbers exhibited of diverse flowers are of little value in making a specially choice selection, because these figures merely represent abundance in cultivation, and not necessarily the best. How often do we see superb flowers in non-winning stands that fail because they also contain inferior flowers. I much prefer to make selections of the finest shown, whether old or new, based on the merits of the flowers as seen at various shows, or under varying conditions.

Many of the finest blooms of the passing season were found in limited numbers; but they will be far more numerous next year because they are of the best. In making a selection of twenty-four blooms some consideration must be given to variations of colour as well as of quality of flower, hence too many whites or yellows, the dominating colours, rather weaken than strengthen a selection, let the varieties be ever so good. The select whites are fine; Madame Carnot, Simplicity, Madame Gustave Henry, Miss Elsie Teichmann, and Mrs. H. Weeks; yellows: Australian Gold and G. J. Warren, pale; and A. H. Wood, Phœbus, Modesto, and Georgina Pitcher, rich. Then come N.C.S. Jubilee and Lady Isabel, mauve shaded; Viviand Morel and Australie, pink; Papa Veillard, rosy carmine; Lady Hanham, rosy cerise; Mons. Chenon de Leché, rosy buff; Charles Davis, rosy bronze; Mons. G. Biron and La Moucherette, reddish bronze; Lady Ridgway, salmon buff; and Edwin Molyneux and Pride of Madford, crimson.

I should be very pleased if readers who have no special interest in any variety, new especially, would criticise this selection, and thus see how far it may be possible in the end to evolve for the benefit of those who wish to know what is a perfect twenty-four. Whilst generally I regard the tasselled varieties, such as Madame Carnot and Viviand Morel, as presenting the most pleasing flowers, yet I have included a fair number of incurved varieties, whites and yellows, the dominant hues, and giving so many grand flowers certainly should not exceed one half of the twenty-four.

My selection of these is just under, but so great are their merits, still leaving outside so many fine varieties, that it is difficult to do with less. Such varieties as N.C.S. Jubilee, a grand mauve shaded incurved, and Papa Veillard, rosy carmine, tasselled, are probably little known, but they will be no doubt in great request. Mr. N. Molyneux's seedlings, especially Mrs. N. Molyneux, will probably be much sought after, and there is a host of French varieties in store that have not yet shown their true characters. Intending purchasers, however, are chiefly concerned with proved varieties, and few of those in the list given above have not failed to make their mark. Every year, because of the great influx of new varieties, the selection of about twenty-four will become all the more difficult.—A. D.

EDWARDSIA GRANDIFLORA.

Amongst the many beautiful plants which British gardeners owe to Sir Joseph Banks must be included this, with several other members of the same family, all shrubs of more or less elegance. Though plants are usually grown in pots, they have been successfully grown out of doors, and in positions against a wall where they are not too exposed they usually

Fig. 89.—Edwardsia grandiflora.

escape damage, even during the most severe winters. When grown in pots a compost of turfy loam, peat, and sand—the former in the largest proportion—is required, and in the greenhouse and conservatory the plants will grow and flower freely. Edwardsia grandiflora (fig. 89) was originally known as Sophora tetraptera, under which name it was figured in the "Botanical Magazine" in 1791. In the remarks accompanying that a tree is mentioned which was planted against a wall in the Apothecaries' Garden, Chelsea, by Mr. Forsyth in 1774. This, it is said, grew strongly and flowered most abundantly; but the plant was protected with mats in severe winters. The leaves are very neatly pinnate, having eight or nine pairs of small pinnules, which are whitish on the under surface and green above. The flowers are of a peculiar yellow hue, the calyx being darker and somewhat brownish. Edwardsia chrysophylla, from the Sandwich Islands, has flowers of a similar shade of yellow and somewhat similar in form, but the leaves have a greater number of pinnæ, and are of a silvery colour on the under surface.

Trade Notice.—Mr. A. A. Hutty, late head gardener at Watergate Emsworth, has taken Park Hurst Nurseries, Pitcroft Road, Portsmouth, where he will carry on business as nurseryman, seedsman, and florist.

SERVING THE KITCHEN.

I CONSIDER that this subject embraces one of the most important connected phases of a gardener's work. He usually devotes his energies, and employs all the appliances at his command, to produce a supply of edible fruits and vegetables for his employer's use. But when they are produced, no matter how excellent the quality may be, the grower's part is not finished until such produce has been sent to the kitchen in the best possible manner, and it is with this aspect of the question that I purpose to deal, and I shall make the notes apply to a medium sized establishment, where both luncheons and late dinners are the rule, and where from eight to a dozen servants are kept. Such a place takes a fair amount of time and close attention, let alone patience, to supply the kitchen properly.

In no two places are the arrangements for serving the kitchen exactly alike. In some this duty is relegated to an old, decrepit labourer who knows how well enough, but is past the work. In others the boy just from school is sent to the work, while in a third the garden woman does the work, and this I consider an objectionable arrangement. In my opinion one of the young men, who fully intends following gardening as a profession, ought to be made responsible for this department. Some gardeners may dissent from this view, but it is an excellent course of training for a young man for at least one year. It gives him a better idea of the wants of an establishment than he could otherwise obtain, and if he does not take the utmost care he will soon find what a well-seasoned tongue a cook possesses.

It does not signify what the arrangements are, if the person who has the work to do is not well supported by his chief, and every facility provided for the proper management of the work. In the first place the man in charge of the kitchen should go about his business in a straightforward manner, and always be as tidy in his appearance as circumstances will permit. I know it is not the cleanest part of a gardener's duty gathering vegetables, neither does gathering Gooseberries improve a good suit of clothes. At the same time it is essential that the young man should not be a fop, for there is a happy medium.

An adequate supply of suitable baskets ought to be at command, those made of strong white willow being the most serviceable for carrying the cleanest vegetables to the kitchen. What are termed "skeps" are the best for gathering vegetables from the garden and for carrying Potatoes. Small round baskets are ever in request, and plenty should be provided, and when finished with for the day should always be put in their proper places, so that if one were wanted, even in the dark, it could be found. A shallow tub should be provided for the washing of Carrots and other roots, and it will be found a great convenience if a shallow receptacle is at disposal in which to place Cauliflowers for their preservation when the supply is larger than the demand. They can be cut with a long stem, and if placed in about 2 inches of water will keep perfectly fresh for several days, and possibly prevent an awkward break in the supply.

In many establishments it is no light task to serve the kitchen owing to the great distance of the residence from the gardens, and entails no small amount of labour. In such places the man needs to have all his wits about him, or he will cause himself a great amount of endless trouble and waste a lot of valuable time. In well managed houses he will always know what to take with him on the first journey each morning, and if the cooks are worthy of their position the work can be very much simplified. For instance, during the small fruit season Gooseberries and Currants can generally be ordered the day before they are required.

In the store rooms, or other places that are provided in connection with every kitchen, receptacles should be provided wherein to place Potatoes and other vegetables so as to avoid confusion. By having such conveniences the man knows where to place his vegetables and the cook to find them. It will generally be found best to keep a small stock of Turnips and Carrots ready for the cook, but never allow any vegetables to remain when they have become stale. A drawer fitted with compartments should also be provided in which to keep dried herbs, such as Sage, Thyme, Mint, Tarragon, Marjoram, and any others that are in stock. A good supply must always be in reserve carefully labelled and ready for use. When small culinary fruits and Green Peas are in season it will be a busy time, especially on a Saturday, for on that day a double supply should always be taken in ready for Sunday use. I have frequently commenced at six o'clock on a Saturday morning during the season above referred to, and have been kept going as hard as possible until twelve o'clock.

Now a few words regarding size of vegetables for the table. Some people appear to have an idea the larger the better; that is a mistake. For instance, of what use are the big Onions we see and hear so much about for general purposes, when they weigh from 2 to 3 lbs. each? True, they would do for Onion porridge, but if you took such in to some cooks you would find perhaps 4 ozs. of one used and the remainder thrown away. With Cabbages medium sized hearts are far more preferable than very large ones. My opinion regarding Cauliflowers is that one about 6 inches in diameter, as white as snow, is better than one twice the size, and is also much more easily protected from sunlight, rain, and frost. In the case of Savoys the small compact heads of the Dwarf Ulm type are more useful than the flabby Drumhead section, but I have found Dwarf Ulm is no use for market work. If we would have the best quality in vegetables we must have medium size; hence the lesson.

Never let the kitchen authorities have the slightest idea of any one thing that is in season if you can possibly help it, or you will be asked for it every day, whereas if you have plenty you can rest perfectly assured you will not be very much troubled. I well remember one place of which I took charge. There was only a small quantity of Artichokes in the garden, and I was asked for them two or three times each week. The next season I remedied that fault and provided plenty, but very few were then required. Always aim at providing plenty for each day's supply, but do not allow any waste if it can possibly be avoided.

One frequent cause of friction is taking vegetables, such as Peas, French and Runner Beans, into the kitchen too old. This is a great mistake, though I know it is somewhat difficult to always prevent a pod of Peas slightly too mature from finding its way into the basket. The test for Runner and French Beans is a very simple one. If a pod will snap in two without leaving any string it will be tender despite what anyone may say to the contrary.

In some establishments the kitchen garden is too small for the requirements of the family and it falls very heavily on the gardener in charge; but if he has any natural resources it will bring them to the front, and he will endeavour to supply his employer's tables, with an occasional dish for the servants. In many cases that cannot be accomplished every day, and here is an opportunity for the man whose duty it is to serve the kitchen. If his heart and mind are in his work he can save his chief a large amount of anxiety by noting how the supplies are holding out. If there are plenty then acquaint the cook and they can be used in the servant's hall, and if supplies are falling short acquaint the chief. Take Potatoes, for instance. The full supply of these can seldom be produced in the kitchen garden proper, and in some cases have to be bought in. Of course, this is part of the gardener's duty, and the man in charge of the kitchen department should always remind his chief before the stock is too low.

A few remarks on packing vegetables for the family when in town may perhaps be serviceable to some, as this is a duty that all gardeners have to perform. Always commence with the heaviest and bulkiest vegetables, placing these at the bottom of the hamper. If the packing is done during the Pea season these may be placed in amongst the other vegetables, thus filling up all crevices. It is well to remember that the firmer all such things are packed the better they will travel. It will also be advisable to keep a list of all things sent to town for family use, with quantities on each date, as in certain cases it is apt to prove a valuable safeguard.

I have endeavoured to place a few hints before you that I have found useful in practice. It is impossible that every gardener can be in charge of such an establishment that I have essayed to sketch. Many may be in larger, where the requirements are far more extensive; but, as in every other walk of life, the gardener wherever his lot is cast must of necessity adapt himself to circumstances, and if he happens to be only single-handed he will find the small things as needful in their several places as the great ones. To the young man who is just entering upon a gardening career I would say, By all means serve the kitchen if you possibly can. There will be hints and information to be gathered that will be of the utmost value in after life. Note down each day what has been supplied, and go about your work with a will that would impress even a stranger that you were in earnest. I think if you do this you will not remain on the bottom rung of life's ladder, though perhaps circumstances will prevent you climbing as high as you would desire. Nevertheless, ever bear in mind it is the strict attention to trifles that ultimately achieves success.—(*A paper read by* MR. J. WILKINSON *at the Hessle Gardeners' Mutual Improvement Society.*)

SUDBROOKE HOLME.

THIS is the winter home of C. C. Sibthorp, Esq., a gentleman whose generosity is well known and appreciated by the inhabitants of Lincoln and the surrounding villages, who have the privilege of visiting the well-kept grounds during the summer time. The charming park contains many fine specimen trees, and is surrounded by woods and game preserves. In one part is a large ornamental lake, to which the public are admitted free in frosty weather for skating. That Mr. and Mrs. Sibthorp study the interest of their employés is proved by the substantial and convenient residences on the estate for their head servants, and their universal kindness to all.

Within recent years the pleasure grounds have been greatly improved by introducing a choice collection of shrubs, both evergreen and deciduous. Among the latter Acers, Prunus, and Elders in variety have been arranged to produce effect, and the colours to harmonise with other plants and trees. There are an extensive Italian garden, Alpine rockeries, long borders of herbaceous plants, with a hardy fernery beneath the shade of magnificent specimens of Weeping Elm and Weeping Beech trees, all of which are much admired when in their season of beauty.

The kitchen garden, of 11 or 12 acres, is well cropped with winter vegetables. Fruit, too, is cultivated extensively. Apricots, Peaches, Nectarines, Cherries, Plums, and Pears are grown on the walls, and a neat system of training is adopted by securing all the main branches to nails with thin shoots of Willow; the nail is driven into the wall where required, the Willow turned once round the nail, and the ends brought round to the front of the branch and tied. The ordinary birch broom is here substituted by one home-made of the Snowberry Tree (Symphoricarpus racemosa), which at this time of the year is cut and stored in a dry shed, and in wet weather the men arrange the pieces in about 18-inch lengths, and they are bound round tightly with green Willow shoots, and put away in bundles. They are said to wear better and last longer than Birch, and have the advantage of being easily made from material that can generally be got in abundance.

Mushrooms have been successfully grown in a rather novel manner

for some years. When the late gardener (Mr. G. Gray) was forming the framework for his new beds in the Mushroom house, instead of making a close bottom he fixed strips of wood about 4 inches wide across, leaving a small space between each, and after the bed was made up and ready for spawning pieces of spawn were inserted in these spaces as well as in the upper surface of the bed, and he was always able to cut fine Mushrooms from both sides. Mr. Randall, the present gardener, is growing them in the same way, and is well satisfied with the results. He has also a good supply of Rhubarb, Seakale, Chicory, and Endive under the beds.

There is a good range of vineries, and in the late house are some capital bunches of Lady Downe's. In the others are wintered large and tender plants required for vases and pedestals in the flower garden, such as Coprosmas and Heliotropes. A large stove recently built by Messrs. Foster & Pearson is well heated and ventilated, and is now furnished with foliage and flowering plants. The wide centre bed is filled with specimen and decorative plants, while on the sides are some well-grown Orchids, among which is a large specimen of Epidendrum ciliare, a common species, but one not to be despised in December. We also observed Calanthes, Cattleya labiata, C. Bowringiana, Vanda cœrulea, and Cypripediums in variety. Palms, Ferns, Crotons, Dracænas, and Alocasia Sanderiana also occupy the sides. Two large Ficus elastica albo-variegata are in the corners, and the roof is well furnished with creepers of light and graceful habit. Stigmaphyllon ciliatum covers a good space, and very pretty it is with yellow Orchid-like blooms, while Gloriosa superba, Aristolochias, Smilax, and Asparagus plumosa all find a place.

In a smaller and cooler house is a fine piece of Oncidium incurvum, with eleven strong branching spikes, the light sprays of which are so useful in making up buttonholes. The yellow Oncidium varicosum stands in contrast to the scarlet Sophronites grandiflora and Masdevallia Veitchi; there are some well grown Miltonia vexillare, Masdevallia tovarensis, Cypripedium insigne, C. Leeanum, Odontoglossum crispum, and O. cirrhosum. There are several low span-roofed structures and heated pits used for forcing and growing plants for the stove; others are filled with Primulas, double and single; Cyclamen, Zonal Pelargoniums, Rhododendrons, Azaleas, Heaths, and quantities of bulbs. A plant worth passing note is the pretty trailing Sibthorpia europæa (named in compliment to the botanist and ancestor of the present owner of that name). Besides the type are two other varieties, aurea and variegata, which are in pots suspended from the roof, and the numerous slender stems with miniature foliage almost hide the pots. The large show house has been gay for some time past with Chrysanthemums, Pelargoniums, Cinerarias, Bouvardias, Deutsche Perle Azalea, Begonias, including the useful winter flowering Gloire de Lorraine. On the roof facing the east Lapageria alba and rosea have been and still are flowering profusely. On the latter were bunches of as many as eight flowers on 4 inches of wood. Fuchsias also are trained up, having stems like Vine canes, and producing an enormous number of flowers.—G. W. Cummins.

THE YOUNG GARDENERS' DOMAIN.

A Bothy Yuletide.

Everyone of us who can read has, by the aid of the printing press, been able in imagination to spend Christmas in picnic fashion under the blue Gum Trees of Australia and the Tree Ferns of New Zealand. We have been present in spirit at the Yuletide gatherings of Arctic explorers, and have shared Christmas cheer with the squatter in his log cabin out West. We know how the festive season is spent aboard ship, and how the mind of the soldier wanders homeward when it is his lot to watch by the lonely bivouac fire on Christmas Eve. We know something of how the time is spent under all these circumstances, but to come closer home gardeners have the best recollections of Christmases in that best of all training schools for the craft—the bothy. Therefore, I dispel all things practical for the present, and ask my readers, young and old, to gather round the bothy fire with those who, since the Christmas of which I write, have scattered in various directions, several of them now holding good positions as head gardeners.

To begin with, there was nothing new or original about our bothy. It was, like the garden itself, quaint and old fashioned, with all rooms on the ground floor, and casements glazed with tiny diamond-shaped squares of glass, artistic, but not admitting a flood of light. Round the low windows rambled an old Wistaria, which formed such a bower over the door that it was a little difficult to tell exactly where the entrance really was. The interior varied little from that of other bothies, with its long dining table, its array of working coats hung along the wall, and its large open fireplace. Ah! that fireplace. How many a youngster, including the writer, has sat and gazed into its embers with heavy heart on his first evening of bothy life, full of the remembrances of the home circle, left for the first time, and downhearted at the prospects before him. The few years of probationship over, last evenings have also been spent around the fire, but with different thoughts. A few happy careless years of youth, spent mostly under the roof, made it a home full of pleasant associations which made the parting sore. All grievances were forgotten on the last night of residence, and the old bothy was dear, the fire a friend, soon to be parted with by the young gardener about to continue his course of training in a new domain.

Behind the cupboard door which contained our stock of culinary utensils was a long list of names, with dates affixed, telling of the coming and going of those who had been residents of the bothy. There was no rule about the keeping of this primitive register, yet each newcomer duly affixed his signature and the date of his advent, and added the day of the month prior to his departure. No mischievous youth dared to erase or tamper with a signature, and everyone had a kind of respect for those heading the list. I wonder if they have forgotten the column on the back of the cupboard door—those who are now on the downward grade.

It would be interesting also to know what has become of all those whose names are still there, though some of them faint. Several, to my knowledge, have passed over to the great majority, others sought their fortunes in Australia and America, and one or two who never had much love for gardening drifted into the army, and one I know fell a victim to a savage's spear in South Africa. Others still followed their calling till they attained good positions, and if I mistake not, look back on the days spent in the old bothy of which I write as being amongst the most happy of their career. Some years have passed since this hand wrote the bottom signature, and doubtless by now many others are below it if the custom is sill continued.

But how was Christmas spent? Who would be on duty? was the question asked weeks beforehand, and the two luckless individuals whose turn it happened to be were open to some little banter; and should, in the weeks that intervened, any unforeseen accident happen which altered the order of events, the one bringing about the change was subject to some scathing remarks. On the whole, however, the unfortunate ones met their fate cheerfully, and though Christmas was to be spent at work, made the best of it. At the Yuletide of which I speak the writer was on duty—the first ever spent from home—and recollects some feelings of depression on seeing portmanteaux packed ready for the holiday.

There were ten in all, and four had gone home. Lucky four, said the six that remained, and those who were free wished that home was nearer. Amongst the latter was the youngest hand; an apprentice boy having his first Christmas experience in a bothy. Poor lad! he shed a few tears, but we cheered him up, and he grew brighter when someone informed him that there was a hamper for him. It was quite a mother's hamper, full of thought for the tastes of her truant boy. A plum pudding, cake, mince pie, and such-like simple dainties to make his Christmas cheerful. She would like him to come home, but was a widow, and it could not be managed. Her husband had died and left her with a family to provide for, and through friendly influence her eldest boy was given a start in our bothy—a start he has taken advantage of and continued, as he has now reached the foreman's stave on the ladder of his career.

Another's home was among the hills o' Scotland, so for him a visit was out of the question, though doubtless he was not forgotten by those gathered round the log fire somewhere away in the Hie'lands. A third was worse off, as he had no home except the bothy, and the fact seemed to strike him with the greatest force at such times as these. But young men are not sentimental long, and low spirits soon departed as we gathered round the bothy fire on Christmas Eve, determined, as Mark Tapley would put it, to be jolly.

The old place looked gay in its Christmas garb of suitable decoration, for in cutting the material for other purposes the best-berried sprigs of Holly had been carefully put aside for the bothy, and a journey had been made to the top of the tallest Blenheim Orange tree in the orchard for a bunch of Mistletoe. There is always something about the Christmas season that makes it quite distinct from any other, and, no matter what the circumstances, spirits usually rise to the occasion. So it was with us on Christmas Eve, gathered round the bothy fire telling stories of other Yuletides and how they were spent, and making the old place ring again with songs of the season, accompanied by that favoured instrument of the bothy, the concertina.

There was work for the duty men of course, and when the time came for banking up the fires everyone accompanied them on their rounds, and the sound of Christmas carols mingled strangely with the rattle of the shovel. Sounds of music and singing broke on the clear frosty air in various directions, telling of "waits" abroad. The work completed, quick march was made to the gardener's house, near which six pairs of stout lungs gave vent to "While shepherds watch." Later on six healthy appetites were appeased by the head gardener's Christmas cheer, while his better half, a kind soul who had sons of her own, and took a motherly interest in the young men, made her guests happy. It is this friendly relationship between head gardeners and those under them that brings out the best qualities of the young men, and adds to the benefit of both.

The next day six men formed a mutual co-operative society for preparing a Christmas dinner, and at length succeeded. Their errors of commission and omission were many. The different ingredients were ready at different times; but the event lasted the longer, and did not appear to be the less enjoyed. May all young men make themselves equally contented in the bothy this Christmastide is the wish of one still young, though an—Ex-Journeyman.

The Reserve Garden.

In all gardens, whether large or small, there should be a portion of ground set apart for the accommodation of plants after they have served their purpose in the flower beds or shrubbery. Many which, owing to the shortness of their flowering season or other causes, are not suitable for a permanency in the flower garden, may be transplanted here. Amongst these may be classed Auriculas, Polyanthus, Primroses, and Violets. Most of these are propagated by division of the root, and when they are transferred back to their quarters in the reserve garden will be the best time for dividing them, and thus increase the stock. During the summer months Wallflowers, Sweet Williams, Campanulas, and other plants of that

description should be raised and grown preparatory to their removal to the flower beds.

The reserve garden is the proper place for raising annuals for either spring or summer flowering. Asters, Stocks, Zinnias, and Marigolds ought to be pricked out here for hardening before being finally moved to their blooming quarters. It is useful for propagating Pinks, Carnations, and a host of other perennials. Roses may be budded, shrubs layered, new varieties of plants tested, and cuttings of plants that will root in the open air inserted.

It is not in itself a thing of beauty, but provides the means of beautifying the flower garden and shrubbery. It should be laid out in beds of convenient lengths, and from 4 to 5 feet wide, divided by walks cut with a spade about 1 foot to 18 inches wide. The soil must be varied to suit the different species of plants therein. It is obvious the ground must have the highest culture to grow the plants to perfection, and attention to the wants of each individual class of plants must be bestowed. When the reserve garden is of sufficient dimensions plants for the supply of cut flowers could be grown here, so that the beauty of the flower beds is not marred by frequent cutting. The reserve garden is to the flower garden what the greenhouse is to the conservatory, and no well ordered garden is complete without one.—E. J. B.

FRUIT FORCING.

Cucumbers.—As these like light, heat, and moisture, the glass should be kept clean, both inside and outside. Add a little soil over the roots as they protrude through the sides of the ridges or hillocks, using it sweet and warmed, and moderately moist. A few sweetened horse droppings sprinkled on the surface of the bed occasionally will attract the roots, and supply them with nourishment. Supply water only when the soil is getting dry, then afford sufficient to moisten the soil through to the drainage. Plants in borders of small area, pots, and boxes should have liquid manure, always tepid, and not too strong or too often. Damping the paths and sides of the bed and house will be sufficient to maintain a genial atmosphere if it be attended to in the morning and afternoon of fine days. Remove surplus fruits as they appear, also tendrils and male blossoms, unless they are required for impregnating the fruit-bearing flowers.

Stopping and thinning the growths will not be much needed, but it must not be neglected, as crowding is the precursor of evil consequences. Tie in the growths as necessary. Do not overcrop the plants, and be careful not to allow the fruit to remain longer on them than to attain a useable size; they keep fresh several days after being cut if the heels are inserted in a saucer of water in a cool place, but safe from frost. Red spider and white fly are sometimes troublesome, especially the former, in structures that are badly heated, and thus necessitating sharp firing. Sponging the infested leaves with a solution of softsoap, 2 ozs. to a gallon of water, is a sure, and, all things considered, the safest remedy for red spider if taken in time; while a little flowers of sulphur on the hot-water pipes checks it, and destroys white fly. Mildew must be kept under by dusting with flowers of sulphur, or if the hot-water pipes are brushed over with a mixture of sulphur and skim milk it will succumb. Green and black aphides may be destroyed by dusting with tobacco powder, vaporisation with nicotine essence, or fumigation with good tobacco paper, but being careful not to give an overdose, as the foliage is at all times, and especially at this time of year, soon injured.

Peaches and Nectarines.—*Earliest House.*—The trees must not be syringed after the blossoms show colour, but a moderately moist atmosphere should be maintained by damping the paths and borders in the morning and in the early part of the afternoon of fine days. Maintain the temperature at 50° to 55° by day, with an advance from sun heat to 60° to 65°, but not without ventilation at top and in front, 50° being sufficiently high for the night. If the weather is cold and sharp the temperature may fall to 45°, or during severe frosts to 40° at night, which is more advantageous than a higher and drier heat. The house should be freely ventilated when the weather is favourable, especially when the blossoms show the anthers clear of the petals, avoiding cold draughts, however; but admit a little air constantly by the top lights. Houses that have innumerable "chinks" of air may remain closed in stormy weather. The temperature, however, must be raised early in the morning to 50°, and be kept between that and 55° through the day; but 55° must not be exceeded by artificial means, nor an advance allowed above it without a free circulation of air, and it is not a good plan to close early in the afternoon at this stage.

A close moist atmosphere favours growth more than sturdy blossom and the setting of the fruit. Under favourable climatic conditions the pollen is dispersed in a golden shower when the day is bright and ventilation has been attended to early; the setting of the fruit is then generally satisfactory, even without artificial fertilisation. The trees or trellises, however, may be shaken every day from the first pollen on a tree becoming ripe until the latest flowers thereon have cast their petals. A plume of Pampas Grass drawn over the blossoms lightly scatters the pollen, or a rabbit's tail mounted on a stick may be used similarly. A camel-hair brush passed over pollen-laden anthers and applied to the stigma of each flower is, however, the most certain method of artificial fertilisation, operating after the house has been ventilated some little time.

Second Early House.—The trees must be started without delay to have ripe fruit in May or early June, according to the variety. Alexander and Early Louise Peaches, started from now to the new year, will ripen the fruit in May, Hale's Early following closely; but Stirling Castle and Royal George, started at the same time, will not ripen their fruit until June, unless very hard forced, which is inadvisable. Fire heat should only be employed to keep out frost at night, and to insure 50° by day, above which ventilate freely, and close the house at that temperature, except that a little air should be admitted constantly by the top ventilators in close-fitting houses. Bring the trees on slowly, not hurrying them in swelling the buds; and if these are abundant, rub off those on the under side or at the back of the growths. Sprinkle the trees in the morning and early afternoon of bright days only, damping sufficing when the weather is dull. Apply water if necessary to bring the soil into a thoroughly moist condition. Outside borders may be covered with about 3 inches thickness of leaves and litter, but avoid thick and rich coverings.

Succession Houses.—These cannot be kept too cool after the leaves are all down and the trees have been pruned and dressed. If the roof-lights are moveable, they should be removed whilst the trees are at rest. The frosts are never so severe as to injure the wood of trees in good health and profitable use, and the borders become thoroughly moistened by the winter rains and snow, so that they seldom require water until the fruit is taking the first swelling and entering on the stoning process. Trees under fixed roofs seldom have the soil thoroughly moistened, therefore the buds are imperfectly formed, and are cast when they should be developing into blossom. If the roof-lights are fixed, the borders must be carefully examined, and water supplied to keep the soil thoroughly moist. Dryness at the roots during the rest period is a fertile source of the buds falling, and thorough watering will not do any harm provided the drainage is effective.

Unheated Houses.—When the roof-lights are removed from these directly the leaves are all down, and they remain off until the beginning of March, the trees enjoy a complete season of rest as far as possible in our climate. Up to that time, or the swelling of the buds, they are simply frost-proof, for it is not these that suffer from severe frost, but the unripe wood, and that is worse than useless, as it falls a prey to disease. Danger to the buds begins when they commence swelling, and having burst their scales, show the downy integuments that protect the blossoms. The pruning in such cases is usually deferred until the spring, which is a light affair when the trees are grown on the long-pruning system, and the useless parts cut out directly the fruit is gathered, so that the wounds heal at once, and the winter pruning is rendered almost nil. Where the roof-lights are fixed the house must be freely ventilated in mild weather, and even in frosty on fine days. Above all things see that there is no deficiency of moisture in the border, affording a thorough supply of water when necessary.

Pines.—If preparations have not been made for producing ripe fruit during May and June, no time should be lost in attending to the matter. Black Jamaica, an excellent fruit, especially in winter; Charlotte Rothschild, and Smooth-leaved Cayenne plants, which, however promising now, failed to show fruit during October and November, will not throw up in time to ripen at the time named. Attention must, therefore, be directed to such as attain perfection in less time, as the Queens, Enville, and Providence varieties. Select at once those plants which have an enlarged base with a tendency to open in the centre, evidence that the fruit will shortly be visible, and place them in a light house or pit, affording a brisk bottom heat, say 85° to 90°, a top heat of 60 to 70° at night, 70° to 75° by day artificially, and 10° to 15° more from sun heat. When the external conditions are favourable, a moderate amount of ventilation must be given, and the atmosphere should be genial, syringing the plants once or twice a week, and then very lightly, damping the paths and similar surfaces in the house, except the hot-water pipes, on fine afternoons. Water will be required at the roots about every ten days, but do not supply it until the soil becomes dry, and then in a tepid state, with a little guano (1 oz. per gallon) or some other fertiliser in it, and always copiously, dribbles doing more harm than good.

PLANT HOUSES.

Poinsettias.—As the bracts of these fail the plants needed for stock should be given careful treatment afterwards. Do not transfer them at once from a warm to a cold structure, but remove them gradually, and with the same care diminish the supply of water until it will be safe to keep them perfectly dry and cool. Plants that are doing duty in the conservatory will need no more water than will keep their foliage fresh; these, when the bracts fail, will do very well in cool quarters.

Euphorbia jacquiniæflora.—Plants that have flowered in the stove need also the same careful treatment. They are liable to suffer if kept too wet or suddenly kept too dry. These after flowering should not be placed in too low a temperature; after they have been gradually hardened, and can be kept dry, they will be perfectly safe in a temperature of 50°. However beautiful these may be while in flower in the stove, they are much more useful in the conservatory where the temperature is not allowed to fall much below 50°; they also last double the length of time. Where nearly all flowering plants have to be employed in this structure there is a tendency to stiffness at this season of the year unless such light graceful plants as the one under notice are grown in

quantity and utilised for standing well above plants of a dwarf compact nature. By the aid of Poinsettias, Euphorbias, late Calanthes, and plenty of Centropogon Lucyanus formal arrangements need not exist. Some care is necessary in removing the latter from heated to cooler structures, or its foliage turns yellow and quickly disfigures its appearance. Plants that have produced in the stove their terminal truss may be bent round four or five small stakes, when they will soon break into growth and flower again.

Linum trigynum.—Those having flowered should be cut well back. It is not necessary to retain many plants for stock. Those that are retained, if they have been infested with red spider, should be thoroughly cleaned. The best means is to remove all the foliage and sponge their stems with a strong solution of an insecticide. Plumbagos may also be cut back. The foliage should not be removed from this plant. Its greatest enemy is thrip, which can readily be destroyed by dipping in a solution of tobacco water.

Coleus and Tradescantias.—Both these are useful in small pots for various purposes of decoration. The latter will root quickly and freely enough in any heated structure, while the former should not be in a lower temperature than 65°. They root freely enough inserted in the pots from which they are to be used if stood on a shelf over a hot-water pipe. They should be kept moderately moist.

Selaginella Kraussiana.—This is most useful in from 3 to 5-inch pots for a variety of purposes. Fill pots with light soil in which plenty of fine leaf soil has been incorporated well above the rim, and prick thickly into them growing ends of plants that have been reserved for this purpose. If placed in a warm moist house they will quickly root and cover the surface. It is a good plan to make up a few pots according to the demand at intervals of a fortnight.

Polystichum proliferum.—A useful Fern in any size pots up to those 5 or 6 inches in diameter. We find it most useful in 4-inch pots. Plants placed in these in autumn, and have been kept cool, may be introduced into a temperature of 50° to 55°. Remove the old foliage and plant a little Selaginella round the crown, and they will soon push up new fronds, and in a few weeks be ready for any form of decoration. Some in small pots to replace these may be placed into large, and Selaginella dibbled in at the same time, not too thickly, or it outgrows the plant when they are first potted. These will do capitally in a Peach house or vinery that has been started, in fact in almost any position until they begin to grow.

Adiantum cuneatum.—Where all the fronds have been gathered that are of any service the old plants may be cut over, and if slugs have infested them they should be well dusted with soot. Place these plants in a temperature of 40° for a few weeks to rest. Be careful not to overwater plants that have just started into growth; for these a temperature of 60° will be ample, while those with abundance of fully developed fronds should have a temperature 5° lower. Any plants that display signs of growing should have fronds that are ready for cutting removed to give the young ones a chance, and should be encouraged to grow. Fern fronds will be less plentiful during the next two months than what they are now, unless ample provision has been made to maintain a supply.

THE BEE-KEEPER.

Seasonable Notes.

It is not often so many changes take place in the weather during twenty-four hours as have been registered on more than one occasion in this district lately. Wind and rain, and blinding storms of hail and snow, were followed by an hour or two of bright sunshine, but owing to a low temperature the bees were not tempted to leave their hives. High winds and heavy storms have prevailed throughout the country, but during the early days of the month now fast drawing to a close bees were unusually busy in the more forward parts of the country. "S. T.," writing from the banks of the Severn, says:—"On the 3rd inst. my bees were flying from all the stocks in my apiary in great numbers, and were as busy for three hours as they usually are in the month of June. This is an unusual occurrence, even for this favoured district, so late in the year. It interested me so much that I fetched some friends to see them, who were greatly astonished." This shows how favourable and beneficial the fine weather experienced throughout the autumn has been for the bees.

In this locality (South Yorkshire), although much farther north, the bees have up to quite a recent date been almost daily on the wing. When they have been confined to their hives from any cause for a few days, and the temperature is about 50°, and the sun makes its appearance, it is surprising the effect it has on the bees. They at once take a cleansing flight, and leave their hives by the thousand, and for a few minutes one could imagine they were swarming, so excited are they, but in the course of half an hour probably not a hundred bees are to be seen, as they have all returned to their hives.

There are exceptions however, and all bee-keepers who observe the bees and their habits closely will have had experience of it. When bees leave the hives as above at this season and alight on the cold soil, or it may be in early spring after a fall of snow, they become chilled, and are unable to return.

Shading the Entrances of Hives.

It is an advantage at this season, when the ground is covered with snow (and this may happen at any time, so it is as well to be prepared), to shade the entrances of all the hives in the apiary. I prefer this plan to closing the entrance, as by so doing much harm may be done to the bees. If the sun strikes directly on the entrance the bees will endeavour to make an exit, and in their excitement many of them will be killed; also through stress of other business the entrance may remain closed longer than was intended, and much injury caused in this manner. In my apiary I go as far as never to close the entrance on any pretext, as I once saw a strong colony of bees suffocated owing to the entrance being closed. Whether the entrance is open its full width, or only an inch more or less, it is a decided advantage to shade them. All that is required is something to obstruct the light, but not the air. I have found nothing better than a piece of wood or slate placed in a slanting position against the entrance. If whatever is chosen is slightly larger than the open entrance and is placed in the right position it will have the desired effect, and should any bees by chance leave their hive there will be ample room for them to return.

By working somewhat on the above lines thousands of bees will be saved which would otherwise have been lost. Care, however, must be taken that the material utilised is not blown down by the high winds, and when the snow has disappeared the obstruction may be removed until again required.

Making Roofs of Hives Secure.

Unless some steps are taken to make the roofs of hives secure during the prevailing high winds the inmates will suffer. In some instances the roofs are fastened to the hive with hinges, and when in this form the wind has little effect on them so long as the hive is not blown over. The majority of hives, however, are made so that the roof lifts off bodily. If a hive is well made and the roof a good fit it will stand a strong force of wind if it is blowing from the same direction in which they face. But if the wind shifts round sideways to the roof it will readily remove them unless some precaution is taken.

To illustrate my meaning, I may state that the majority of my hives face due west, others have a south aspect; the prevailing high winds come from the west. If the roofs on the latter hives are not secured, the first high wind that comes will blow them in all directions, whereas the roofs of the former will not be interfered with. If the roof is flat a couple of bricks will hold it secure, and if span-roofed a piece of stout cord with a brick at each end will have the desired effect. If there is any danger of the hive being blown over—and I have seen that happen—drive a stake firmly into the ground on each side, and make secure with stout cord.

Artificial *versus* Natural Swarming.

In further reference to straw skeps it may be an advantage to note the difference between artificial and natural swarming, and under which system the bees do the better. When bees are swarmed artificially, it should always be done when they are ready to swarm naturally. If the bee-keeper does not know when they are at this stage, it is better to leave them alone. It is, however, a very easy matter to tell when they are in the right condition. If on lifting the skep from the floorboard late in the evening it is found to be crowded with bees, the floorboard being also covered, so that it is with difficulty the few remaining bees on the wing can gain access to the hive, an artificial swarm may be taken. If, on the other hand, the hive appears to be full of bees, but the floor board is not covered, wait a few days until they are of sufficient strength.

In swarming bees artificially it is better to leave the operation till the middle of a fine day, as there will then be plenty of bees on the wing to return to the old stock to attend to the hatching brood. It is an advantage being able to swarm the bees artificially, instead of having to wait several days or weeks for the bees to swarm naturally; but care must be taken not to remove too many of the old bees with the queen. There is a risk in allowing bees to swarm naturally on account of them flying away, but when left to themselves they never make the mistake of swarming before they are ready, or of too many bees going with the swarm.—An English Bee-keeper.

GARDENERS' CHARITABLE AND PROVIDENT INSTITUTIONS.

The Gardeners' Royal Benevolent Institution.—*Secretary*, Mr. G. J. Ingram, 50, Parliament Street, London, W.C.

United Horticultural Benefit and Provident Society.—*Secretary*, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

Royal Gardeners' Orphan Fund.—*Secretary* Mr. A. F. Barron, The Royal Gardeners' Orphan Fund, Chiswick, W.

TO CORRESPONDENTS

All correspondence relating to editorial matters should, until further notice, be directed to "THE EDITOR," **8, Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Grevillea robusta (*W. G.*).—This is a New Holland evergreen greenhouse plant belonging to the natural order Proteaceæ. It certainly cannot be exhibited as a Fern, and the adjudicators were right in rejecting it.

Carnation Blooms Diseased (*G. E.*).—The flowers are what is commonly called "damped,' meaning a turning brown or discolouration of the petals, and speedy decay. This is considered a consequence of a close and damp atmosphere, especially when the development has been somewhat forced and the tissues thin and tender, hence very susceptible to injury. The "damping" sometimes occurs without any accompanying micro-organisms at first, but these may follow. A very minute form of parasitic fungus was found outside of the ovary of one of the flowers, producing slender fertile hyphæ, bearing the conidia, and when falling away forming a dark powder. In other cases the ovaries were quite healthy, and the ovules within perfectly normal—indeed, in several cases fertilised. The presence of the fungus may or may not have had something to do with the flowers "damping off," but it is not the damping followed by a blue mould, and is interesting even if disastrous in result. Perhaps a little sulphur on the hot-water pipes might keep the parasite at bay, especially with air left on the house constantly, and the moisture somewhat reduced. This we have found the best preventive of common damping and mould, but this case of yours is altogether different, and we are obliged by your bringing it under notice.

Cucumbers Failing (*A. E. C.*).—We regret to report that the plant has succumbed to the root-stem eelworm, Tylenchus obtusus, the same enemy as is represented on page 597. The lateral roots are not affected in any way by the parasite. The disease commences at the point where the radicle issues from the seed, but we do not for one moment entertain the idea that the nematode has gone over in the seed. As the decayed parts contain countless numbers of cysts, and the swollen parts of root-stem innumerable eggs, we advise the careful lifting of the plants with a spade, cutting all round and under, so as to remove the root-stem intact, and place each as removed in a pail smeared inside with petroleum, finally burning, then do one of the three things following:—1, Scald the bed without delay with boiling water, also the walls of the bed and house, as well as the paths. 2, Use 6 ozs. of kainit per square yard to each 6 inches depth of soil, and either 6 ozs. of quicklime or ¾ lb. basic slag phosphate along with the kainit, mixing uniformly through the soil, then let it lie a few weeks. 3, Place on the bed 1 oz. of mustard dross per square yard for 6 inches depth of soil, and mix similarly. These we have found the most simple and safe preventives. Corrosive sublimate is the best germicide, and can be applied in two ways:—One mixed with 1000 parts of dry earth, or in solution with water, 1 oz. to 6¼ gallons. It is, however, such a virulent poison that we do not like to incur the responsibility of recommending it. If you employ the kainit and basic slag phosphate, as much growth as desired can be secured by using nitrate of soda or sulphate of ammonia, half to 1 oz. per square yard, at intervals of four to six weeks, or better supply it in liquid form, and never stronger than ½ oz. to a gallon of water. As regards prevention in respect of fresh soil, either (1) Char the turfy loam or compost, heating it through to a temperature of about boiling point; (2) Scald with boiling water; or (3) Stack the turf along with the other intended ingredients of the compost, using the kainit and basic slag phosphate in the proportion before quoted—viz, 1 oz. kainit per square yard to each inch thickness of soil, or 2¼ lbs. per cubic yard, and double that amount of basic slag phosphate, sprinkling the proportionate quantities on each layer of turf as placed in the heap; you will then have a compost containing potash and magnesia, phosphate, lime, and iron, also probably devoid of animal parasites. A little nitrate of soda given occasionally, when the plants are growing, will supply the essential nitrogen to enable them to utilise the other food elements to the best advantage in the production of healthy growth and profitable crops.

Hard Carrots (*L. Row*).—It is comparatively well known that there is a tendency in some varieties, particularly those which form part of the root above ground, to become more or less hard in places. This is partly due to the early sowing (late March or early April). The hardness of the flesh is in no way attributable to the manure. We should not sow before the middle of April for the main crop, and even then in light silicious and calcareous soils the roots are liable to become overgrown—that is, advanced towards the seeding state, and so have more or less hard cores or parts that do not become tender without extra long boiling. In such soils it is sometimes necessary to sow early in July to produce a late crop; the roots then attain to a good useable size, and are tender and delicious when cooked.

Pruning Roses when Planting (*Rose Amateur*).—Certainly you may when planting your Roses do a certain amount of pruning. Do not hesitate to shorten the very long growth, reducing them about half, though we know they are often left uncut till spring, and Roses thus left unpruned, say till April, have grown very well, though we have also known some to fail. The difference may be attributable to the weather. Should the air be very dry over a long period, as it often is in February or March, when easterly winds prevail, the longer the shoots are the greater the evaporating surfaces, and consequently the greater the escape of the juices from the plants, at a time when the roots are inactive, and cannot absorb moisture from the soil to compensate for the loss. When Roses are dug up and planted in October and November they may commence rooting at once, and can then imbibe moisture to meet the demands of evaporation; but when planted now and onwards, we suspect the roots remain dormant till the spring, and on this account we should shorten the branches as the safest course to adopt in conserving the moisture in the lower part of the stems. If a Rose tree is dug up in October, before the leaves fall, the moisture escapes from them, and the stems shrivel, but if most of the leaves are cut off the evaporating surface is reduced, and the stems remain fresh. But, observe, we should only "half prune" now, shortening more closely in spring after the buds push from near the tops of the shoots, and if they grow an inch or more no harm is done by their removal.

Vine Leaves and Shoot Diseased (*Ardgown*).—The leaves are slightly, and the wood seriously, infested with the Grape anthracnose fungus (Sphaceloma ampelinum), and in very characteristic form, the most damage being done to the young shoots and (when any) the fruit. The small raised spots represent the pycnidia of the anthracnose fungus, and from these the minute spores are pushed out when mature. When these spores fall on green leaves or young shoots, they germinate under favourable conditions, the resulting mycelial hyphæ growing in the bark tissues down to the outer wood, causing it to become brown or black. The fungus lives over the winter on the Vines. The treatment usually found effective as a preventive consists in cutting out all injured canes during the winter, and spraying the Vines thoroughly with a solution of sulphate of iron, 1 lb. to 5 gallons of water. Stronger solutions are used on the Continent as a winter dressing, the solution being applied by means of a brush when the Vines are quite dormant. When the disease appears a powder composed of equal parts of air-slaked lime and flowers of sulphur may be dusted on. The Vines are so weak that we should use the solution first named shortly after the pruning. But what is the condition of the roots? We put this question as the wood is very weak, and the leaves thin in texture. Examine carefully the stems within the soil, and you may possibly find either eelworms (see page 597) on the root-stem, or mites, or some other pests to account for the indifferent growth. If you find anything abnormal we shall be pleased to render any further assistance in our power if you submit specimen for examination.

Vallota purpurea (*P. R. J.*).—The compost for Vallotas should consist of turfy loam with a little decayed manure and leaf mould, with sufficient coarse sand to keep the soil open. In potting place three bulbs in a well drained 6-inch pot; if the bulbs are scarce have one in a 3-inch pot, but we recommend the former practice where possible, as the plants will flower profusely and make a beautiful display. In potting place some of the roughest of the compost over the drainage, then three-parts fill the pots with soil, and press it down gently to prevent it sinking too much. If 6-inch pots are used place the bulbs a little distance apart to allow the growth of offsets. Give a good watering through the rose of a watering-can and transfer the pots to the greenhouse, assigning them a position near the glass; the bulbs will then soon commence growing. Never permit them to be insufficiently supplied with water, and in the summer months they should be gently sprinkled. When the pots are quite full of roots and the flower stems appearing, weak guano water may be given twice a week. After flowering remove the flower stems, as they exhaust the bulb; the pots can then be placed in any sunny part of the greenhouse, so as to have the bulbs well ripened. The soil must not be allowed to become dust-dry at any time, not even in the winter months. The Vallota is increased by offsets. The small bulbs can be taken in the spring, and are either potted singly in small well-drained pots or placed in pans in a compost of half loam and leaf soil with a little sand, and if placed in a warm part of the greenhouse they will soon produce roots. To flower the plants well they must be root-bound, and three bulbs in a 6-inch pot will not require a larger one for three or four years, providing the drainage is open.

Burning Clay for Garden Use (*An Old Subscriber*).—The clay is best burned with wood, as the ashes have considerable manurial value in potash and phosphoric acid. We should select a spot in a situation where fire would not prejudice the surroundings, and for such small quantity as a cartload of clay stand an ordinary wood faggot on end, opening the part placed downward somewhat, and introduce in this a wisp of dry straw for lighting, the faggot then having a cone-like appearance. Around this place some cord wood, standing it on end all round the faggot, and bringing the wood up to about a height of 3 feet. The clay being ready at hand light the straw, an opening being left for that purpose, and when the faggot gets well alight, and the surrounding wood commences to kindle, place the clay all round the base of the wood, and about an ordinary spit thick, working upwards as in covering a Potato pie with earth, the clay being put on in junks, thus lying somewhat open, and allowing the fire to burn fairly freely. When covered to the top the thick wood will be well alight, and the flames coming through openings between the lumps of clay. Close these by placing on the remainder of the clay, and it will soon become heated through, the clay first put on falling through more or less as the wood consumes. The only further attention consists in placing any lumps of clay not receiving sufficient action of the fire where this breaks through, thus exposing all parts equally to the burning, and as the heap falls in the bottom layer of clay may need placing on the fire to secure an effectively burned heap. When burned and cool it will be a crumbling mass, or can easily be broken, and when mixed with the ashes form excellent material for adding to soil, being suitable for most kinds of plants and fruits. The process of burning is more difficult to explain than carry out.

Names of Fruits.—*Notice.*—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*T. B.*).—1, Winter Nelis; 2, Pitmaston Duchess; 3, unknown. (*W. T. A.*).—1, New Hawthornden; 2, Yorkshire Greening; 3, Alfriston; 4, Mère de Ménage; 5, Golden Noble; 6, Gloria Mundi. (*A. S. H.*).—1, Joséphine de Malines; 2, Easter Beurré. (*D. D.*).—1, Bramley's Seedling; 2, Wellington; 3, Dr. Harvey; 4, Ribston Pippin; 5, Cox's Orange Pippin; 6, American Mother.

Names of Plants.—We only undertake to name *species* of plants, not varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*F. J. B.*).—1, A good form of Lælia anceps; 2, Cypripedium insigne; 3, Lælia autumnalis; 4, Odontoglossum Rossi majus. (*W. L.*).—1, Nephrolepis tuberosa; 2, Adiantum cuneatum grandiceps; 3, Asplenium bulbiferum: 4, Pteris serrulata; 5, Davallia canariensis; 6, Nephrodium molle. (*E. E.*).—1, Coccoloba platyclada; 2, Maxillaria picta; 3, Cyperus alternifolius. (*R. A.*).—Justicia flavicoma. (*R. J.*).—1, Adiantum cuneatum grandiceps; 2, Nephrolepis davallioides furcans; 3, Davallia canariensis; 4, Nephrolepis exaltata. (*B. S.*)—As we have repeatedly stated, we cannot undertake to name florists' flowers. Send your specimens to some specialist and you will get what you require.

IS THERE A RELATIONSHIP?

In the great European wars nations were decimated. To make a great victory, as at Blenheim, many thousands fell—fell for no purpose but to add to the aggrandisement of a monarchy, or to minister to foolish ambition. Of late we have had no European wars, but we have lost men and money in our little African and Indian wars—more men than we can well afford, for they were tried, good honest English soldiers. We regret their loss, and wreath their tombs with Laurel, and talk about the time when disputes shall be settled by arbitration instead of by gunpowder.

There is a foe at our own firesides—a foe far more deadly than the bravest soldier ever born; it is an insidious foe, creeping upon us unawares, deluding us with feigned retreats, and playing with our hopes and fears. It is an enemy vigilant and relentless, with no more mercy than the tiger shows to its victim. It regards neither youth nor old age—indeed, for choice, prefers the youngest and fairest. Palace and cottage alike suffer from its ravages, and though money and its attendant comforts may do much to alleviate, yet no skill, no care can avail to save the victim.

We speak of England's scourge, consumption; we need not dwell on it, for who among us cannot speak feelingly of dear ones removed from our sight by this fell disease? We doubt there are but few families in this dear old country of ours perfectly free from the taint. True, our variable climate may, and is, in a great measure, to blame. The dampness and humidity foster the disease; but we are led to consider whether there are not other causes at work—causes which might be prevented, or at any rate mitigated.

We are indebted to Professor Long, in "Nineteenth Century," for October, for a capital article on "Consumption in Cattle Conveyable to Man." He gives us some startling facts, and deduces some strange conclusions. We had some idea that cattle were, in a measure, affected by tuberculosis, but had little notion to what extent the mischief had spread.

Professor Long is in a position to put before us a most alarming

array of figures—figures that he has received from some of the greatest veterinarians in the world, men who have made this particular disease almost a life study.

Granted that this tuberculosis exists to such a great extent among cattle (and Professor MacFadgean is of opinion that one cow out of every four is more or less tuberculous), can this disease be transmitted from the animal to man? We say most undoubtedly so, and in more ways than one. The disease is caused by an organism known as Koch's bacillus, and whenever this bacillus establishes itself in an animal, the growth of a tubercle follows. Sometimes the bacillus lodges in a vital organ, such as the lungs or kidneys; sometimes only in the muscular tissue.

An animal in healthy surroundings has a better chance of throwing off the complaint; an animal in a crowded, ill-ventilated, dark shed has no chance whatever. Now, suppose a cow whose life is spent practically in confinement; she has these tubercles on the lungs, or the kidneys or bowels, or, worse than all, on the udder. She is continually passing off these bacilli into the surrounding air or into the milk pail. The sheds are warm and dark, and therefore most probably dirty; the air is full of germs, only waiting to transmit themselves to some other convenient breeding ground, either in the bodies of other cows or oxen, or in the bodies of men.

Well, a reader may say, Why allow these animals to live? Quite right; but till Government is ready to pay part compensation to the owner for his loss, he is not likely to pose as a public benefactor, and slaughter all "suspects." For instance, a small farmer with a herd of eighteen cattle gets an inspector to examine them for traces of tuberculosis; out of the eighteen seventeen are found to be diseased. To kill these seventeen, without any hope of part compensation, of course means ruin.

Then, again, it is often that the disease exists unsuspected. A case is reported of an apparently healthy cow being killed; the whole of the body was perfectly clear till the udder was examined, and there among the milk glands was found a formation about the size of an egg full of yellow serum. In another case the calf of an apparently healthy cow developed diarrhœa, which ceased as soon as the calf's food was changed. The cow was slaughtered, and the udder was found to be one mass of corruption. Nice, this, for the consumers of the unboiled milk.

Whether the milk of a cow is full of bacilli where the udder is not affected seems still to be an open question. Professor Long appears to think the danger is there, and Dr. Ernst, an American authority, says: "First and emphatically that the milk from cows affected with tuberculosis in any part of the body may contain the virus of the disease. Second, that there is no ground for the assertion that there must be a lesion of the udder before the milk can contain the infection of tuberculosis. Third, that on the contrary the bacilli of tuberculosis are present, but with no discoverable udder lesions."

Of course great danger arises from improperly cooked meat from diseased animals, but here we hope Government inspectors do take precautions. Of private slaughter houses we still have our doubts. Public abbatoirs are the greatest safeguard the consumers have. In 1894 in Manchester seventy-two entire carcases were condemned; 1895, ninety-eight; in 1896, 108. These were all apparently healthy.

This is what the chief inspector found—out of 398 animals, 111 were diseased; of these 111, ninety-six were cows and heifers. In Berlin it is shown that 12 per cent. of cattle slaughtered publicly are diseased; in Dresden 14·4; Upper Silesia 9·5; in Durham 18·7, Midlothian 20 per cent., New York 22 per cent., London 25 per cent. Now Koch, when he found out so much about this disease also discovered a means by which animals could be tested as to their state of health. "Tuberculin lymph is injected into the system of a suspected animal; if the tubercle is present reaction follows, the temperature subsequently falling." Thus is the test remedy explained by Professor Long to the ordinary layman.

Of course this test is not infallible, but it is as near perfection as any human test can be. The Danish Government and that of some parts of the United States of America have adopted preventive measures. Any animals showing signs of disease are done away with. The calves are most carefully fed only from healthy cows, and the sanitation of the sheds is made a necessity.

We are so frightened in England of infringing on the liberty of the subject that we let infectious diseases reach such a point as no other civilised nation would permit. If, as Professor Wright of Glasgow states, the loss annually to Scotch farmers from tuberculosis is £440,000 per annum, we think we have let the thing go far enough. Compulsory slaughter was the only remedy for rinderpest, and the compensation was, we believe, something about two-thirds of the full value. The first outlay would be very heavy. Professor McFadgean estimates the first year at £200,000; but we fancy even then the gain to our own health, to say nothing of healthy stock, would be cheap at the price.

Since writing the above we met with the following in "Pall Mall Gazette," December 8th, 1897:—

"The medical officer, after pointing out in 1896 that of all the deaths that have occurred during the last twelve years at Maidstone (between the ages of fifteen and thirty-five), more than 37 per cent. were caused by tuberculosis, goes on to call attention to the importance of insuring Maids one against diseased milk and meat. 'From a personal inspection of all the cowsheds I find regulations are urgently required,' he says. 'With the exception of one or two of these sheds none is in a wholesome condition. As a rule they are overcrowded, ill-ventilated, ill-drained, and in many cases ill-adapted to the purposes to which they are put; and, in the light of the "Report of the Royal Commission on the Effect of Food Derived from Tuberculous Animals on Human Health," I am quite positive they are calculated to excite and foster the evil now under consideration.'"

WORK ON THE HOME FARM.

We are on the eve of Christmas, a season peculiarly associated with peace and goodwill, and this should remind us not to neglect those items of farm work which may perhaps be of more use to our neighbours than to ourselves. Included in such a category would be the proper repair of fences belonging to us, but which during the ensuing season may be only useful to keep out our neighbours' cattle, not to keep in our own.

The law only requires us to provide a reasonable fence, but if the next field happens to be grass stocked with horses, and the fence be a weak one, the owner of it is too often inclined to fall back on the judgment so often given of late in County Courts that "Owners of stock are responsible for the keeping of their stock off their neighbours' land. If this were acted upon universally, great expense would have to be incurred all round; in fact, there would inevitably be a deadlock.

It therefore behoves us all to do as we would be done by, for we never know when it may be our turn next, and to keep all our fences in good repair, whether for the convenience of ourselves or of others; for we have known many instances where neglect in this respect has been the cause of rupture of the state of peace and goodwill between neighbours which we should cultivate not only at Christmas but all the year round.

Whilst finding time to give proper attention to the fences we must not neglect the fields. Any roadside scrapings, ditch cleanings, or anything of the nature of compost will do good on grass land, particularly where the grass is inclined to grow rough and coarse. When carting such material as mentioned above on to grass we always put it where the herbage is tussocky and long. It acts like magic; the following season we find the animals biting, or rather nibbling, close to the bone, as it were, where previously autumn found a patch of long coarse herbage which nothing would touch. It is not the pasture which most fills the eye of the farmer, which is of the greatest value, but that which best fills the stomachs of his animals.

12th.—Incessant rain from 9 a.m. to 2.30 p.m., clearing after, and brilliant night.
13th.—Dull, damp, and rainy throughout, and mild in afternoon.
14th.—Mild and drizzly early, clearing gradually, and bright sun from 11.30 a.m.; fine night.
15th—Gale in small hours, with heavy showers and thunder, lightning, and hail; bright sunshine all day, but slight showers in evening.
16th.—Squally and damp early; fair morning, sunny afternoon, and clear night.
17th—Fine and sunny all day.
18th.—Fog, thick till about 11 a.m., and in evening; sunny for an hour or two at midday.

A sharp frost in the early hours of the 13th; otherwise very mild for the time of year.—G. J. SYMONS.

Journal of Horticulture.

THURSDAY, DECEMBER 30, 1897.

THE JOURNAL OF HORTICULTURE *can be obtained from the Office*, 171, *Fleet St., London, post free for a Quarter*, 3/9. **Editorial communications must be addressed to 8, Rose Hill Rd., Wandsworth, S.W.**

THE CLOSING YEAR AND ROLL CALL.

BEFORE taking a more general review of the different sections embraced in the great subject of horticulture in my new year's address, which I am again privileged to supply, for publication next week, I may dwell briefly in a preliminary way on a few features that may not be inappropriate to the last issue of the *Journal of Horticulture* for 1897, including a reference to some "heroes in the strife" who have passed away.

The one great event of the year which dwarfed all others, and some of them into nothingness, was the historical Diamond Jubilee of our Queen. It was very amusing to notice what a stalking horse this event was made for all sorts of schemes; if anyone had an institute to found, or school to build, or even a cock loft to provide, it was all to be connected with the Jubilee. Many of these proj cts were good, some very incongruous, and some utter failures. There was a grand flourish of trumpets about the Horticultural Hall which was to be provided in commemoration of the event, but the initial difficulty of where it was to be completely "squashed" the idea, and I can only repeat what I have before said, that it is a great reflection on the millionaires and wealthy men who are interested in horticulture that a sum necessary for such a project was not obtained long ago.

There were other plans for connecting Horticulture with the Jubilee which had more or less a commercial aspect about them, and therefore deserved to fail. There was one notable exception to all this, and that in a quarter which was most welcome—viz., the Council of the Royal Horticultural Society. The idea of instituting an Order of Merit in connection with Horticulture owed its origin to what the President of the Royal Horticultural Society aptly called "the fertile brain" of its Secretary, the Rev. W. Wilks. The idea was to select sixty of the most noticeable persons connected with horticulture, and to make them recipients of the medals of the new Order. It is a mistake, however, to suppose that the Council made the selection entirely on their own

responsibility, for circulars were sent round to a large number of persons connected with Horticulture, in which they were asked to supply the names of those whom they would recommend. Fortified with these lists, and strengthened by their own personal experience, the selection was made. Of course, like everything of the kind, objections were put forward. "Why was this or that weakling put upon it?" was asked; and "Why was such and such a fine fellow omitted?" while others, in the true "fox and the grapes" fashion, sneered at the whole thing; but I believe that after a little while it will be generally acknowledged that the Council of the Royal Horticultural Society did a most graceful act in a most graceful way, and well worthy of its high position as the leader of all things connected with horticulture in this kingdom, and that its recipients will proudly add V.M.H. to whatever other letters they may take after their names. A brief review of the ordinary work of the Society and other matters must be postponed.

In these preliminary observations I may perhaps refer to the garden literature during the past year. The four leading journals have well maintained their position, and have contributed scientific and practical information to their various readers, while for those who are more economically disposed the minor ones have catered successfully, and it will surely not be the fault of the Press if growers do not obtain the information they require. Several books, too, both popular and scientific, have been produced during the year, which, presumably, find readers in the horticultural community; while I think nothing more clearly indicates the great number of persons who now take active share in gardening than the wonderful catalogues of various kinds that are sent over the length and breadth of the land. This great literary spread and feast of infinite variety shows that the field of Horticulture is a wide one, and the energy and enterprise of those engaged in it are sure to afford matter of interest.

Nor must one omit in looking back upon those enterprises, which have tended to the enjoyment of its members, the proceedings of the Horticultural Club. Its periodical social gatherings have afforded alike pleasure and profit; the papers read at its meetings, and which have afterwards, most of them, appeared in the gardening papers, have been highly appreciated; it has had the pleasure of inviting many foreign horticulturists to be its guests; it affords to those who attend the meetings of the Royal Horticultural Society the advantages of a good hotel in the most convenient position, and it is perhaps a happy augury for the future that probably the most successful gathering that has been had for some time was its last meeting for the present year. The Club is now twenty-two years old, and has been of incalculable benefit to Horticulture; and it must never be forgotten that it was at one of its meetings, many years ago, that a proposal was made which formed a new era in the annals of the Royal Horticultural Society, and which loosened the bands by which it had hitherto been bound.

As after a campaign the roll-call ever calls forth feelings of sorrow for those who have fallen out of the ranks; so year after year one has to record the gaps which have been made in *our* ranks, which always recall memories of those we have valued in past years. The gaps are not perhaps so numerous this year, but many of them are very noteworthy. Can we not say so especially of one who for so many years managed the affairs of the Journal, and who occupied so prominent a place amongst horticulturists—the late Dr. Robert Hogg? Many of us regard his loss not merely as a public man, but as a personal friend. For nearly forty years I had been associated with him as a contributor to the pages of the Journal. I believe I am the oldest regular contributor to its pages now; I think the only other contributor who can trace back his connection to so long a period is Mr. Robert Fenn, and he is only an occasional contributor. I need hardly say that nothing ever occurred "to strain our relations," and the Doctor and myself continued good friends to the very last. He is already much missed. His extensive knowledge of fruit made him ever a welcome member of the Fruit Committee of the R.H.S., and I am very thankful that his name will be held in continual remembrance, for some of his many friends have obtained a die which will be presented to the R.H.S., who will award medals struck from it at some of their exhibitions from time to time.

Another man well known to the older generation has also passed away in the person of Mr. James Bateman, whose beautiful place at Biddulph Grange (which displayed not only his knowledge of Horticulture, but also an artistic taste) was regarded as one of the chief gardens of interest in the kingdom. At that time he and Mr. Warner of Chelmsford were perhaps the two most prominent cultivators of Orchids, but their collections could not vie with those of Sir Trevor Lawrence and Baron Schröder in the present day. Mr. Bateman was a kindly man and a fluent speaker, who used often to recount his experiences in Guatemala and Mexico, to the great pleasure of all who heard him.

A contemporary of his, and one who was well known at the meetings of the Royal Horticultural Society, was Col. R. Trevor Clarke. He had an extensive and varied knowledge of plants, and was never more happy than when communicating information to some of his younger brethren. He was one of the recipients of the Veitch medal, and also of the gold medal of the Cotton Supply Association of Manchester for his experiments in the cross-breeding of cotton in order to obtain better varieties.

Another name which is very dear to us florists is that of the Rev. Charles Fellowes of Shottesham. All lovers of the Picotee and Dahlia know how much they are indebted to him for the raising of new and beautiful varieties. The rosarians also miss the cheery presence of the Rev. E. N. Pochin, one of the best judges of the Rose that I ever knew, and at one time a very successful exhibitor.

Another personal friend whose loss I mourn, but who never was much of a public man (one of the heads of the great firm of Messrs. Sutton & Sons), Mr. Alfred Sutton, will be sorely missed, not only amongst horticulturists but by many a man whom he has helped forward by his loving words and generous aid. He was ever foremost in all religious and philanthropic work, especially in his native town of Reading, and was one of those of whom it can be truly said, "and his works do follow him."

Mr. Head, too, the able garden superintendent of the Crystal Palace, is gone, and so, also, is Mr. Robert Owen, who had been so successful a raiser and cultivator of Chrysanthemums, while to men in the North of England the name of Mr. E. J. Baillie, the managing director of the great firm of Dickson's, Chester, recalls one who was ever valued for his genial and happy disposition. He was cut off in the prime of life, for he was only forty-seven when he died; he was a man of varied talents, a musician and an artist. Then, also, the loss is mourned of such well known and long respected men as Mr. James Cocker, Aberdeen; Mr. Charles Sharpe, Sleaford; Mr. James Webber, a familiar name in Covent Garden; and Mr. James Brown of Abercairney, who, as will be found on another page, passed to his rest on December 22nd. So one generation goes and another comes, and the world goes on as it has ever done.

And so, my friends, the veteran, as some are pleased to call him, or the old fogey as others represent him to be, has once more had his say with regard to the past, and once more wants to give encouragement to his younger fellow workers in the same cause for the future. No matter what may be the department in Horticulture to which your fancy leads you, there is everything to help you on. We older ones can testify to the great pleasure which our loved pursuit has given to us, and although we are old we can still love and cherish our favourites. The sportsman has to give up his gun, as he cannot see the birds as he used to do; the follower of the chase cannot save himself as he was wont to do—"his bridle and saddle are laid on the shelf;" the entomologist can no longer pursue *his* small game, but the lover of flowers need not abandon that which has given such pleasure in the past. Believe, then, one who speaks with the experience of fourscore years that some of your happiest hours will be those that you spend in your garden. Ever around you are there many lessons to be learned; the means whereby your thoughts may be lifted from the perishable things of time and sense to the eternal verities of our Father's kingdom.—D., *Deal.*

NOTES ON VINE BORDERS.

THE season has again come round when the bulk of Vine borders in gardens throughout the country will receive their annual overhauling and top-dressing. Early and second early houses will, of course, have been dealt with during the autumn, but as late Grapes are not as a rule cleared till Christmas, the border dressing does not receive attention till January. Comparatively narrow Vine borders seem to be much more general now than they were twenty years ago, and to my mind it is decidedly a step in the right direction.

At various times I have had to deal with numbers of Vines growing in borders of very limited dimensions, and with many more having wide ones for the roots to ramble in, and the difference in regard to the number and character of the roots found in the two types of borders has usually been very marked. I do not remember ever having seen a wide Vine border really well permeated with roots. This fact alone should show us that great width is not required; indeed, it is a distinct drawback, because if Vine roots do not ramble through the whole of the soil at their disposal during the first few years such soil becomes sour, and roots avoid it, to seek the food given in the form of top-dressings. I am convinced that Vine borders from 6 to 8 feet in width and 2½ feet in depth are large enough for all purposes. I have frequently helped to reduce the size of borders—especially inside ones—and in each instance the results justified the procedure.

When preparing for top-dressing I remove loose surface soil, clear it out of the house, and then point the border over with a fork. If plenty of fibrous roots are found the fork is only allowed to penetrate the soil about an inch in depth, but if few are noticed another layer of soil is removed till roots are met with, as it is quite useless to add fresh soil, unless it is placed where active feeders will soon find their way to it. It is an excellent plan to dig a hole every year or two near the extremity of the border to find out whether or not the roots are working freely there. If few roots are found, a trench should be taken out along the whole length of the border from 2 to 3 feet in width, and any good roots that are met with be tied back and carefully preserved.

The old soil must, of course, be wheeled away to make room for fresh. An excellent compost for filling in such trenches is one made by mixing thoroughly with six barrowloads of good turfy loam one of horse droppings, one of lime rubble, a half-bushel of half-inch bones, and three shovelfuls of soot. Before this is placed in the trench, the drainage at the bottom should be cleared, and, if necessary, increased by adding another layer of clinkers or broken bricks, to be covered with straw, turf, or bracken. As the work of filling the trench proceeds, the preserved roots already referred to should be spread out evenly in the soil, have the points cut with a sharp knife, any long fibreless ones being "notched" as well to induce them to send out fibres.

It is important that as large a number of roots as possible should be brought up to within 9 inches of the surface of the border, for they will generally go down fast enough, although we may hold out many inducements to keep them near the surface. After the trench has been filled up, and the soil pressed moderately firm, the whole of the border will be ready for top-dressing. For this purpose a compost almost identical with the one already referred to will answer well, the only alteration needed being to substitute bonemeal for half-inch bones. I like to have the soil fairly loose upon the surface, as it usually gets pressed down when attending to the necessary work among the Vines.

Now let us turn to the consideration of Vines growing in narrow borders. I have grown excellent early Grapes from Vines in a border only 2½ feet in width. Very high feeding was of course given, and as the border was bounded by a brick wall, which stood several inches above the surface of the soil, it was always an easy matter to soak the soil thoroughly when water was given. The great point to attend to in connection with borders of this description is never to allow them to become really dry during the growing season, or the Vines quickly receive a severe check, and many roots are killed. Their advantages are, that the roots being under complete control, it is easy to know exactly how to treat them.

If after a few years the limited quantity of soil that was provided becomes exhausted renovation is an easy matter, because we get no long straggling roots, but a mass of fibres instead similar to those which pot Vines produce. All good cultivators know that Vines of this description can be lifted entirely out of the border, and after the old soil has been removed be replanted in fresh compost without receiving any great check. At the annual winter dressing the surface soil should be removed—it usually only requires to be scraped off—and a coating of very rich compost given. The plan I adopt is to sprinkle a coating of granulated bonemeal over the roots and then cover with a 6-inch top-dressing of the following compost:—Three parts loam, one part horse droppings or cow manure, half a part wood ashes with a little soot added. The whole surface is then covered with a sufficient thickness of leaves or rough manure to prevent frost from reaching the Vine roots, if the border is an outside one, if inside the latter covering is omitted.

Wide Vine borders have, I think, had their day, for although sometimes they prove successful, they are uncertain as a rule, and it has always been extremely difficult to know exactly where the bulk of the roots were in such a great body of soil. As a young man I remember helping to top-dress the borders in a long range of vineries for several years in succession, but very few roots were ever noticed. The Vines in one house were lifted the next season, when we found that nearly all the roots were at the bottom of the border, just over the drainage, and it was evident that the top-dressings could have done little, if any, good to roots so far from the surface. Narrow borders must be kept packed with roots if the Vines are to succeed, and when such conditions prevail, we know that every particle of soil and manure given are turned to good account by the Vines.—VITIS.

DEATH OF MR. JAMES BROWN OF ABERCAIRNEY.

IT is with deep regret that we record the death of Mr. James Brown, gardener for over forty years at Abercairney, Perthshire (the splendid domain of Captain Drummond Moray), on December 22nd. Mr. Brown was for many years a keen and most successful exhibitor of vegetables and hardy fruits. At Perth, Dundee, Edinburgh, and Glasgow his skill was strikingly exemplified by his superior products. His services as a judge were much sought after, and by his knowledge and care he commanded the esteem and confidence of exhibitors. Captain Moray highly appreciated the work of Mr. Brown, who, through a long course of active service showed much devotion to duty and his employer's interests. Abercairney was the home of the Mackintoshes of Dalkeith and Drumlanrig, and is one of the most beautiful seats in Scotland.—M. TEMPLE, *Carron*.

FIG. 90.—MR. JAMES BROWN.

[We reproduce a portrait of Mr. Brown, who was one of the best of British gardeners, and a most genial and excellent man.]

GRAPES AT TILEHURST.

HAVING been asked for the week's Journal containing my reference to this subject, commented upon by Mr. Bradley last week, I cannot refer to it, but I do not think I threw any discredit on Mr. Bradley's statements. So far from that I took them as they were, and made my own deductions. Now, we were told that the house is 151 feet long, that it had Vines planted at 5 feet apart, each Vine carrying two rods, which would of course be at 2½ feet apart only. It is not of the least importance that a portion of the roof is covered with supernumerary Vines, because we all know that if the rafters be 15 feet in length, and the rods, whether from permanent or temporary Vines, cover the roof, it is impossible to train them closer together than 2½ feet, as to do so would be reckless culture and cropping.

Anyone can see that on each side of the house there could not possibly be more than sixty rods, or 120 in all, each of the length of 15 feet at the least. Now if anyone will take the trouble to divide 4635 bunches by 120 rods, each 15 feet long, it will be seen that the average number of bunches per rod was, as I previously said, 38½, or at the rate of one bunch to at least every 5 inches. Then if these were so good relatively that there were at the rate of 1½ lb. to each bunch, the total weight per rod could not have been less than about 58 lbs. As I have before said, it is immaterial whether these 15 feet lengths of rod be produced by one or two Vines, there is the statement as to the quantity carried; and I think there are few readers but will agree that such a crop is not only excessive, but astonishing. No wonder I said that it could hardly be termed cultivation, but it certainly is production. The photo of the vinery has been sent to me. It is disfigured by three men in the foreground, which "dwarf" everything else in comparison; in other respects it appears to differ nothing from many photos of similar houses I have seen.—A. D.

ONCIDIUMS.

IT is doubtful if a more generally useful genus of Orchids could be named than Oncidiums, the flowers appearing all through the year, lasting well, and of the richest and most beautiful colours. To take the genus as a whole it will be found to contain a large percentage of yellow flowering species—a much larger than any other—but the yellows are so varied and, moreover, so delightfully blended in the blossoms with other rich tints, that no suspicion of sameness exists. To grow all under one mode of treatment, and in one house, is impossible; in fact few genera require such a varied treatment. To touch ever so lightly upon the culture of all the kinds would require a great deal of space, but a few remarks on those now flowering may prove of interest.

There are one or two of the crispum set in bloom, but these have recently been noticed. Of quite a different class is the charming little O. cucullatum, with which, for convenience, we may bracket O. nubigenum, O. Phalænopsis, and O. olivaceum, besides one or two other varieties more or less beautiful and popular. Descriptions of these are probably unnecessary, as most of them are well known to readers. Their culture is not difficult, and one and all are useful and beautiful plants, distinct in colour from the majority of Orchids, and fine subjects for the cool Orchid house.

None of them likes large pots; the roots seem to delight in growing close together, over one another, and round rough bits of charcoal and crocks rather than push far from the centre of growth. Coming as they do from high up on the mountains in New Grenada, light and air are among the chief necessities. In fact, all through the late autumn and winter months it is quite impossible to give the plants anything like as much light as they want, and the pale, sickly looking foliage and pseudo-bulbs of many cultivated plants tell only too plainly of the pining of each and all for light and air. Compost is a secondary matter. In a well aërated and divided medium the roots will thrive, be this peat moss or any other material.

Moisture at the roots is an important item, and without this good results are not to be looked for. Drainage then will be needed, for unless there is facility for the moisture to escape the compost soon gets into a bad, unhealthy state. Another charming, sweetly scented kind is O. cheirophorum, also a native of Alpine heights in New Grenada, and requiring similar treatment to that noted above. It pushes up its delicate spikes of flowers in late autumn, and is now in good condition in many collections. Although the individual flowers are but half an inch or so across, they are closely set and very brightly coloured, the yellow ground being among the brightest in the genus.

O. Cavendishianum is a grand species, and it is difficult to say why it is not more grown. There seems to be an idea among cultivators that all the bulbous kinds are difficult to grow; but however true this may be of some, it cannot be said of this one. The large fleshy leaves seem to hold nutriment in even a greater degree than the pseudo-bulbs of some kinds, and month after month will the plants carry the immense panicles of bloom. The spikes rise a yard in height, or thereabouts, and upon the upper portion produce a score or two of the most beautiful yellow blossoms, the ground colour being overlaid with very small crimson or brownish dots.

The best place to grow O. Cavendishianum is in the Cattleya house, though it is not fastidious, and if necessary can do with more heat. The roots are large and very freely produced, liking a rough, open description of compost over good drainage. During the time growth is active, and this is usually from March till the late autumn, plenty of water is required; but when the leaves are fully developed they are safer on the dry side. It blooms every season, and while the spikes are pushing up is apt to be attacked by green fly. If a damp sponge is passed lightly up the spike daily the insects will all be got rid of easily, or where many plants are grown a couple of light fumigations may be given.

O. Jonesianum is also in flower just now, this and its varieties having a fine effect arranged among some of the smaller Adiantums. Considerably more heat, a sunny position, and a very moist atmosphere are necessary for this plant. In habit it differs from the majority of Orchids, having Rush-like, almost terete leaves and very small pseudo-bulbs or stems. From eight to twelve flowers occur on a spike, and these are whitish, the sepals and petals being somewhat heavily marked with chestnut brown. The plants do best in rather small receptacles, and I have seen fine specimens on blocks of cork. If grown in baskets these may be nearly filled with crocks, a light surfacing of peat and sphagnum moss sufficing. It is a native of Paraguay, and was introduced in 1883.

There are several other kinds one often comes across at this time of year, such as the charming little O. ornithorhyncum, the Butterfly species, O. Kramerianum, and O. papilio, while O. tigrinum is hardly over yet, and O. splendidum just coming on. But one that calls for special note is the beautiful O. varicosum, a plant without which no collection is complete. It produces its grand spikes all through the winter, and if only reasonably treated is easy of cultivation. Keep the rooting medium sweet and open, give the plant plenty of moisture while growing, and a genial intermediate temperature, then all will be right. Such plants flower freely, and carry the blossoms well, but to let a half-starved and weak plant keep its flowers on too long is fatal. —H. R. R.

SCHEDULE MAKING.

I TRUST our good friend, Mr. Easter, is a better gardener than schedule maker. What trouble to exhibitor and judge would be behind that suggested class, "A collection of ripe dessert fruit, eight distinct kinds, two varieties of Grapes allowed, three black and three white.' If that is not a pretty mix of epithets then I am confused. Mark the requirement, "eight distinct kinds." Does Mr. Easter mean that as one of the kinds two varieties of Grapes may be shown? If so, that would make nine dishes. I do not suppose he means anything of the sort, but if he means "eight dishes of fruit, distinct kinds," then he cannot admit two dishes of Grapes, because Grapes are one kind only. Then he adds, "three black and three white." Three what—varieties or bunches, which is meant?

No doubt he meant bunches, but if he did then he should have said so. Now, this is a capital sample of schedule wording, such as is enough to drive any ordinary judge as well as exhibitor mad. If the class read, "A collection of eight dishes of fruit, distinct kinds, black and white Grapes (three bunches of each) being regarded as distinct kinds," no doubt or difficulty could arise. As to the question of flavour or appearance, it is evident that when flavour is specially desired all the fruits would have to be tasted, a serious trouble in the case of several collections, unless it were agreed to take flavour for granted, according to variety, when the decision after all would have to be determined by appearance. Collections of fruits of any sort, not to be absolutely tasted for flavour, must be judged by appearance only. After all, discussion of this nature does but show how difficult it is to frame classes that are absolutely unobjectionable, and how much trust must be placed on the common sense of judges.—D.

REST IN PLANT LIFE.

ALTHOUGH comments have been made by two correspondents on my recent observations on this subject, I fear we are not much nearer to a perfect definition of what is "rest" so called in relation to plant life. Is it assumed that, like animal life, there has been on the part of plants actual physical exhaustion, and that rest, which we call sleep, is absolutely essential to them? "H. R. R." proves in the case of his typical Peach tree that there is no such thing as actual rest, because he shows that even if the wood be leafless the roots are active. Now, what we want to know is, in such a case what are the roots doing during the period of defoliation, or "rest," and what changes are being, through their activity, effected in the sap formation or cellular tissue of the wood during this rest period? What I hold is that mere defoliation on the part of a Peach or any other tree or shrub does not necessarily imply that it is resting, but simply that whatsoever of active operations are proceeding in roots or wood is not visible to us, hence our deduction that the tree is resting, or in a comatose state.

Rest implies recuperation; that is to say there has been physical exhaustion that has to be made good through a season of rest or of non-productiveness. Well, is that so? I want to set up no empirical theories, all I wish is to learn. We can all draw our own inferences from what we see, but may all the same entirely fail to understand what are the operating causes, and why they operate. When I take exception to the use in ordinary phraseology of the term "rest" as applied to plants, I do so because I want it to be more exactly described, explained, elucidated. I fear, after all, our knowledge of plant physiology is too imperfect to enable this complete explanation to be furnished. The study of plant life is indeed a beautiful and attractive one. It is as much so as is animal physiology, but with the pleasing addition that there can be no painful and terribly cruel vivisection associated with it.—A. D.

PINE APPLES.—A prominent importer of Pine Apples stated a day or two ago that it was probably safe to say that upon an average there are 10,000 Pines imported into London every week throughout the year. They are coming now in enormous quantities from the Azores, which seem to have given up growing Oranges and have taken to this new cultivation, for which their soil and climate seem to be admirably adapted. Pines are still too dear to be a popular luxury. The average wholesale price is said to be 3s., and the retail buyer has to give 4s. 6d. or 5s. for a good Pine this Christmas. But the growing of these is rapidly extending, and there is every probability that the price will go down.

BASKERVILLE HOUSE.

SITUATED at Harborne, upwards of three miles to the west of the busy city of Birmingham, is the charming seat of Fred Ryland, Esq. The estate was purchased by its present owner ten years ago, and comprises about thirty-five acres of, in general, a good holding loamy pasture land, and is sufficiently furnished with old-established trees—chiefly Oak and Ash—to give it a park-like appearance. This feature has been accentuated by judicious planting. The principal entrance to the demesne is distant about a stone's throw from the mansion, the carriage drive being lined on each side by a row of Lime trees, planted probably about twenty-five years ago. It is being, however, supplanted by a new and more extended route commencing a short distance from the original entrance. The new approach has a serpentine form, and is in pleasing contrast to the straight-lined original, as well as affording greater privacy from the public road. A considerable portion of the new drive has been furnished on each side with fine Golden and Silver Variegated, and Green Hollies, removed from the grounds under the superintendence of Mr. Thos. Hirst, the experienced head gardener, whilst large masses of trees and shrubs in variety are introduced behind the avenue so as to harmonise with the shrubbery more contiguous to the mansion, which is in the Italian style of architecture. By virtue of its open and high altitude, about 600 feet above sea level, the mansion commands a splendid view of the famous range of the Lickey and Clent hills lying to the south-west, which, in conjunction with the intervening varied arboreal and pastoral landscape, affords a picture of no ordinary beauty.

Immediately after securing the property Mr. Ryland resolved to effect considerable improvements, and an extension of the ornamental grounds, for which latter purpose the services of Mr. H. E. Milner, the eminent landscape gardener, were requisitioned, and with the happiest results. Subsequently, however, several additional alterations have been conceived and effected by Mr. Ryland himself. The whole of the estate has an aspect gently trending towards the south-west, and the major portion of the more immediate surrounding scenery beyond the confines of the estate is such as to convey the impression that the latter is larger than is really the case.

In the elaboration of his designs Mr. Milner materially altered and extended lengthways the existing old terrace at the south front. The edge of the terrace—as seen in the illustration (fig. 91)—was furnished with a Yew hedge in substitution of a stone wall, a feature harmoniously blending with the climber-clad façade and the surrounding adjuncts. Between the hedge in question and the gravelled terrace walk is a narrow bordering of grass containing four stone vases, intervened with narrow oblong flower beds. The end of the terrace terminates in a kind of rampart, round the edge of which there is an extension of the clipped evergreen parapet wall.

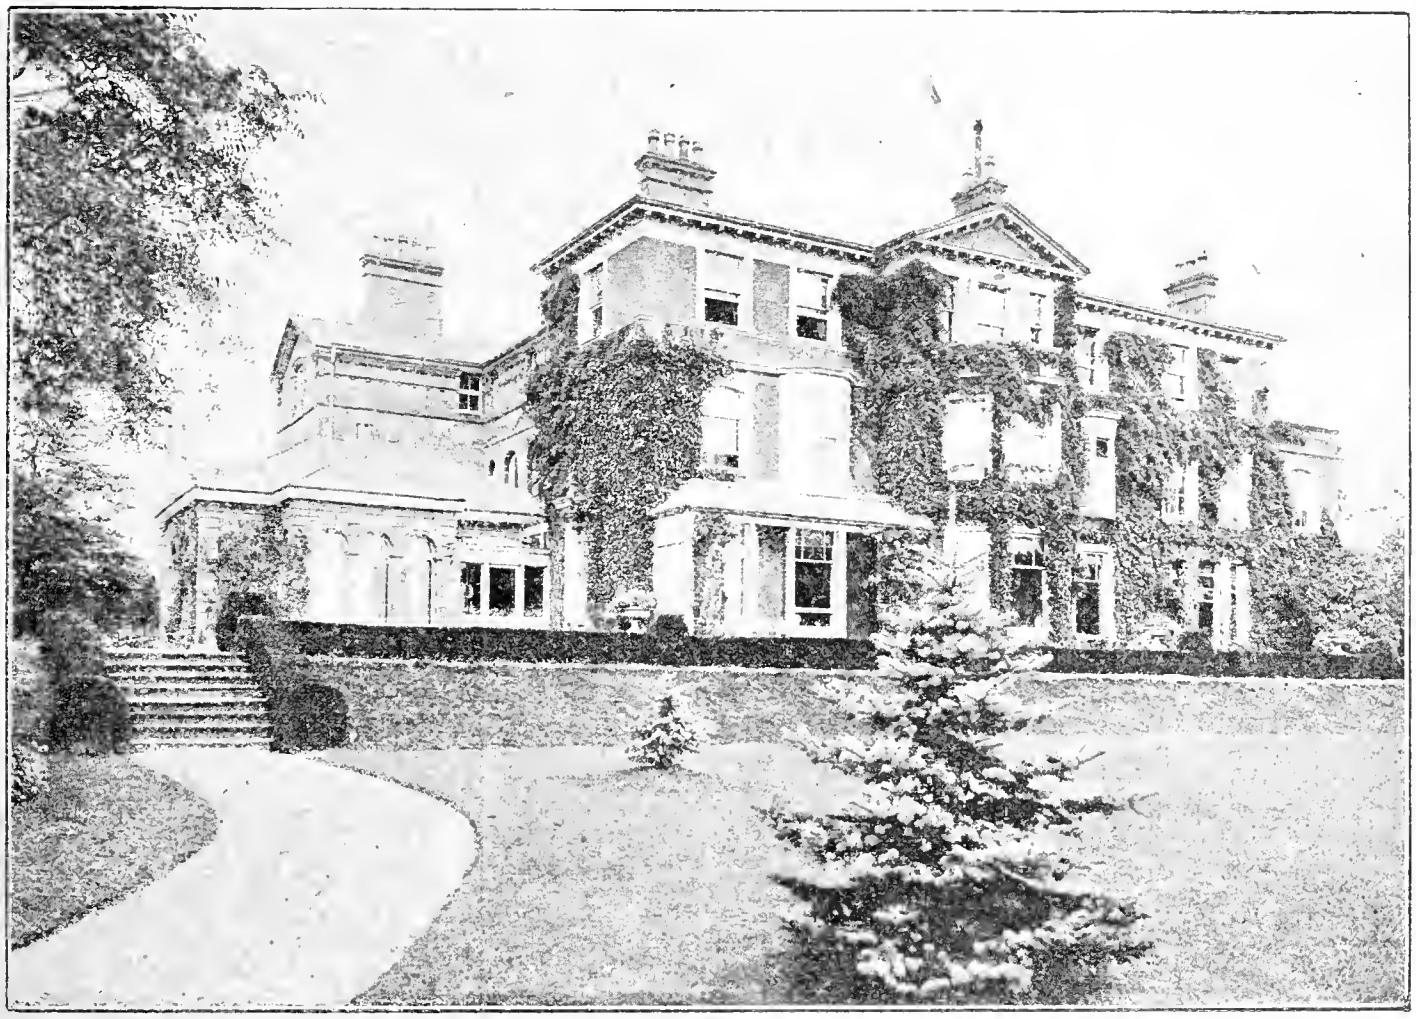

Photo by H. Stokes, Birmingham.

FIG. 91.—BASKERVILLE HOUSE.

From this coign of vantage, in a westerly direction, is obtained a view of the pretty semi-dell-like bit of scenery immediately below. The centre portion of this (as seen in fig. 92, page 622) consists of Yew hedge design, whilst the steep face of the terraced rampart is faced with a pretty natural stone rockery, embellished with a small but choice selection of alpine flowers, and through the centre of which winds a streamlet. The exterior portion of the dell is appropriately planted with groupings of shrubs and ornamental flowering trees, including Lord Penzance's Sweet Briars and flourishing specimens of the charming Cytisus Andreanus, novelties without which no collection of shrubs can be considered complete. Immediately below the terrace, at its south frontage, is a very considerable extension of the old lawn, bounded by shrubberies sufficiently disposed, whilst several ornamental beds distributed here and there, and variously filled with such dwarf shrubs as Pernettyas, the Irish or St. Dabeoc's Heath (Menziesia polifolia and alba), Andromeda floribunda, Daphne cneorum, Ericas, and Rhododendron ovatum, which impart a pleasing effect to the scene. To break the flat surface of those portions of the ground on the exterior of the lawn mounds and undulations were formed, and now present a nature-like effect.

Extending away to the left or eastern side of the grounds is a continuation of shrubberies and lawns, and in which Rhododendrons and specimen Hollies in variety form a conspicuous feature, whilst beyond, in a secluded spot, is a rosery. Situated between the latter and the eastern end of the terrace what was formerly a somewhat formal oblong pond, not remarkable for pictorial effect, has been changed to a pleasing dell (fig. 93, page 623), well embosomed by banks of trees and shrubs (Rhododendrons chiefly), diversified with beds of Ghent Azaleas and other appropriate shrubs. Extending beyond that portion of the grounds already described is an open and expansive acreage of park-like pasture.

Proceeding from the west side of the mansion the visitor comes to what was formerly the old kitchen garden, now converted into a reserve garden for the cultivation chiefly of Roses, Carnations, Liliums, and herbaceous flowers, and which are under the special charge of Mr. W. Charlton. It may here be remarked that both Mr. and Mrs. Ryland—like the latter's illustrious brother, Mr. Joseph Chamberlain, the Colonial Secretary—have a strong penchant both for hardy herbaceous flowers and ornamental shrubs. At the far end of this garden are the houses, solely for the production of plants and cut flowers, excepting an old vinery. The garden is enclosed by a Thorn hedge. Leading in a southerly direction downwards, bordering the west side of the pasture already mentioned, is a belting of trees and shrubbery, faced with a bordering of herbaceous and other plants, including annuals, to the grounds below and the ornamental lake (fig. 94, page 625), all of which afford a striking and most effective feature, whether viewed from the mansion or in closer proximity. The formation of the lake and its contiguous surroundings of shrubberies and hardy herbaceous flowers entailed a considerable expenditure both in money and labour, owing principally to the steep incline of the natural surface of the ground. In juxtaposition at the head of the lake there is a secluded nook, which has recently been converted into a bog garden, a happy conception of Mr. Ryland's own, successfully carried out by Mr. Hirst. It is furnished with a variety of suitable plants. The supply of water is derived from the ground above, and the overflow trickles through a rocky channel into the lake close by. Altogether this combined portion of the grounds affords a charming retreat, and is rendered further attractive when the comparatively young plantation of Apple and Pear trees is in bloom.

The foregoing brief and inadequate notes must close with a slight reference to the new vegetable garden, lying out of sight of the house, and the well kept grounds to the right hand of the lake and its surroundings, likewise of the considerable extent of plantations and beltings of trees and shrubs dispersed over other parts of the estate.—W. G.

Notes & Gleanings

WEATHER IN LONDON.—Christmas has come and gone since our last issue went to the machines, and we have had a touch of seasonable weather. Throughout Thursday, Friday, and the morning of Christmas Day London was enveloped in a dense fog, the last two days, with Sunday, being cold, owing to the prevalence of sharp white frosts. On Monday it was much warmer, with rain in the evening and night, as well as on Tuesday morning. Later in the day it cleared, and the stars shone brightly at night. Wednesday morning was very wet.

—— JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY.—The last number (vol. xxi., part 2) of this publication is now before us. Besides other matters of interest, it comprises papers on "Mutual Accommodations,' by the Rev. G. Henslow; "What Can We Do at Chiswick?' by Dr. Maxwell T. Masters; "Garden Insects," by Mr. W. D. Drury; "Insects and Fungi in U.S.A.," by Mr. S. C. Lamb; "Crossing Florists' Flowers," by Mr. Jas. Douglas; "The Plum," by Mr. Alfred H. Pearson; "Nepenthes," by Mr. Harry J. Veitch; and "Persian Cyclamen," by Mr. W. Iggulden. The price (to non-Fellows) is, as usual, 5s.

—— BIRMINGHAM GARDENERS' ASSOCIATION.—A comprehensive and practical paper, contributed by Mr. H. Dunkin, on "Strawberry Culture," was read in the absence of the essayist, by Mr. J. Hughes, the Secretary, at the fortnightly meeting, held on the 20th inst. at the Athletic Institute, before a moderate assembly of the members. In addition to the several systems of culture which have been practised in this country, reference was made to the enormous crops of Strawberries grown in Kent, and that as many as seventy-five tons had been despatched from Swanley station in one day. A list of several of the best known old and new varieties was given. The reading of the essay led to an instructive and pertinent discussion, more particularly in regard to the varieties tried in the Birmingham district. A hearty vote of thanks was directed to be sent to Mr. Dunkin for his interesting paper.

—— READING HORTICULTURAL SOCIETY.—The last fortnightly meeting for the season 1897 of the above Association was held recently in the Abbey Hall, and was presided over by Mr. C. B. Stevens. A large number of members attended to hear a paper entitled, "A Chat about Chrysanthemums," by Mr. H. J. Jones of Lewisham, the well known exhibitor and grower. The paper was given in a very interesting and "racy" manner, and was full of practical hints and illustrations, and was greatly appreciated. Messrs. Sutton & Sons sent some beautifnl specimens of Cyclamen; Mr. Townsend, Sandhurst Lodge Gardens, grand plants of Primula obconica; Mr. Bright dwarf plants of Chrysanthemum W. H. Lincoln, showing the decorative value of plants grown in 3-inch pots; Mr. Bradley, Tilehurst Nurseries, cut blooms of Chrysanthemums and a basket of Mushrooms; and Mr. Woolford, The Gardens, East Thorpe, Begonia Gloire de Lorraine.

—— OUTDOOR TOMATOES.—That this popular vegetable can be grown successfully under the shelter of walls is abundantly testified in the illustration on page 579. I have had a similar crop grown in the same position, with the exception that in Mr. Empson's case the frontage is of glass, whereas mine is 4 feet of brick wall before the glass (roof) is reached. On that being attained I allow the plants to continue their course up the glass. I find this does no harm to the inmates of the house, but, on the contrary, if the foliage of the Tomatoes is reduced it acts as a medium shade from the midday sun. Does Mr. Empson mean in his last paragraph that he does not renew his soil in the confined space at all when he says "it is the sixth year he has grown them on the same ground?" This year is the second that I have done so, and with periodical dressings of artificial manure the crop has been satisfactory in every way. The plants must be got out as early as possible. In my case they were sheltered by frame lights laid lengthwise, these being again needed as temporary coverings as autumn approaches to complete the ripening. I grew Sutton's Perfection, Best of All, and Eclipse; the last named was the best of the trio. I see Mr. Empson's plants, like my own, have the inevitable curl of the leaf. I attribute this to occasional dryness at the root rather than to any other cause. They are not affected until about a third of the season is over; or can it be the terrible eelworm in disguise?—GEO. DYKE, *Stubton Gardens, Newark.*

—— GARDENING APPOINTMENTS.—Mr. H. Baldwin, for the last three years foreman at Galloway House, Garliestown, N.B., is appointed gardener to Captain Gower, Castle Malgwyn, Cardigan. Mr. G. Fulford, late gardener at West Park, Damerham, Salisbury, has been appointed gardener and bailiff to A. G. Sandeman, Esq., Presdales, Ware, Herts.

—— THE LAST ROSE OF SUMMER.—Mr. J. Croal, Stone House Gardens, Haslingden, writes:—"I have to-day (December 24th) cut a Général Jacqueminot Rose from the open ground after two nights, on each of which 8° of frost were registered. This is certainly the highest town, if not the highest garden in Lancashire, and surely one is justified in calling this the 'last Rose of summer.'"

—— A ROTHESAY GATHERING.—On the evening of Thursday, December 23rd, Messrs. Dobbie & Co, Rothesay, held their annual social gathering. The New Public Hall was requisitioned for the purpose, and the proceedings took the form of a tea, to be followed by dancing. The company numbered 200, and comprised besides the employés all the members of this enterprising firm. One or two seasonable speeches were made, but these were not made a great feature of, as the desire of the firm was wholly for a social evening. There were songs and instrumental music, with dancing, and a most enjoyable evening was passed.

—— HESSLE GARDENERS' SOCIETY.—A meeting of the above Society was held on Tuesday, December 21st, Mr. Geo. Picker in the chair. Mr. J. Hardy, gardener to Lieut.-Col. Sir Gerard Smith, gave a brief but practical essay on the "Cultivation of Vegetables." The essayist did not go very deeply, but mentioned a few of the leading varieties, and gave a short cultural account of each. The long and animated discussion which followed amply repaid for the shortness of the essay. The Chairman showed a splendid collection of Apples, which obtained the Society's maximum number of points. There was only a moderate attendance. A hearty vote of thanks to the essayist and Chairman terminated a very enjoyable evening.—G. W. G.

—— CACTUS DAHLIAS.—I enclose a copy of the National Dahlia Society's list of Cactus Dahlias for 1898, which I think will be of interest if you can find space for it:—Alfred Vasey, Annie Jones, Annie Turner, Arachne, Beatrice, Bertha Mawley, Britannia, Capstan, Chas. Woodbridge, Cinderella, Countess of Gosford, Cycle, Daffodil, Delicata, Earl of Pembroke, E. J. Deal, Fantasy, Fusilier, Gloriosa, Harmony, Harry Stredwick, Iona, Island Queen, J. E. Frewer, Juarezi, Keynes' White, Lady Penzance, Mary Hillier, Mary Service, Matchless, May Pictor, Miss A. Nightingale, Mrs. A. Beck, Mrs. A. Peart, Mrs. Barnes, Mrs. Gordon Sloane, Mrs. H. Cannell, Mrs. John Goddard, Mrs. Leopold Seymour, Mrs. Montefiore, Mrs. Wilson Noble, Night, Regulus, Robert Cannell, Starfish, Tillie, and. Violet Morgan.—J. F. HUDSON, *Hon. Secretary, The Gardens, Gunnersbury House, Acton, W.*

—— EYNSFORD COTTAGE GARDENERS.—On Thursday, Dec. 16th, the last lecture of a series of six was delivered for the Technical Education Committee of the Kent County Council by Mr. W. P. Wright. The meeting was a very large one, the number reaching 110, which is a record for the village. The leading plants were dealt with briefly, the lecture being compressed to permit of several prizes being distributed to allotment holders by Mr. Henry Cannell, who had been unanimously voted to the chair. The excellent Secretary, Mr. E. D. Till, in the course of some very interesting remarks, said the event of the evening was the presentation to Mr. W. Howard of Mr. H. M. Pollett's silver cup, given to commemorate Mr. W. Howard's sixty years' tenure of his Eynsford allotment. All were deeply indebted to Sir Percival Hart Dyke, Bart., the grandfather of the present M.P., for initiating the allotment system in Eynsford. They were also indebted to the public spirit of Mr. Pollett for bestowing the silver cup; but, after all, it was the enterprise and industry of William Howard which attracted hearts that evening. Although the cup records the jubilee period of sixty years, it was nevertheless sixty-six years since Howard trenched his allotment. He planted a Winter Queening Apple sixty years ago, and a sieve of fruit shown at the meeting was a small sample of this year's crop. Mr. Till said he could not do better than quote Howard's own words, which quaintly connected cause with effect, in reference to the Winter Queenings, "If I hadn t' a' planted that ere tree I shouldn't a' had all this here fruit." Mr. Cannell accompanied the presentation with a few happily chosen words, and the recipient then said how thankful he felt to the donor, and to those present, for the honour they had done him. He spoke of his endeavour to treat his allotment well, and how he had regularly removed the earth round his tree, and treated it to a good dressing of manure. There was a splendid display of vegetables from the allotments and from Messrs. H. Cannell & Sons. Votes of thanks to the Chairman, Secretary, and the lecturer brought this successful meeting to a close.

—— Weather in the North.—From the 14th to the 21st inst., with an occasional touch of frost, and the 18th a good bright day, dull and changeable weather prevailed. Then followed (21st to 24th) three days of keen frost averaging about 12°, accompanied by unusually dense rime. On Christmas Eve the frost gave way ; Christmas Day was raw and cold, and since then rather high winds have occurred and a good deal of rain has fallen. This continued on Tuesday morning which was windy and wet.—B. D., *S. Perthshire.*

—— A Multum in Parvo Diary.—Messrs. Lever Brothers, of "Sunlight" fame, send us what they call the "Waistcoat Pocket Diary" for 1898. It fits easily into that familiar receptacle, is 3 inches long, 2 inches wide, and ¼ inch thick, gilt-edged, contains tables on money, mensuration, and sundry other things, space for entries of various kinds for every day in the year, with blank pages for addresses and memoranda ; it is clear, good, and a model in condensation, meriting the name which we have ventured to give it—a veritable sound English lever that ought to keep us up to time during the coming year.

—— Some Rare and Expensive Drugs.—A writer in the January number of "Chambers' Journal" throws some interesting light on rare and peculiar drugs. Saffron, he points out, would strike an ordinary observer as decidedly expensive at 56s. a pound, until told that it is composed of the central small portions only of the flowers of a Crocus, 70,000 of which it takes to yield the material for one pound. Otto of Roses sells at £28 odd per pound, and it takes 10,000 pounds—or nearly five tons—of Roses to obtain one pound of the oil. Aconitine, extracted from the root of Monkshood, is said to be the very strongest poison extant, the dose being 1-600th of a grain. It is sold at the rate of £27 per ounce !

—— Professor Huxley and his Flowers.—The "Westminster Gazette" says some interesting glimpses of the late Professor Huxley's home life are given by his son, Mr. Leonard Huxley, in the "Century" Magazine. In his later years especially the Professor took great interest in his garden. "I begin to think with Candide,' he writes in 1881, "that *cultivons notre jardin* comprises the whole duty of man." From this time his letters contained many references to the garden. His son writes :—"After his long battlings for his early loves of science and liberty of thought his later love of the tranquil garden seemed in harmony with the dignified rest from struggle. To those who thought of the past and the present there was something touching in the sight of the old man whose unquenched fires now lent a gentler glow to the peaceful retirement he had at length won for himself. His latter days were fruitful and happy in their unflagging intellectual interests set off by the new delights of the *succidiam alteram*, that second resource of hale old age for many a century." All through his last and prolonged illness he longed to hear how the garden was getting on, and would ask after certain flowers. These children of his old age helped to cheer him to the last.

—— An Eminent Lady Horticulturist.—The Duchess of Sutherland, like her sister the Countess of Warwick, is an earnest horticulturist. At Trentham a great speciality is made of Orchids, especially Cypripediums and Odontoglossums, also of the finest Malmaison Carnations, which are splendidly grown by Mr. Blair. At Littleshall in Shropshire there is an extensive Rose garden, which she carefully superintends ; while at Dunrobin Castle there are millions of Snowdrops, her head gardener, Mr. Melville, taking a deep interest in their welfare. There is also at Trentham a unique collection of Oriental and American Lilies, many of which, however, as the soil is not entirely favourable for their cultivation—notably L. giganteum and L. longiflorum Harrisi—are grown under glass, and much used for the decoration of Stafford House. The Duchess of Sutherland, who is a daughter of the late Earl of Rosslyn, inherits her distinguished father's literary gifts, and especially his intense love of Nature, which, as her recent article on Sicily in "The Lady's Realm," sufficiently indicates, is her predominating theme. The Duchess has also proved in this and other contributions to periodical literature that she can write very gracefully upon the subject of horticulture. Some years ago she gave to the world an interesting book entitled, "How I Spent my Twentieth Year," which has passed through several editions. —David R. Williamson.

NOTES ON PEARS.

The contribution by "J. H. W." (page 572) will be accepted as a corresponding experience with that of many of the Journal readers, and the last paragraph is particularly applicable to my case when he says, "All are ripening a month earlier than usual, and, what is worse, remaining a much shorter time in prime condition." Such a disappointing trait in the Pear supply leads to many difficulties, and explanations in numerous cases have been oft repeated between gardeners and employers when a poor supply only is forthcoming and the usual demand a heavy one. Where there is provision made for a fruit supply in gardens—and it is a poor garden indeed that has not a collection of fruit trees—owners, as a rule, do not care for the alternative of procuring their supply, probably of foreign growth, from the fruiterer.

The unfortunate part of a fruit failure with many employers uninitiated in its growth is their inability to grasp what influence frost has on the tender flowers in the spring, or a mild autumn and early winter in the keeping of the fruit when there is a crop, light or heavy, as the case may be. It is true there are other contributory causes for the failure of trees to bear fruit beside the action of frost on the tender blossoms, none of which is more certain than when trees are left alone at the roots, and closely pruned about their heads. This unequal balance between branch and root is sure to bring about an unfruitful disposition on the part of most trees, but particularly in Apples and Pears. The closer and severer the pruning, the stronger is the resultant lateral growth, and the hope for fruit buds become less each year, until a balance has been effected by a proportionate shortening of the thong-like roots, which are the actual offenders. In gardens having a clayey subsoil trees seem more prone to go deeply than on gravelly stations. There would seem a peculiar attraction in sandy clay for the roots of trees, but whether it be of a light or heavy nature, it results in the same strong unfruitful growth once roots penetrate deeply into it. Canker, too, comes from the same cause, especially in ground not well drained.

To prevent this deep root growth some growers employ large stone or slate slabs immediately beneath the trees, while others will put in a bed of concrete, either of which prevent tap roots from descending immediately beneath the trunk or stem. It is these centrally situated roots that give so much trouble in the course of root-pruning, especially in a large tree, and there is sure to be disappointment if only one strong root remain unsevered.

I well remember removing some fairly large Pear trees a few years since that had never given any trouble at their roots, and always produced a wealth of blossom in the spring. These satisfactory conditions were brought about by a layer of lime refuse, perhaps 8 inches in thickness, about 1½ foot from the surface. Not a root ventured to penetrate this mass of dry lime, and the object of the planter completely obtained. It is quite true that material of this kind in quantity is seldom to hand at planting time, but certainly where deeply rooting and barren trees are troublesome it would be well worth the labour in carrying out a similar provision in the planting of additional or replacing worthless ones with young trees from the nursery.

Commenting on the shortness of the crop of Williams' Bon Chrêtien to a large fruiterer in the late summer, he remarked, "Well, I am very glad," and on my inquiring his reason, he said, "I lose more on that variety than on any other during the season, simply because there are invariably such heavy crops." This bears out what "J. H. W." says in his notes of the reliable cropping of the Bon Chrêtien. Doyenné du Comice with me is unsatisfactory as a pyramid, and what fruits there are wasps, hornets, and tomtits show such a great partiality for that few sound ones remain at gathering time. On an east wall they do not attract this notice from our winged enemies. Emile d'Heyst with us ranks next to Williams' for regular cropping, makes a good pyramid, and its quality is first-rate, and it seemed particularly so this year. It ripened early, however, and did not remain in use a long time, and the same may be said of Winter Nelis and Joséphine de Malines. Easter Beurré does ripen here, but some months before the festival from which it takes its name, and its quality is far below that of the two kinds previously mentioned. Nec plus Meuris and Marie Louise d'Uccle are others that always crop freely with us, and although both are useful, they are not particularly high in quality.

There are many October and November Pears, but few reliable ones of good quality for December and onwards. A short list of sorts that could be depended on for that part of the winter season would form a useful and valued contribution from any grower. In this case, presumably, the co-operation of southern and northern growers would be desirable, for sorts that might prove useful in December in the latter case would be in conflict with other November Pears in the milder counties. At the present time I have a few Beurré d'Aremberg, which are small, and of no particular quality ; Easter Beurré, most of them ripe ; Nec plus Meuris, a few have ripened, but the bulk will last for some time. This is not of very high quality, but is nevertheless useful on account of its lateness and regular bearing. In each case they are borne by old trees, which to some extent account for their being unsatisfactory in size and richness. Glou Morçeau is, according to my judgment, an over-rated Pear ; its appearance bespeaks better quality than it actually possesses. No doubt the fruit room has a lot of influence for good or otherwise, but of this most gardeners are without any choice. I have never seen a thatched building in a private garden, such as may be seen in Messrs. Bunyard's nursery at Maidstone, and which is said to be so eminently suited to the purpose in question.

Pear and all other trees at the present time are full of promise for another year, and it only requires a freedom from frosts and insect interference to make the coming season a contrast to the one just complete. It is to be hoped, at any rate, that our anticipations may be realised, and that if we do not get a heavy, we may be favoured with a more uniform, crop than in 1897.—W. S., *Wilts.*

[Mr. J. Lyne, the well-known gardener at Foxbury, Chislehurst, has a thatched fruit room in which Pears and Apples keep splendidly.]

VEGETABLES FOR HOME AND EXHIBITION.

(*Continued from page* 521.)

French Beans.

This is one of the vegetables that occupy the attention of gardeners over a long period—first, in a forced state; and secondly, in its natural season outdoors; therefore, let us commence by dealing briefly with the former phase of culture. The forcing of this vegetable is not a difficult matter with the aid of one or more low span-roofed houses with good heating arrangements. Sowing may be commenced in November or December, and the plants grown in beds, provided these are close to the glass. A pit, in which bottom heat is provided by one or two rows of pipes underneath the bed, is the best, and over these should be placed a layer of leaves or other loose material. The bed need not be more than a foot or 18 inches deep, and may be composed of soil previously used for Cucumber or Melon. Stout, strong growth is conducive to good cropping, and though this is somewhat difficult to obtain when the weather is severe, and strong fire heat is necessary, every care should be taken to admit air on favourable occasions, and to allow the plants ample room.

An average heat of from 55° to 60°, increasing with the growth of the plants to 75° and 80°, will generally be found suitable. Watering is another important matter, and forced Beans should never be allowed to suffer by the want of it. Walls, floor, and surroundings must be regularly damped with the syringe to keep red spider in check, as this pest frequently plays havoc with forced Beans. Care, however, should be taken not to wet the plants when in flower during the dullest part of the winter, and at this period the supply should be lessened. When the pods are swelling, an occasional watering with weak liquid manure will assist the plants, and the beans should be gathered directly they are large enough.

Where the facilities for forcing Dwarf Beans are only such as are provided by vineries and warm plant houses, late in December or early in the new year is soon enough to begin. Pots or propagating boxes are used as is most convenient. If the former are employed three or four plants in an 8-inch pot will be ample, and if the latter a double row may be grown. The boxes can be placed on the water pipes to afford bottom heat till the plants appear. They should then be supported by short Birch twigs, and moved close to the light, or the growth will be weak, and what flowers appear will fail to set. A second sowing should be made when the plants from the first are removed from the pipes.

One of the greatest drawbacks to forcing French Beans in a vinery is the susceptibility of the plants to attacks of red spider, and unless close attention is paid the pest will soon spread to the Vines. Beans in pots may be forced by the same rules in Cucumber and Melon pits. Among the varieties most suitable for this phase of culture are Earliest of All, Osborn's Forcing, and Ne Plus Ultra.

Turning our attention now to outdoor culture, the aim of most growers is to obtain a dish as early as possible, and in attempting to do this a very important point is frequently lost sight of—namely, succession. While raising no argument against the orthodox rules of sowing and gathering as early as possible, one is surprised that more attention is not paid to late cropping. By making a sowing of a good early variety in July, a late crop of excellent Beans can frequently be obtained which proves very acceptable in the kitchen. It is necessary to bear in mind two points in order to be successful with French Beans—the first, deep cultivation: the second, growing thinly to fully allow for branching. The former may be obtained by deeply digging the soil and working in the bottom of the trench some good farmyard manure, and the latter by bearing in mind what the plant will be like when fully developed and dispersing the seeds accordingly.

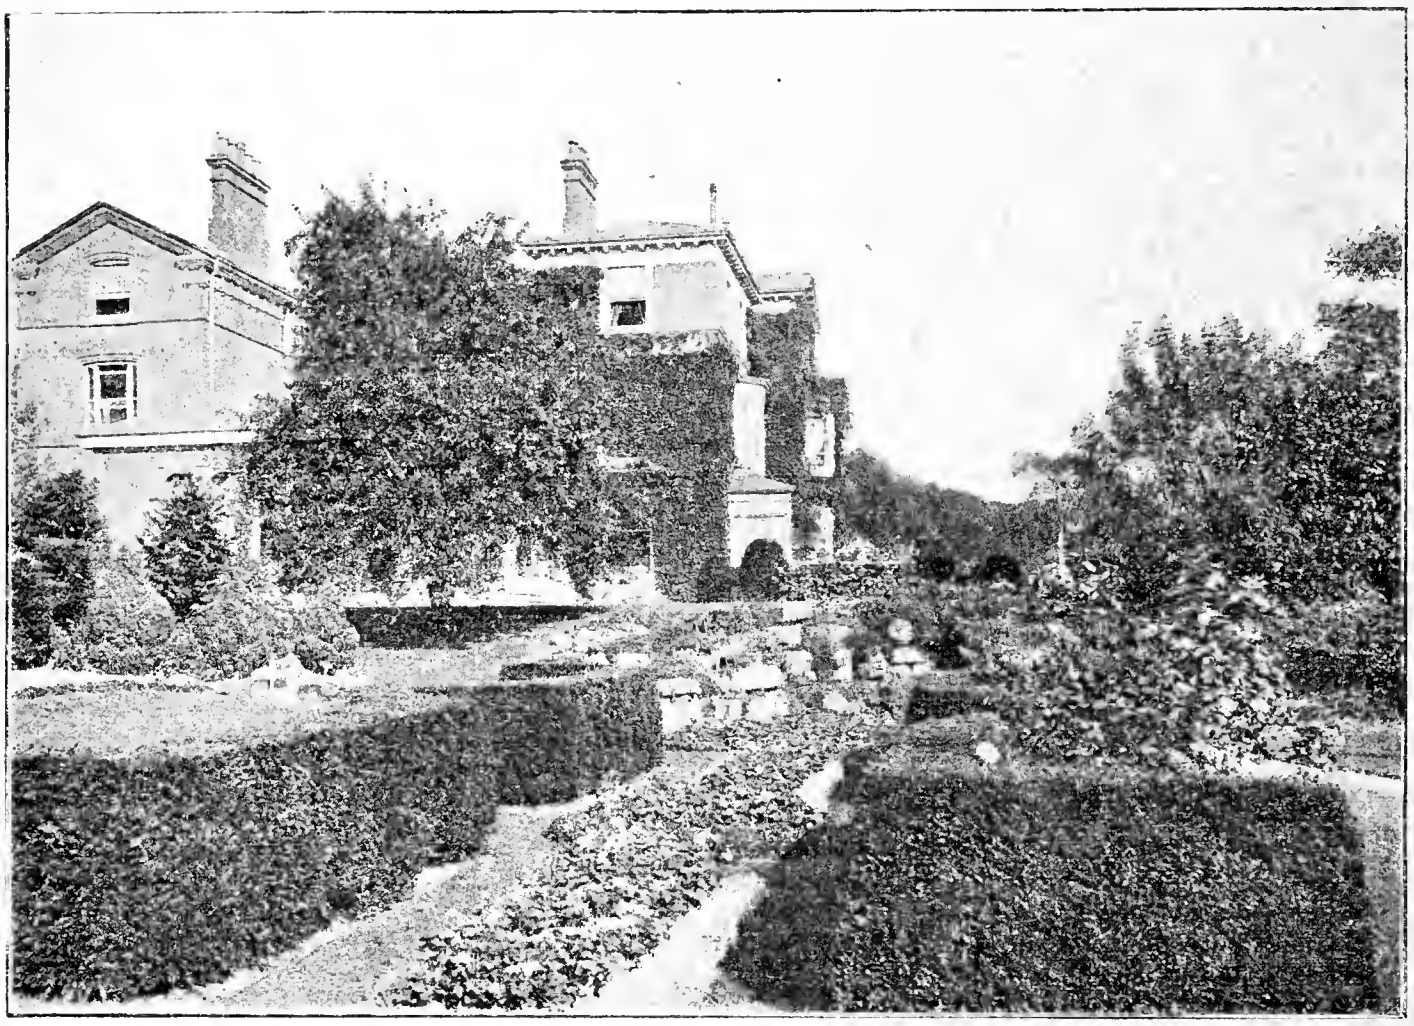

Photo by H Stokes, Birmingham.

Fig. 92.—Dutch Garden, Baskerville House.

It is good practice to make a sowing in April where the young plants can be protected, and transfer them to the permanent rows during showery weather in May. Under this treatment, however, a little leaf mould should be mixed with the soil, so that the plants can be lifted with balls of earth adhering to them. Main crops should be sown in succession from the end of April to June, and a late sowing of an early variety be made as suggested in July. Gathering is best done by rule, and all pods removed as they mature, whether wanted for immediate use or not, as by leaving them on a check is caused to the continual bearing that is desirable. High standard varieties like those previously mentioned will meet the requirements of growers either for home or exhibition.

Just a word respecting the latest addition to the family—the Climbing French Bean. Doubtless it is an acquisition, and is now so well known that little comment is necessary. Here we have a combination of the climbing habit of the Runner and the refined tender pod of the Dwarf Bean. Two varieties are recognised—viz., Sutton's Tender and True and Veitch's Climbing French Bean. Both are robust in habit and constitution, producing heavy crops over a long period. Many growers of Climbing French Beans were disappointed at the outset, owing to the fact that they sowed and grew the plants too thickly. Being robust in habit, if this mistake is made a thicket of growth is the result, which prohibits the admission of sunlight in order to set the blossoms. Given a fairly deep fertile soil and the plants thinly disposed, the culture of Climbing French Beans is otherwise simple, and the results generally satisfactory.

There is little that is really new to tell in dealing with a subject like this; it is the old and useful story—close attention to apparently small matters of detail, coupled with a careful selection of the best varieties, and with conditions of soil and season favourable, success will invariably follow.—Grower and Judge.

THE ART OF TABLE DECORATION.

The importance of table decoration at the present time cannot be over-estimated, and gardeners who are unable to make effective combinations either in fruit, flowers, or foliage, or all combined, are not able to obtain first-class appointments, however skilful they may be in other branches of their profession; while men who are only of average abilities as gardeners, but accomplished in the art of table decoration, command

first-class appointments. After the coloured silk style, which was in vogue some time back, came the light, elegant, and really artistic style practised at the present time, and the style lends itself to such variety of changes, and gives such scope to anyone possessed of artistic abilities, that it is not likely to be superseded by any other for a long time to come. The variety in flowers and foliage that can be used with excellent effect is almost endless.

In dealing with practical table decoration it was assumed a table was being decorated for twenty diners, which would be about 25 feet in length. He would suppose that there was a massive centrepiece of silver, with provision for arranging flowers in the top or centre of it. We arranged in this as lightly as possible a number of spikes of Calanthe Veitchi, intermixed with Fern or Asparagus, and on the cloth, say, ten or twelve plants in 3-inch pots of Begonia Gloire de Lorraine. The pots were concealed with Selaginella, the flowers of the Begonia drooping over the moss. Between the centrepiece and the ends of the table were two ice pails or wine coolers of silver, containing two plants of Croton Warreni. Disposed about the white cloth were a number of long trailing growths of Smilax, and placed on the top of the Smilax thinly single flowers of Calanthe Veitchi, the centrepiece having long streamers of Smilax depending to the cloth, the table being lighted by massive candelabra down the centre and by single candles at the ends or corners and perhaps at the sides; ten or twelve dishes of dessert, either on stands or in dishes without stands, being arranged among or intermediate with Begonias.

On a succeeding night it is necessary to give change and variety, and we used two, four, or six Chards' arcadian arches, made of galvanised wire, each of the larger arches being about 2 feet across the arch and 15 to 18 inches to the rise of the arch, and holding twelve trumpet-shaped glasses in which to place the flowers. These might consist of Begonia Madame Sharratt, a bright coral red, of graceful drooping habit, with Fern or Asparagus for greenery. These arches, when lightly dressed, give quite a charming effect, especially when arranged with such light and graceful flowers as Sweet Peas, Calanthes, Lily of the Valley, and Dielytra spectabilis intermixed. Tea Roses, in their many charming shades of colour, are also very beautiful for this purpose, as also are Carnations, arranged either along with their own grass or with Fern or Asparagus. Then again, a very charming effect can be had by festooning the table from candelabra to candelabra or candlesticks with such flowers as Rhodochiton volubile, pieces of the same being laid on the white cloth, intermixed or dotted about being a few deep yellow Chrysanthemums, which contrast very beautifully with the deep purple Rhodochiton and made a striking effect. Another grand plant for festooning purposes is Asparagus deflexus, and hanging lightly amongst single flowers of Calanthes or Oncidiums, the latter giving the effect of butterflies settling on the streamers. Yet another festooning plant is Lygodium scandens, or another, Russellia juncea.

A third change could be made by making up six, eight, ten or a dozen balls of soft clay, about the size of a cricket ball, covering these with Selaginella and pricking them full of any kind of flowers that are of the desired shade of colour, the stems, of course, to be of varying length, so that when made up there is nothing stiff or formal about the arrangement. When made up they may be disposed about the table in the most desirable positions for effect, taking care to place under each ball of clay several thicknesses of paper to prevent the cloth being marked. If these are arranged in an artistic manner, one or two plants being used in vases down the centre according to the size of the table, the effect is very beautiful. The arrangement on the cloth could be made to suit the taste of the decorator, whose object at all times should be either a harmonious blending of colours or a distinct and telling contrast.

A novelty in table decoration, which he once used, was much commended. Going through the woods he one day spied a brilliant patch of colour, which turned out to be a fungus. The upper surface of the fungus was a brilliant scarlet, and the under surface of a rich golden yellow. It was growing on rather long dead branches of Beech. He gathered a goodly number of branches with the fungus growing upon them, and arranged them on the dinner table at night among a bed of green moss, and the effect was most striking. His employer was entertaining a number of distinguished members of the British Archæological Association, and several of these gentlemen said they had never before seen such a beautiful table.—[*Abridged from a paper read by* MR. B. ASHTON, *The Gardens, Latham House, at a meeting of the Preston and Fulwood Horticultural Society.*]

NOTES ON APPLES.

I AM charmed with the very effectual methods of the writer of the article on "Fruit Notes" on page 567 of the Journal, and nothing would produce a more beneficial effect on British fruit growing than to have similar reports from other counties favoured for the production of Apples, for where these will grow well, other fruits cannot fail by intelligent treatment. Readers cannot do better than act on the advice given on the page cited. It would be useful to know the best varieties as most generally so acknowledged, and such as are favoured by special localities, which might with advantage be indicated.

The double-close planting is excellent advice from more points of view than one. Transplanting a young tree is the most effective root-pruning when properly done, and often the real making of the tree, especially if allowed to grow two or three years in its first quarters. It is only in these circumstances trees lifted at home that the full advantage of the system is obtainable, and it is grievous to see dried out roots on unpacking nurserymen's parcels, the result of trees being left exposed to drying winds while other batches are being lifted.

Unless the natural soil be very light indeed, I have much faith in planting each tree, if not on the level, yet so little below it that when the roots are covered a slight mound is formed, the slope corresponding with the natural slope of the roots of the tree. A gentle hill and dale formation is the result, which is beneficial for natural drainage as well as for the action of the sun's rays; these, being more nearly at right angles on the slope, favour the conditions of maturity and the saccharine of crops. Timely mulching in dry weather with stable manure, especially if the trees are well cropped, would be more essential than regular manuring. Trees thus raised above any unfavourable subsoil would relieve partly from the necessity of deeply interfering with it, meaning considerably diminished labour, an important item for market growing. Certainly on clay soil trees should be planted on the level absolutely in a moderate layer of lighter soil. I should certainly also prefer the bush form of training, the better fruit being produced from that style, not to speak of diminished risk from high winds.

The varieties of early dessert Apples referred to in the article in question can hardly be improved upon, and I was pleased to see such

Photo by H. Stokes, Birmingham

FIG. 93.—BOG GARDEN, BASKERVILLE PLEASURE GARDENS.

modern favourites of mine come to the front, including even September Beauty, rarely seen, and which keeps very well. Of course, the list might be extended with quite equal merit if Transparent (or Grand Sultan), the earliest of all, be included, which I have known for the last fifteen years through Sawbridgeworth, together with Benoni, a beautiful and tasty little American Apple, also early. Gravenstein is a variety deserving extreme praise. It is ready to eat from the tree in September, of large size for a dessert variety, and keeps better as to flavour than does Cox's Orange Pippin, nor does it lose its high aroma. I tasted it from several sources last week, and found the slightly acid ingredient in the early stages turned into a very pleasant mellow flavour. Thousands of barrels of its beautiful fruit arrive in England from America in October, but without the rich aroma and flavour in fruit which are grown here and in Germany; indeed, I think the American sun is too much for it, as its colour becomes deep cherry red instead of clear yellow with lovely stripes, as here produced. It ought to be grown by acres, as it is also an excellent cooking Apple. Of course, we must not omit our well-known old first-rate favourites, Quarrenden and Kerry Pippin, without which the list would have serious gaps. Not to be out of Apples of our own, and better than Australian when the latter arrive, from April we ought to plant D'Arcy Spice, also known as Baddow Pippin, although its development is slow. It is perhaps more of a garden Apple for affording a private supply of fruit than a market variety for field planting; its quality is, all the same, excellent.—H. H. R., *Forest Hill.*

SELECT NEW CHRYSANTHEMUMS.—Incurved Varieties.

These do not number more than seven that deserve a prominent place in the present list. Unfortunately there is a tendency nowadays to disseminate all that approach the typical form desirable. Especially is this the case now that incurved varieties are almost as easily obtained from seed as other sections. As experience is gained in intercrossing varieties for a definite purpose, no doubt raisers will be able to control somewhat the progeny. At present it is simply a question of chance in the raising of seedlings as it always has been in regard to sports. It is the addition of varieties with brighter and more decided colours that are required, such, for instance, as Refulgence. If incurved Chrysanthemums are to maintain their popularity, it can only be by the addition of new and improved varieties in colour and form. The latter requires careful attention, there being at the present time far too much favour shown to varieties possessing coarseness and irregularity of petal. The future welfare of this section, too, might be much improved if the granting of certificates were a little less free than at present. Really deserving varieties, of course, demand due recognition; but where some exist that are neither incurved nor Japanese, it would be in the interest of the incurved section that much stringency should be observed.

Another point needs emphasising, I mean that of sending varieties out before they have been properly tested as to which section they really belong. Sometimes a variety is sent out and described as a Japanese incurved, whereas the second year's test proves it to be distinctly belonging to the incurved race. Take, for instance, Mdlle. Lucie Faure, sent out in the past spring as an incurving Japanese. As exhibited by Mr. Godfrey at one of the floral meetings of the N.C.S. it is undoubtedly the best of the present year's introductions. The following are the best that I have grown or seen staged during the current year.

Mdlle. Lucie Faure.—As previously noted, this demands a prominent place. Properly developed blooms measure fully 5 inches in diameter and as many deep. The florets are pointed, incurve regularly, and are pure white. It is undoubtedly one of the finest novelties seen for some time.

Madame Ferlat.—This is a true Chinese incurved. The florets are narrow, pointed, and faintly tipped with yellow as the flower unfolds. This colour, however, passes away, and sometimes is replaced with a faint pink flush. As in all other varieties in this section the date of bud formation controls the colour to a certain extent.

Mrs. N. Molyneux.—Obtained by Mr. N. Molyneux by crossing James Agate with C. B. Whitnall. This variety differs from others in producing its best blooms from fairly early crown buds. Full sized blooms are 6 inches wide, an inch less in depth, of globular form, and ivory white in colour. The habit of growth is most desirable—4 feet to 5 feet high.

Mrs. W. C. Egan.—This reminds one strongly of R. Petfield, except in colour, which is much lighter.

Lady Isobel.—Mr. Silsbury raised this variety, and it may be described as the most massive in the incurved section. The florets are extra broad and "fleshy," giving a huge appearance to the flower. The colour is pleasing—a silvery pink, deepening in later blooms. In general form and compactness this variety possesses all the attributes of a good bloom.

Austin Cannell.—An excellent incurved, the blooms being full and thoroughly well "built." In colour it reminds us of Lord Derby—a rich purple—except that the new variety has silver lines running through the reverse of the petals.

Ernest Cannell.—A distinct and pleasing variety, of which the colour is somewhat difficult to describe. Some catalogues give it as "a pretty shade of deep fawn, margined soft red, reverse of petals creamy fawn, tinted deeper." I, however, prefer to call it blush-pink at the base, with a yellow suffusion.

Madame Edmond Roger.—Those who care for novelties in Chrysanthemums should cultivate this variety, which may be briefly described as a pale green Princess of Wales on a trifle larger scale. No doubt it will become a favourite with some.

Miss Phyllis Fowler.—This is a really good late-flowering variety. The lower petals are a little loose, but the remainder incurve regularly. The colour, canary yellow, is pleasing.

In other sections there is little to quote of what is new or an improvement upon existing kinds. Single flowered varieties have received a few additions of merit. Framfield Beauty, with exceptionally bright red florets, which droop a trifle at the point, is worth noting, as are Evan Cameron, white flushed pink; Miss May Braithwaite, an exceptionally high coloured and shapely variety; Mrs. F. P. Trevors, not large, but the circular formed flowers are bright red in colour; Lady Dunn, cream yellow flushed pink; Earlswood Beauty, creamy white, with the points of the florets slightly twisted; Duchess Elizabeth, with broad stiff florets, buff suffused with bronze and red; Alice Felgate, white flushed pink; Captain Felgate, rose pink; and Mr. F. W. Travers, dark red.—Edwin Molyneux.

Sixty Japanese Chrysanthemums.

On page 582 "W. Bowman" asks for the best sixty Japanese for exhibition. I send you my special list and hope it may prove of assistance. But I would like Mr. E. Molyneux to send one as well, then we could see how they tally together. Mine does not include this season's English novelties. No doubt Mr. Molyneux sees a few varieties in better condition in the North than I have seen, so that his list will be more practical for a wider range. I have made the dates for stopping so as to be about right for the shows in the South of England, but these would also be right for the northern shows as they are a week or fortnight later. In my list I have not included Stanstead White, but when I was in Scotland three years ago it was one of their best varieties, but in England it is not seen good except in wet seasons.

Madame Carnot, root in January, stop middle of April, second crown.
G. J. Warren, ditto.
Mrs. J. Lewis, natural growth, second crown.
Georgina Pitcher, stop first week in May, first crown.
Julia Scaramanga, ditto.
Mons. Chenon de Leché, natural, second crown.
Phœbus, for early flowers secure first crowns, but for November shows run one shoot to second break, and secure second crowns.
Simplicity, stop end of April, second crown.
Edwin Molyneux, run one shoot to second break, and secure second crowns.
Viviand Morel, second or third crown, do not retain bud until last week in August.
Charles Davis, ditto.
Lady Hanham, ditto.
Australian Gold, root in January, natural growth, second crown.
Edith Tabor, root in January for first crown, or stop first week in March, run one shoot to next break, and secure second crown.
Mutual Friend, stop first of March, second crown.
Pride of Madford, root in January, first crown.
Mons. Panckoucke (adopt the advice given for Edith Tabor).
Mrs. H. Weeks, root end of February, grow in 7-inch pots, and secure the first bud which shows.
Australie (adopt the advice given for Edith Tabor).
Thomas Wilkins, natural, second crowns.
Mons. Hoste, ditto.
Mdlle. Laurence Zede, first crown for early flowers, or stop early April for second crowns.
Madame G. Bruant, run one shoot only to second break, then secure second crown, natural growth.
Madame Louis Remy, second or third crown, secure bud last week in August.
Mrs. G. W. Palmer, (adopt the advice given for Madame Louis Remy).
Surpasse Amiral, second crown, natural growth.
Lady Ridgway, good on first crown, but for November stop in March and secure second crown.
Modesto, second crown, natural.
Oceana (adopt the advice given for Edith Tabor).
Eva Knowles (adopt the advice given for Edith Tabor).
Mdlle. Therese Rey, ditto.
Mons. Chs. Molin (adopt the advice given for Mdlle. Thérèse Rey).
Pride of Exmouth (adopt the advice given for Edith Tabor).
Madame Gustave Henry, natural growth, second crown.
N.C.S. Jubilee, stop first of April, second crown.
Lady Byron, run one shoot to second break, and secure second crown, natural.
Emily Silsbury, natural growth, second crown.
George Seward, stop end of March, second crown.
Graphic, ditto.
Louise, ditto.
Madame Ad. Chatin, ditto, or root in January for first crown.
Col. W. B. Smith, stop first of March, second crown.
Madame Laillant, stop end of March, second crown.
Madame Phillip Rivoire, stop early in March, second crown.
Mrs. F. A. Bevan, run one shoot to second break, and secure second crown.
Royal Standard (adopt the advice given for Edith Tabor).
President Nonin, natural growth, second crown.
Swanley Giant, natural growth, second crown.
Western King (adopt the advice given for Edith Tabor).
Ella Curtis, ditto.
Madame M. Ricoud, stop early in April, secure second crown.
C. A. Owen, stop first of May, first crown.
Mrs. C. H. Payne (adopt the advice given for Madame Louis Remy).
C. W. Richardson, stop end of March, second crown.
International (adopt the advice given for Edith Tabor).
Rose Wynne, ditto.
Amiral Avellan, natural growth, second crown.
Mrs. H. Kloss, stop first of May and secure first crown.
Mrs. Chas. Blick, stop early in March, second crown.
Miss Elsie Tiechmann, stop early in March, second crown.

Supposing an amateur wishes to make a selection he should take the first dozen, and so on.

Papa Viellard, which "A. D." recommends, is a lovely colour, and I have no doubt he must have taken a fancy to it while at Earlswood, but I only had one plant, and that had but two blooms, so that I should not recommend it on that test. It is of Viviand Morel shape, and must come to the front.—W. WELLS.

THE N.C.S.—WHY NOT THE AGRICULTURAL HALL OR EARL'S COURT?

FROM the controversy that has been and is being carried on in the columns of the *Journal of Horticulture* respecting the present home of the National Chrysanthemum Society, it is apparent that a change is desired. To know that our strongest floricultural society is without a suitable place in which to hold its shows is by no means creditable to the country, which is as much a nation of gardeners as it is a nation of shopkeepers, as our French neighbours dub us. By no stretch of imagination can the Royal Aquarium be considered a really suitable place for an exhibition of flowers. It is better than no place at all, and that is as much as one can say. No one could find a worse, and equally, no one as yet has come forward to sing the praises of a better.

Our kith and kin "down under," and friends on the Continent, as well as those in America, with their advantages of horticultural halls and similar institutions, must look down on poor England, which has nothing of the same kind. Foreign and colonial visitors who come to London in the Chrysanthemum season go away convinced that though we can grow magnificent flowers we have no place in our vast metropolis where we can show them. What do they think of the Royal Aquarium for a flower show? Personally, I should be sorry to ask them, for I know the answer would be strongly condemnatory. At the conclusion of the big November show I asked an opinion of it and its surroundings of one of the truest flower lovers in the country. His reply was to the effect that no doubt it was a magnificent show if it could be seen, but that it was sacrilege to take a flower within the doors of the Royal Aquarium. Emphatic, is it not? and some will say, "perfectly true."

However, one and all must recognise the necessity of utilising the Royal Aquarium for the time being—until, in fact, a change can be made. There can be no doubt that some of the officials of the N.C.S. are decidedly averse to a move in any direction, and it is impossible to see why this is so. Figures, it is true, have been given as to the cost to the Aquarium Company of the shows by the Secretary of the N.C.S., but it was observed that these were merely estimates based on supposition, and therefore valueless. Possibly the items are too insignificant to appear in detail in the financial statement of the Aquarium Company. If they are stated, then Mr. Dean as the Company's one and only champion should give them, if only to annihilate Mr. Moorman, who has, by keeping to authorised figures, certainly got the whip-hand of the Secretary, who was first adroitly "drawn" and then so effectively used as evidence against his own claim for the "independence" of the N.C.S.

But let us leave the controversial aspect of the question for a moment, and see if another place can be found for the show season. So far it can be said we have had two suggestions. The first emanated from Mr. Alex. Dean, who names the Agricultural Hall, and the second from Messrs. H. Cannell and "H. H. R., *Forest Hill*," each of whom advocates "A Home or Hall of Horticulture." For the latter it seems almost futile to hope. Some few years ago the energy of Baron Schröder placed us within measurable distance of this consummation, but now we seem a very long way from it. The scheme is feasible if worked by business men, but the longer the question is shelved the more difficult of solution becomes the problem.

With regard to the first proposal—that of adjourning to the Agricultural Hall—I am of the opinion that many practical men will support it. The building is admirably adapted to such an exhibition as that of the N.C.S. But is it sufficiently accessible? Though there is no railway station near the Hall, I think there are five main line stations from which the cab fare to it is only a shilling. Can more be said for the Aquarium? For visitors little objection can be found, as the tram and omnibus services to the Hall are excellent. As showing the accessibility of the great building, I see it recorded that 68,000 persons passed the turnstiles on Bank Holiday this week. Did anything like half so many visitors find their way to the Aquarium? or did the Aquarium numbers equal the attendance at the Crystal Palace, 26,217?

Looking over the existing buildings in the metropolis two others appear suitable, and these are Earl's Court and Olympia. Of these the former seems to be preferable. It is spacious, easily accessible, and no possible objection can be taken to it. As has been repeatedly proved in bygone days, excellent shows can be got there simply because the railway accommodation is excellent. There are three stations practically in contact with the building, these being Earl's Court, West Brompton, and West Kensington, and to the former one can readily get from all of the great termini. In this respect it is preferable to the Royal Aquarium, to which the nearest station is St. James', which is not so well served as Earl's Court. It may be said that many who go to the Aquarium would not go to Earl's Court, and this may be true. On the other hand hundreds, possibly thousands, who would not endure the crush, smoke, and noise of the Aquarium, would go with pleasure to Earl's Court.

The building contains ample space for the effective arrangement of a show of the National Chrysanthemum Society, and for convenient inspection by far more persons than jostle against each other at the Aquarium on a November show day. I should be glad to see the opinions of others on the suggestions made, and if favourably received, no doubt the N.C.S. Committee will consider the whole matter on its merits.

Photo by H. Stokes, Birmingham.

FIG. 94.—THE LAKE, BASKERVILLE PLEASURE GARDENS.

If I remember rightly Mr. R. Dean has been the manager of large shows at Earl's Court; but whether that is so or not, after what he has said he would not be likely to sever himself from the Aquarium Company if it should establish shows in opposition to the N.C.S. at Earl's Court or elsewhere. On that point it need only be said that if the prosperity of any society is dependant on any one man, however able, it cannot possess permanent strength.

I could understand Mr. Dean's reluctance to leave the Aquarium if, as he seems to feel, he would be responsible for a share of any possible loss that might by chance be incurred through a change. He has an undoubted right to protect himself from any such contingency. But would he incur any risk whatever? I have been told that members of committees are alone responsible in that direction, and that secretaries who are, and very properly, paid for their services, are quite free from financial liability. Will someone who knows kindly say if this is so?—AN EXHIBITOR.

THE N.C.S. AND ITS DUNGEON.

SEEING the pointed manner in which that class of visitors is referred to in the recent correspondence, as conspicuous by their absence from

the Aquarium shows, I must emphasise my opinion that this absent class is pre-eminently possessed of the true love of flowers without incumbrances such as render the home (?) of the N.C.S. shows utterly unsuitable for a horticultural display. That place of amusement is not an abode for the beauties of plant life to be seen to advantage, but rather its dungeon.

On the Tuesday of the N.C.S. show I visited the Drill Hall to see the usual fortnightly, and, on that particular day, very moderate display, without bands and gymnastics, but in peaceful repose and ethical fitness, and was told the diminutive character of the display was owing to the claims that day of the Aquarium show. I left the former pleased with the good things, though few, and passed the very doors of the Aquarium without a thought other than of pity that the show should be held there. I did not feel in the least attracted to enter. I am the truest lover of plant life in all its manifold forms, and should find a pleasure in proceeding to a poor man's little garden on the mere chance of finding some original conception in horticulture. I trust members of the Committee of the N.C.S. will pause before giving themselves away by following their leader who dares to be bold in the knowledge of the bondage of the rest.

The way out of the deadlock for this Society may be a fresh election of the Committee, when doubtless in its composition the voice of true horticulture will make itself heard, and that body strive in good earnest for the realisation of a central hall of horticulture, where all the existing forces would act in unison. I can only recommend the Secretary of the N.C.S. to join frankly in the movement with head, heart, and hand, so that "splendid isolation' should not be regretted when too late.—H. H. R., *Forest Hill.*

YOUNG GARDENERS' DOMAIN.

Stoking.

Now that winter has at last arrived more care and attention will be required of young gardeners to wage war with frost and cold winds, and to keep houses at the requisite temperature. It is a "thorn in the side" of many of us probationers, especially where there is a large amount of glass, but with care and intelligence the work may be made easier, and a pleasure to perform. Several kinds of fuel are used—coal and coke chiefly—but whatever it is the stoker should first study the heating properties of the kind he has to use, and also the boiler, so that he can guard against overheating or the reverse. It is an anxious time for all concerned, and often irretrievable damage is done through too high temperatures.

A tidy stokehole, free from ashes and clinkers, and clean flues round the boiler, should be the first consideration. When extra heat is required begin with a small fire clear of ashes and clinkers, and rake it into the middle of the bars. This should be fed by a few shovelfuls as often as it burns through—on no account piling on a lot of fuel at once, as this prevents the heat having proper play on the boiler—until the requisite degree is obtained. A little slack or damp ashes may then be put on, at the same time reducing the draught. The weather should always be observed, and sun heat taken advantage of in place of fire heat. The pipes must never be overheated on sunny days, or weak growth will be the result. If it gives promise of a sunny day, so that enough can be husbanded to keep the temperatures at the proper height, the fire should be damped down as advised above, and started again as the sun loses power. The fire ought always to be well under the boiler, heat at the dead plate being almost useless, but some stokers place fuel on it to become charred and pushed into the fire at the next stoking.

When banking-in for the night, the fire should be raked about to free it from ashes, and all clinkers taken out, then pushed well back and enough fuel put on to insure a regular temperature during the night. In the case of saddle boilers a space must be left between the top of the fuel and boiler, and a few shovelfuls of ashes or coal slack well damped placed over the front part of the fuel and made firm with the back of the shovel. In attending the fire the next morning, if it be a moderate one, rake it to the front and clear it of ashes and clinkers, then push back to the middle of the bars, place on a little fuel as previously advised, and give all the draught possible for a time. If it should be low, rake it up together, put on a little good fuel, and let it burn through; it can then be cleaned. If this were attempted at first it would probably be put out altogether.

It is a credit to every young gardener to be a good stoker as well as a good fruit and plant grower, for do not the majority depend on proper temperatures to bring them to perfection? When a man can stoke to the satisfaction of his chief, and can be relied on in this respect, he saves him much anxiety caused by his work being badly performed, either through want of thought or knowledge. The subject of these few notes deserves more attention from those who have it to do than it often gets, and although unpleasant to some it can be made both interesting and instructive.—Nil Desperandum.

—— Gardening Scholarship.—We learn that Lord Amherst of Hackney has expressed his intention of giving, through the Gardeners' Company, a scholarship of the value of £25 in the years 1899 and 1900. This scholarship is, as in the case of the Burrows and Sherwood scholarships for 1897–98 and 1898–99, to be awarded by examination held by the Royal Horticultural Society. The Master, Mr. N. N. Sherwood, has also promised a prize of 10 guineas annually, to be known as the Master of the Gardeners' prize.

HARDY FRUIT GARDEN.

Pruning Gooseberries.—*Bushes.*—Gooseberries in bush form are best when grown with a fair number of main branches disposed thinly and in a regular manner so far as is possible. From these, young shoots may be allowed to spring, but not so rankly as to crowd the trees with growths. The main object of winter pruning must be to thin out the crowded annual shoots, leaving the best placed and most promising at their full length as they produce the best fruit. The shoots which it is necessary to prune back so as to avoid crowding need not in all cases be cut out entirely, but to within an inch of the main branch to form spurs. Some treat all the annual shoots alike, spurring them back closely, but this is not desirable, a combination of both methods being better. Worn-out branches may be replaced, selecting suitable growths at the base of the bushes for extending. Shoots or branches that destroy the symmetry of the bushes or growing too near the soil remove entirely. Bushes are best on clear stems 6 or 9 inches above the soil, especially the drooping varieties.

Cordons.—When growing on walls or espalier fences the branches are treated as cordons, and trained upright about 9 inches apart. The winter pruning consists in shortening the side growths to within an inch of the base. During the time the branches are in course of formation 6 to 9 inches of the leading growth should be left to each branch annually. When they have reached their full extent shorten in closely. New cordon branches may be formed when necessary by originating a shoot at the base of the old branch which must be cut out.

Pruning Red and White Currants.—Bushes are formed with a definite number of main branches. The side and spur shoots developed during the summer duly prune back to within half an inch of their base. While the branches are in the course of formation shorten the weakest leaders to 6 and the strongest to 9 inches, eventually, when extension is not further required, pruning closely, the same as the side shoots. When desirable to replace a worn-out or exhausted branch select a suitable growth at the base. Whether grown as bushes in the open, or as cordons on walls and espalier fences, the same course of pruning is necessary.

Pruning Black Currants.—Black Currants are only profitably grown as bushes. They require to be annually regulated, selecting the best and stronger young growths for retaining, and cutting out entirely the weaker and older. Endeavour not to leave the bushes too crowded. Treat similarly to Gooseberries with the exception that no shoots are shortened back to form spurs, but cut out entirely when not required. All shoots retained leave at full length.

Protecting Buds from Birds.—Gooseberries and Currants are liable to loss of buds by the attacks of birds in winter. There are various remedies adopted to prevent these depredations. Stringing black cotton over the bushes is one effective method; tying the branches together in a mass for the winter is another. Dustings of soot or quicklime applied when the bushes are wet prevent attacks to some extent, but require renewal when washed off by rain. A mixture of quicklime, sulphur, and softsoap, with water to make it thin enough to pass through a syringe, will readily adhere and prove a good preventive.

Cleansing Fruit Trees.—This is the best season for attacking pests that infest fruit trees. Red spider, scale insects, and the eggs of numerous insects may be dislodged or destroyed by the application of effective insecticides.

Lichens and Moss.—The growth of these on fruit trees is always detrimental to their health, and a means of harbouring insects and fungi which do further harm. After pruning, thinning, and the cutting out of dead and diseased wood, the stems and branches infested with lichenous and mossy growths ought to be well scraped with hoop iron as a preliminary. Follow this by applying a dressing of freshly slacked lime. The better plan, perhaps, is to dust the smaller branches and twigs with the powdered lime, and to dress the thicker branches and stems with limewash by means of a brush. Sulphate of copper is also a good remedy, using 1 lb. to 25 gallons of water. This should be sprayed on the trees while dormant. It is also an excellent plan to apply the now well known American remedy recommended by Mr. L. Coates of California. This consists of making a strong caustic solution as follows:—Half a pound of caustic soda (Greenbank's 98 per cent.), half a pound of crude commercial potash, 5 gallons of water, applying hot at 130°, using a force pump with brass cylinder and spray nozzle attachment. For Peaches, Nectarines, and Apricots use double the quantity of water. This is a good general wash for any trees. It cleanses the bark, lichenous and mossy growths fall off, insects and their eggs are destroyed.

American Blight.—Washing infested trees with an insecticide is the best remedy for winter application. The most common solutions are softsoap, a quarter of a pound to one gallon of water, or Gishurst compound, half a pound to the same quantity of water. Dissolve thoroughly, and heat to a temperature of 90°. Apply to the infested parts of trees by brushing it well into all crevices and wounds; afterwards spray the trees with the potash and soda solution.

Winter Culture among Fruit Trees and Bushes.—After pruning and cleansing trees fork over soil so as to bury weeds and give a finished appearance. In doing this roots near the surface must not be injured. When the latter are very numerous in the surface soil it is best to dispense with the forking, but remove any large weeds, and apply a mulch of decayed manure or decomposed compost.

FRUIT FORCING.

Vines.—*Earliest Forced.*—The Vines started early in November will now have the root action excited by the development of the foliage, and great care is necessary to prevent a chill. The temperature about the pots of the earliest forced Vines should be kept steady at 70° to 75°, pressing down the fermenting materials, and adding fresh as required. Disbud and tie down before the shoots touch the glass, not being in too great a hurry in stopping. When two leaves are made beyond the bunch the laterals of Vines in pots should have their points pinched off when the leaf at the joint is the size of a halfpenny. Those planted in borders may be stopped three or four joints beyond the fruit, and then extend the growths so as to secure well-developed foliage all over the trellis. Remove superfluous bunches as soon as choice can be made of the best, under, rather than over, cropping the Vines. Maintain the night temperature at 60° to 65°, and 70° to 75° by day, with an advance to 80°, 85°, or 90° from sun heat. When the flowers open keep the heat regularly at 70° to 75°, and maintain a rather dry atmosphere; and when the fruit is well set return to the temperatures previously named. Artificial fertilisation should not be neglected, operating about midday. Afford liquid manure when the soil is moderately dry to Vines in pots, even when in flower, or always after they have developed the first leaves. Maintain a moist genial atmosphere by damping the paths two or three times a day, and occasionally with weak liquid manure. Houses having fermenting beds will not require any aërial ammonia.

Houses to Afford Ripe Grapes in June.—These are the first in a majority of establishments. Of black varieties Black Hamburgh, Mill Hill Hamburgh, Madresfield Court; and of white Buckland Sweetwater hold front rank; Foster's Seedling is also excellent, and keeps some time. The Frontignans have gone back in estimation from the smallness of berry, otherwise the value of White Frontignan for early forcing is unrivalled for cropping and quality. The Vines should be planted inside the house, and be confined to the inside border until this is occupied with roots, when they may be allowed to pass into the outside border. This must be covered with about 3 inches thickness of dry leaves, with a little long stable litter to prevent their blowing about, as under no circumstances should the soil be allowed to become frozen. If the roots are entirely in an outside border, it ought to have about 6 inches depth of leaves and enough stable litter to prevent their displacement by wind, and reduce this covering late in April or early in May to an ordinary mulch. Where fermenting materials are at command and the supply adequate they may be used in the proportion of two parts leaves to one part stable litter, turning and adding to as the heat declines. The house should be started at the new year, watering the inside border thoroughly with tepid water, or, better, liquid manure. Damp the house and Vines two or three times a day in bright weather, but when dull once, or at most twice, will be sufficient. Maintain a temperature of 50° to 55° at night and on dull days, advancing to 65° from sun heat and a free circulation of air, closing at this degree.

Early Houses of Muscats.—To have the Grapes ripe in June the Vines must be started without delay. Vines that have been forced before will respond at once, but those utilised for the first time will require starting a fortnight or three weeks earlier, or bringing forward by an increased temperature of at least 5°. There are not any equal to Muscat of Alexandria, and for early forcing the roots should be entirely in an inside border. The border will need to be made evenly moist, but not wet. Start with a minimum temperature of 55°, and 65° to 75° by day from sun heat.

Houses from which the Grapes have been Cut.—Prune the Vines, cutting to a round bud as near the main stem as possible; shorten or cut away elongated spurs where there are others nearer the stem to supply fruit, or train up young canes to displace any worn-out rods after these have produced fruit. Remove the loose bark carefully, and thoroughly cleanse the house, washing the Vines with some approved solution. Remove the loose surface soil, especially near the collar of the stems, and supply fresh loam with about one-third of earth-closet manure mixed with it, decayed stable, preferably farmyard, manure, or artificial manure. The house should be kept cool, but frost is best excluded. If used for plants the temperature ought not to exceed 40° to 45° by artificial means, and those plants only that require safety from frost should be placed in vineries when the Vines are at rest. If the house has a minimum temperature of 50° for any length of time the buds will be excited, and that prejudices the after growth.

Late Houses.—The tender-skinned Grapes, such as Muscat of Alexandria and Canon Hall Muscat, do not keep well on the Vines after this period owing to the fluctuation of temperature. If kept on the Vines they weigh heavier, hence some growers cover the roof-lights with straw or similar material, keeping the house freely ventilated in mild weather, close in cold, with little more heat than is necessary to exclude frost. For general purposes Grapes are best cut and kept in a cool dry room in an equable temperature after the new year. The more wood the Grapes are cut with the better. Use rain water in the bottles, and incline in such position that the Grapes hang clear. Any dry room is suitable for keeping bottled Grapes, provided the temperature is kept as near as may be at 40° to 45°. The Vines being cleared of the Grapes are set free for pruning and the house for cleansing. The most popular late Grape, Gros Colman, with Alicante and Lady Downe's, succeeds under the close-pruning system, spurring the laterals to one or two buds, as the bearing shoots are usually stout and short-jointed. Gros Guillaume does best on the long-pruning plan, the shoots being shortened to plump buds on well-ripened wood, as the basal buds are often too small for pushing reliable fruitful shoots. Mrs. Pince, with Muscat of Alexandria and Canon Hall, also succeed best on the semi-long rod system, but sturdy, short-jointed, well-ripened, and not overcropped shoots of these varieties generally show enough fruit when pruned to two buds. When these are small and the growth weak, it is wise to shorten the current year's wood to the first plump bud from its base, never relying on any but those on well-ripened wood. Keep the houses as cool as possible after pruning and cleaning, so as to give as complete rest as possible.

THE BEE-KEEPER.

Removing Stocks.

The shortest day is now past; the sun, too, is also at its lowest ebb. It is, therefore, worthy of consideration at this dull season whether advantage should not be taken under these favourable circumstances of removing any stocks of bees that may be improved thereby to a more favourable situation.

The majority of bee-keepers, I am glad to say, study their bees' requirements, and when this is the case their first consideration is to find a suitable position in which to place the hive. There are, however, many different ideas as to which is the most favoured spot. A south aspect is preferred by many bee-keepers, and if a sheltered position is chosen it would probably be difficult to make an improvement; but under those circumstances it will be necessary to pay close attention to shading and ventilation, otherwise the bees will incline more to swarming than to storing a surplus, and when bees are thus left to take their chance they invariably do quite as well in a less favoured spot.

Owing to a variety of causes many bee-keepers are unable to obtain as favourable a situation as they would wish, but if they will provide shelter and protection from the heavy rains, and the necessary attention when required, it is of little consequence whether the hives face north, east, west, or south.

As a proof of this statement, I may be allowed to state the fact that, out of upwards of forty hives in my apiary, only four of them have a south aspect. If the difference were so marked that the bees in the hives facing in one particular direction always did the best, I should have no hesitation in recommending that aspect in preference to all others. In theory this may be so, but in practice it is quite the opposite. Looking back over a series of years, I cannot call to mind two successive years in which the bees stored a larger surplus from one aspect than from another.

During the busy season, owing to stress of other work, a newly hived swarm may be placed for manipulating and other purposes in a very inconvenient spot. When it has remained there for twenty-four hours, it would be unwise to remove it any distance, as many bees would fly to the old spot and would die.

When to Remove Stocks.

When re-arranging the apiary, and the stocks have only to be removed a few yards, any time during the day is suitable for the operation; and if dull so much the better, as the hives should not be interfered with at this season, when the bees are on the wing.

If they are to be removed a mile or more, a day when a low temperature prevails should be chosen for the purpose. The entrance must be temporarily closed with perforated zinc, so that the bees cannot escape if they are disturbed. In removing stocks, more particularly at this season, it is highly necessary that they are not roughly handled, or much mischief may be done. If carefully done the bees will not be disturbed in the least. They should always be carried by hand; a handbarrow answers admirably for the purpose, or two stakes with a couple of cross-pieces to keep them the proper distance apart will make a good substitute.

If bees are to be removed several miles by road or rail, spring is preferred to midwinter, as at that season the bees are active and will soon get over the excitement of the jolting they will get on the way, whereas during the dark days of winter many bees may succumb from cold, as they may be shaken from the cluster, and, being in a state of stupor, be unable to return.

Bees in straw skeps may be removed with impunity at almost any season if cross-sticks are used, as the combs being fastened to the sides of skep will prevent any breakdown.

Beginners should always remember that it is unwise to remove stocks from their original position after the bees are flying freely in the spring, hence the necessity of making any alterations required at this season.

Dry Floor Boards.

Now that the weather has become somewhat settled after the heavy rain and thick fogs that have prevailed for several weeks past, advantage should be taken of the first fine day to examine the floor boards of all the hives.

It is in this simple operation that the great benefit is observed of using loose floor boards in preference to those that are fastened to the body of the hive. With the former all that is necessary is to have a few spare floor boards which are dry and ready for use, place one of these by the side of the hive, which may be lifted and at once placed on the dry board. The damp board is then removed and cleaned of any débris, and may be used again when dry. It does not take many minutes to treat several hives in this manner.

With the fixed floor board it is quite impossible to renew them without removing the bees into another hive, which would be very unwise at this season. All that can be done is to remove all spare frames from the ends and wipe the floor as dry as possible without disturbing the bees. But that is unsatisfactory when compared with the other method.—An English Bee-keeper.

TO CORRESPONDENTS

All correspondence relating to editorial matters should, until further notice, be directed to "The Editor," **8, Rose Hill Road, Wandsworth, London, S.W.**, and **NOT** to Fleet Street. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense, and departmental writers are not expected to answer any letters they may receive on Gardening and Bee subjects through the post. If information be desired on any particular subject from any particular authority who may be named, endeavour will be made to obtain it by the Editor.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only; and the name and address of each writer must be known by the Editor, though not necessarily for insertion. We cannot, as a rule, reply to questions through the post, and we do not undertake to return communications which, for any reason, cannot be inserted.

Labour Required for Garden (*Anxious*).—For keeping everything in thoroughly good order, the 2 acres of kitchen garden, 1 acre within the walls, will require two men; flower garden and pleasure grounds of 4 acres, two men; three vineries, one man; three Orchid houses, one man; stove, Cucumber and Rose house, one man; Peach houses and conservatory, one man; Melon pits, frames, Mushroom house, and Chrysanthemums, one man; with a couple of strong youths as general helpers. The whole must work together, not in sections as given above, as certain of them would have far too much to do at some times, and at other periods next to nothing. The head gardener would need to be a hand worker in any department; the foreman energetic and competent; the others brisk in their movements, and taking interest in their duties.

Wintering Coleuses (*Amateur*).—We do not think you will succeed in keeping Coleuses in your cold house. If you heated the house you might keep them by having a box made in which to place the plants, with a hand-light or a large square or two of glass over it. By some means you must give a rather dry temperature of from 45° to 50°. We think you may keep them in your living room more easily than in an orchard house. An amateur kept some last season according to our directions. The plants were small, struck in August, and potted in 3-inch pots; others were rooted about the end of September, four or five round the sides of a 4-inch pot, and were left in the cutting pots all the winter. He had for these and similar things two rough boxes, made 18 inches deep and 2 feet square, a bottom of zinc was placed 5 inches from the bottom of the box, the place beneath had putty placed all round the sides at the joints, and then the whole below the zinc was well tarred, and done in time to dry well before being used. A simple plug-hole was left at the top and bottom for pouring in hot water, and letting it off when cold. Little bits of wood for placing the pots on were set inside, and the top of the box was covered by two squares of glass laid on. In severe weather the glass could be covered. When more severe still a little hot water from a tea-kettle would heat the enclosed space through the zinc, and the bits of board free of the zinc prevented the pots being overheated. Something of the same contrivance would do in the cold house, but, of course, it would be more easily looked after in a dwelling house.

Senecio pulcher in Pots (*R. J. M.*).—Certainly this plant can be successfully grown in pots, and there ought to be no difficulty in getting good flowering plants in 5-inch or 6-inch pots. The compost should consist of good yellow loam, leaf soil, and well-decayed cow manure, with some wood ashes and sand, or in lieu of the ashes nodules of charcoal; the latter is of decided advantage in growing the plant. Perfect drainage is also essential, and an abundance of moisture during the growing season; and it would be advisable to plunge the pots in some material, such as spent hops or ashes, which would greatly assist to keep the roots cool and moist.

Culture of Oxalis (*Amateur*).—These plants are very easy to grow, and we see no reason why you should not succeed with them. Place them on shelves near the glass, potting when they are beginning to grow in a mixture of three parts light fibrous loam, one part leaf soil, and two parts sandy peat, with a part of silver sand, watering moderately until in free growth, increasing the supply with the growth, and after flowering, or the growth is complete, diminish the supply, ceasing watering when the leaves become yellow, and keeping dry until the plants again start into growth. They do well in a light airy position in a greenhouse. Their great bane is too much water and shade.

Forcing Lily of the Valley (*T. E. J.*).—You should pot and plunge them in a bottom heat of 75°, and not exceeding 90°, and cover with inverted flower pots, taking care that the soil does not become dry. Every crown will grow, and when the spikes are about 5 or 6 inches high then withdraw the pots from the hotbed and place them in a house with a temperature of 65° by day and 55° at night, in which they will expand the flowers and develop the foliage. In the new year they will succeed admirably in a vinery started at that time; but the plants must be brought on gradually with the Vines or they will remain dormant or go "blind," which is obviated by bottom heat or a rising temperature, commencing from a low one.

Winter Ericas (*S. R. M.*).—The plants of the varieties you name should, after they are past their best, be cut close back if they are intended to be utilised for the same purpose another autumn. If they have been in structures where heat has been maintained, they should not be placed direct into the cold greenhouse or they will be seriously checked. They should be gradually hardened to greenhouse treatment, so that they will start into growth slowly but naturally. Plants that have long been in rooms for decoration are useless for growing another year. All plants employed for such purposes are better conveyed to the rubbish heap as soon as they are removed, for they are not worth the trouble necessary to restore them to health. Young plants in small pots that are intended for flowering another year must be kept in a light position and as cool as possible, so that they will not be excited into growth. Any plants that did not show flowers and are dwarf and bushy should be subjected to the same treatment. These plants should be watered carefully, taking care never to allow them to suffer by an insufficient supply.

Names of Fruits.—*Notice.*—We have pleasure in naming good typical fruits (when the names are discoverable) for the convenience of regular subscribers, who are the growers of such fruit, and not collectors of specimens from non-subscribers. This latter procedure is wholly irregular, and we trust that none of our readers will allow themselves to be made the mediums in infringing our rules. Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruits or flowers to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. *They should be sent on the first indication of change towards ripening. Dessert Pears cannot be named in a hard green state.* (*C. F. H.*).—Your specimens reached us in the form of a mass of pulp, in which condition it was obviously impossible for us to name them. (*D. E. A.*).—1, Court Pendû Plat; 2, Cox's Orange Pippin; 3, Dr. Harvey; 4, Blenheim Pippin. (*G. P. A.*).—1, New Hawthornden; 2, Alfriston; 3, closely resembles Golden Winter Pearmain; 4, Cellini; 5, Calville Rouge d'Hiver; 6, Scarlet Leadington. (*A. C. F.*).—Scarle. Pearmain. (*P. R. S.*).—1, Winter Nelis; 2, Easter Beurré; 3, unknown.

Names of Plants.—We only undertake to name *species* of plants, not varieties that have originated from seeds and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass, or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*Fern Lover*).—1, Adiantum tenerum; 2, A. formosum; 3, Asplenium bulbiferum. (*S. R.*).—1, Curculigo recurvata; 2, Sparmannia africana; 3, Erica hyemalis; 4, Cuphea platycentra; 5, Streptosolon (Browallia) Jamesoni. (*H. Rose*).—1, Begonia manicata; 2, B. Gloire de Sceaux; 3, B. Ingrami; 4, Cyperus alternifolius. (*Youngster*).—1, Asparagus decumbens; 2, A. deflexus; 3, Daphne indica.

EDITORIAL NOTICE.—It is particularly desired that all communications, parcels, catalogues, and newspapers intended for the Editor, be sent direct to 8, Rose Hill Road, Wandsworth, S.W.

BEYOND RECALL—1897.

Shakespeare, who knew more than any other living man of the thoughts and feelings of the human race, is for ever summing up our virtues and our weaknesses in a few short words or phrases that go straight to the goal as ever did arrow of Robin Hood.

How true to all eternity are those words of his relative to the flight of time as experienced by various individuals. The slow pace of time to the maid who wearies her wedding day; the lazy pace of time for the unlettered priest and rich man, and the galloping of time for the poor criminal who awaits execution ("As You Like It," act iii., s. ii.). As we get older time appears to fly—the seasons come and go so quickly that we hardly mark the changes. Certain it is we never get the half done we intended; whether it is that we plan out for ourselves more than is possible of execution, or whether it is that our powers are failing us, is an open question—probably both causes are at work.

The cry is ever of unfinished work, uncompleted task, and the end of the year finds us lamenting over lost opportunities and chances gone for ever. We shall never again see such a year as this wonderful 1897. And it is doubtful if our children's children can ever show one so full of incident. It has pleased the Almighty to make us a power among the nations. We have lived for sixty years under the beneficent rule of a justly loved Sovereign. Peace and plenty crown our board, and prosperity would be the motto of our trade, if only the evil spirit of discontent would spread his wings and leave us. Happily it is only in one branch of our industry that distress prevails, and we are hoping daily that affairs will be adjusted, and that masters and men may be on better terms and understand one another better than they have done for years.

We think we may say without hesitation that for the agriculturist the year, on the whole, has been better than for several past. The winter was mild and open—indeed, almost too open. The autumn of 1896 was exceedingly wet, and the wetness of the season affected the growth of the Wheat crop; the verdict generally was, "Gone away thin." A good spell of frost is always beneficial to the land. There is nothing like frost for producing a fine mould, in which the young rootlets so delight.

The spring and early summer generally were dry, and the south and south-east suffered much from lack of moisture. This applies particularly to pasture lands. Happily, a warm genial, and we may say general, rain fell in June and put us all in heart again.

There was much complaint in parts about the failure of early Turnips, and fears were entertained for the safety of the Swede crop. Potatoes need moisture in July, and, alas! many fields had to go without. Harvest came—fine, brilliant weather in the earlier part, so that south country farmers and "forrard" northerners got their crops housed in grand condition; not heavy crops, but the colour and quality made amends. Then the weather broke.

Roots were much benefited; but what suited the Turnip and Mangold fields, although improving the quantity of the Potato, badly spoilt the quality; in fact, some of the Potatoes were too far gone, haulms dry and withered, "second growth" was all the story, and from land that, as a rule, sends only Potatoes to Covent Garden, the sample is very poor. We have heard of some fortunate speculators who went in for "Up to Dates," and we are glad to think they are recovering a little of that Potato money lost last season.

The end of September the weather took up, and the autumn has been one of the most beautiful we ever remember—a perfect boon to all concerned in agriculture. There was one touch of frost in October, but since then up to the date of writing, St. Thomas' Day, there has been nothing material. The pastures are a most beautiful green, and little or no inroad has been made on the store of winter provisions.

Grazing beasts have not done well except in favoured places. The early drought told on their pastures, and it also told on the dairy cows. Lambs, taking the country throughout, have done well. We all know the old expression as to how lambs prefer roast to boiled food. There have been local outbreaks of disease, but in many cases these outbreaks were the result of overcrowding. A farm gets "sheep sick," and is no longer a healthy habitat, and yet the farmer, despite of warning, will go against Nature and keep a huge flock, hence a heavy bill of mortality. Mr. Thornton reports some capital averages at Shorthorn sales, and Messrs. Sexton & Grimwade have made grand prices of shire horses. Many of the best and purest Lincoln rams have gone abroad, and the breeders look with satisfaction on the handsome cheque left by the "furriner."

Now for a comparison of prices. Nothing beats figures, they

are more convincing than columns of words. We take Wheat first. Last Christmas Wheat was worth 30s. per quarter, this Christmas it fetches 38s. Barley ranged last year from 16s. to 36s., this year from 25s. to 40s. Oats were 12s. to 21s., as against 17s. to 22s. Potatoes per ton last year, 20s. to 35s. (a few really good made a little more); this Christmas the prices are 65s. to 90s. Maize is 18s., as against 14s. 6d.

With regard to Barley and Potatoes we believe we have by no means seen the highest price yet. With offal Barley and pig Potatoes dear and scarce, we need not wonder that pork has gone up 1s. 6d. per stone. Those who have pork pigs will get a nice little draw, for we fancy any lean pigs there may be will, at any rate for the present, remain lean. Mutton makes about last year's price, but the wool trade has been disappointing, very. We had hoped better things; but, alas! for the present there seems little to cheer in that direction.

We, as farmers, have often been accused of inordinate grumbling. Things do go very contrary with us as they did with Martha Gummidge; but, indeed, it takes only a few gleams of sunshine to cheer us up, and we live much in the future on hope. Little pieces of good fortune turn up when least expected, and we go on toiling and rejoicing, trying modestly to leave our own little corner of this world a better place than we found it.

May we all be spared to see 1898 out as well as in.

WORK ON THE HOME FARM.

Farm work during the year just drawing to a close has, generally speaking, been accomplished under more favourable conditions than those prevailing during 1896. The chief drawback of 1897 was the absence of winter frost, and consequently a rough cloddiness in the Turnip stubbles, which took much hard work to reduce to anything approaching a suitable tilth for spring corn sowing.

Little difficulty was experienced in getting Turnips well sown. That the seed did not germinate, or, having germinated, the plants did not grow well in the early stages, was not the fault of the farmer, but rather his misfortune.

Hay-making time was a heyday time (no pun); never was hay better got or easier to get; we have known very dry seasons when it was as easy, but alas! there was not the fair, almost average, crop of the present season.

For many districts the ingathering of the grain crops was equally satisfactory. They did not bulk up to so much straw as might have been wished, but this helped to lighten the work of carting. As to the reaping, the self-binder now fairly holds the field, and few farmers who require a new machine think for a moment of purchasing one of the old type. This is the result of two or three dryish seasons with an absence of laid crops; but should we have another season like 1892, when Barleys were laid almost before they shot, we fear the new inventions might not stand the severe tests to which they would be subjected. The farm labourer would chuckle heartily at this, for much as the reaper has benefited him in relieving him of laborious work, he is nothing but a thorough Tory at heart, whatever his political colours may be.

BRITISH EGG PRODUCTION.

As you are connected with the agricultural industry and interested in its welfare, I write to ask you if you will take an active part in a National Poultry Test, which I am striving to put on foot on the 1st of March next.

The object of the test is to set at rest the vexed and oft debated question of profit or loss involved by the keeping of fowls, more particularly as egg producers. The British public (townspeople in particular) are for ever asking our farming community why they do not produce the 1,300,000,000 of eggs we annually import. The only answer they get to this query is, Because we cannot produce them at a profit. The rejoinder which follows upon this reply is, So you say, but you have never tested the matter; it pays other nations, why can't you make it a profit? Now, it may be a bold assertion to make, but it is nevertheless a fact, that this question of profit or loss has never yet been subjected to actual test. What I assert is, that no farmer has ever yet kept, say, forty or fifty head of laying hens for twelve months confined and wired in upon an acreage of grass land, and can tell you the exact sum they have cost for food, rent, labour, interest on capital, as against their yield of eggs and price obtained for them. It has hitherto been all guess work.

Now, to carry conviction to the minds of the public, and more particularly of our farmers, it is essential that any such test shall be above suspicion and not open to cavil, and also that it shall not be a mere local test, but one distributed over a wide area with diversity of soil and climate. Let England, Scotland, Wales, and Ireland be represented, or better still, let every county send in a return for at least one flock of fowl. We shall then, and not till then, be in a position to say whether it is our British farmers' fault, or their misfortune and beyond their control, that we import instead of produce the eggs we consume.

No amount of mere argument is sufficient to convince the British farmer that egg production can be made to pay, but I venture to assert that he can be convinced by ocular demonstration, or by the publication of a number of balance-sheets, showing what has actually been done experimentally by men of his own class and similarly circumstanced as himself.

To carry out this test, a strictly uniform system of management must be adopted by all who take part in it.

1st, Each flock subjected to the test shall number forty head.

2nd, Each flock of forty shall be wired in, and confined upon an acre of grass run.

3rd, Each and every flock to receive the same description of food and to be fed twice daily. During the six spring and summer months upon grain only, Maize, Wheat, Barley, and Oats. During the six autumn and winter months, the morning food to be boiled roots mixed with meal, with whole grain at night.

4th, All food to be purchased in the local market, carefully weighed, and stored in a locked shed. The eggs to be counted daily and sold weekly in the best open market obtainable. No fancy price realised to be taken account of.

5th, A strict account to be kept of the number of hours per week devoted to the necessary care of the stock.

6th, A statement of capital involved at the start by the purchase of stock, cost of fowl houses and other appliances, also estimated depreciation of live and dead stock at the close of the year's operations.

The above generally represents the lines upon which the test must be conducted, but there are other minor details, particulars of which will be forwarded to all who are willing to assist in the solution of this question. I may mention that any breed of fowl may be utilised for the purpose of the test, but in most cases it will be manifestly advisable to keep some sitting breed, the production of eggs being the object sought. It is also a matter of importance that the fowls should be located at no great distance from the farmstead, and that the suitability of the spot chosen and the question of shelter should receive due consideration.

Now what does the test involve financially to those who are willing to undertake it? Simply this. It involves their being out of pocket for a few months by the purchase price of their live stock, the necessary appliances and food. The sale of eggs, however, will rapidly reduce this outlay week by week, and without attempting to count the proverbial chicken before it is hatched, it is not unreasonable to say that long ere the twelve months have expired the owner of the stock will have far more than recouped himself for his outlay, after making full allowances for all costs, depreciation of stock, and interest on capital. The risk therefore is *nil*.

Without wishing in any way to depreciate the good which has been done by our farmers' clubs, agricultural colleges, County Council lectures, and even by our poultry shows, yet I believe that a practical test such as I have suggested will do more to impress upon the attention of our farmers the importance of the egg question than anything before attempted. It is the one and only way to satisfy the public mind and enable our farmers to decide for themselves as to whether they are or are not to blame in leaving so long neglected this particular branch of their calling.

If we are ever to make an appreciable impression upon our hitherto insufficient egg supply, it is to our farmers we must look, and why? Because they are in possession of our soil, which is an essential element in the successful keeping of poultry in any quantity.

That Leicestershire shall not be a defaulter in the taking up of this scheme, I intend myself to establish three or four flocks of different breeds which shall be tested under my own supervision, and I do not think it too much to hope that at least a hundred other individuals interested in agriculture will do likewise. This matter should commend itself to the attention of landowners, and especially our educational agricultural colleges and dairy schools, which are, more or less, supported out of public funds.

It may seem to be a matter of small moment to our farmers as to whether fifty head of fowls realise a profit of £5 or £10, or even £15' the sum in either case being insignificant. This, however, is a very narrow view to take of the question. If satisfactory results can be shown from a single flock we have something to warrant an increased number being kept, four flocks upon four acres, or eight upon eight acres, each flock enjoying equal advantages with the first. The return from this increased quantity may prove as substantial a sum as the other was deemed insignificant.

These tests will not only set at rest the question of profit or loss in the keeping of fowls as egg producers, but it will also conclusively show which particular breed of fowl are the most prolific layers and best suited to our climate.

It is intended that the results which are realised by the several trials shall at the close of the year be published in detail in all the leading agricultural papers, as well as, if possible, widely distributed in pamphlet form through the aid of our County Councils and other societies in touch with the agricultural industry.

My thirty years' experience in poultry keeping leads me to believe that results will be forthcoming from these tests calculated to both astonish and impress. It is not, however, possible to carry this scheme to a successful issue unless a sufficient number of agriculturists express their willingness to take part in it. I shall therefore be pleased to hear from anyone interested in this question, or who may desire further information. —K. B. Baghot-De La Bere, *Burbage Hall, Leicestershire.*
